Introduction

Welcome to the User Manual of Oxygen XML Author 18.0.

Oxygen XML Author is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful *Integrated Development Environment* and the intuitive *Graphical User Interface* of Oxygen XML Author is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with *XSLT* and *FOP* transformation technologies, Oxygen XML Author offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Author to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

Chapter

2

Getting Started

Topics:

- [*What is Oxygen XML Author*](#)
- [*Getting Familiar with the Layout*](#)
- [*Supported Document Type*](#)
- [*Resources to Help You Get Started Using Oxygen XML Author*](#)
- [*Your First Document or Project*](#)
- [*Getting Help*](#)

This chapter is designed to help you get started using Oxygen XML Author as quickly as possible.

This chapter provides you with a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Author would be to install the software. For detailed information about that process, see the [*Installation chapter*](#).

After installation, when you launch Oxygen XML Author for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

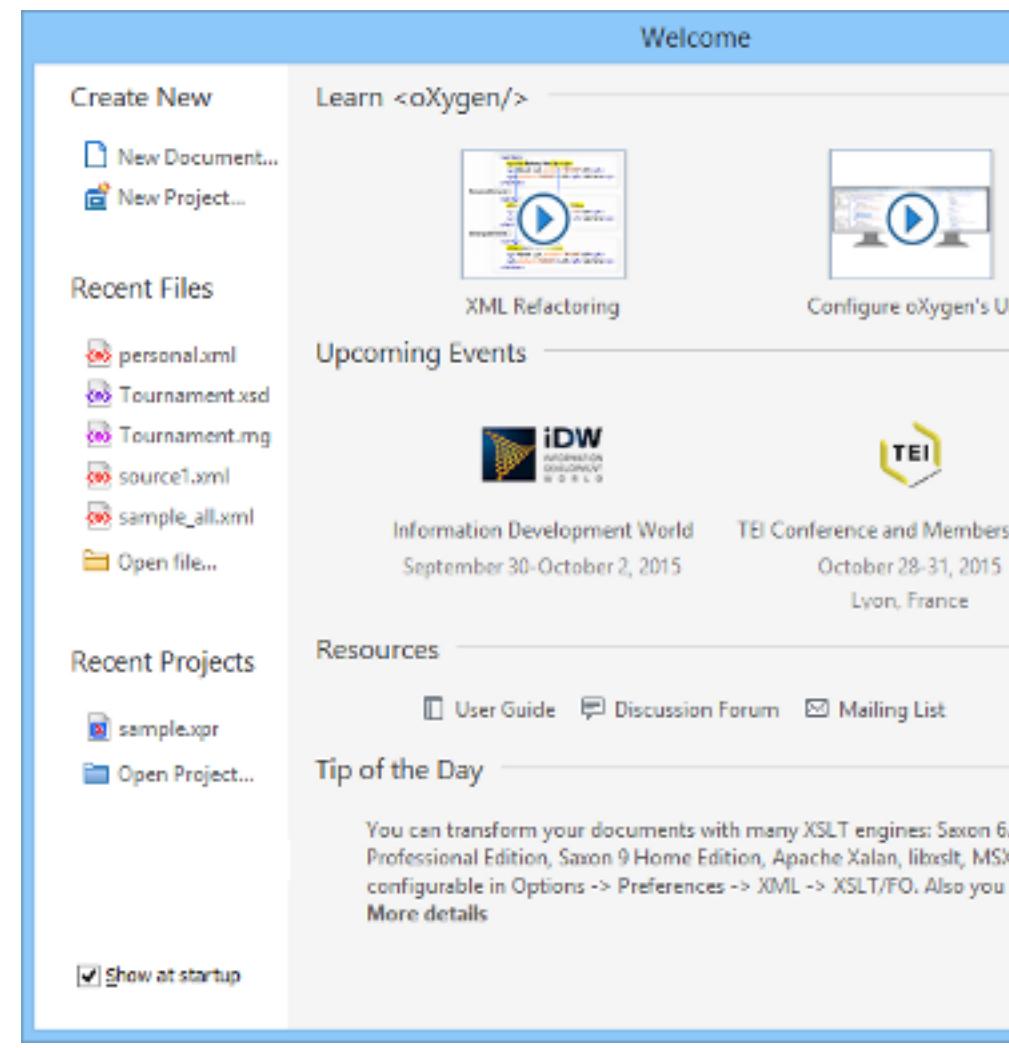

Figure 1: Welcome Dialog Box

If you do not want it to be displayed every time you launch Oxygen XML Author, disable the **Show at startup** option. To display it any time, go to **Help > Welcome**.

What is Oxygen XML Author

[Edit on GitHub](#)

Oxygen XML Author is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Author to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Author, see the [oxygen Website](#).

Getting Familiar with the Layout

[Edit on GitHub](#)

Oxygen XML Author includes several *perspectives* and *editing modes* to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

Regardless of the *perspective* or *editing mode* that you are working with, the default layout is comprised of the following areas:

Menus

Menu driven access to all the features and functions available in Oxygen XML Author. Most of the menus are common for all types of documents, but Oxygen XML Author also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited. All the *toolbars can be configured* to suit your specific needs.

Helper Views

Oxygen XML Author includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs. The *layout of the views can also be configured* according to your preferences.

Editor Pane

The main editing area in the center of the application. Each *editing mode* provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each *editing mode* also includes a variety of contextual

Perspectives

menu actions and other features to help streamline your editing tasks.

Oxygen XML Author includes *several different perspectives* that you can use to work with your documents. The **Editor** perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Author for the first time. Oxygen XML Author also includes a **Database** perspective that allows you to manage databases.

Status Bar

The status bar at the bottom of the application contains some useful information when your working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The *Unicode value* for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In *Text editing mode*, the current line and character position is displayed.
- If the *Check for notifications option* is enabled, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Author website, the announcement of upcoming webinars and conferences where the Oxygen XML Author team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the *Show memory status option* is enabled, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Supported Document Type

[Edit on GitHub](#)

You can use the main editing pane in Oxygen XML Author to edit a large variety of document types.

The supported document types include the following:

-  - XML documents
-  - JavaScript documents
-  - CSS documents
-  - LESS documents

Resources to Help You Get Started Using Oxygen XML Author [Edit on GitHub](#)

Configuring Oxygen XML Author

There are numerous ways that you can configure Oxygen XML Author to accommodate your specific needs.

- See the [Configuring Oxygen section](#) for details on the various ways that you can configure the application and its features.

Video Tutorials

The Oxygen XML Author website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Author and show you how to complete specific tasks or how to use the various features.

- Go to the [Oxygen XML Author Videos Page](#) to see the list of video tutorials and webinars.

Oxygen XML Author Documentation

The Oxygen XML Author documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the **F1** key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- [Text Editing Mode Section](#) - Provides information about the **Text** editor.
- [Author Editing Mode Section](#) - Provides information about the visual WYSIWYG-like **Author** editing mode.
- [Editing Documents Section](#) - Includes information about editing numerous different types of documents.
- [DITA Authoring and Publishing Section](#) - Provides information about using DITA to edit and structure your content.
- [WebHelp System Output Section](#) - Provides information about the WebHelp system that can be used for publishing content.
- [Importing Data Section](#) - Provides information about importing data from text files, MS Excel files, database data, and HTML files.

Sample Documents

Your installation of Oxygen XML Author includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Author. You will find files and folders for various types of documents, including the following:

- **sample.xpr file** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Project** view.
- **personal files** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Author:

- See the [Oxygen XML Author Blog Site](#) for a large variety of current and archived blogs in regards to numerous features, requests, and instructional topics.
- Take advantage of the [Oxygen XML Author Forum](#) to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).
- To learn about the WebHelp features in Oxygen XML Author, see the [Publishing DITA and DocBook to WebHelp](#) section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Author, see the [Tools section](#).
- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the [oXygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Author frameworks and plugins, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Author, see the [What's New Section of the Website](#)
- You can select the **Tip of the Day** action in the **Help** menu to display a dialog box that includes a variety of tips for using Oxygen XML Author.

Your First Document or Project

[Edit on GitHub](#)

This section includes several topics that will help you get started with your first document or project.

Your First XML Document

[Edit on GitHub](#)

To create your first XML document, select **File** > **New** or click the **New** button on the toolbar. The [New document wizard](#) is displayed:

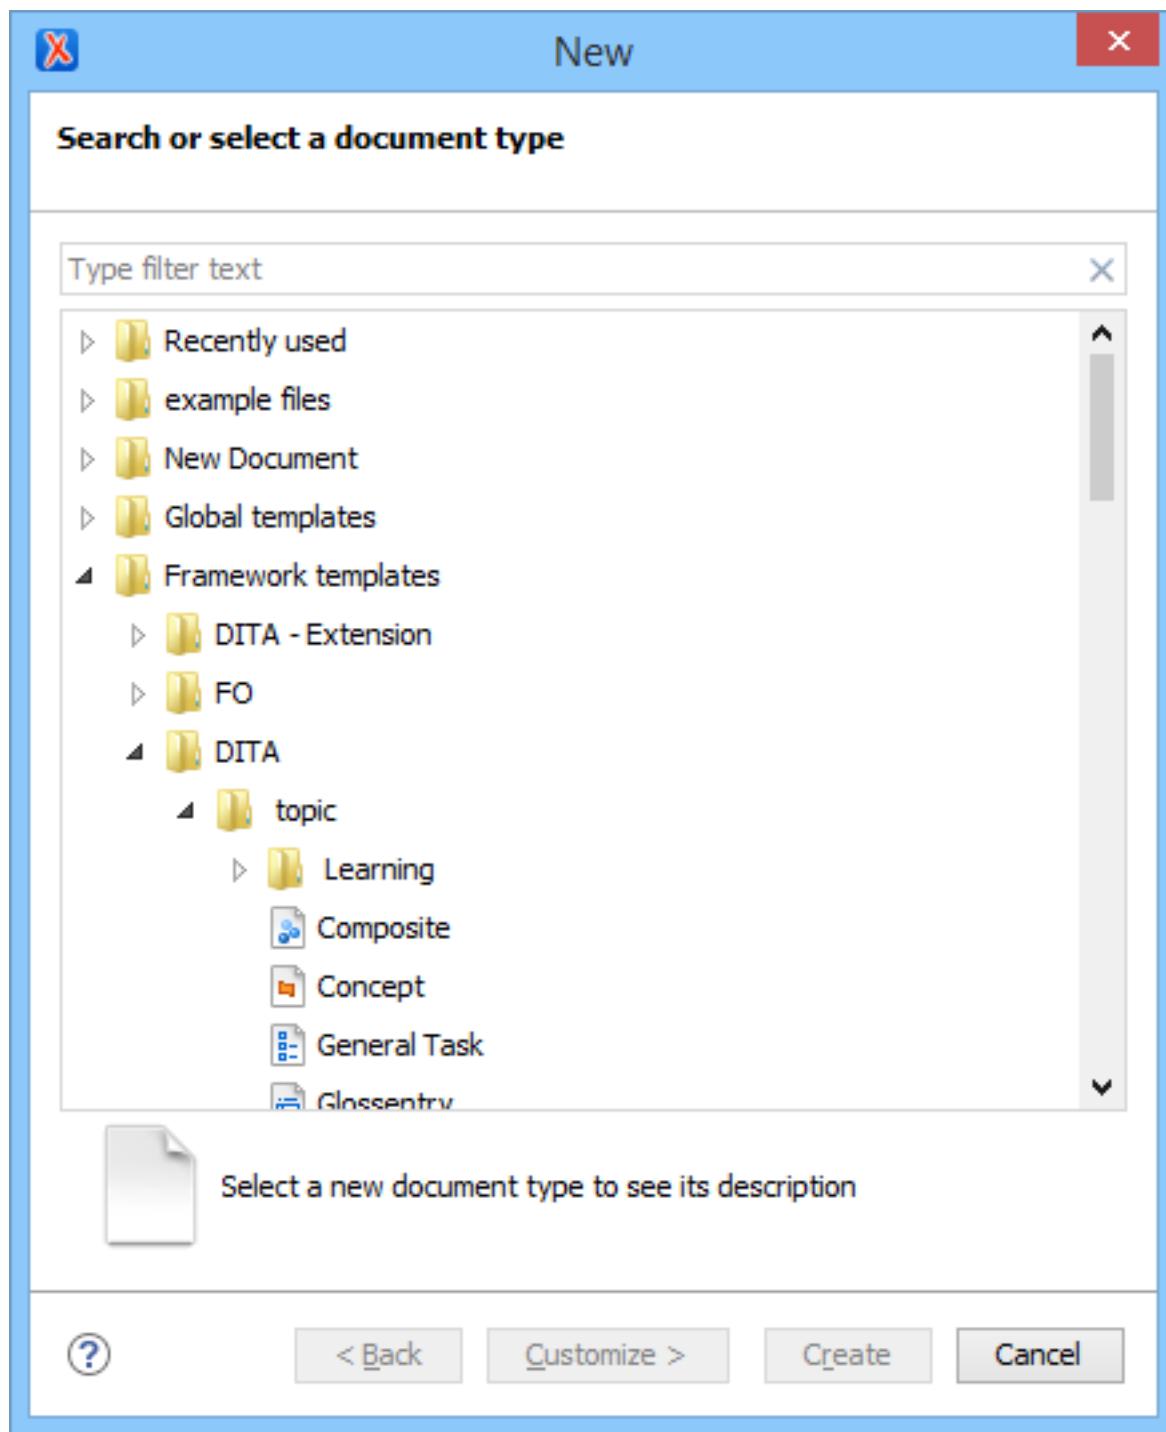

Figure 2: New Document Wizard

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there. After you use this dialog box to create a few documents, those document types will appear in the **Recently used** folder, which allows you to easily create other new documents of those types.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Author interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Author may open your document in [Text](#) or [Author](#) mode. **Text** mode shows the raw XML source file, while **Author** mode shows a graphical view of the document.

The availability of **Author** mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the **Author** mode. Oxygen XML Author includes default **Author** mode views for most of the document types it supports. If your company has created its own document types, **Author** mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Author built-in support, you need to edit it in **Text** mode or [create your own Author mode style sheet](#) for it.

You can switch back and forth between **Author** mode and **Text** mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from **Author** to **Text** mode. **Text** and **Author** modes are just different views for the same XML document. There is also a [Grid mode](#) available, which is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it to [sort things such as list items and table rows](#).

If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Author assists you with a continuous validation of the XML markup.

Structuring Your First Document

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Author helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, Oxygen XML Author assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model** view (**Window > Show View > Model**).
- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Author does its best to help you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Author creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Author presents [XML Quick Fixes](#) that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

Editing Your First Document

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Author provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Author provides many tools to help you edit your structure and to keep your structure valid while editing text.

The Document Breadcrumbs

Across the top of the editor window, there is a set of breadcrumbs that shows you exactly where the insertion

point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

book chapter sect1 sect2 sect3 para figure tit

Showing Tags

To see exactly where you are in the structure of the document, you can show the tags graphically in the **Author** view. There are several levels of tag visibility

that you can choose using the  **Display tags mode** drop-down menu on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

Outline View

The **Outline** view shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

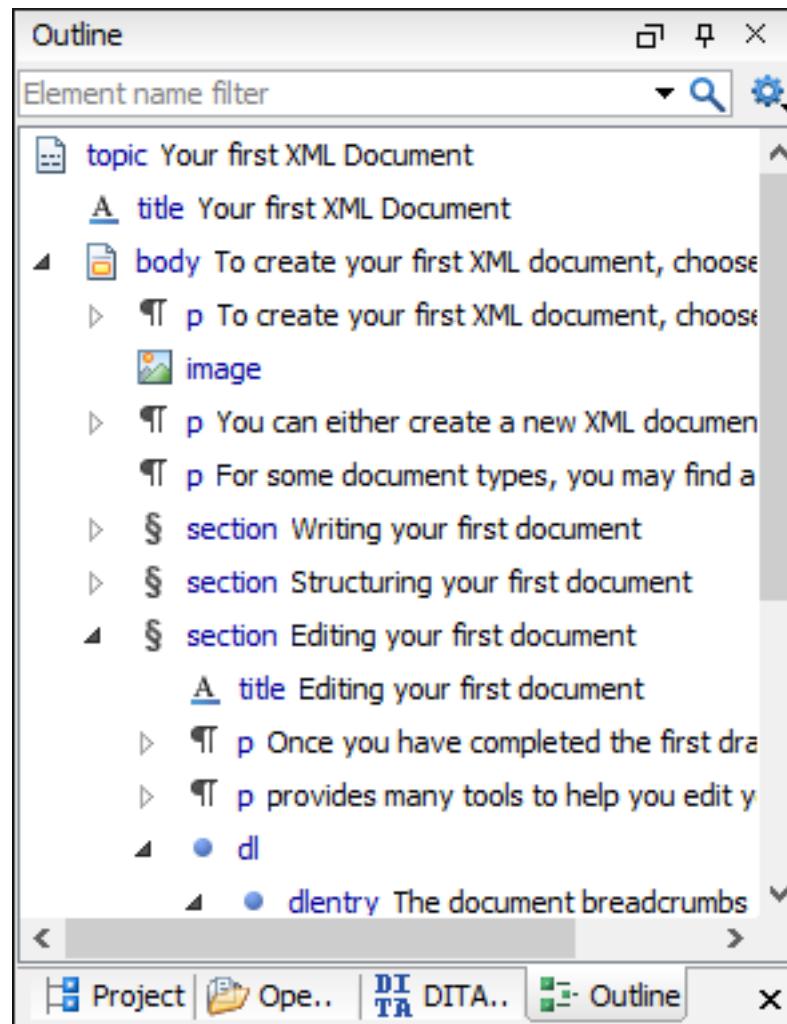

Figure 3: Outline View

You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document

types. You can also filter the **Outline** view to show only elements with a certain name.

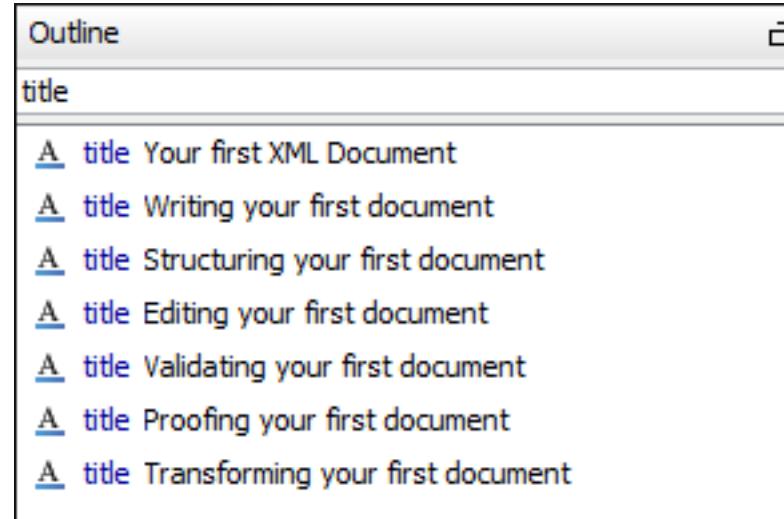

Figure 4: Outline View Filtered to only Show Element Names

Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or **Outline** view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Author warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using **Author** mode, you can also switch to **Text** mode to see exactly which bits of XML you are selecting and moving.

Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the **Refactoring** menu of the contextual menu (or the **Document > Markup** menu). More advanced refactoring operations are also available using the **XML Refactoring tool** that is available in the **Tools** menu.

Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Author knows how to find the schema, it validates the document for you as you type. Oxygen XML Author finds the schema automatically for most of the document types created from templates. However, in some cases you may have to [tell it how to find the schema](#).

When Oxygen XML Author validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Author also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Author cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu.. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

Note: Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select **Show Message**.

Proofing Your First Document

Oxygen XML Author includes an [automatic \(as-you-type\) spell checking feature](#), as well as a manual spell checking action. To check the spelling of your document manually, use the  **Check Spelling** action on the toolbar or from the **Edit** menu.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such as DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Author uses [transformation scenarios](#) to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Author or ones created by your organization.

To see the list of transformations available for your document, select the  **Apply Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu. A list of available transformation scenarios are displayed. Choose one or more scenarios to apply, and click **Apply associated**. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Your First DITA Topic

[Edit on GitHub](#)

To create your first DITA topic, select **File > New** or click the  **New** button on the toolbar. The [New Document Wizard](#) is displayed:

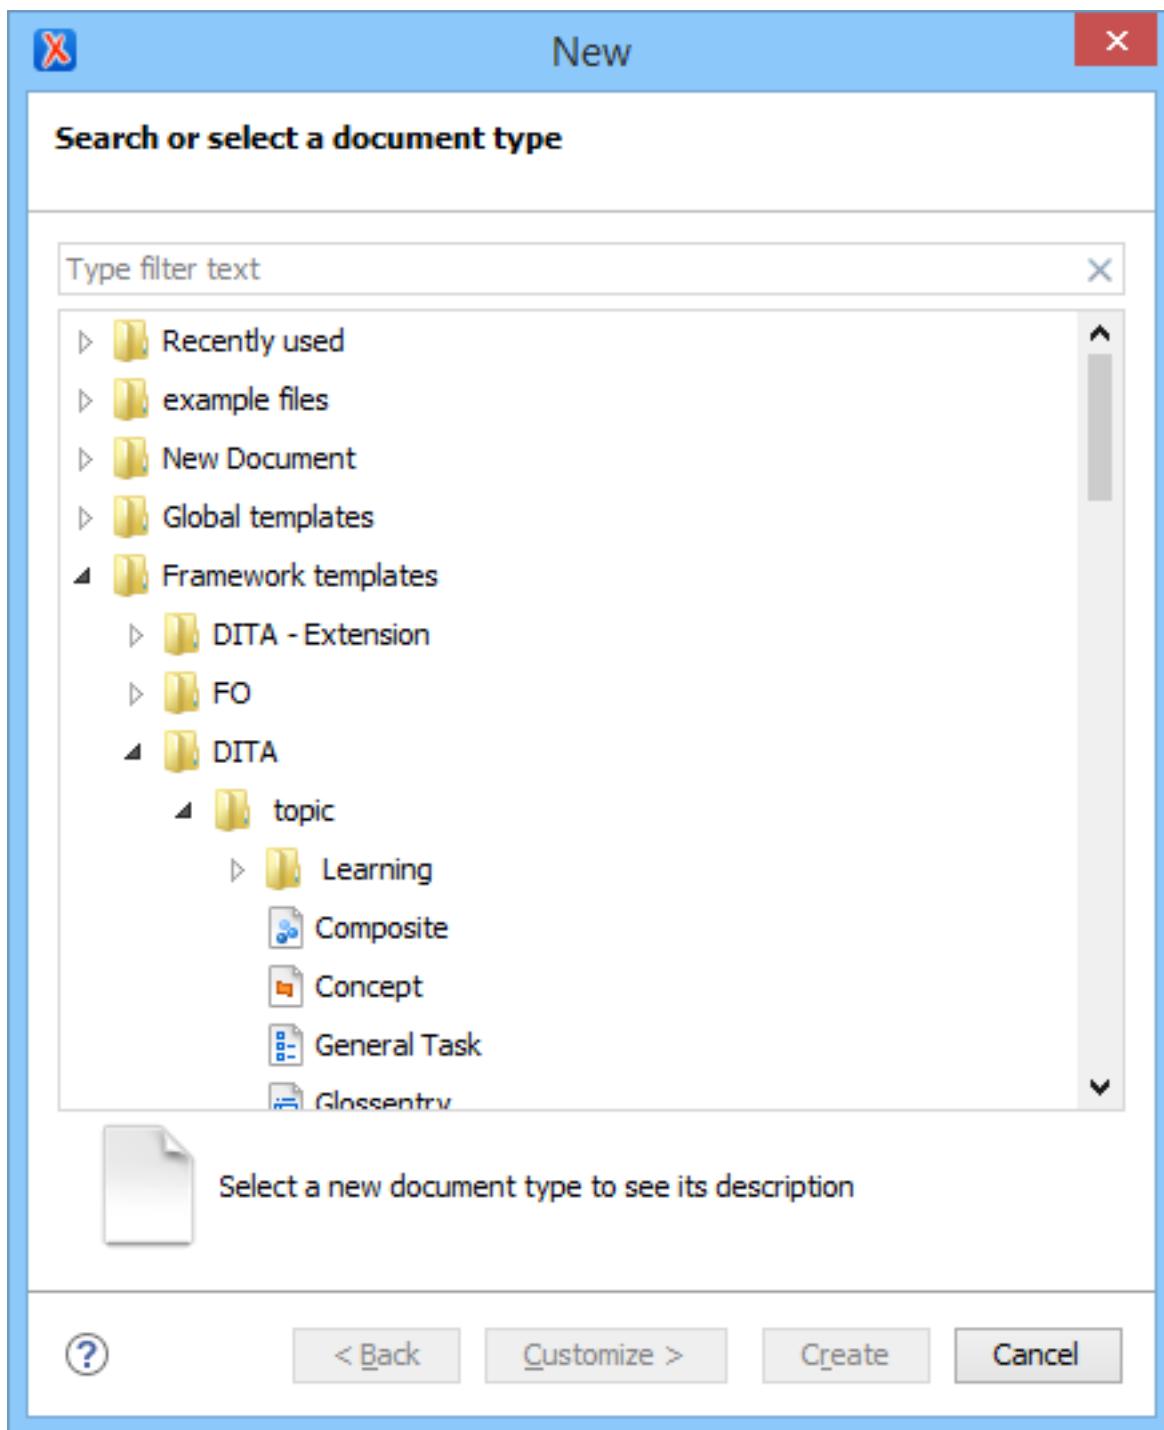

Figure 5: New Document Wizard

Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

Note: If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

Your DITA topic is an XML document, thus all *the editing features that Oxygen XML Author provides for editing XML documents* also apply to DITA topics. Oxygen XML Author also provides extensive additional support for *editing DITA topics, their associated DITA maps*, and for *creating DITA output*.

Understanding DITA Topics

It is important to understand the role that a *DITA topic plays in a DITA project*. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Author works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Author helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Author, along with the features of DITA, in a variety of ways.

Role of Maps

The basic method that DITA uses to express the relationship between topics is *through a DITA map*. Other relationships between topics, such as cross references, generally need to be made between topics in the same map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a map to create each chapter and then organize the chapters in another map to create the book. If you are writing help topics, you might use a map to combine several DITA topics to create a single help topic and then create another map to organize your help topics in a help system. This allows you to reuse the content of a map in multiple projects.

Creating a Map

To add topics to a map, you must first *create the map*. A map is an XML document, similar to a topic. To create a map, select **File > New** or click the  **New** button on the toolbar, go to **Framework templates > DITA Map > map** and select the type of map you want to create. Oxygen XML Author asks if you want to open your map in the editor or in the **DITA Maps Manager**. Usually, opening it in the **DITA Maps Manager** is the best choice, but you can also open the map in the editor from the **DITA Maps Manager**. The **DITA Maps Manager** presents a view of the DITA map that is similar to a table of contents.

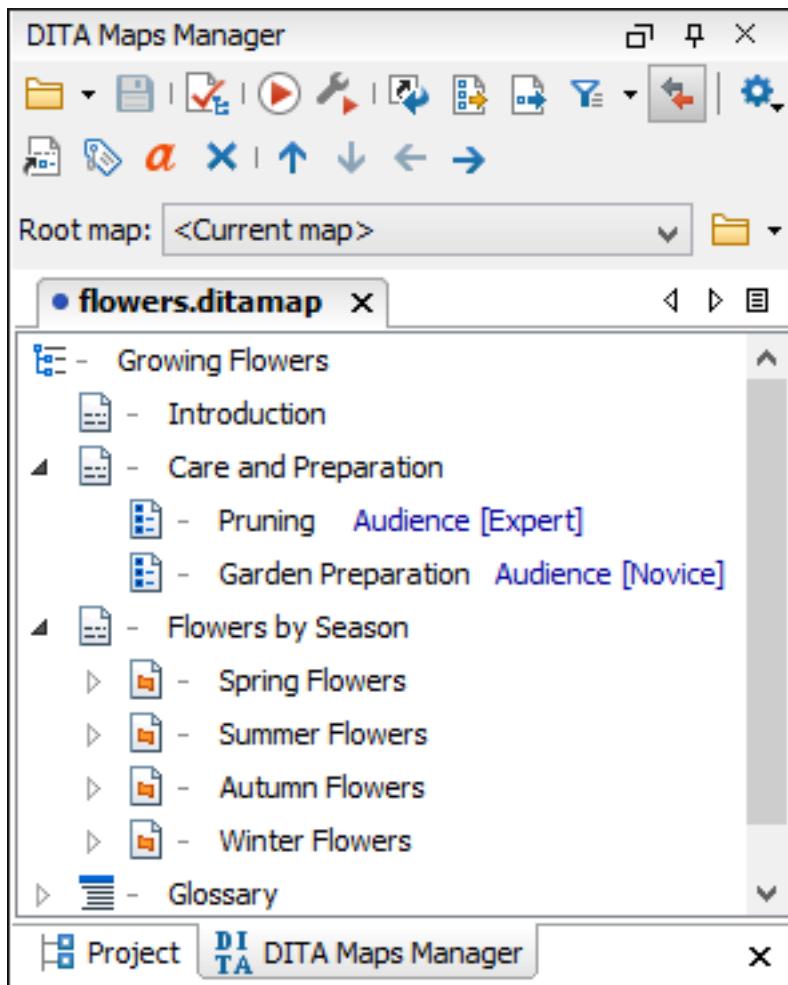

Figure 6: DITA Maps Manager View

Adding Topics to a Map

To [add a topic to a map](#), add a topic reference to the map using a `topicref` element. The easiest way to do this is to open the topic in the editor, then right-click the DITA map in the **DITA Maps Manager** view and choose **Reference to the currently edited file** from the **Append child** or **Insert After** submenus. This opens the [Insert Reference dialog box](#) with all of the required fields already filled in for you. You can fill in additional information in the various tabs in this dialog box or add it to the map later. When you select **Insert and close**, a reference to your topic is added to the map.

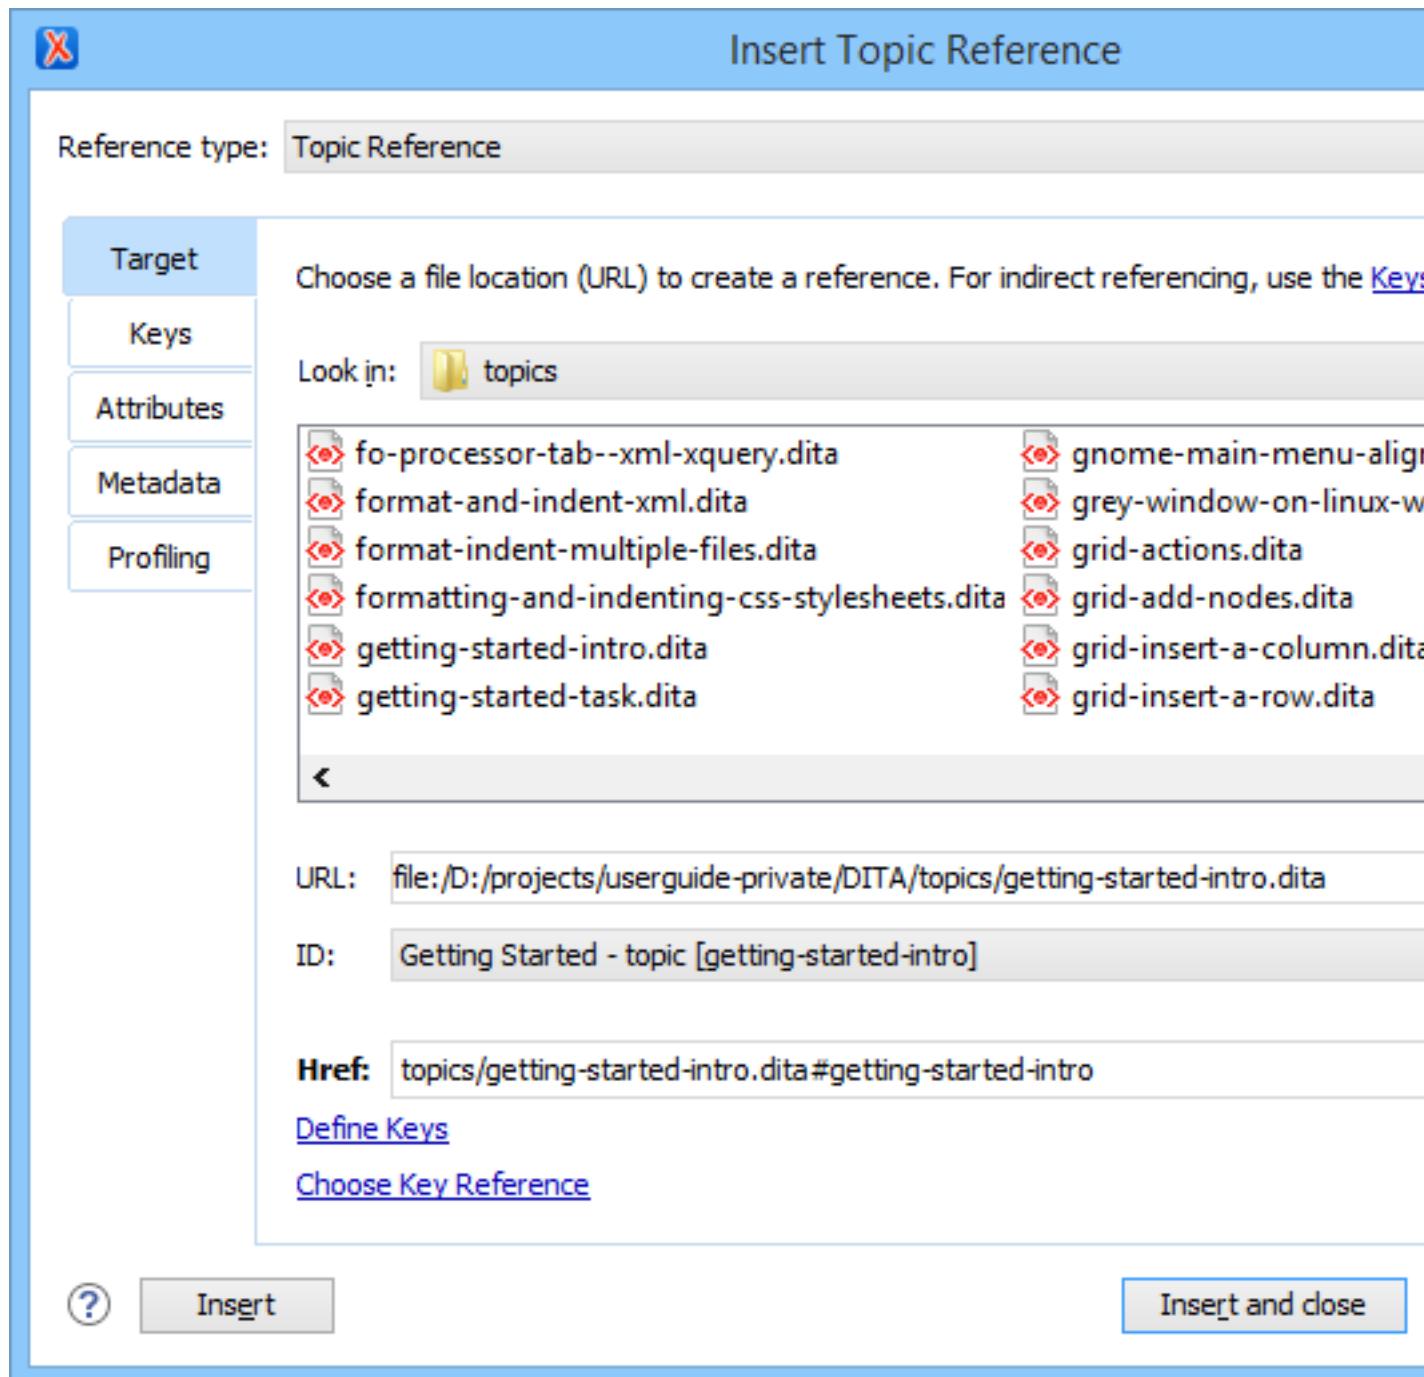

Figure 7: Insert Reference Dialog Box

If you want to see what the resulting map looks like in XML, save your map and then double-click the DITA map in the **DITA Maps Manager** view. The XML version of the map opens in the editor.

As you add topics to your map, you may want to make a topic the child or sibling of another topic. This is usually done at the map level. To create a child topic reference, right-click the parent topic in the **DITA Maps Manager** view and choose **Append child**. To create a sibling topic reference, right-click a topic in the **DITA Maps Manager** view and choose **Insert After**. From either of these submenus you can then choose one of the following options:

- **New** - Opens the *New file wizard* for creating a new topic.
- **Reference** - Opens the *Insert Reference dialog box* that allows you to create a reference to an existing topic.

- **Reference to the currently edited file** - Opens the *Insert Reference dialog box* that helps you to easily create a reference to the file that is currently opened in the editor.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Child Maps

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can *break up the content into smaller submaps*. A submap might represent a chapter of a book, a section of a user manual, or a page on a website.

To build a publication out of these smaller maps, you must add them to a map that represents the overall publication. To add a child map to the current map, right-click the parent DITA map and choose **Append child > Map reference**.

Validating a Map

Just as it is with your individual topics, it is important to *validate your maps*. Oxygen XML Author provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them. To validate a map, click the  **Validate and Check for Completeness** button in the **DITA Maps Manager** view.

Publishing Your Topics

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you *create published output* by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Author uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Author manages them by using transformation scenarios.

To publish output for a map, select the transformation scenario you want to run and set any of the parameters it requires. To select a transformation, click the  **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view. This opens the **Configure Transformation Scenario(s)** dialog box.

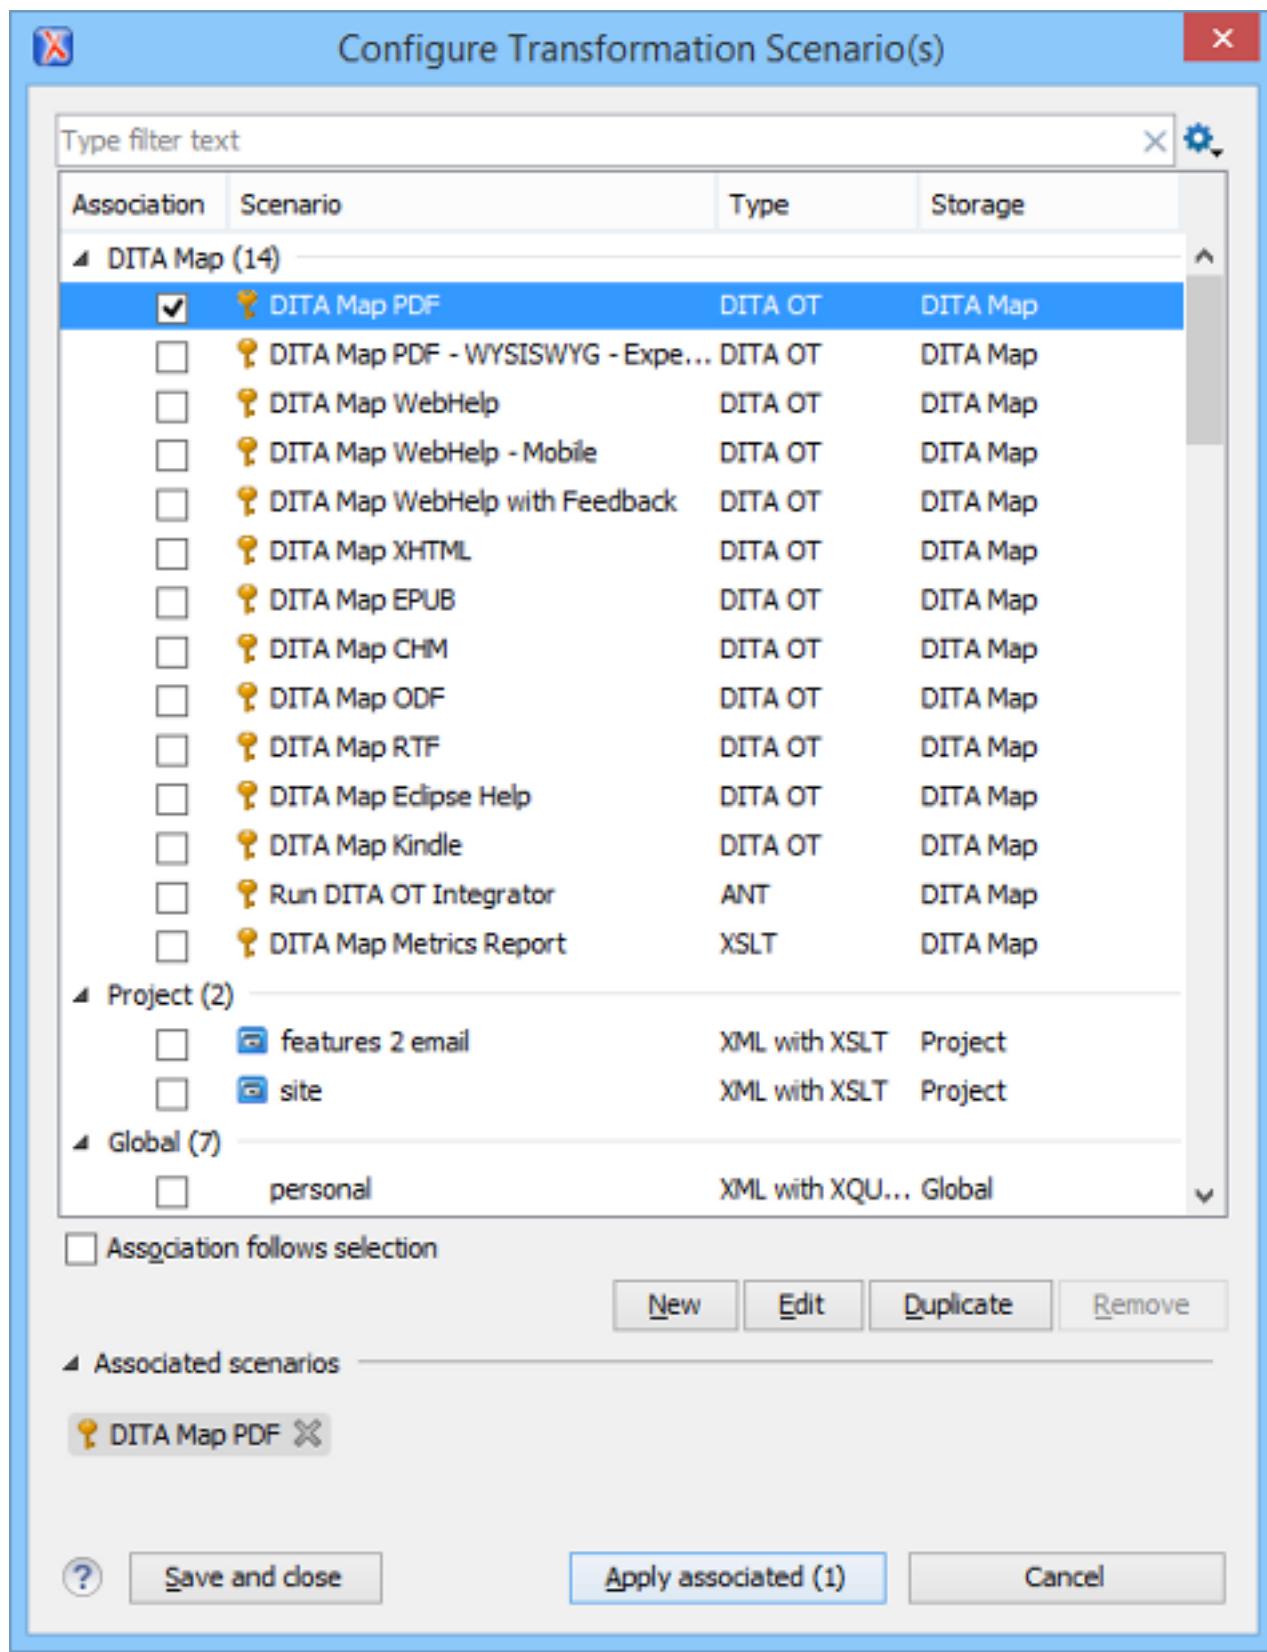

Figure 8: Configure Transformation Scenarios Dialog Box

Choose the transformation scenarios you want to apply and click **Apply associated**. Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the

appropriate application. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

Related information

[DITA Authoring and Publishing](#) on page 1577

Creating a New Project

[Edit on GitHub](#)

Oxygen XML Author allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also *share your project settings and transformation/validation scenarios* with other users. Use the [Project view](#) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select  **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the [Project view](#).

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

 **New > File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

 **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

 **New > Logical Folder**

Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

 **Add Folder**

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

 **Add Files**

Adds links to files on the local file system.

 **Add Edited File**

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  **Refresh (F5)** action from the toolbar or contextual menu and the **Project** view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project** view with bold text. To create a file inside a linked folder, select the **New > File** action from the contextual menu. The linked files presented in the **Project** view are marked with a special icon.

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see *Project View* on page 246.

For more details about how you can share projects with other users, see *Sharing a Project - Team Collaboration* on page 358.

Using Projects to Group Documents on page 347

Getting Help

[Edit on GitHub](#)

If you run into specific problems while using Oxygen XML Author you can take advantage of a variety of support related resources. Those resources include the following:

- *The Oxygen XML Author Support Section of the Website*
- *The Oxygen XML Author Forum*
- *The Oxygen XML Author Video Tutorials*
- *The Common Problems and Solutions Section of the User Manual*
- *The Online Technical Support Form*

The application also includes various specific help-related resources in the **Help** menu.

Help Menu

[Edit on GitHub](#)

The Oxygen XML Author **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Author.

Help (**F1**)

Use this action (or the **F1** key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the **Use online help** option is enabled, this action will open the User Manual in an online mode.

Use online help

If this option is enabled, the **Help (**F1**)** action will open the Oxygen XML Author User Manual in an online mode.

Show Dynamic Help view

Use this action to open a dynamic view that automatically loads the relevant help section of the User Manual for the focused editor, view, or dialog box.

Install new add-ons

Opens a dialog box that allows you to install new add-ons to extend the functionality of Oxygen XML Author.

Check for add-ons updates	Opens a dialog box that allows you to check for updates on installed add-ons.
Manage add-ons	Opens a dialog box that allows you to manage installed add-ons.
Check for a New Version	Use this action to view information about the latest version of Oxygen XML Author.
Browse <oXygen/> Website	Opens the Oxygen XML Author website in your default internet browser.
Register	If you encounter problems with your Oxygen XML Author license, you can use this option to open a dialog box that provides options for obtaining or using a license key.
Report problem	<p>You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:</p> <ul style="list-style-type: none"> • General info - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution. • Class Loader URLs - You can choose whether or not to include the listed <i>Class Loader URLs</i> with your report. • System properties - You can choose whether or not to include the listed system property details with your report. <p>Tip: You are able to change the URL where the reported problem is sent by using the <i>com.oxygenxml.report.problems.url</i> system property. The report is sent in XML format through the <i>report</i> parameter of the POST HTTP method.</p> <ul style="list-style-type: none"> • Plugins - You can choose whether or not to include details about your installed plugins with your report. • Frameworks - You can choose whether or not to include details about your installed frameworks with your report.
Support Center	Use this option to open the <i>Oxygen XML Author Support Section of the Website</i> .
Support Tools > Clipboard Inspector	Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Author. You can use the Copy button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Author support team.
Tip of the Day	Opens a dialog box that offers tips for using Oxygen XML Author.

About

Use this option to open a dialog box that contains information about Oxygen XML Author and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the *SGN* number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third party libraries that Oxygen XML Author uses. To view the End User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the frameworks that are bundled with Oxygen XML Author.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

Installation

Topics:

- *Installation Options for Oxygen XML Author*
- *Install Oxygen XML Author on Windows*
- *Install Oxygen XML Author on Mac OS X*
- *Install Oxygen XML Author on Linux*
- *Installing Oxygen XML Author on Windows Server*
- *Installing Oxygen XML Author on a Linux / UNIX Server*
- *Installing Oxygen XML Author using the Java Web Start (JWS) Installer*
- *Group Deployment*
- *Obtaining and Registering a License Key for Oxygen XML Author*
- *Setting Up a Floating License Server*
- *Transferring or Releasing a License Key*
- *Upgrading Oxygen XML Author*
- *Installing and Updating Add-ons in Oxygen XML Author*
- *Uninstalling Oxygen XML Author*
- *Oxygen XML Author Installer Command Line Reference*

The platform requirements and installation instructions are presented in this chapter.

This chapter includes information about installing and licensing Oxygen XML Author on various platforms.

Installation Options for Oxygen XML Author

[Edit on GitHub](#)

Choosing how Oxygen XML Author runs

You can install Oxygen XML Author to run in a number of ways:

- As a desktop application (running standalone or as an Eclipse plugin) on *Windows*, *Linux*, or *Mac*.
- As a desktop application (running standalone or as an Eclipse plugin) on a *Unix or Linux server* or on *Windows Terminal Server*.
- From within a browser though the *Java Web Start* technology.

Choosing an installer

You have a choice of installers;

- The native installer for your platform. On Windows and Linux, the native installer can run also in unattended mode.
- The All-platforms installer, which can be used on any supported platform.

The installation packages were checked before publication with an antivirus program to make sure they are not infected with viruses, trojan horses, or other malicious software.

Choosing a license option

You must *obtain and register a license* key to run Oxygen XML Author.

You can choose from two kinds of license:

- A named-person license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, transferring, and uninstalling.

You can also *upgrade* Oxygen XML Author, *transfer a license*, or *uninstall* Oxygen XML Author.

Getting help with installation

If you need help at any point during these procedures, please send us an email at support@oxygentools.com.

Install Oxygen XML Author on Windows

[Edit on GitHub](#)

Choosing an Installer

[Edit on GitHub](#)

You can install Oxygen XML Author on Windows using one of the following methods:

- *Windows installer*
- *Windows installer in unattended mode*
- *All Platforms installer* (choose this installer if you have trouble with the Windows installer)

System Requirements

[Edit on GitHub](#)

System requirements for a Windows install:

Operating systems

Windows Vista, Windows 7, Windows 8, Windows 10,
Windows Server 2008, Windows Server 2012

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Author requires Java. If you use the native Windows installer, Oxygen XML Author will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.7) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Author updates and releases.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Author using the batch file, `oxygenAuthor.bat`, you can edit the batch file to specify a particular version to use.

Install Using the Windows Installer

[Edit on GitHub](#)

To install Oxygen XML Author using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. Download the Windows installer.
3. Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.

4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Author using one of the following methods:
 - Using one of the shortcuts created by the installer.
 - By running `oxygenAuthor.bat`, which is located in the install folder.
6. To license your copy of Oxygen XML Author go to **Help > Register** and enter your *license information*.

Unattended Installation

[Edit on GitHub](#)

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Author with the default options and does not overwrite existing files. You can change many options for the unattended installer using the *installer command line parameters*.

Install Using the All Platforms Installer

[Edit on GitHub](#)

To install using the all platforms installer, follow these steps:

1. Download the all platforms installation package (`oxygenAuthor.tar.gz`) to a folder of your choice.
2. Extract the archive in that folder.
Oxygen XML Author is now installed in a new sub-folder called `oxygenAuthor`.
3. Optionally, you can move the directory where you installed Oxygen XML Author to your applications directory. You can also rename it to contain the product version information. For example, you can rename it as `oxygenAuthor18.0`.
4. Start Oxygen XML Author by running `oxygenAuthor.bat`, which is located in the install directory.
5. To license your copy of Oxygen XML Author go to **Help > Register** and enter your *license information*.

Install Oxygen XML Author on Mac OS X

[Edit on GitHub](#)

Choosing an Installer

[Edit on GitHub](#)

You can install Oxygen XML Author on Mac OS X using one of the following methods:

- Install using the Mac OS X installation package, `oxygenAuthor.zip`.
- Install using the all platforms installer. Choose the all platforms installer if you have trouble installing using the Mac OS X archive installation.

System Requirements

[Edit on GitHub](#)

System requirements for a Mac OS X install:

Operating system

OS X version 10.6 64-bit or later

CPU

- Minimum - Intel-based Mac, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Author requires Java to run. OS X includes Java by default or it will install it on the first attempt to run a Java application.

Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0 from Apple). Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Author updates and releases.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you start Oxygen XML Author with the application launcher (.app) file then:
 - a. If you use the zip distribution for OS X Oxygen XML Author uses the Apple Java SE 6 available on your Mac computer
 - b. If you use the tar.gz distribution that contains a bundled JRE then Oxygen XML Author will use that bundled JRE
2. If you start Oxygen XML Author using a startup .sh script then:
 - a. If a bundled JRE is available then it will be used
 - b. Otherwise, if the JAVA_HOME environment variable is set then the Java distribution indicated by it will be used
 - c. Otherwise, the version of Java pointed to by your PATH environment variable will be used

If you run Oxygen XML Author using the oxygenAuthor.sh script, you can change the version of Java used by editing to script file. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/System/Library/Frameworks/
JavaVM.framework/Versions/1.6.0/
Home/bin/java "-Xdock:name= ..."
```

OS X Installation
[Edit on GitHub](#)

To install Oxygen XML Author on OS X, follow these steps:

1. Download the OS X installation package (oxygenAuthor.zip).

The Safari web browser should recognize and expand the compressed file. If it is not automatically expanded, you can expand it manually by double-clicking it.

2. Validate the integrity of the downloaded file by *checking it against the MD5 sum* published on the download page.

3. In **Finder**, move the expanded folder to your Applications folder.
Oxygen XML Author is now installed.
4. Start Oxygen XML Author, using one of the following methods:
 - Double-click `Oxygen XML Author.app`.
 - Run `sh oxygenAuthorMac.sh` on the command line.

Notice: You can start multiple instances on the same computer by running the following command for each new instance:

```
open -n OxygenAuthor.app
```

5. To license your copy of Oxygen XML Author, go to **Help > Register** to enter your *license key*.

Install Using the All Platforms Installer

[Edit on GitHub](#)

To install using the all platforms installer:

1. Download the all platforms installation package (`oxygenAuthor.tar.gz`) to a folder of your choice.
2. Extract the archive in that folder.
Oxygen XML Author is now installed in a new sub-folder called `oxygenAuthor`.
3. Optionally, you can move the directory where you installed Oxygen XML Author to your applications directory. You can also rename it to contain the product version information. For example, you can rename it as `oxygenAuthor18.0`.
4. Start Oxygen XML Author by running `oxygenAuthorMac.sh`, which is located in the install folder.
5. To license your copy of Oxygen XML Author go to **Help > Register** and enter your *license information*.

Install Oxygen XML Author on Linux

[Edit on GitHub](#)

Choosing an Installer

[Edit on GitHub](#)

You can install Oxygen XML Author on Linux using any of the following methods:

- Install using the Linux installer.
- Install using the Linux installer in unattended mode.
- Install using the all platforms installer. Choose the all platforms installer if you have trouble installing using the Linux installer.

System Requirements

[Edit on GitHub](#)

System requirements for a Linux install:

Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Author requires Java. Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Author updates and releases. Oxygen XML Author does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Author by editing the script file, `oxygenAuthor.sh`. Go to the `Java` command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

Linux Installation

[Edit on GitHub](#)

Linux installation procedure.

To install Oxygen XML Author on Linux, follow these steps:

1. Download the Linux installer.
2. Optionally, you can validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
3. Run the installer that you downloaded.

For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

4. Start Oxygen XML Author using one of the following methods:
 - Use the `author` shortcut created by the installer.
 - From a command line, type `sh oxygenAuthor.sh`. This file is located in the installation folder.
5. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license key](#).

Unattended Installation

[Edit on GitHub](#)

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Author with the default options and does not overwrite existing files. You can change many options for the unattended installer using the [installer command line parameters](#).

Install Using the All Platforms Installer

[Edit on GitHub](#)

To install using the all platforms installer:

1. Download the all platforms installation package (`oxygenAuthor.tar.gz`) to a folder of your choice.
2. Extract the archive in that folder.
Oxygen XML Author is now installed in a new sub-folder called `oxygenAuthor`.
3. Optionally, you can move the directory where you installed Oxygen XML Author to your applications directory. You can also rename it to contain the product version information. For example, you can rename it as `oxygenAuthor18.0`.
4. Start Oxygen XML Author by running `oxygenAuthor.sh`, which is located in the install folder.
5. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license information](#).

Installing Oxygen XML Author on Windows Server

[Edit on GitHub](#)

Choosing an Installer

[Edit on GitHub](#)

You can install Oxygen XML Author on Windows using one of the following methods:

- [Windows installer](#)
- [Windows installer in unattended mode](#)
- [All Platforms installer](#) (choose this installer if you have trouble with the Windows installer)

System Requirements

[Edit on GitHub](#)

System requirements for a Windows Server install:

Operating systems

Windows Server 2008, Windows Server 2008 R2,
Windows Server 2012, Windows Server 2012 R2

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum values per user - 512 MB of RAM
- Recommended values per user - 2 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Author requires Java. If you use the native Windows installer, Oxygen XML Author will be

installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.7) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Author updates and releases.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Author using the batch file, `oxygenAuthor.bat`, you can edit the batch file to specify a particular version to use.

Install Using the Windows Installer

[Edit on GitHub](#)

To install Oxygen XML Author using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. Download the Windows installer.
3. Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Author using one of the following methods:
 - Using one of the shortcuts created by the installer.
 - By running `oxygenAuthor.bat`, which is located in the install folder.
6. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license information](#).

Install Using the All Platforms Installer

[Edit on GitHub](#)

To install using the all platforms installer, follow these steps:

1. Download the all platforms installation package (`oxygenAuthor.tar.gz`) to a folder of your choice.
2. Extract the archive in that folder.
Oxygen XML Author is now installed in a new sub-folder called `oxygenAuthor`.
3. Optionally, you can move the directory where you installed Oxygen XML Author to your applications directory. You can also rename it to contain the product version information. For example, you can rename it as `oxygenAuthor18.0`.

4. Start Oxygen XML Author by running `oxygenAuthor.bat`, which is located in the install directory.
5. To license your copy of Oxygen XML Author go to **Help > Register** and enter your *license information*.

Configuring Windows Terminal Server

[Edit on GitHub](#)

Windows Terminal Server configuration procedure.

1. Install Oxygen XML Author on the server and make its shortcuts available to all users.
2. If you need to run multiple instances of Oxygen XML Author, make sure you add the `-Dcom.oxygenxml.MultipleInstances=true` parameter in the `.bat` startup script.
3. Make sure you allocate sufficient memory to Oxygen XML Author by adding the `-Xmx` parameter either in *the .bat startup script*, or in *the .vmoptions configuration file* (if you start it from an executable launcher).

Installing Oxygen XML Author on a Linux / UNIX Server

[Edit on GitHub](#)

Choosing an Installer

[Edit on GitHub](#)

You can install Oxygen XML Author on Linux using any of the following methods:

- Install using the Linux installer.
- Install using the Linux installer in unattended mode.
- Install using the all platforms installer. Choose the all platforms installer if you have trouble installing using the Linux installer.

System Requirements

[Edit on GitHub](#)

System requirements for a Linux install:

Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Author requires Java. Oxygen XML Author only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Author may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Author updates and releases.

Oxygen XML Author does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Author uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Author installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Author uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Author by editing the script file, `oxygenAuthor.sh`. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

Linux Installation

[Edit on GitHub](#)

Linux installation procedure.

To install Oxygen XML Author on Linux, follow these steps:

1. Download the Linux installer.
 2. Optionally, you can validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
 3. Run the installer that you downloaded.
- For example, open a shell, cd to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.
4. Start Oxygen XML Author using one of the following methods:
 - Use the `author` shortcut created by the installer.
 - From a command line, type `sh oxygenAuthor.sh`. This file is located in the installation folder.
 5. To license your copy of Oxygen XML Author go to **Help > Register** and enter your [license key](#).

Install Using the All Platforms Installer

[Edit on GitHub](#)

To install using the all platforms installer:

1. Download the all platforms installation package (`oxygenAuthor.tar.gz`) to a folder of your choice.
2. Extract the archive in that folder.
Oxygen XML Author is now installed in a new sub-folder called `oxygenAuthor`.
3. Optionally, you can move the directory where you installed Oxygen XML Author to your applications directory. You can also rename it to contain the product version information. For example, you can rename it as `oxygenAuthor18.0`.
4. Start Oxygen XML Author by running `oxygenAuthor.sh`, which is located in the install folder.

- To license your copy of Oxygen XML Author go to **Help > Register** and enter your *license information*.

Unix / Linux Server Configuration

[Edit on GitHub](#)

To install Oxygen XML Author on a Unix / Linux server:

- Install Oxygen XML Author on the server and make sure the oxygenAuthor.sh script is executable and the installation directory is in the PATH of the users that need to use the application.
- Make sure you allocate sufficient memory to Oxygen XML Author by setting an appropriate value for the -Xmx parameter in the .sh startup script.
The default value of the -Xmx parameter is 512 MB. To avoid *performance issues with large documents*, you may need to adjust it.
- Make sure the X server processes located on the workstations allow connections from the server host. For this, use the xhost command.
- Start telnet (or ssh) on the server host.
- Start an *xterm* process with the **display** parameter set on the current workstation. For example: `xterm -display workstationip:0.0`.
- Start Oxygen XML Author by typing `sh oxygenAuthor.sh` from the command line. This file is located in the installation folder.

Installing Oxygen XML Author using the Java Web Start (JWS) [Edit on GitHub](#) Installer

Oxygen XML Author provides the tools to create your own JWS distribution that can be installed on a custom web server. The advantages of a JWS distribution include:

- Oxygen XML Author is run locally, not inside a web browser, overcoming many of the browser compatibility problems common to applets.
- JWS ensures that the most current version of the application will be deployed, as well as the correct version of JRE.
- Applications launched with Java Web Start are cached locally. Thus, an already downloaded application is launched on par with a traditionally installed application.
- You can preconfigure Oxygen XML Author and the rest of your team will use the same preferences and frameworks.

Important: If you want to create your own JWS distribution package, please [contact Syncro Soft](#) for permission through a *Value Added Reseller Agreement*.

Note: A code signing certificate is needed to sign the JWS distribution. The following procedure assumes that you already have such a certificate (for example, Thawte™, or Verisign™).

The following schematics depicts the Oxygen XML Author Java Web Start deployment procedure:

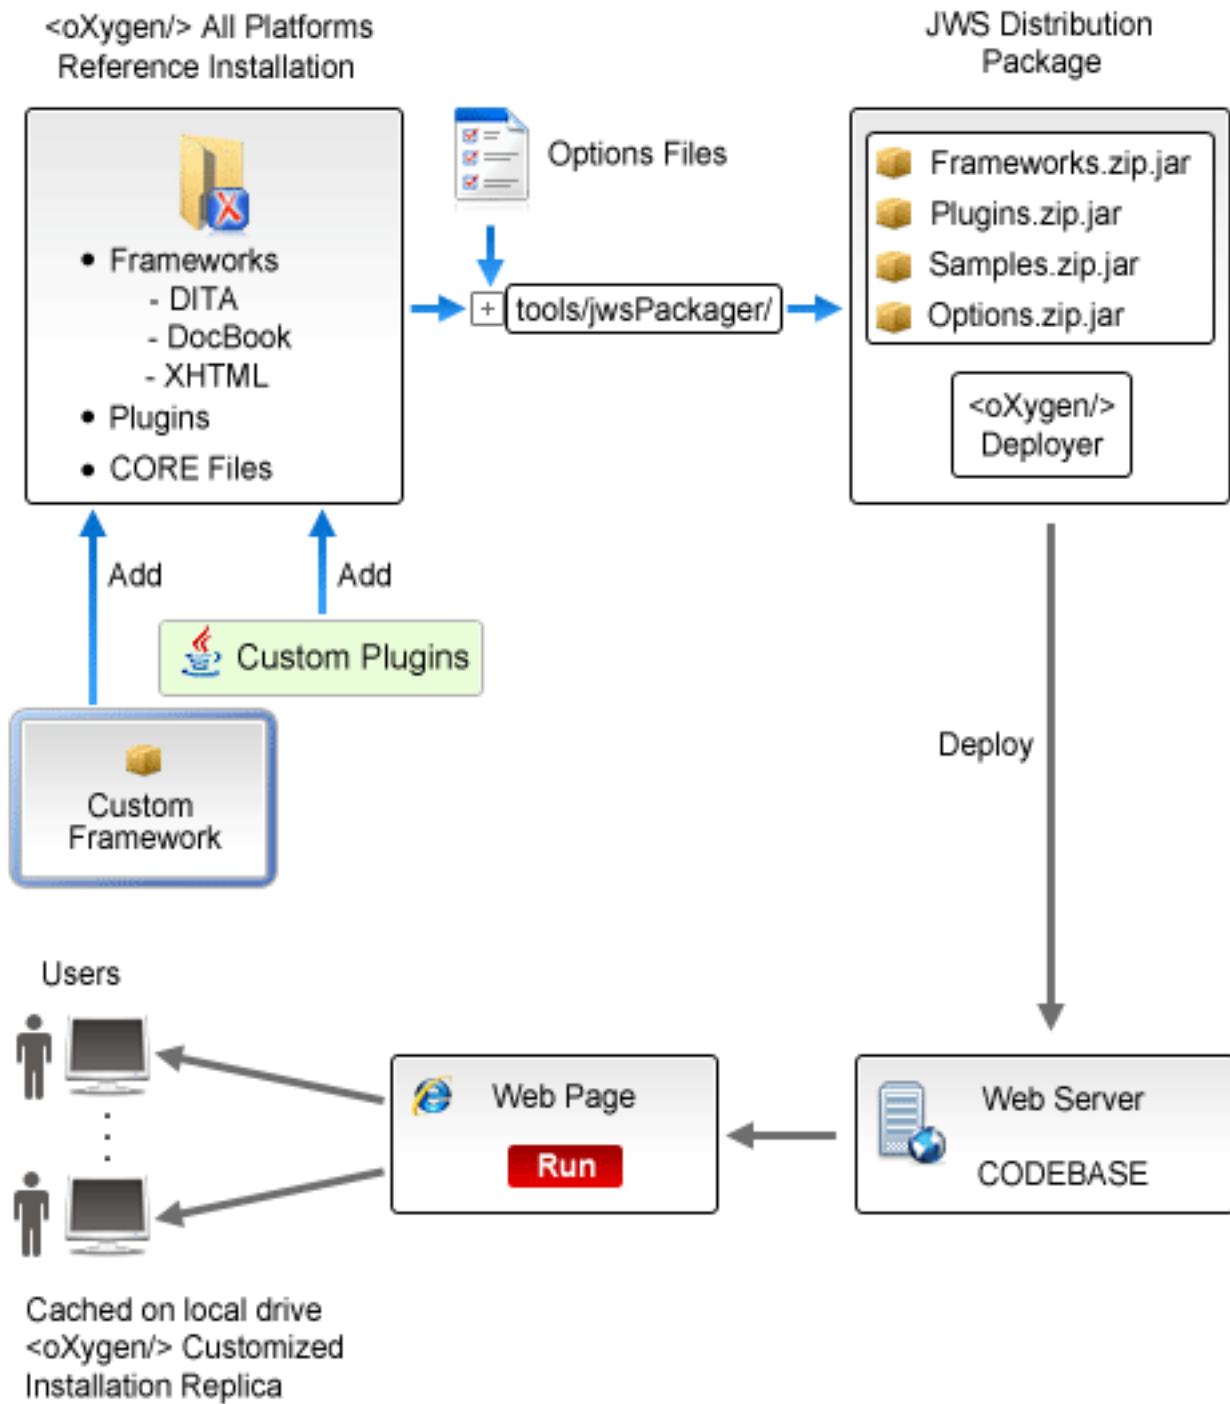

Figure 9: Java Web Start Deployment Procedure

To deploy an Oxygen XML Author installation on a server.

1. Go to <http://www.oxygenxml.com/InstData/Author/All/oxygenAuthor.tar.gz> and download the All Platforms Installation package to a local drive.
2. Expand the archive to a temporary location.
The `oxygenAuthor` folder is created.
3. Optionally, you can customize the content of the **frameworks** folder.

4. Edit the `oxygenAuthor\tools\jwsPackager\packager.properties` configuration file. Adjust the following properties appropriately for your server:
 - **codebase** - Represents the location of the future JWS distribution.
 - **keystore** - The *keystore* location path.
 - **storepass** - The password for *keystore* integrity.
 - **storetype** - The type of the certificate file, such as PKCS12 or JKS.
 - **alias** - The *keystore* alias.
 - **optionsDir** - Points to the options directory that may be distributed with the JWS installer. If the directory contains an XML document named `options.xml` or `default.xml` containing exported options, these options will be used. Otherwise, the structure of the options folder has to match the structure of a stand alone application options folder.

Note: This property is optional. It is provided only if *custom options* need to be delivered to the end users.

The values of **keystore**, **storepass**, and **alias** properties are all provided by the code signing certificate. For more information, please check the documentation for your *jarsigner* tool.

5. If you want to modify the default settings, edit the JNLP `oxygenAuthor\tools\jwsPackager\dist\javawebstart\author\author.jnlp` template file. You can specify the list of files opened at startup by modifying the `<argument>` list. To pass system properties directly to Oxygen XML Author when it is started, add the `oxy` prefix to them (for example: `<property name="oxyPropertyName" value="testValue"/>`). The system property is passed to Oxygen XML Author with the prefix stripped.
6. Open a command-line console and run `ant` in the `oxygenAuthor\tools\jwsPackager` folder. The **ant** process creates the `oxygenAuthor\tools\jwsPackager\dist\InstData\authorJWS.zip` archive that contains the actual remote JWS installer.
7. Copy the expanded content of the archive to the folder specified in the **codebase** property, previously set in the **packager.properties** file.
8. Using your favorite web browser, go to the address specified in the **codebase** property or to its parent folder and start the remote installer.

Important: When running the Java Web Start distribution on OS X, due to changes in this *security release*, clicking the link to the JNLP file does not start the application. The selected JNLP is downloaded locally. Right-click it and choose to open the resource.

Group Deployment

[Edit on GitHub](#)

If you are deploying Oxygen XML Author for a group, there are a number of things you can do to customize Oxygen XML Author for your users and to make the deployment more efficient.

Creating custom default options

You can *create a custom set of default options* for Oxygen XML Author. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Author, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Author project files are used to configure a project. You can create and deploy default project files for your projects so that your users will have a preconfigured project file to begin work with.

Shared project files

Rather than each user having their own project file, you can create and deploy shared project files so that all users

Using the unattended installer

share the same project configuration and settings and automatically inherit all project changes.

Using floating licenses

You can speed up the installation process by using the *unattended installer for Windows* or *Linux installs*.

If you have a number of people using Oxygen XML Author on a part-time basis or in different time zones, you can use a *floating license* so that multiple people can share a license.

Obtaining and Registering a License Key for Oxygen XML Author

[Edit on GitHub](#)

Oxygen XML Author is not free software. To enable and use Oxygen XML Author, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at <http://www.oxygenxml.com/register.html>. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license. If a trial period greater than 30 days is required, please contact support@oxygenxml.com.

Choosing a License Type

[Edit on GitHub](#)

You can use one of the following license types with Oxygen XML Author:

1. A named-user license may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of named users. It is your responsibility to keep track of the named users that each license is assigned to.
2. A floating license may be used by any user on any machine. However, the total number of copies of Oxygen XML Author in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Author (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.

For definitions and legal details of the license types, consult the End User License Agreement available at http://www.oxygenxml.com/eula_author.html.

Obtaining a License

[Edit on GitHub](#)

You can obtain a license for Oxygen XML Author in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Author website at <http://www.oxygenxml.com/buy.html>. A license key will be sent to you by email.
- If your company or organization has purchased licenses please contact your license administrator to obtain a license key.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from <http://www.oxygenxml.com/registerCode.html>. A license key will be sent to you by email.
- If you want to evaluate the product you can obtain a trial license key for 30 days from the Oxygen XML Author website at <http://www.oxygenxml.com/register.html>.

Register a Named-User License

[Edit on GitHub](#)

To register a named-user license on a machine owned by the *Named User*:

1. Save a backup copy of the message containing the new license key.
2. Start Oxygen XML Author.

If this is a new install of Oxygen XML Author, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

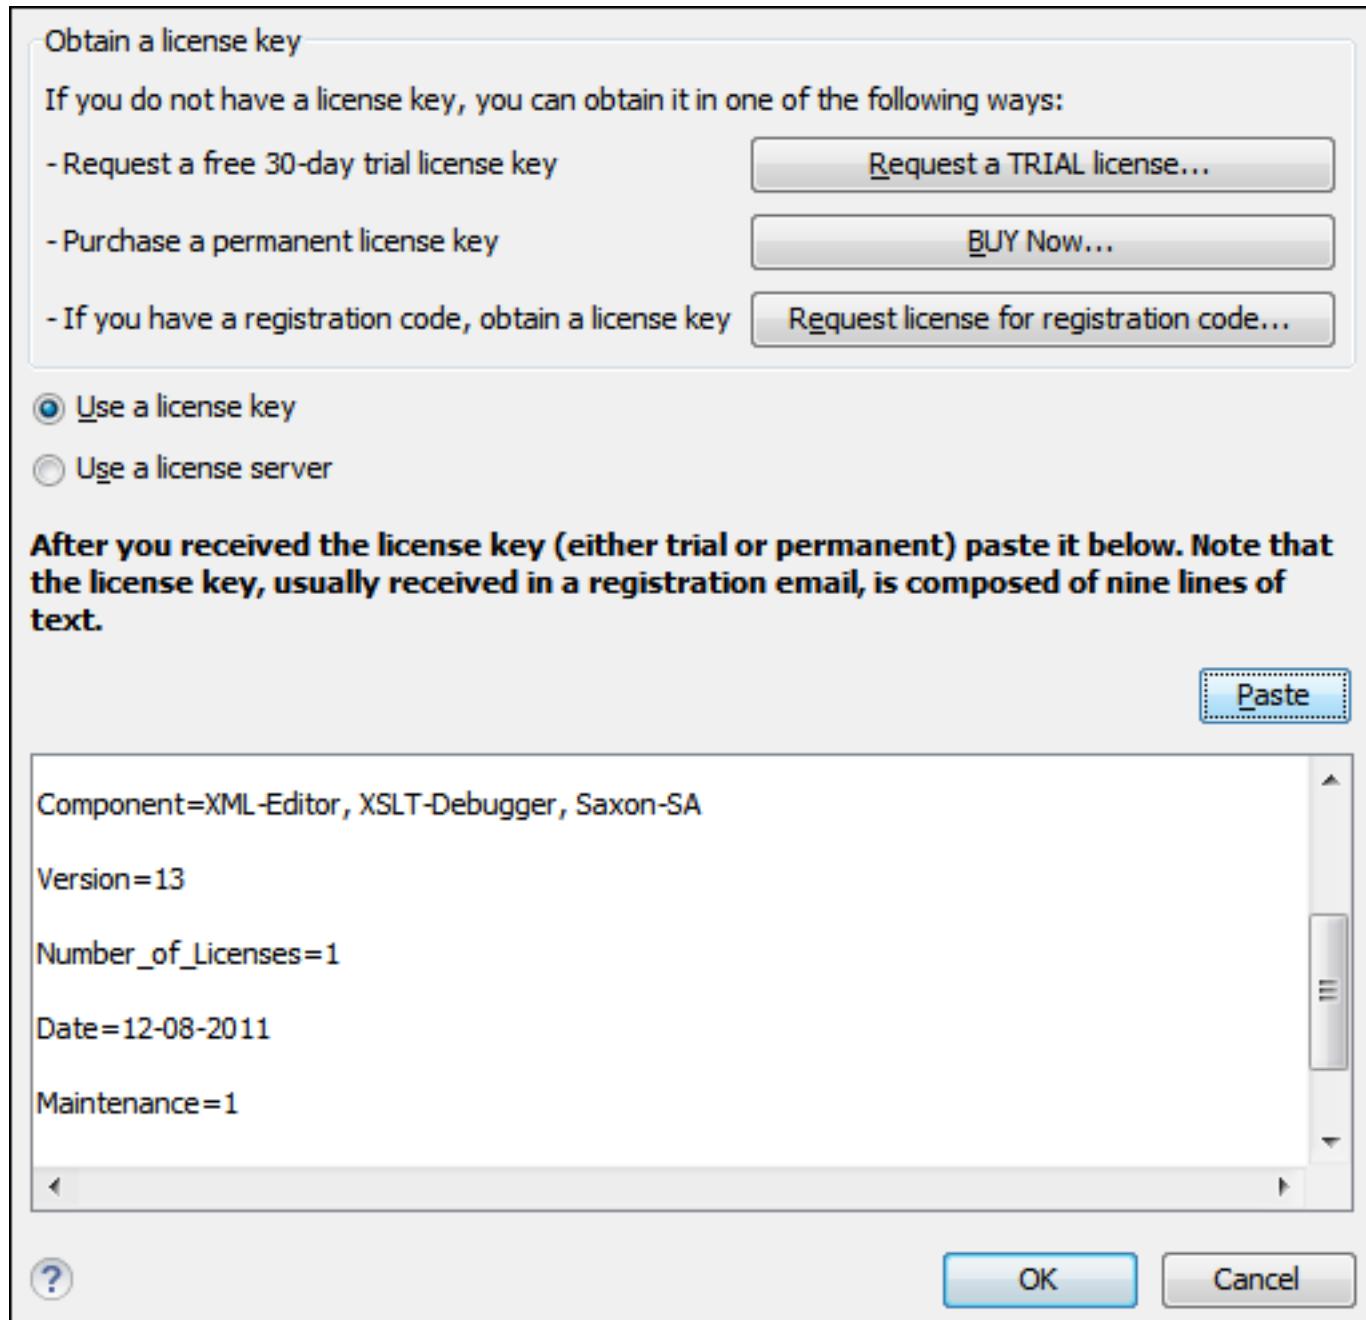

Figure 10: License Registration Dialog Box

3. Select **Use a license key** as licensing method.
4. Paste the license text into the registration dialog box.
5. Press **OK**.

Registering a Floating License

[Edit on GitHub](#)

How you register to use a floating license will depend on how floating licenses are managed in your organization.

- If all the machines sharing a pool of floating licenses are on the same network segment, you will register your licence the same way you [register a named-user licence](#). Oxygen XML Author will use your connection to a local area network, without additional notice, to automatically connect to other running instances of Oxygen XML Author. These connections may transmit your IP address to the local network.

Note: [For System Administrators] Multiple running instances of Oxygen XML Author communicate with each other using UDP broadcast on the 59153 port, to the 239.255.255.255 group.

Warning: This mechanism was deprecated starting with version 17.0 and it is scheduled for removal in a future version. It is recommended to switch to the license server licensing mechanism.

- If the machines sharing the pool of floating licenses are on multiple network segments, someone in your company will need to [set up a license server](#). Consult that person to determine if they have set up a license server as a TCP or HTTP server as the registration process is different for each.

Request a Floating License from a TCP License Server

[Edit on GitHub](#)

Use this procedure if your company uses a TCP license server:

- Contact your server administrator to get network address and login details for the license server.
- Start Oxygen XML Author.
- Go to **Help > Register**.
The license registration dialog box is displayed.
- Choose **Use a license server** as licensing method.
- Select **TCP server** as server type.
- In the *Host* field enter the host name or IP address of the license server.
- In the *Port* field enter the port number used to communicate with the license server.
- Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Author. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

Request a Floating License from an HTTP License Server

[Edit on GitHub](#)

Use this procedure if your company uses an HTTP license server:

- Contact your server administrator to get network address and login details for the license server.
- Start Oxygen XML Author.
- Go to **Help > Register**.
The license registration dialog box is displayed.
- Choose **Use a license server** as licensing method.
- Select **HTTP/HTTPS Server** as server type.
- In the *URL* field enter the address of the license server.
The URL address has the following format: `http://hostName:port/oxygenLicenseServlet/license-servlet`
- Complete the *User* and *Password* fields.
- Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Author. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

Release a Floating License

[Edit on GitHub](#)

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Author running on your machine are using your floating license.
- You register a *Named User* license with your copy of Oxygen XML Author, and no other copies of Oxygen XML Author running on your machine are using your floating license.

Register a Floating License for Multiple Users

[Edit on GitHub](#)

If you are an administrator registering floating licenses for multiple users, you can avoid having to open Oxygen XML Author on each machine and configuring the registration details by using the following procedure:

1. Reset the registration details:
 - a. Select **Register** from the **Help** menu.
 - b. Click **OK** without entering any information in this dialog box.
 - c. Click **Reset** and restart the application.
2. Register the license using one of the [floating license registration procedures](#).
3. Copy the `license.xml` file from the Oxygen XML Author [preferences directory](#) to the installation folder on each installation to be registered.

Setting Up a Floating License Server

[Edit on GitHub](#)

Installing a License Server to Manage Floating Licenses

If you are using floating licenses for Oxygen XML Author, you must set up an Oxygen XML Author floating license server. A floating license server can be installed as one of the following:

- An [HTTP server](#). This is the recommended method.
- A [TCP server](#) (deprecated).

Note: Oxygen XML Author version 17 or higher requires a license server version 17 or higher. License servers version 17 or higher can be used with any version of a floating license key.

Activating Floating License Keys

To help you comply with the Oxygen XML Author EULA (terms of licensing), all floating licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Author servers, which in turn will sign the license key.

Split or Combine License Keys to Work with Your License Servers

A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Author version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact support@oxygenvxml.com and ask for a new license key.

Setting up an HTTP Floating License Server

[Edit on GitHub](#)

Setting up the floating license server as an HTTP server.

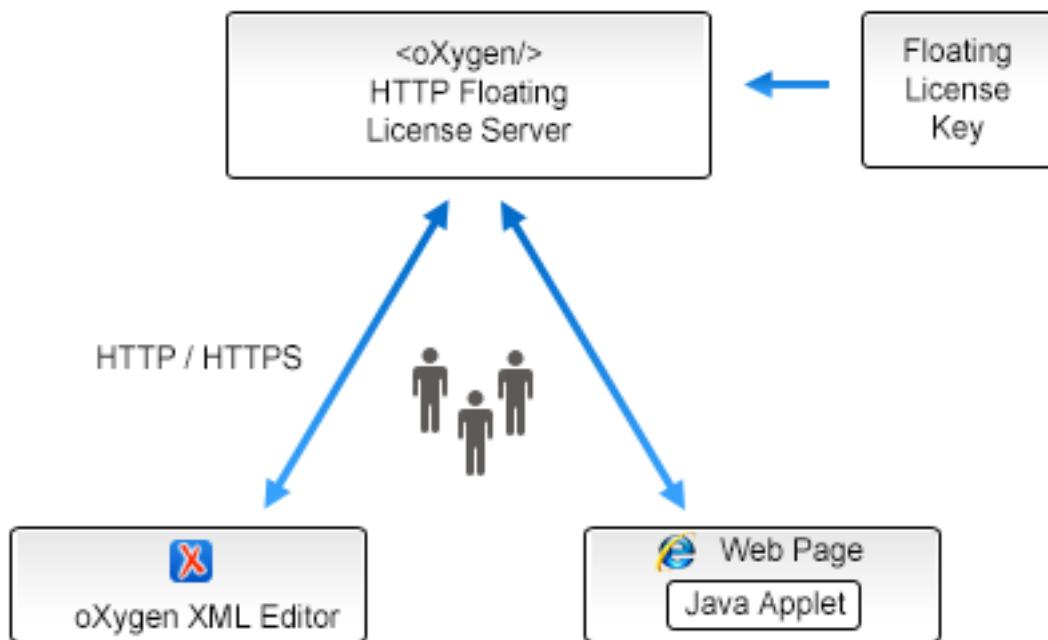

Figure 11: Floating License Server (HTTP Server)

The Oxygen XML Author license server is available in several distributions, tailored for covering a variety of deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, Mac, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

Installation Steps for the HTTP License Server Installer Distribution for Windows

1. Download the HTTP license server installer from the [Oxygen XML Author website](#).
2. Run the installer and follow the on-screen instructions.
3. You need to configure two sets of credentials:
 - a. **Administrator credentials** - used for accessing the Oxygen XML Author license server administrative interface. Optionally you can choose to change the standard 8080 port.
 - b. **Standard user credentials** - used by an Oxygen XML Author application to connect to the license server.

4. Optionally you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

Installation Steps for the HTTP License Server All-Platform Distribution

1. Download the HTTP license server all-platform archive from the [Oxygen XML Author website](#).
 2. Unpack the archive.
 3. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and Mac).
- Note:** To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, `licenseServer.bat 8082`).
4. On the first run, you will be prompted to set two sets of credentials:
 - a. **Administrator credentials** - used for accessing the Oxygen XML Author license server administrative interface.
 - b. **Standard user credentials** - used by an Oxygen XML Author application to connect to the license server.

Installation Steps for the HTTP License Server WAR Distribution

1. Make sure that Apache Tomcat 5.5 or higher is running on the machine you have selected to be the license server. To get it, go to <http://tomcat.apache.org>.
2. Download the HTTP license server **Web ARchive (.war)** from the [Oxygen XML Author website](#).
3. Configure two Tomcat users:
 - a. One user with the role *user*, used by an Oxygen XML Author application to connect to the license server. In the subsequent example, this user name is **John**.
 - b. Another user with the roles *admin* and *manager-gui*, used for accessing the Oxygen XML Author license server administrative interface and the Tomcat management interface. In the subsequent example, this user name is **Mary**.

A typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat `zip/tar.gz` distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the two users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
              xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
              xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-
users.xsd"
              version="1.0">
    <!-- ... other user and role definitions ... -->
    <role rolename="user"/>
    <role rolename="admin"/>
    <role rolename="manager-gui"/>
    <user username="John" password="user_pass" roles="user"/>
    <user username="Mary" password="admin_pass" roles="admin,manager-gui"/>
</tomcat-users>
```

4. Go to the Tomcat Web Application Manager page and log-in with the user you configured with the *manager-gui* role (**Mary** in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oxygenLicenseServlet` application is now up and running, but the license key is not yet registered.
5. Go to the oxygen license server administration page by clicking the `oxygenLicenseServlet` link in the manager page. You will need to authenticate with the user configured with the *admin* role (Mary in our example).
6. Activate the floating license key. This process involves binding your license key to your license server deployment. Once the process is completed you cannot activate the floating license with another license server. Follow these steps to activate the license:

- a. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the *admin* or *manager* users.

Result: A page is displayed that prompts for a license key.

- b. Paste your floating license key into the form and press **Submit**. The browser used in the activation process needs to have Internet access.

Result: You will be redirected to an online form hosted on the Oxygen XML Author website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

Note: If, for some reason, your browser does not take you to this activation form, refer to the [Manual Activation Procedure](#).

- c. Press **Activate**.

If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Author client applications.

7. By default, the license server logs its activity in the `TomcatInstallDir/logs/oxygenLicenseServlet.log` file. To change the log file location, edit the `log4j.appenders.R2.File` property from the `TomcatInstallDir/webapps/oxygenLicenseServlet/WEB-INF/lib/log4j.properties` configuration file.

Manual License Activation Procedure

1. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. You will be taken to the license registration page.
2. Copy the license server activation code.
3. Go to the activation page at <http://www.oxygenxml.com/activation/>.
4. Paste the license server activation code and floating license key in the displayed form, then click **Activate**.
5. The activated license key is displayed on-screen. Copy the activated license key and paste it in the license registration page of the HTTP server.

Upgrading Your HTTP Floating License Server

[Edit on GitHub](#)

The goal of the following procedure is to help you minimize the downtime when you upgrade the Oxygen XML Author HTTP floating license server to its latest version.

Follow this procedure:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the *admin* or *manager* credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the *manager* role, and *Undeploy* the floating license server.
4. Go to Oxygen XML Author website and [download the HTTP license server](#).
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the *admin* or *manager* users.
7. Paste the license key into the form and register it.

Replacing a Floating License Key in an HTTP Floating License Server

[Edit on GitHub](#)

The following procedure assumes that your Oxygen XML Author HTTP floating license server contains a previously [activated license key](#) and provides instructions for replacing it with another one. The goal of the procedure is to allow you to activate and configure the new license key without any downtime.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key *that accommodates a different number of users*.

To replace a floating license key that is activated on your HTTP floating license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page.
2. Click the **Replace license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Yes** button to begin the replacement procedure.
4. Paste the new floating license key in the displayed form, then click **Submit**. The browser used in the process needs to have Internet access.

You will be redirected to an online form hosted on the Oxygen XML Author website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

Note: If for some reason your browser does not take you to this activation form, refer to the [Manual Activation Procedure](#).

5. Press **Activate**.

If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

Getting More Information From the Report Page

[Edit on GitHub](#)

You can access a license server activity report at `http://hostName:port/oxygenLicenseServlet/license-servlet/report`.

It displays the following real time information:

- **License load** - A graphical indicator that shows how many licenses are available. When the indicator turns red, there are no more licenses available.
- **Floating license server status** - General information about the license server status, including the following information:
 - server start time
 - license count
 - rejected and acknowledged requests
 - average usage time
 - license refresh and timeout intervals
 - location of the license key
 - server version
- **License key information** - License key data, including the following information:
 - licensed product
 - registration name
 - company name
 - license category
 - number of floating users
 - Maintenance Pack validity
- **Current license usage** - Lists all currently acknowledged users, including the following information:
 - user name
 - date and time when the license was granted
 - name and IP address of the computer where Oxygen XML Author runs
 - MAC address of the computer where Oxygen XML Author runs

Note: The report is also available in XML format at `http://hostName:port/oxygenLicenseServlet/license-servlet/report-xml`.

Setting up a TCP Floating License Server Using a 32-bit Windows Installer

[Edit on GitHub](#)

Setting up the TCP floating license server as a Windows process.

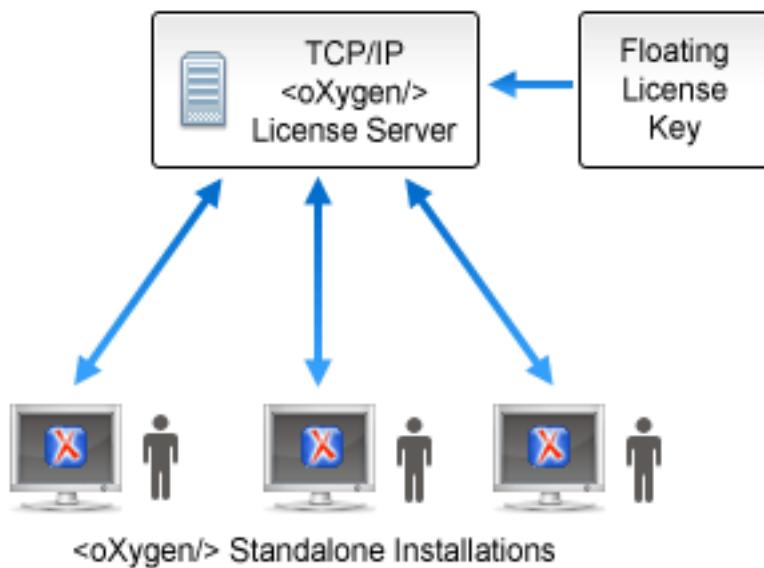

Figure 12: TCP Floating License Server (Process in Windows)

Installation Steps

1. Download the license server installation kit for Windows from the [Oxygen XML Author website](#).
2. Run the downloaded installer and follow the on-screen instructions.

By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the **Start** menu for starting and stopping the Windows service manually. If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name *serviceName*. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

Note: If you do not provide the *serviceName* argument, the default name `oXygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- `outLicenseServer.log` - Standard output stream of the server.
- `errLicenseServer.log` - Standard error stream of the server.

3. Manually add the `oXygenLicenseServer.exe` file in the Windows Firewall list of exceptions. Go to **Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program** and browse for `oXygenLicenseServer.exe` from the Oxygen XML Author License Server installation folder.
4. Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a *command line interface*) or in the `outLicenseServer.log` log file.

Note: A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Author version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact support@oxygenxml.com and ask for a new license key.

Upgrading Your TCP Floating License Server

[Edit on GitHub](#)

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Author floating license server to its newest version.

Follow this procedure:

1. Go to the Oxygen XML Author website and download the [latest floating license server](#).
2. Run the installation kit.
3. Leave the default **Update the existing installation** option enabled. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
4. Follow the on-screen instructions to complete the installation process.

Replacing a Floating License Key in a TCP Floating License Server

[Edit on GitHub](#)

The following procedure assumes that your Oxygen XML Author TCP floating license server contains a previously [activated license key](#) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users](#).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the service that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, [the server will fail to start](#).
4. Find the license activation procedure in the on-screen instructions (if the license server is started in a *command line interface*) or in the `outLicenseServer.log` log file.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

Common Problems

[Edit on GitHub](#)

This section includes some common problems that may appear when setting up a TCP floating license server.

Windows Service Reports 'Incorrect Function When Started'

[Edit on GitHub](#)

The "Incorrect Function" error message when starting the Windows service usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

Windows Service Reports 'Error 1067: Process Terminated Unexpectedly'

[Edit on GitHub](#)

This error message appears if the Windows service launcher quits immediately after being started.

This problem usually happens because the license key has not been correctly deployed (`license.txt` file in the license folder). For more information, see the [Setting up a Floating License Server section](#).

Setting up a TCP Floating License Server Using All-Platforms Distribution

[Edit on GitHub](#)

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

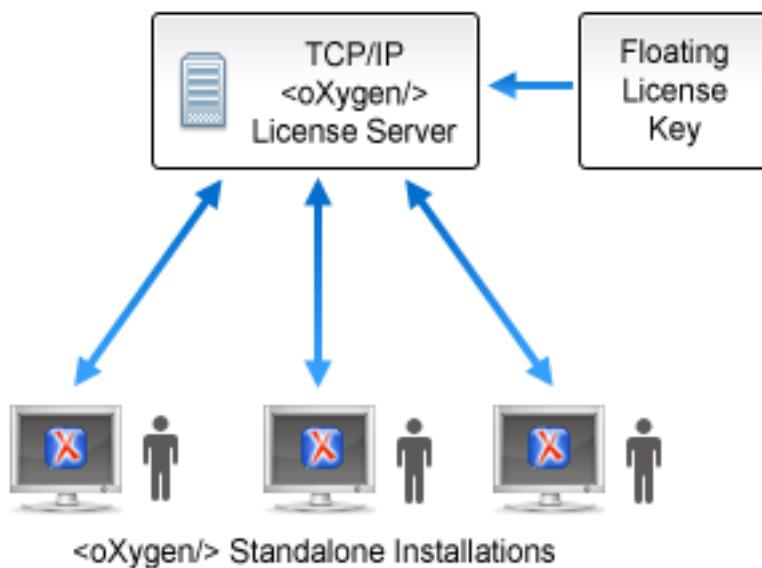

Figure 13: TCP Floating License Server (All-Platforms Distribution)

Installation Steps

1. Ensure that a Java runtime version 6 or later is installed on the server machine.
2. Download the license server installation kit for your platform from the [Oxygen XML Author website](#).
3. Unzip the installation kit into a new folder.
4. Start the server using the startup script from a command line console.

The startup script is called `licenseServer.sh` for OS X and Unix/Linux or `licenseServer.bat` for Windows. The following parameters are accepted:

- `licenseDir` - The path of the directory where the license files will be placed. The default value is `license`.
- `port` - The TCP port number used to communicate with Oxygen XML Author instances. The default value is **12346**.

The following is an example of the command line for starting the license server on Unix/Linux and OS X:

```
sh licenseServer.sh myLicenseDir 54321
```

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

Upgrading Your TCP Floating License Server

[Edit on GitHub](#)

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Author TCP floating license server to its newest version.

Follow this procedure:

1. Stop the current license server process.
2. Locate and open the floating server startup script. It should look like this:

```
sh licenseServer.sh pathToLicenseDir 54321
```

3. Make a note of the path to the license directory (in our example is `pathToLicenseDir`) and the port number (in our example is 54321).
4. Go to the license directory and copy the license key file (`license.txt`) for later use.
5. Go to the Oxygen XML Author website and download the [*all-platforms floating license server installation kit*](#).
6. Unzip the archive and overwrite the content of your current floating license server installation.
7. Copy the license key file (`license.txt`) saved in step 4 to `license` directory of the floating license server installation.
8. Edit the floating server startup script and configure with the info you made note of in step 3.
9. Start the floating license server process.

Replacing a Floating License Key in a TCP Floating License Server

[Edit on GitHub](#)

The following procedure assumes that your Oxygen XML Author TCP floating license server contains a previously [*activated license key*](#) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the HTTP license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [*that accommodates a different number of users*](#).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the process that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

Transferring or Releasing a License Key

[Edit on GitHub](#)

If you want to transfer your Oxygen XML Author license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), or release a [*floating license*](#) so that someone else can use it, you must first unregister your license. You can then [*register your license*](#) on the new computer in the normal way.

1. Go to **Help > Register**.

The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.

A dialog box is displayed asking if you want to reset your license key.

5. Select between:

- **Use the last one** - Falls back to your previous license key (for the case of releasing a floating license and reverting to a *Named User* license).
- **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Author.

Upgrading Oxygen XML Author

[Edit on GitHub](#)

From time to time, upgrade and patch versions of Oxygen XML Author are released to provide enhancements that fix problems, and add new features.

Checking for New Versions of Oxygen XML Author

[Edit on GitHub](#)

Oxygen XML Author checks for new versions automatically at start up. To disable this check, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and uncheck **Automatic Version Checking**.

To check for new versions manually, go to **Help > Check for New Versions**.

What is Preserved During an Upgrade?

[Edit on GitHub](#)

When you install a new version of Oxygen XML Author, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Author already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in [document type \(framework\) files](#), XSLT stylesheets, XML catalogs, and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in [Document type associations > Locations](#)) will be preserved and will be found by the new installation.

If you install in a new directory.

- All the files from the old install directory will be preserved, including any modification in [document type \(framework\) files](#), XSLT stylesheets, XML catalogs, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in [Document type associations > Locations](#)) will be preserved and will be found by the new installation.

Upgrading the Standalone Application

[Edit on GitHub](#)

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.

2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Start Oxygen XML Author.
5. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Installing and Updating Add-ons in Oxygen XML Author

[Edit on GitHub](#)

Oxygen XML Author provides an add-on mechanism that can automatically discover and install *frameworks* and *plugins* from a remote location.

Note: Frameworks that you install through the add-ons system are read-only.

Installing Add-ons

To install a new add-on, follow these steps:

1. Go to **Help > Install new add-ons**.
2. In the displayed dialog box, fill-in the **Show add-ons from** with the *update site* that hosts add-ons. If you want to see all Oxygen XML Author default add-ons, choose the **ALL AVAILABLE SITES** option from the **Show add-ons from** drop down. The add-ons list contains the name, status, update version, Oxygen XML Author version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.

Note: To see all the add-ons from the remote update site, disable **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site. You cannot install an incompatible add-on.

3. By default, only the latest versions of the add-ons that are compatible with the current version of Oxygen XML Author are displayed.
4. Choose the add-ons you want to install, press the **Next** button, then follow the on-screen instructions.

Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Note: All add-ons are installed in the *extensions* directory inside the Oxygen XML Author *preferences directory*.

Managing installed add-ons

To manage the installed add-ons, follow these steps:

1. Go to **Help > Manage add-ons**
2. The displayed dialog box presents a list of the available updates (compatible with the current version of Oxygen XML Author) and with the already installed updates. Under the updates list, Oxygen XML Author presents a short description of each update.
3. Check for box for a specific add-on, then press **Update** to update it (or **Uninstall** to remove it). If there is a newer version of the add-on available, Oxygen XML Author will download the package and install it. Follow the on-screen instructions to complete the installation process.

Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Checking for add-on updates

To check if there are available updates for the installed add-ons, go to **Help > Check for add-ons updates**. This action only displays updates that are compatible with the current Oxygen XML Author version.

To watch a video demonstration about the add-ons support in Oxygen XML Author, go to <http://www.oxygenxml.com/demo/AddonsSupport.html>.

Related information

[Packing and Deploying Plugins or Frameworks as Add-ons](#) on page 1150

Uninstalling Oxygen XML Author

[Edit on GitHub](#)

Uninstalling the Oxygen XML Author Standalone

[Edit on GitHub](#)

CAUTION: The following procedure will remove Oxygen XML Author from your system. **All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a back up of any data you want to keep before uninstalling Oxygen XML Author.**

1. Backup any data you want to keep from the Oxygen XML Author installation folder.
2. Remove the application.
 - On Windows use the appropriate uninstaller shortcut provided with your OS.
 - On OS X and Unix manually delete the installation folder and all its contents.
3. If you want to remove the user preferences:
 - **On Windows Vista/7/8/10**, remove the directory: %APPDATA%\Roaming\com.oxygenxml.author (usually %APPDATA% has the value: [user-home-dir]\Application Data). Note that this directory is hidden.
 - **On Windows XP**, remove the directory: %APPDATA%\com.oxygenxml.author (usually %APPDATA% has the value: [user-home-dir]\Application Data).
 - **On Linux**, remove the directory: .com.oxygenxml.author from the user home directory.
 - **On OS X**, remove the directory: Library/Preferences/com.oxygenxml.author of the user home folder .

Unattended Uninstall

[Edit on GitHub](#)

The unattended uninstall procedure is available only on Windows and Linux.

Run the uninstaller executable from command line with the -q parameter.

The uninstaller executable is called `uninstall.exe` on Windows and `uninstall` on Linux and is located in the application's install folder.

Oxygen XML Author Installer Command Line Reference

[Edit on GitHub](#)

The Oxygen XML Author installers for Windows and Linux creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. You can use a `response.varfile` to set the options for an unintended install. Here is an example of a `response.varfile`:

```
#install14j response file for Oxygen XML Editor 16.0
#Fri Jul 18 21:52:15 EDT 2014
sys.adminRights$Boolean=true
sys.programGroupDisabled$Boolean=false
createDesktopLinkAction$Boolean=true
autoVersionChecking=true
```

```

sys.fileAssociation.launchers
$StringArray="19","19","19","19","19","19","19","19","19","19","19","19","19","19","19"
sys.programGroupAllUsers$Boolean=true
reportProblem=true
downloadResources=true
sys.languageId=en
sys.installationDir=C:\\Program Files (x86)\\Oxygen XML Editor 16
createQuicklaunchIconAction$Boolean=true
sys.programGroupName=Oxygen XML Editor 16.0
executeLauncherAction$Boolean=true
sys.fileAssociation.extensions
$StringArray="xml","dita","ditamap","ditaval","xsl","xslt","xspec","xsd","rng","rnc","so

```

The following table describes some of the settings that can be used in the response.varfile:

Table 1: response.varfile Options Parameters

Parameter Name	Description	Values
autoVersionCheck	Automatic version checking.	true / false. Default setting is true.
reportProblem	Allows you to report a problem encountered while using Oxygen XML Author.	true / false. Default setting is true.
downloadResources	Allows Oxygen XML Author to download resources (links to video demonstrations, webinars and upcoming events) from http://www.oxygenxml.com to populate the application welcome screen.	true / false. Default setting is true.

The Oxygen XML Author installation uses the install4j installer. A description of the response.varfile format can be found on the [install4j site](#).

Command line parameters

The Oxygen XML Author installer supports the following command line parameters:

Option	Meaning
-q	<p>Run the installer in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a response.varfile is specified using the -varfile option or individual settings are specified using</p> <ul style="list-style-type: none"> - on Windows: oxygenAuthor.exe -q - on Linux: oxygenAuthor.sh -q
-overwrite	In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Author is installed in the same folder. The

Option	Meaning
	<p>-overwrite parameter added after the -q parameter forces the overwriting of these files.</p> <p>- on Windows:</p> <pre data-bbox="1176 318 1449 375">oxygenAuthor.exe -q -overwrite</pre> <p>- on Linux:</p> <pre data-bbox="1176 439 1432 496">oxygenAuthor.sh -q -overwrite</pre>
-console	<p>To display a console for the unattended installation, add a -console parameter to the command line.</p> <p>- on Windows:</p> <pre data-bbox="1176 671 1524 749">start / wait oxygenAuthor.exe -q -console</pre> <p>Note: The use of start /wait on Windows is required to make the installer run in the foreground. If you run it without start / wait, it will run in the background.</p> <p>- on Linux:</p> <pre data-bbox="1176 1094 1432 1151">oxygenAuthor.sh -q -console</pre>
-varfile	<p>Points to the location of a response.varfile to be used during an unattended installation. For example:</p> <p>- on Windows:</p> <pre data-bbox="1176 1326 1465 1404">oxygenAuthor.exe -q -varfile response.varfile</pre> <p>- on Linux:</p> <pre data-bbox="1176 1467 1465 1545">oxygenAuthor.sh -q -varfile response.varfile</pre>

Option	Meaning
-V	<p>Is used to define a variable to be used by an unattended installation. For example:</p> <ul style="list-style-type: none"> - on Windows: <pre data-bbox="1176 318 1594 413">oxygenAuthor.exe -q - VusageDataCollector=false</pre> <ul style="list-style-type: none"> - on Linux: <pre data-bbox="1176 466 1594 561">oxygenAuthor.sh -q - VusageDataCollector=false</pre>

The Oxygen XML Author installation uses the install4j installer. A full list of the command line parameters supported by the install4j installer can be found on the [install4j site](#).

Chapter

4

Configuring Oxygen XML Author

Topics:

- [*Preferences*](#)
- [*Configuring Options*](#)
- [*Associating a File Extension with Oxygen XML Author*](#)
- [*Configuring the Layout of the Views and Editors*](#)
- [*Configure Toolbars*](#)
- [*Scenarios Management*](#)
- [*Editor Variables*](#)
- [*Custom System Properties*](#)
- [*Localizing the User Interface*](#)
- [*Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author*](#)

A description of all of the options that allow you to configure Oxygen XML Author.

This chapter presents all the user preferences and options that allow you to configure various features, or the application itself, and the editor variables that are available for customizing the user-defined commands.

Preferences

[Edit on GitHub](#)

You can configure Oxygen XML Author options using the **Preferences** dialog box.

To open the preferences dialog box, go to **Options > Preferences**.

You can select the preference page you are interested in from the tree on the left of the **Preferences** dialog box. You can filter the tree by using the filter box or expand/collapse the tree by using the  **Expand All** and  **Collapse All** buttons above the tree.

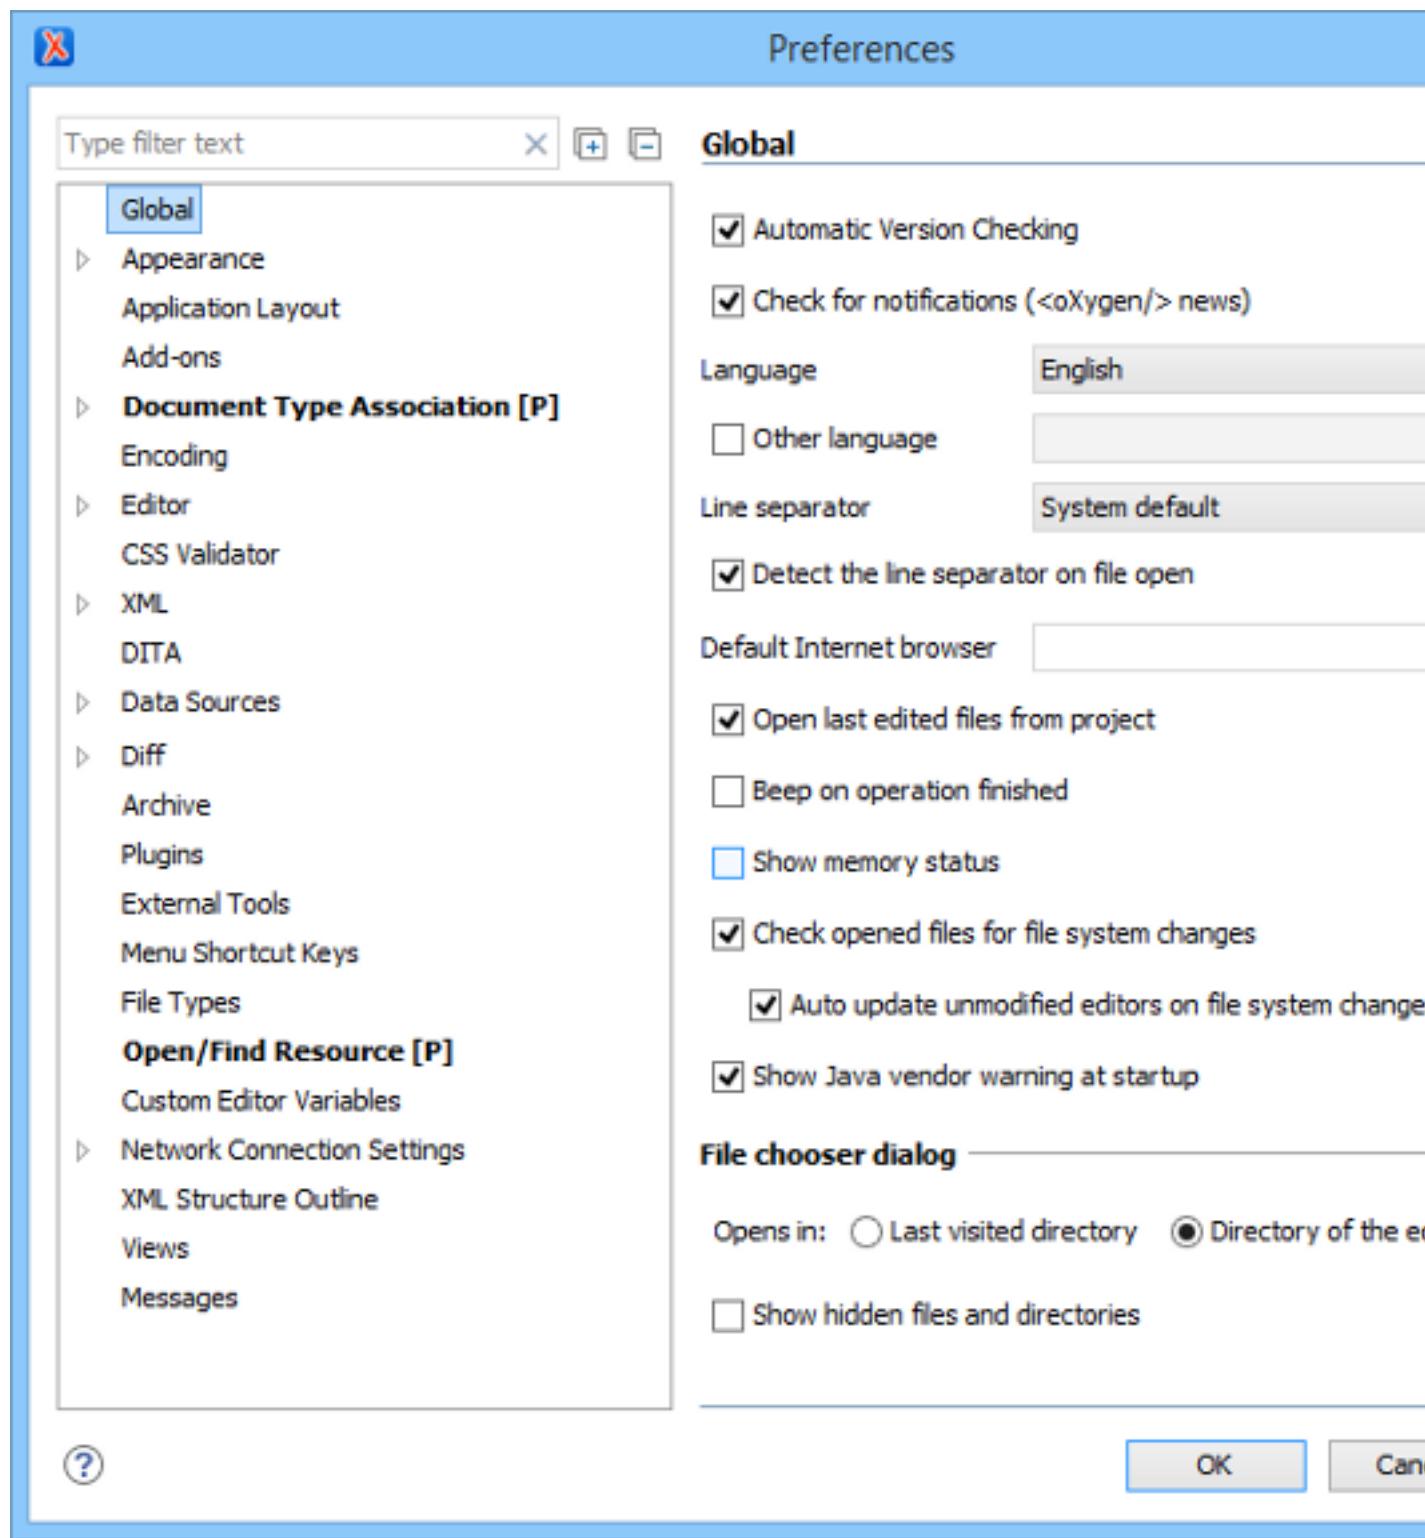

Figure 14: Preferences Dialog Box

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

Press **?** or **F1** for help on any preferences page.

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (`com.oxygenxml`) that is in the following locations:

- **Windows (Vista, 7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml`
- **Windows XP** - `[user_home_directory]\Application Data\com.oxygenxml`
- **Mac OS X** - `[user_home_directory]/Library/Preferences/com.oxygenxml`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml`

Global Preferences

[Edit on GitHub](#)

The global options cover a number of aspects of the overall operation of Oxygen XML Author. To configure the **Global** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Global**.

The following options are available in the **Global** preferences page:

Automatic Version Checking

If this option is enabled, Oxygen XML Author will check for a new version on startup.

Check for notifications

If enabled, the application will check for various types of messages from the Oxygen XML Author website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Author team will participate, and more. This option is enabled by default.

Language

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, or Japanese. You must restart Oxygen XML Author for the change to take effect.

Other language

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see [Localizing the User Interface](#) on page 233. You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Author.

Note: If some interface labels are not rendered correctly after restarting the application, (for example, Chinese or Korean characters are not displayed correctly), make sure that your operating system has the appropriate language pack installed (for example, the East-Asian language pack).

Line separator

This option sets the line separator used when saving files. Use **System Default** to select the normal line separator for your OS. If you want the existing file separator of a file to be maintained, regardless of your current OS, check **Detect the line separator on file open**.

Detect the line separator on file open

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. New files are saved using the line separator defined by the [Line separator option](#).

Default Internet browser

This option sets the Web browser that Oxygen XML Author will use to do the following:

	<ul style="list-style-type: none"> • Open (X)HTML or PDF transformation results. • Open a web page (for example, pointing to specific paragraphs in the W3C recommendation of XML Schema if there are XML Schema validation errors).
Open last edited files from project	If you leave this setting blank, the system default browser will be used.
Beep on operation finished	When this option is enabled, Oxygen XML Author opens the files you had open the last time you used a project whenever you open the application or switch to that project.
Show memory status	When this option is selected, Oxygen XML Author beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.
Check opened files for file system changes	When this option is selected, the memory Oxygen XML Author uses is displayed in the status bar. To free memory, click the  Free unused memory button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Author uses too much memory. You can change the amount of memory available to Oxygen XML Author by <i>changing the parameters of the application launcher</i> .
Show Java vendor warning at startup	When this option is selected, Oxygen XML Author checks the content of the all opened editors to see if they have been updated by another application. If the file has changed, Oxygen XML Author will ask you if you want to reload the file.
File Chooser Dialog	<p>Auto update unmodified editors on file system changes If this option is selected, Oxygen XML Author automatically updates unmodified editors if the edited file changes externally.</p> <p>This options specifies the directory that will be shown when the <i>Open file dialog box</i> is displayed. You can choose between:</p> <ul style="list-style-type: none"> • Last visited directory - The last visited folder will be displayed. • Directory of the edited file - The folder where the currently edited file is stored will be displayed.
Show hidden files and directories	If this option is selected, Oxygen XML Author shows system hidden files and folders in the file browser dialog box and the folder browser dialog box. This setting is not available on OS X.

Appearance Preferences

[Edit on GitHub](#)

This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Author. To configure the **Appearance** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance**.

The following options are available in the **Appearance** preferences page:

Look and Feel

This option allows you to change the graphic style (look and feel) of the user interface. Depending on the operating system, you can choose between various predefined style options.

Theme

This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in MAC OS)

Note: In Windows, if a high contrast theme is detected and the **Theme** option is set to **Classic** and the **Look and Feel option** is set to **Default** or **Windows**, Oxygen XML Author inherits the high contrast theme colors that are set in the operating system.

- **Graphite**
- **Ultramarine**

You can also change various appearance related options in other preference pages for the selected theme by clicking on the various links in this section.

Custom Themes

You can also create custom themes to share with others or use in other installations of Oxygen XML Author. To create a custom theme, follow these steps:

1. Select a **Theme** to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.
3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** dropdown list. Otherwise, if you save it to another location, you can use

the **Import button** to make it appear in the drop-down list.

Note: In OS X (starting with Yosemite), if you choose Graphite for the **Theme**, it is recommended that you enable the *Use dark menu and Dock* option that is found in **System Preferences > General**.

Theme preview area

Displays a preview of the current **Theme selection** (available for predefined color themes).

Theme management section

Reset	Resets the theme to its default values (this option is available when the theme is modified).
Rename	Changes the name of the theme (not available for default or predefined themes).
Delete	Removes the selected theme (not available for default or predefined themes).
Import	Allows you to import a color theme from an XML theme file. You can use this option to load an exported <i>custom theme</i> .
Export	Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Author.

Colors Preferences

[Edit on GitHub](#)

Oxygen XML Author allows you configure the colors for frames, dialog boxes, controls, and commands. To configure the **Colors**, *open the Preferences dialog box (Options > Preferences)* and go to **Appearance > Colors**.

Clicking the color button for any of the options opens a **Choose color** dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

Background Colors

Background - Background color for various general user interface items.

Components background - Background color for various components (such as text fields, views, tables, and dialog boxes).

Foreground Colors

Components selection background - Background color for the current selections in certain components, such as some views and panes.

Components inactive selection background - Background color for a selection in a view that is not the current focus.

Menus, toolbars and frame background - Background color for specific components such as menus, toolbars, and the application frame.

Menus and toolbars selection background - (This option is not available for Mac OS) Background color for menu selections and toolbar buttons.

View titles background - Background color for the titles of view and tabs.

Status bar background - Background color of the status bar at the bottom of the editor.

Foreground - Foreground color for various general user interface items.

Component selection foreground - Foreground color for the current selection.

Disabled foreground - Foreground color for various components that are not the current focus (such as views other than the currently selected one).

Link foreground - Foreground color for links in views and dialog boxes.

View titles foreground - Foreground color for the title bar of views.

Status bar foreground - Foreground color for the text in the status bar at the bottom of the editor.

Other Colors

Borders and table grids - Color for certain borders and table grid lines.

Text component border - Color for the borders of text fields and drop-down lists.

View/Editor tabs border - Color for the borders of views and tabs.

Scroll bars, chevrons - Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

Separator - Color for the separators in toolbars, menus, and dialog boxes.

Note: You must restart the application for your changes to be applied.

Fonts Preferences

[Edit on GitHub](#)

Oxygen XML Author allows you to choose the fonts to be used in the **Text** and **Grid** editor modes, and fonts for the **Author** mode that are not specified in the associated CSS stylesheet. To configure the font options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance > Fonts**.

The following options are available:

Editor	Allows you to choose the font that will be used in the editor.
Author mode default font	Note: On Mac OS X, the default font, Monaco, cannot be rendered in bold.
	This option allows you to choose the default font that will be used in Author mode. The default font will be overridden by the fonts specified in any CSS file associated with the opened document.
Text antialiasing	This option allows you to set the text anti-aliasing behavior:
	<ul style="list-style-type: none"> • Default - Allows the application to use the setting of the operating system, if available. • On - Sets the text anti-aliasing to pixel level. • Off - Disables text anti-aliasing. • Sub-pixel anti-aliasing modes, such as GASP, LCD_HRGB, LCD_HBGR, LCD_VRGB, and LCD_VBGR.
Text components	This option allows you to choose the font to be used in text boxes within the interface.
GUI	This option allows you to choose the font to be used for user interface labels.
View titles font	This option allows you to choose the font to be used in the titles of the various views that are opened within the interface.

Note: You must restart the application for your changes to be applied.

Related information

[Changing the Font Size in the Editor](#) on page 366

Application Layout Preferences

[Edit on GitHub](#)

Oxygen XML Author offers various perspectives and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Application Layout**. The following options are available:

Select application layout

You can choose between the following three layouts:

- **Default** - Uses the default layout for all perspectives. Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.
- **Predefined** - Allows you to choose one of the predefined layouts:
 - **Advanced** - All views are displayed.
 - **Author** - An authoring-oriented layout that displays views such as **Project**, **Archive**, **Browser**, **DITA Maps Manager**, **Outline**, **Attributes**, **Model**, and **Elements**.

- **Basic** - Only the **Project** view and the **Outline** view are visible. Recommended when you edit XML content and you need maximum screen space.
- **Schema development** - The **Project**, **Component Dependencies**, **Resource Hierarchy/Dependencies**, **Outline**, **Palette**, and **Attributes** views are displayed.
- **XQuery development** - The **Project**, **Outline**, **Transformation Scenarios**, **XSLT/XQuery input** views are displayed.
- **XSLT development** - The **Project**, **Component Dependencies**, **Resource Hierarchy/Dependencies**, **Outline**, **Attributes**, **Model**, **XSLT/XQuery input**, **XPath Builder**, and **Transformation Scenarios** views are displayed.
- **Custom** - Allows you to specify a custom layout to be used. You can save your preferred layout using **Window > Export Layout**, then enter the location of the saved layout file in this setting.

Reset layout at startup

When this option is enabled, Oxygen XML Author forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

Remember layout changes for each project

When this options is enabled, Oxygen XML Author saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

Allow detaching editors from main window

When this options is enabled, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

Note: If the main screen is maximized, you cannot drag and drop an editor outside of it.

View tab placement

Specifies whether the *View* tabs are located at the top or bottom of the window.

Editor tab placement

Specifies whether the *Editor* tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined *layout* files are saved in the preferences directory of Oxygen XML Author.

To watch our video demonstration about configuring the user interface of Oxygen XML Author, go to http://oxygenxml.com/demo/Dockable_Views.html.

Add-ons Preferences

[Edit on GitHub](#)

You can use add-ons to enhance the functionality of Oxygen XML Author. To configure the **Add-ons** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Add-ons**.

The following options are available in this preferences page:

Enable automatic updates checking

When this option is selected, Oxygen XML Author will automatically search for available updates.

Add-on Sites URLs

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.

Document Type Association Preferences
[Edit on GitHub](#)

Oxygen XML Author uses document type associations to associate a *document type* with a set of functionality provided by a framework. To configure the **Document Type Association** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for framework add-on update sites.

Document Type Table

This table presents the currently defined document type associations (frameworks), sorted by priority and alphabetically. Each edited document type has a set of association rules (used by the application to detect the proper document type association to use for an opened XML document). A rule is described by:

- **Namespace** - Specifies the namespace of the root element from the association rules set (* *(any)* by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the ANY_VALUE string).
- **Root local name** - Specifies the local name of the root element (* *(any)* by default).
- **File name** - Specifies the name of the file (* *(any)* by default).
- **Public ID** - Represents the Public ID of the matched document.
- **Java class** - Presents the name of the Java class, which is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustom` interface.

New

Opens a [Document type configuration dialog box](#) that allows you to add a new association.

Edit

Opens a [Document type configuration dialog box](#) that allows you to edit an existing association.

Note: If you try to edit an existing association type when you do not have write permissions to its store location, a dialog box will be shown asking if you want to extend the document type.

Duplicate

Opens a [Document type configuration dialog box](#) that allows you to duplicate the configuration of an existing document type association.

Extend	Opens a Document type configuration dialog box that allows you to extend an existing document type. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.
Delete	Deletes the selected document type associations.
Enable DTD/XML Schema processing in document type detection	When this option is enabled (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected in the root element, helping Oxygen XML Author to correctly match the DITA customization.
Only for local DTDs/XML Schemas	When this option is enabled (default value), only the local DTDs / XML Schemas will be processed.
Enable DTD/XML Schema caching	When this option is enabled (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Locations Preferences

[Edit on GitHub](#)

Oxygen XML Author allows you to change the location where [document types \(frameworks\)](#) are stored, and to specify additional framework directories. The **Locations** preferences page allows you to specify the main frameworks folder location. You can choose between the **Default** directory (`[OXYGEN_INSTALL_DIR]/frameworks`) or a **Custom** specified directory. You can also change the current frameworks folder location value using the `com.oxygenxml.editor.frameworks.url` system property set in either the [.vmoptions configuration files](#) or in the [startup scripts](#).

A list of additional frameworks directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type (configuration) can be loaded from the following locations:

- Internal preferences - The document type configuration is stored in the application [Internal preferences](#).
- Additional frameworks directories - The document type configuration is loaded from one of the specified **Additional frameworks directories** list.
- Add-ons - An add-on can contribute a framework. You can manage the add-ons locations in the [Add-ons preferences page](#).
- The frameworks folder - The main folder containing framework configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

Document Type Configuration Dialog Box

[Edit on GitHub](#)

The **Document type** configuration dialog box allows you to create or edit a *Document Type Association* (framework). It is displayed when you use the **New**, **Edit**, **Duplicate**, or **Extend** buttons in the **Document Type Association** preferences page ([open the Preferences dialog box \(Options > Preferences\)](#)) and go to **Document Type Association**.

The configuration dialog box includes the following fields and sections:

- **Name** - The name of the *Document Type Association*.
- **Priority** - Depending on the priority level, Oxygen XML Author establishes the order in which the existing document type associations are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority to *Document Type Associations* you want to be evaluated first.
- **Description** - A detailed description of the framework.
- **Storage** - Displays the type of location where the framework configuration file is stored. Can be one of: **External** (framework configuration is saved in a file) or **Internal** (framework configuration is stored in the application's internal options).

Note: If you set the **Storage** to **Internal** and the document type association settings are already stored in a framework file, the file content is saved in the application's internal options and the file is removed.

- **Initial edit mode** - Sets the default edit mode when you open a document for the first time.
- **Configuration Tabs** - The bottom section of the dialog box includes various tabs where you can configure numerous options for the *framework*.

Related information

[Document Type Sharing](#) on page 1202

Association Rules Tab

[Edit on GitHub](#)

By combining multiple association rules you can instruct Oxygen XML Author to identify the type of a document. An Oxygen XML Author *association rule* holds information about *Namespace*, *Root local name*, *File name*, *Public ID*, *Attribute*, and *Java class*. Oxygen XML Author identifies the type of a document when the document matches at least one of the *association rules*. This tab give you access to a **Document type rule** dialog box that you can use to create *association rules* that activate on any document matching all the criteria defined in the dialog box.

To open the **Association Rules** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend button**, and click on the **Association Rules** tab.

In the **Association rules** tab you can perform the following actions:

New

Opens the **Document type rule** dialog box allowing you to create *association rules*.

Edit

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected *association rule*.

Delete

Deletes the currently selected *association rules* from the list.

**Move Up**

Moves the selected *association rule* up one spot in the list.

**Move Down**

Moves the selected *association rule* down one spot in the list.

Schema Tab

[Edit on](#)
[GitHub](#)

In the **Schema** tab, you can specify a schema that Oxygen XML Author uses if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

Schema type

Use this drop-down list to select the type of schema.

Schema URI

You can specify the URI of the schema file. You can

specify the path by using the text field, the **Insert Editor Variables** button, or the browsing tools in the

Browse drop-down list.

Tip: It is a good practice to store all resources in the framework directory and use the \${framework} editor variable to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

[Edit on](#)
[GitHub](#)

The **Classpath** tab displays a list of folders and JAR libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and framework translation files. Oxygen XML Author loads the resources looking in the folders in the order they appear in the list.

To open the **Classpath** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Classpath** tab.

The **Classpath** tab includes the following actions:

**New**

Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Tip: The path can also contain wildcards (for example, \${framework}/lib/*.jar).

**Edit**

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the

text field, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

Tip: The path can also contain wildcards (for example, \${framework}/lib/*.jar).

Delete

Deletes the currently selected resource from the list.

Move Up

Moves the selected resource up one spot in the list.

Move Down

Moves the selected resource down one spot in the list.

Use parent classloader from plugin with ID

Use this option to specify the ID of a plugin. The current framework has access to the classes loaded for the plugin.

Related information

[Extensions Tab](#) on page 97

[Author Tab](#) on page 83

[Localizing Frameworks](#) on page 1149

Author Tab

[Edit on GitHub](#)

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding framework-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button, and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.

CSS Subtab

[Edit on GitHub](#)

The **CSS** subtab contains the CSS files that Oxygen XML Author uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

To open the **CSS** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button, click on the **Author** tab, and then the **CSS** subtab.

The following actions are available in the **CSS** subtab:

New

Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, the

 **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit the current selection.

Delete

Deletes the currently selected CSS file.

**Move Up**

Moves the selected CSS file up in the list.

**Move Down**

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is enabled by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

Related concepts[CSS Stylesheet](#) on page 1109**Related information**[Selecting and Combining Multiple CSS Styles](#) on page 1222**Actions Subtab**[Edit on GitHub](#)

The **Actions** subtab contains a sortable table that includes all the framework-specific actions. Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Actions** subtab.

The following actions are available in this subtab:

**New**Opens [the Action dialog box](#) that allows you to add an action.**Duplicate**

Duplicates the currently selected action.

**Edit**

Opens a dialog box that allows you to edit an existing action.

**Delete**

Deletes the currently selected action.

Action Dialog Box[Edit on GitHub](#)

To edit an existing document type action or create a new one, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Actions** subtab. At the bottom of this subtab, click **New** to create a new action, or **Edit** to modify an existing one.

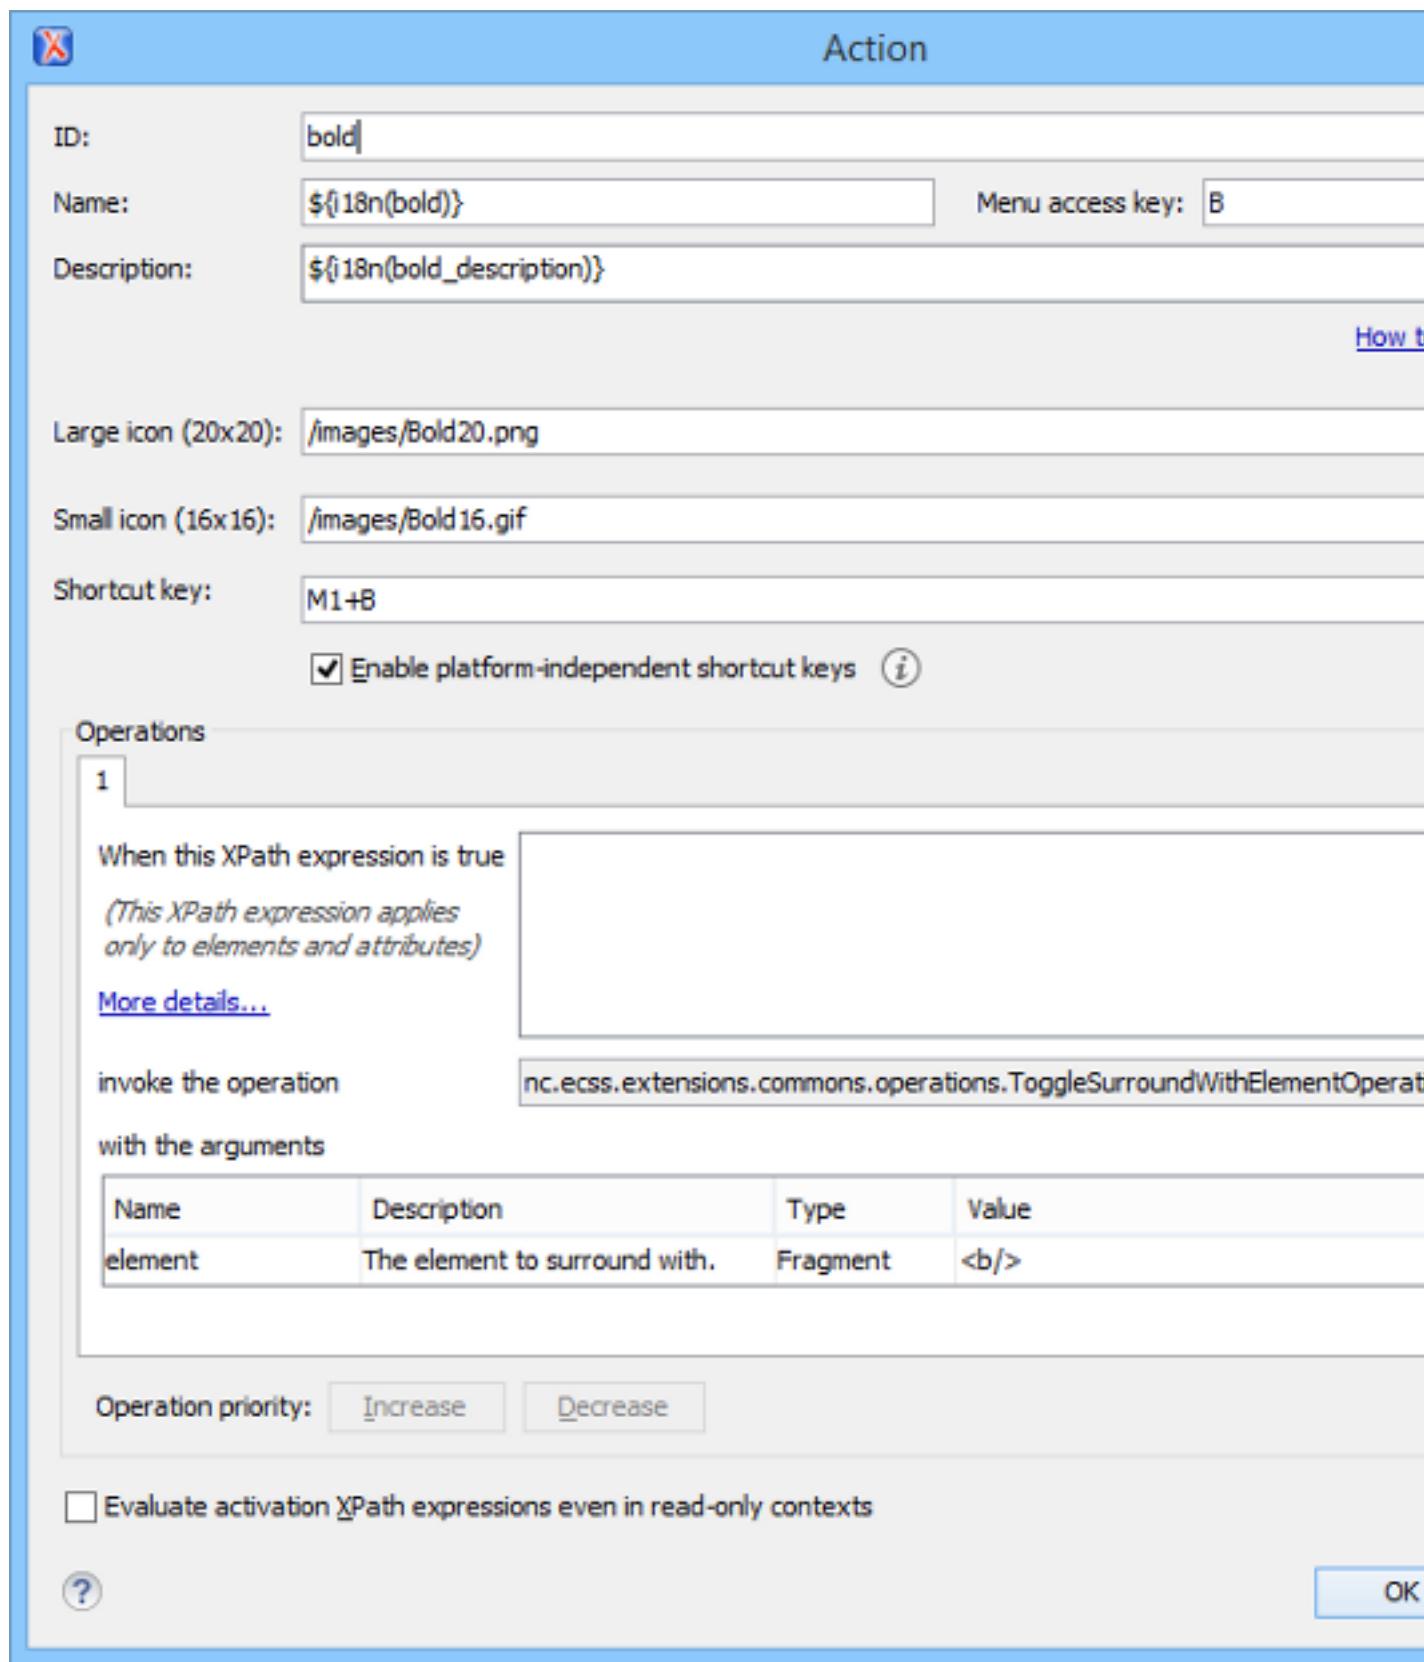

Figure 15: Action Dialog Box

The following options are available in the **Action** dialog box:

ID	Specifies a unique action identifier.
Name	Specifies the name of the action. This name is displayed as a tooltip or as a menu item. Tip: You can use the <code>\$/i18n('key')</code> editor variable to allow for multiple translations of the name.
Menu access key	In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the <i>Letter</i> that is underlined in the name of the menu. Then, while still holding down Alt , you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the <i>Letter</i> in the name of the action that can be used to access the action.
Description	A description of the action. This description is displayed as a tooltip when hovering over the action. Tip: You can use the <code>\$/i18n('key')</code> editor variable to allow for multiple translations of the description.
Large icon	Allows you to select an image for the icon that Oxygen XML Author uses for the toolbar action. Tip: A good practice is to store the image files inside the framework directory and use the <code> \${frameworks}</code> editor variable to make the image relative to the framework location. If the images are bundled in a <i>jar</i> archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the <i>class-path</i> .
Small icon	Allows you to select an image for the icon that Oxygen XML Author uses for the contextual menu action. Note: If you are using a Retina or HiDPI display, Oxygen XML Author automatically searches for higher resolution icons in the path specified in both the Large icon and Small icon options. For more information, see the Adding Retina/HiDPI Icons in a Framework section .
Shortcut key	This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.
Enable platform-independent shortcut keys	If this checkbox is enabled, the shortcut that you specify in this field is platform-independent and the following modifiers are used: <ul style="list-style-type: none"> • M1 represents the Command key on MacOS X, and the Ctrl key on other platforms. • M2 represents the Shift key.

- M3 represents the **Option** key on Mac OS X, and the **Alt** key on other platforms.
- M4 represents the **Ctrl** key on Mac OS X, and is undefined on other platforms.

Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first enabled operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: [Activate Multiple Functions for Actions using XPath Expressions](#) on page 88.

The following options are available in this section:

When this XPath expression is true	An XPath 2.0 expression that applies to elements and attributes. For more details see: Activate Multiple Functions for Actions using XPath Expressions on page 88.
invoke the operation	Specifies the invoked operation.
with the arguments	Specifies the arguments of the invoked operation.
Edit	Allows you to edit the arguments of the operation.
Operation priority	<p>Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.</p> <ul style="list-style-type: none"> • Add - Adds an operation. • Remove - Removes an operation.

-  **Duplicate** - Duplicates an operation.

Evaluate activation XPath expressions even in read-only contexts	If this checkbox is enabled, the action can be invoked even when the cursor is placed in a read-only location.
---	--

Activate Multiple Functions for Actions using XPath Expressions

[Edit on GitHub](#)

An **Author** mode action can have multiple functions, each function invoking an **Author** mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a *true* result). If it is fulfilled, the operation defined in the function will be executed.

Two special XPath extension functions are provided: the `oxy:allows-child-element()` function that you can use to check whether or not an element is valid in the current context, considering the associated schema and the `oxy:current-selected-element()` function that you can use to get the currently selected element.

`oxy:allows-child-element()` Function

[Edit on GitHub](#)

This extension function allows author actions to be available in a context only if the associated schema permits it.

The `oxy:allows-child-element()` is evaluated at the cursor position and has the following signature:
`oxy:allows-child-element($childName, ($attributeName, $defaultValue, $contains?))?`.

The following parameters are supported:

`childName`

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the para element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

```
oxy:allows-child-element("*:para")
```

The above example verifies if the para element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

```
oxy:allows-child-element("{prefix}para")
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of *false*.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element("{namespaceURI}para")
```

The `namespaceURI` is the namespace of the element. The above example verifies if the para element (of the specified namespace) is allowed in the current context.

- Any element.

```
oxy:allows-child-element("*)")
```

The above function verifies if any element is allowed in the current context.

Note: A common use case of `oxy:allows-child-element("*)")` is in combination with the `attributeName` parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-child-element("*, "class", "topic/topic")
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

```
oxy:allows-child-element("*, *:localname", "topic/topic")
```

- A qualified name of an attribute.

```
oxy:allows-child-element("*, prefix:localname", "topic/topic")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of `false`.

defaultValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

contains

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultValue` parameter. If the value is `false`, the two values must be the same.

oxy:current-selected-element() Function

[Edit on GitHub](#)

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

```
oxy:current-selected-element()[self::p]/b
```

This example returns the `b` elements that are children of the currently selected `p` element.

Menu Subtab

[Edit on GitHub](#)

In the **Menu** subtab, you can configure which actions will appear in the framework-specific menu. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Menu** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Menu** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Author

menu. To add an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button.

To add an image in this section as a child of the currently selected action use the  **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Contextual Menu Subtab

[Edit on GitHub](#)

In the **Contextual menu** subtab you configure what framework-specific action the **Content Completion Assistant** proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Contextual Menu** subtab.

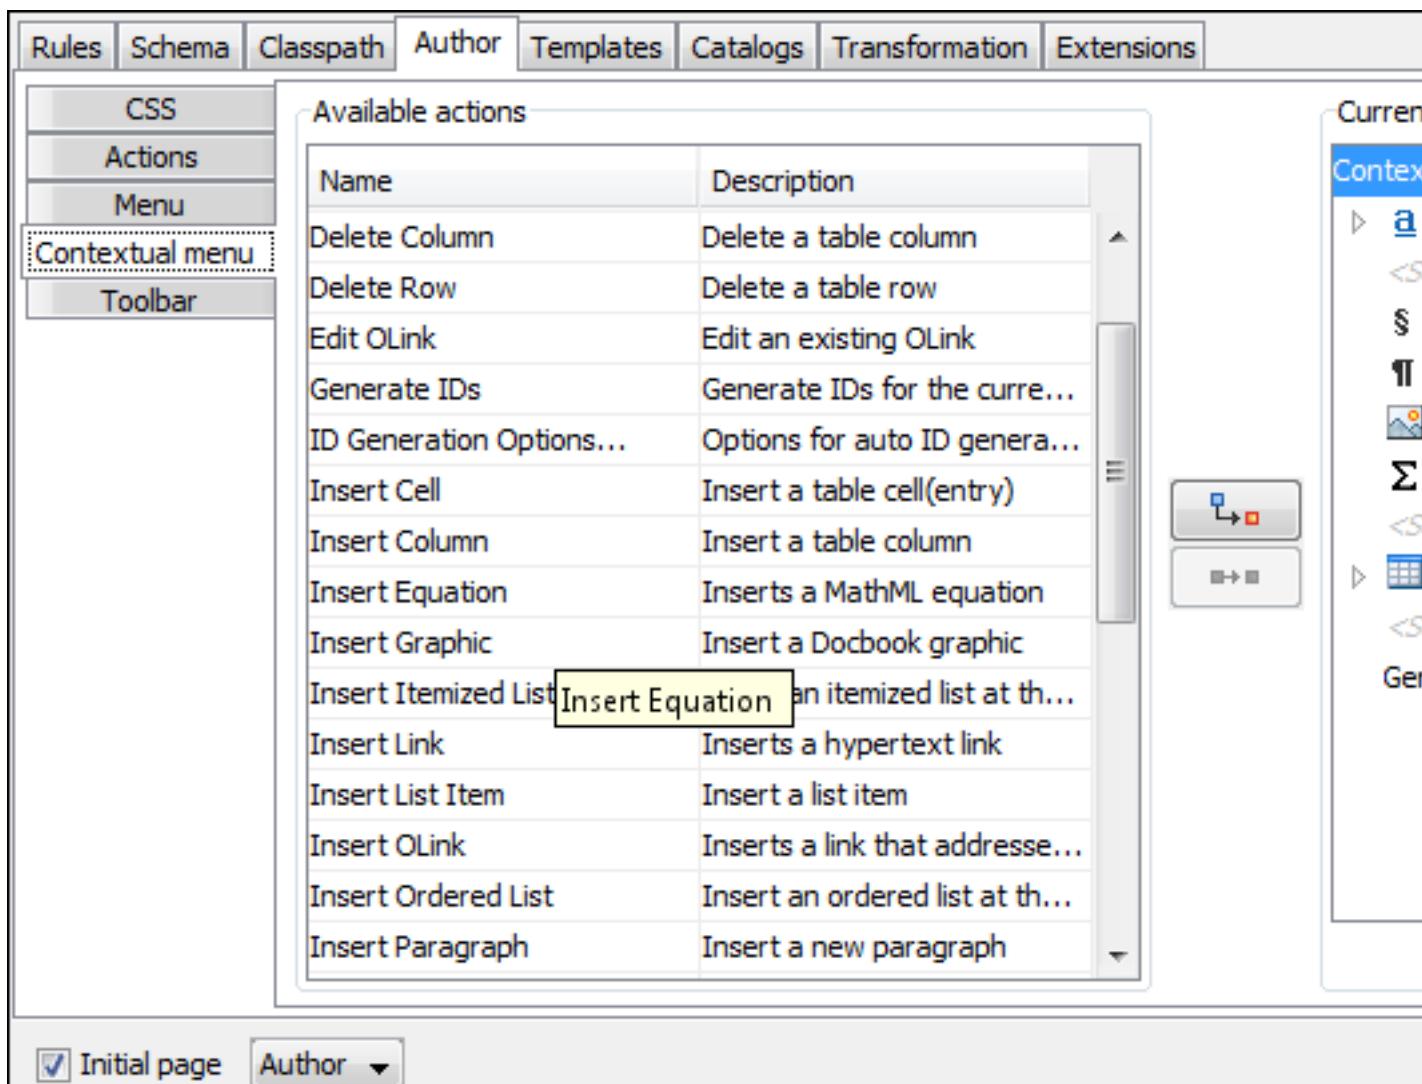

Figure 16: Contextual Menu Subtab

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited framework.

The following actions are available in this subtab:

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

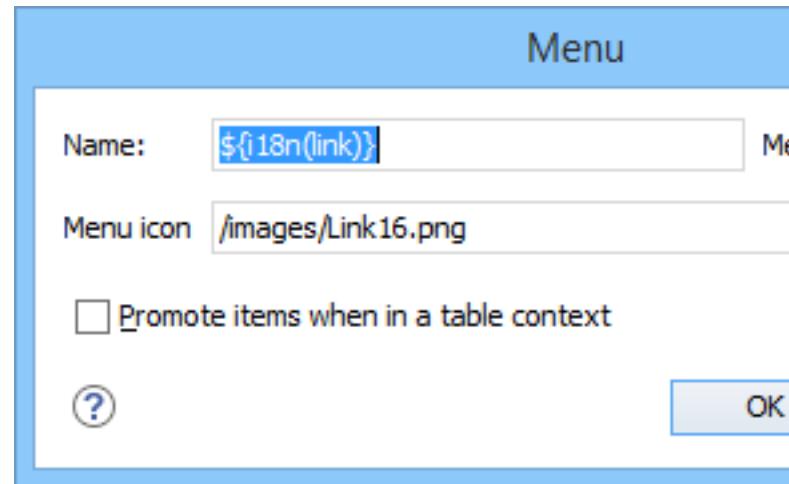

Figure 17: Menu Action Configuration Dialog Box

The following options are available in this dialog box:

Name	Specifies the name of the action. This name is displayed as a tooltip or as a menu item. Tip: You can use the <code>\$(i18n('key')) editor variable</code> to allow for multiple translations of the name.
Menu access key	In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the <i>Letter</i> that is underlined in the name of the menu. Then, while still holding down Alt , you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the <i>Letter</i> in the name of the action that can be used to access the action.
Menu icon	Allows you to select an image for the icon that Oxygen XML Author uses for the container (submenu).
Promote items when in a table context	If this option is enabled, when invoking the

contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

Remove

Removes the selected action or submenu from the **Current actions** section.

Move Up

Moves the selected item up in the list.

Move Down

Moves the selected item down in the list.

Toolbar Subtab

[Edit on GitHub](#)

In the **Toolbar** subtab you configure what framework-specific action the Oxygen XML Author toolbar holds. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Toolbar** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Toolbar** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Author toolbar when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action use the **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Content Completion Subtab

[Edit on GitHub](#)

In the **Content Completion** subtab you configure what framework-specific the **Content Completion Assistant** proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Content Completion** subtab.

Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the **Content Completion Assistant** proposes when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action use the **Add as child** button.

The following actions are available in the **Current actions** section:

- | | |
|------------------|---------------------|
| Edit | Edits an item. |
| Remove | Removes an item. |
| Move Up | Moves an item up. |
| Move Down | Moves an item down. |

Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the **Content Completion Assistant** or from some specific helper views or menus. Use the **Add** button to add more filters to the table, the **Edit** button to modify an existing item in the table, or the **Remove** button to remove a filtered item. The **Add** and **Edit** buttons open a **Remove item** dialog box.

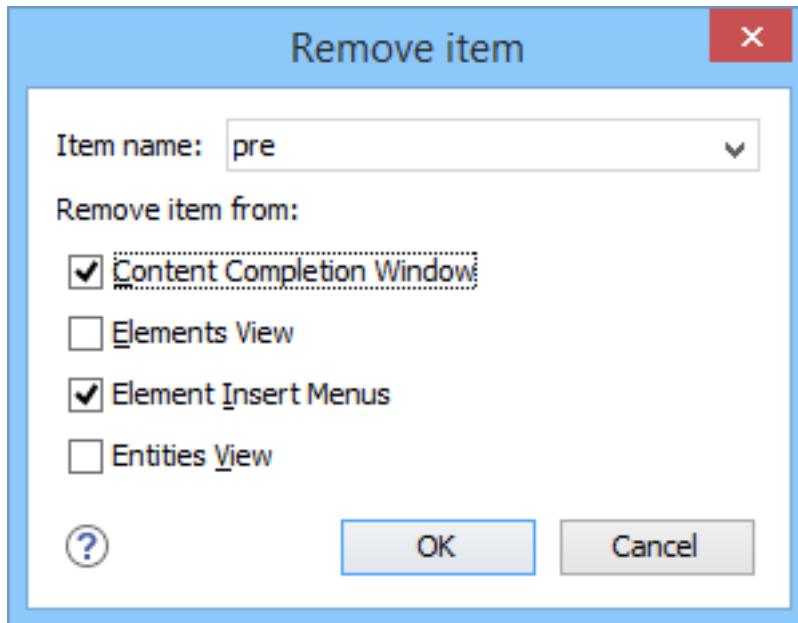

Figure 18: Remove Item Dialog Box

Use this dialog box to add or configure the elements that will be filtered:

Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered (<SPLIT> and <ENTER>).

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the **Content Completion Assistant**.
- **Elements View** - The element will not appear in the **Elements** view.
- **Element Insert Menus** - The element will not appear in the **Append Child**, **Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).
- **Entities View** - The element will not appear in the **Entities** view.

Related information

[Customizing the Content Completion Assistant](#) on page 1204

Templates Tab

[Edit on GitHub](#)

The **Templates** tab specifies a list of directories where new file templates are located. These file templates are gathered from all the document types and presented in the various folders inside the **Framework templates** folder in the [New document wizard](#).

To open the **Templates** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Templates** tab.

The **Templates** tab includes the following actions:

New

Opens a dialog box that allows you to specify the path to the directory of the template. You can specify the path

by using the text field, the [Insert Editor Variables](#) button, or the browsing tools in the [Browse](#) drop-down list.

Tip: The path can also contain wildcards. For example, using \${frameworkDir}/templates/* would add all the template folders found inside the templates directory.

Edit

Opens a dialog box that allows you to edit the path of the selected template. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the browsing tools in the [Browse](#) drop-down list.

Tip: The path can also contain wildcards. For example, using \${frameworkDir}/templates/* would add all the template folders found inside the templates directory.

Delete

Deletes the currently selected template from the list.

**Move Up**

Moves the selected template up one spot in the list.

**Move Down**

Moves the selected template down one spot in the list.

Catalogs Tab

[Edit on](#)[GitHub](#)

The **Catalogs** tab specifies a list of *XML catalogs*, specifically for the edited framework, that are added to list of catalogs that Oxygen XML Author uses to resolve resources.

To open the **Catalogs** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend button**, and click on the **Catalogs** tab.

You can perform the following actions:

**Add**

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, the

Insert Editor Variables button, or the browsing tools in the

Browse drop-down list.

**Edit**

Opens a dialog box that allows you to edit the path of an existing catalog.

**Delete**

Deletes the currently selected catalog from the list.

**Move Up**

Moves the selected catalog up one spot in the list.

**Move Down**

Moves the selected catalog down one spot in the list.

Transformation Tab

[Edit on](#)[GitHub](#)

In the **Transformation** tab, you can configure the transformation scenarios associated with the particular framework you are editing. These transformation scenarios are presented in the **Configure Transformation Scenarios** dialog box when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the **Transformation** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend button**, and click on the **Transformation** tab.

The **Transformation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the **Configure Transformation Scenarios** dialog box.

**New**

Opens the **New scenario** dialog box allowing you to create a new transformation scenario for the particular document type. For more information, see *Creating New Transformation Scenarios* on page 712.

 Edit	Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected transformation scenario. For more information, see Creating New Transformation Scenarios on page 712.
 Delete	Deletes the currently selected transformation scenario.
 Import scenarios	Imports transformation scenarios.
 Export selected scenarios	Export transformation scenarios.
 Move Up	Moves the selection to the previous scenario.
 Move Down	Moves the selection to the next scenario.

Validation Tab

[Edit on GitHub](#)

In the **Validation** tab, you can configure the validation scenarios associated with the particular framework you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Defining Master Files at Project Level](#) on page 360 or [Working with Modular XML Files in the Master Files Context](#) on page 606.

To open the **Validation** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend button**, and click on the **Validation** tab.

The **Validation** tab offers the following options:

Default checkbox	You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the Configure Validation Scenarios dialog box.
 New	Opens the New scenario dialog box allowing you to <i>create a new validation scenario</i> .
 Edit	Opens the Edit scenario dialog box allowing you to <i>edit the properties of the currently selected validation scenario</i> .
 Delete	Deletes the currently selected validation scenario.
 Import scenarios	Imports validation scenarios.
 Export selected scenarios	Export validation scenarios.
 Move Up	Moves the selected scenario up one spot in the list.
 Move Down	Moves the selected scenario down one spot in the list.

Extensions Tab

[Edit on GitHub](#)

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Extensions** tab.

Libraries containing the implementations must be present in the [classpath](#) of your document type. The Javadoc available at <http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/> contains details about how each API implementation functions.

Encoding Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Encoding**.

The following encoding options are available:

Fallback character encoding

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

Note: For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Author tries to collect the character encoding from the document. If no such encoding is found, then *UTF-8* is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the *UTF-8* encoding is used.

UTF-8 BOM handling

This setting specifies how to handle the *Byte Order Mark* (BOM) when Oxygen XML Author saves a UTF-8 XML document:

- **Keep** (default) - Do not alter the BOM declaration of the currently open file.
- **Write** - Save the BOM bytes.
- **Don't Write** - Do not save the BOM bytes. Loaded BOM bytes are ignored.

Note: The UTF-16 BOM is always preserved. UTF-32 documents have a *big-endian* byte order.

Encoding errors handling

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- **REPORT** (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.

- **REPLACE** - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code FFFD, and if the encoding is ASCII, the replacement character code is 63.
- **IGNORE** - The error is ignored and the character is not included in the document displayed in the editor.

Attention: If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the **Encode Selection** or **Decode Selection** actions for *Base64*, *Base32*, or *Hex conversions*. The default setting is *UTF8*.

Editor Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you configure the appearance of various components and features of the main editor. To access these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor**.

The following options are available:

Selection background color

Allows you to set the background color of selected text.

Selection foreground color

Allows you to set the color of selected text.

Completion proposal background

Allows you to set the background color of the **Content Completion Assistant**.

Completion proposal foreground

Allows you to set the color of the text in the **Content Completion Assistant**.

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the **Content Completion Assistant**.

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the **Content Completion Assistant**.

Find highlight color

Allows you to set the color of the highlights generated by the **Find** and **Find all** actions.

XPath highlight color

Allows you to set the color of the highlights generated when you run an XPath expression.

Maximum number of highlights

Allows you to set the maximum number of highlights that Oxygen XML Author displays.

Show TAB/NBSP/EOL/EOF marks

Makes the *TAB/NBSP/EOL/EOF* characters visible in the editor. You can use the color picker to choose the color of the marks.

Show SPACE marks

Makes the space character visible in the editor.

Can edit read only files

If this option is selected, Oxygen XML Author will let you edit, but not save, a read-only file. If the option is

Display quick-assist and quick-fix side hints

disabled, a warning message is displayed when you try to edit a read-only file.

Undo history size

Displays the *Quick Assist* icon () and *Quick Fix* icon () in the line number stripe on the left side of the editor.

Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (**Text**, **Author**, **Design**, **Grid**).

Print Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you configure how files are printed out of the editor. Note that these setting cover how files are printed directly from Oxygen XML Author itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the **Print** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Print**.

This page allows you to customize the headers and footers added to a printed page when you print from the **Text mode** or **Author mode** editors. These settings do not apply to the **Grid** mode.

You can specify what is printed on the **Left**, **Middle**, and **Right** of the header and footer using plain text of any of the following variables:

- `${currentFileURL}` - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- `${cfne}` - Current file name with extension. The current file is the one currently opened and selected.
- `${cp}` - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- `${tp}` - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- `${env(VAR_NAME)}` - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `${system(var.name)}` editor variable.
- `${system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `${env(VAR_NAME)}` editor variable instead.
- `${date(pattern)}` - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd` ;

Note: This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about `xs:datetime`, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the **Right** text area of the **Header** section: `${cp} of ${tp}` .

You can also set the **Color** and **Font** used in the header and footer. Default font is `SansSerif`.

You can place a line below the header or above the footer by selecting **Underline/Overline**.

Edit Modes Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you configure which [edit mode](#) a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and

restored the next time it is opened. To configure the options for editing modes, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes**.

If **Allow Document Type specific edit mode setting to override the general mode setting** is selected, the initial edit mode setting set in the [Document Type configuration dialog box](#) overrides the general edit mode setting from the table below.

The initial edit mode can be one of the following:

- [Text](#)
- [Author](#)
- [Grid](#)
- **Design** (available only for the W3C XML Schema editor).

Editor / Edit modes	
<input checked="" type="checkbox"/> Allow Document Type specific edit mode setting to override the general edit mode settings

Schematron Editor	Text
<input type="button" value="Edit"/>	

Figure 19: Edit Modes Preferences Page

Text Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you configure how the [Text mode editor](#) appears. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Text**.

The following options are available:

Editor background color	Sets the background color for the Text editing mode, Outline view, and some external tool editors (Large File Viewer , Compare Files , Compare Directories).
Editor cursor color	Sets the color for the cursor in Text mode.
Highlight current line	If enabled, the current line is highlighted with the foreground color specified with the color chooser.
Show line numbers	If enabled (default value), line numbers are shown in the editor panels and in the Results view of the debugger perspectives. You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.
Show print margin	If enabled, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.
	Print margin column Allows you to specify a limit for the print width, measured in the number of characters.
Line wrap	If enabled, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use <i>newline</i> characters to break long lines.
Cut / Copy whole line when nothing is selected	If enabled, <i>Cut</i> and <i>Copy</i> actions operate on the entire current line when nothing is selected in the editor.
Enable folding	If enabled (default value), the vertical stripe that holds the <i>folding markers</i> is displayed in Text mode.
Highlight matching tag	If enabled, when you place the cursor on a start or end tag, Oxygen XML Author highlights the corresponding member of the pair. You can also customize the highlight color.
Lock the XML tags	If enabled, XML are locked and cannot be edited in Text mode.

Grid Preferences

[Edit on GitHub](#)

Oxygen XML Author provides a *Grid view* of an XML document. To configure the **Grid** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Grid**.

The following options are available:

Compact representation	If selected, the <i>compact representation</i> of the grid is used: a child element is displayed beside the parent element. In the <i>non-compact representation</i> , a child element is nested below the parent.
Format and indent when passing from grid to text or on save	If selected, the content of the document is <i>formatted and indented</i> each time you switch from the Grid view to the Text view.

Default column width (characters)	Sets the default width (in characters) of a table column of the grid. A column may contain the following:						
	<ul style="list-style-type: none"> • Element names • Element text content • Attribute names • Attribute values 						
	If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.						
Active cell color	Allows you to set the background color for the active cell of the grid. There is only one active cell at a time. The keyboard input always goes to the active cell and the selection always contains it.						
Selection color	Allows you to set the background color for the selected cells of the grid except the active cell.						
Border color	Allows you to set the color used for the lines that separate the grid cells.						
Background color	Allows you to set the background color of grid cells that are not selected.						
Foreground color	Allows you to set the text color of the information displayed in the grid cells.						
Row header colors	<table border="0"> <tr> <td>Background color</td><td>Allows you to set the background color of row headers that are not selected.</td></tr> <tr> <td>Active cell color</td><td>Allows you to set the background color of the row header cell that is currently active.</td></tr> <tr> <td>Selection color</td><td>Allows you to set the background color of the header cells corresponding to the currently selected rows.</td></tr> </table>	Background color	Allows you to set the background color of row headers that are not selected.	Active cell color	Allows you to set the background color of the row header cell that is currently active.	Selection color	Allows you to set the background color of the header cells corresponding to the currently selected rows.
Background color	Allows you to set the background color of row headers that are not selected.						
Active cell color	Allows you to set the background color of the row header cell that is currently active.						
Selection color	Allows you to set the background color of the header cells corresponding to the currently selected rows.						
Column header colors	The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.						
	<table border="0"> <tr> <td>Background color</td><td>Allows you to set the background color of column headers that are not selected.</td></tr> <tr> <td>Active cell color</td><td>Allows you to set the background color of the</td></tr> </table>	Background color	Allows you to set the background color of column headers that are not selected. Background color	Allows you to set the background color of column headers that are not selected.						
Active cell color	Allows you to set the background color of the						

Author Preferences	Edit on GitHub
Oxygen XML Author provides an Author editing mode that provides a configurable graphical interface for editing XML documents. To configure the options for the Author mode, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author .	
The following options are available:	
Author default background color	Sets the default background color of the Author editing mode. The <code>background-color</code> property set in the CSS file associated with the currently edited document overwrites this option.
Author default foreground color	Sets the default foreground color of the Author editing mode. The <code>color</code> property set in the CSS file associated with the current edited document overwrites this option.
Show XML comments	When this option is selected, XML comments are displayed in Author mode. Otherwise, they are hidden.
Show processing instructions	When this option is selected, XML processing instructions are displayed in Author mode. Otherwise they are hidden.
Show doctype	When this option is selected, the <code>doctype</code> declaration is displayed in Author mode. Otherwise it is hidden.
Show placeholders for empty elements	When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.
Show Author layout messages	When this option is selected, all errors reported while rendering the document in Author mode are presented in the Errors view at the bottom of the editor.
Show block range	When this option is selected, a <i>block range indicator</i> is displayed in a stripe located in the left side of the editor. It is displayed as a heavy line that spans from the first line to the last line of the block.
Display referenced content (entities, XInclude, DITA conref, etc.)	When enabled, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.
Images Section	The following options in regards to images in Author mode are available in this section:

Auto-scale images wider than (pixels)	Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.
Show very large images	When this option is selected, images larger than 6 megapixels are displayed in Author mode. Otherwise, they are not displayed. Important: If you enable this option and your document contains many such images, Oxygen XML Author may consume all available memory, throwing an <i>OutOfMemory error</i> . To resolve this, increase the <i>available memory limit</i> , and restart the application.

Tags Section

In this section you can configure the following options in regards to tags that are displayed in **Author** mode:

Tags display mode	Sets the default display mode for element tags presented in Author mode. You can choose between the following:
	<ul style="list-style-type: none"> • Full Tags with Attributes - All XML tags are displayed, with attribute names and values, making it easier to transition from a Text-based editing to Author mode editing. • Full Tags - All XML tags are displayed, but without attributes. • Block Tags - The XML tags that enclose block elements are displayed in full. Compact tags (no element names) are displayed for inline elements. • Inline Tags - The XML tags that enclose inline elements are

	displayed in full. Block tags are not displayed.
• Partial Tags - Partial tags (no names) are displayed for all elements.	
• No Tags - No tags are displayed. This representation is as close as possible to a word-processor view.	
Tags background color	Sets the Author mode tags background color.
Tags foreground color	Sets the Author mode tags foreground color.
Tags font	Allows you to change the font used to display tags text in the Author visual editing mode. The <i>[Default]</i> font is computed based on the setting of the <i>Author default font option</i> .
Compact tag layout	When you deselect this option, the Author mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

Serialization Section

In this section you can configure options in regards to the formatting and indenting that is applied when a document is saved in **Author** mode, or when switching the editing mode from **Author** to **Text**. The following options are available:

Format and indent	Use this option to specify what should be formatted and indented when you save a document (or switch from Author to Text mode). You can choose between the following two options:
Only the modified content	The Save operation only formats the nodes that were modified in the Author

mode. The rest of the document preserves its original formatting.

Note: This option also applies to the DITA maps opened in the **DITA Maps Manager**.

The entire document The **Save** operation applies the formatting to the entire document regardless of the nodes that were modified in **Author** mode.

Also If applythis 'Format and' is Indent enabled, actionthe as content in of 'Text' the edit document mode is formatted by applying the Format and Indent rules from the *Editor/Format/XML* option page.

In this case, the result of the **Format and indent** operation will be the same as when it is applied in **Text** editing mode.

Compatibility with other tools Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

Note: New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this

option automatically disables the *'Also apply 'Format and Indent' action as in 'Text' edit mode option*, since the formatting from **Text** mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent**
 - Choose this option to instruct Oxygen XML Author to insert new lines only after elements that have a CSS display property set to anything other than inline or none (for example, block, list-item, table, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

Note: New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the *'Also apply 'Format and Indent' action as in 'Text' edit mode option*, since the formatting from **Text** mode does not take the CSS styles into account.

For advanced Author configuration see the Document Type Association settings Click this link to open the [Document Type Association preferences page](#).

Cursor Navigation Preferences

[Edit on GitHub](#)

Oxygen XML Author allows you to configure the appearance and behavior of the cursor in the **Author mode editor**. To set cursor navigation preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Author > Cursor Navigation**.

The following options are available:

Highlight elements near cursor

When this option is enabled, the element containing the cursor is highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Author uses *tool tips in Author mode to indicate the position of the cursor in the element structure* of the underlying document. Depending on context, the tool tips may show the current element name or the names of the elements before and after the current cursor position.

Show location tooltip on mouse move

When this option is enabled, Oxygen XML Author displays *Location Tooltips* when you are editing the document in certain tags display modes (**Inline Tags**, **Partial Tags**, **No Tags**) or when the mouse pointer is moved between block elements.

Quick up/down navigation

This option is disabled by default and this means that when you navigate using the up and down arrow keys in **Author** mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is enabled, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is enabled by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is disabled, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in **Author** mode for bidirectional (BIDI) text. When this option is enabled (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is disabled, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Schema Aware Preferences

[Edit on GitHub](#)

Oxygen XML Author can use the schema of your XML language to improve the way the **Author** mode editor handles your content. To configure the **Schema Aware** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Schema Aware**.

The following options are available:

Schema aware normalization, format, and indent

When you open or save a document in **Author** mode, white space is normalized using the `display` property of the current CSS stylesheet and the values of the [settings](#) for **Preserve space elements**, **Default space elements**, and **Mixed content elements**. When this option is selected, the schema will also be used to normalize white space, based on the content model (*element-only*, *simple-content*, or *mixed*) . Note that the schema information takes precedence.

Indent blocks-only content

To avoid accidentally introducing inappropriate white space around inline elements, Oxygen XML Author does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Author will apply indenting to the source of mixed content elements that only contain block elements.

Schema Aware Editing section

The options in this section determine how Oxygen XML Author will use the schema of a document to control the behavior of the **Author** mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

**Delete element tags
with backspace and
delete**

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Author will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list items.

- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Author tries to find an appropriate insert position. The possibilities include:
 - Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
 - Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below an existing list).
 - Inserting the content into an ancestor element where it would be valid.
 - **Reject action when its result is invalid** - If enabled, Oxygen XML Author will not let you paste content into a position where it would be invalid.

Typing

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.
- **Reject action when its result is invalid** - If checked, and the result of the typing action is invalid, the action will not be performed.

Content Completion

Controls the behavior that takes place when inserting elements using content completion.

Available options are:

- **Allow only insertion of valid elements and attributes** - If selected, the content completion list shows only the elements that can be inserted at the current position and will not allow you to enter any other element.
- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Author will attempt to find a valid location to

		insert it and may present you with several options.
Warn on invalid content when performing action	A warning message will be displayed when performing an action that will result in invalid content. Available options are:	
		<ul style="list-style-type: none"> • Delete Element Tags - If selected, a warning message will be displayed if the Delete Element Tags action will result in an invalid document. You will be asked to confirm the deletion. • Join Elements - If selected, a warning message will be displayed if the Join Elements action will result in an invalid document. You will be asked to confirm the join.
Automatically apply the best schema-aware insertion operation	If enabled, Oxygen XML Author automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If disabled, Oxygen XML Author will ask the user to choose from a list of proposed solutions.	
Convert external content on paste	If selected, the smart paste feature is enabled when external content is pasted in Author mode.	
Convert even when pasting inside space-preserve elements	If enabled, the smart paste feature will be used even when external content is pasted inside a <i>space-preserve</i> element (such as a <code>codeblock</code>).

[Review Preferences](#)

[Edit on GitHub](#)

Oxygen XML Author lets you [enter review comments and track changes](#) in your documents. The **Review** preferences page allows you to control how the Oxygen XML Author review features work. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

Author	Specifies the name to be attached to all comments and to changes made while Track Changes is active. By default, Oxygen XML Author uses the system user name.
Track Changes section (applies for all authors)	<p>Initial State</p> <p>Specifies whether or not Track Changes is enabled when you open a document. You may have the Track Changes feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:</p> <ul style="list-style-type: none">• Stored in document - The current state of track changed is stored in the document itself, meaning that track changes are on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.• Always On - The Track Changes feature is always on when you open a document. You can turn it off for an opened document, but it will be turned on for the next document you open.• Always Off - The Track Changes feature is always off when you open a document. You can turn it on for an opened document, but it will be turned off for the next document you open.

Display changed lines marker

A changed line maker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, disable this option.

Inserted content color

When **Track Changes** option is on, the newly inserted content is highlighted with an *insertion marker* that uses a color to adjust the following display properties of the inserted content: *foreground*, *background*, and *underline*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Author automatically assigns a color to each user who inserted content in the current document. The colors are picked from the [*Colors for automatic assignment list*](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If enabled, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the inserted content.

- **Use same color for background** - If enabled, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

Deleted content color

When **Track Changes** option is on, the deleted content is highlighted with a *deletion marker* that uses a color to adjust the following display properties of the deleted content: *foreground*, *background*, and *strikethrough*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Author automatically assigns a color to each user who deleted content in the current document. The colors are picked from the [*Colors for automatic assignment list*](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author uses the specified color for all deletion markers, regardless of who the author is.
- **Use same color for text foreground** - If enabled, Oxygen XML Author uses the color defined above (**Automatic**

or **Fixed**) to render the foreground of the deleted content.

- **Use same color for background** - If enabled, Oxygen XML Author uses the color defined above (**Automatic** or **Fixed**) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

Comments color section (applies for all authors)

Sets the background color of the text that is commented on. The options are:

- **Automatic** - If this option is selected, Oxygen XML Author automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the [Colors for automatic assignment list](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Author uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

Colors for automatic assignment list

These are the colors that will be automatically assigned for tracked insertion changes, tracked deletion changes, and comments if the **Automatic** option is selected in any of the sections in this preferences page. The colors are assigned in the order that you see in this list. You can use the **Add**, **Edit**, or **Remove** buttons to modify the list of colors.

Callouts Preferences

[Edit on GitHub](#)

Oxygen XML Author can display callouts for *review items such as comments and tracked changes*. To customize options for review callouts, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Review > Callouts**.

The available options are as follows:

Show review callouts for:

Comments

If enabled, callouts are displayed for comments, including comments that are added to tracked

		changes. This option is enabled by default.
Track Changes deletions	If enabled, callouts are displayed for tracked change deletions and the following additional option becomes available:	
Show deleted content in callout	If enabled, the deleted content is also displayed in the callout.	
Track Changes insertions	If enabled, callouts are displayed for tracked change insertions and the following additional option becomes available:	
Show inserted content in callout	If enabled, the inserted content is also displayed in the callout.	
Rendering section		
Show review time	When enabled, timestamp information is displayed in callouts.	
Show all connecting lines	When enabled, lines are shown that connect the callout to the location of the change.	
Initial width (px)	Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.	
Text lines count limit	Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select	

 [Edit Comment or](#)
 [Show Comment.](#)

Profiling/Conditional Text Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you configure how *profiling and conditional text* is displayed in **Author** mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure Profiling/Conditional Text options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.

Note: Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in **Author** mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA Subject Scheme Map is defined in the root map of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

Import from DITAVAL

This button allows you to import profiling attributes from .ditaval files. You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Author displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

Note: When importing profiling attributes from DITAVAL files, Oxygen XML Author automatically creates condition sets based on these files.

Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the **New** button at the bottom of the table [to add profiling attributes](#), the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Author uses the one that is positioned highest in the table.

**Allow additional
profiling attribute
values collected from the
document**

This option is enabled by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the

Edit Profiling Attributes
action from the contextual menu in **Author** mode
(or for DITA topics,

the  **Edit Properties**
action in the **DITA Maps Manager**, the **Profiling Values Conflict dialog box** will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute.

If this option is disabled, it means the following:

- The **Profiling Values Conflict** dialog box will never be displayed and the current conditional text configuration is preserved. Therefore, users will not be allowed to easily add new values to profiling attributes.
- In DITA, the automatic validation will display a warning that the value is not defined.
- In the DITA  **Validate and Check for Completeness** dialog box, the **Report attributes and values that conflict with profiling preferences option** is not displayed. This means that the validation will behave the same as if that option was enabled and it will always report such values.

[Configure profiling colors and styles link](#)

Use this link to open the **profiling Colors and Styles preference page**.

Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for

your content. You can use the **New** button at the bottom of the table *to add condition sets*, the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Author uses the one that is positioned highest in the table.

Colors and Styles Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you set the colors and styles used to display *profiling / conditional text* in the **Author mode editor**. To set Colors and Styles preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.

The preference page includes the following options and sections:

Import from DITAVAL

Allows you to import profiling styles from .ditaval files. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Author displays a dialog box containing two tables: the first one previews the imported styles and the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones.

Profiling Colors and Styles Table

You can use this table to set specific colors and styles for profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the *Profiling / Conditional Text* preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the **Defined attributes values** category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name and value). This is the reason why a style from this category can only be *reset*, not deleted.
- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the *Profiling / Conditional Text* preferences page. In this category are listed:
 - All the styles that were defined in other projects (with other profiling attribute value sets).
 - All the styles set for the profiling attributes defined in a *subject scheme map*.

Automatic styling button

If you click this button, Oxygen XML Author will apply automatic styling to the profiling attribute values that do not have a style defined.

New button

Opens the **Add Profiling Style** dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

Note: You can define a default style for a specific attribute by setting the **Attribute value** field to <ANY>. This style is applied for attribute values that do not have a specific style associated with it.

Edit button

Open the **Edit Profiling Style** dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

Clear style button

Resets the style for the selected value to its default setting (no color or decoration).

Delete button

Delete the selected style from the **Other** category.

Attributes Rendering Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you *display the profiling attributes applied to your content* in the **Author** mode editor. To configure how the profiling attributes appear, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes Rendering**. When the *Show Profiling Attributes option* is enabled, the **Author** mode displays conditional text markers at the end of conditional text blocks. Use the options in this page to customize the rendering of these text markers.

The following options are available:

Show profiling attribute name

If checked, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

Background color

Sets the background color used to display the profiling attributes.

Attribute name foreground color

Sets the foreground color used to display the names of the profiling attributes.

Attribute values foreground color

Sets the foreground color used to display values of the profiling attributes.

Border color

Sets the color of the border of the block that displays the profiling attributes.

MathML Preferences

[Edit on GitHub](#)

Oxygen XML Author allows you to *edit MathML* equations and displays the results in a preview window. For a more specialized *MathML* editor, you can *install Design Science MathFlow*, which is a commercial product that requires a separate license.

To configure the *MathML* editor or to enter your *MathFlow* license information, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Author > MathML**.

You can configure the following options:

Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the **Author** mode.

MathFlow installation directory

The installation folder for the *MathFlow* components product (*MathFlow SDK*).

MathFlow license file	The license file for the <i>MathFlow</i> components product (<i>MathFlow SDK</i>).
MathFlow preferred editor	A <i>MathML</i> formula can be edited in one of three editors of <i>MathFlow</i> components product (<i>MathFlow SDK</i>). <ul style="list-style-type: none"> • Structure Editor (default selection) - Targets professional XML workflow users. • Style Editor - Tailored to the needs of content authors. • Simple Editor - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.
Save special characters	Specifies how special characters are saved in the XML file. <ul style="list-style-type: none"> • As entity names - Saves the characters in &name; format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek <i>Omega</i> character is saved as &Omega;. • As character entities (default selection) - Saves the characters in a hexadecimal value, using the &#xNNN format. For example, the Greek <i>Omega</i> character is saved as &#x3a9;. • As character values - Saves the characters as the actual symbol. For example, the Greek <i>Omega</i> character is saved as #.

More documentation is available on the [Design Science MathFlow](#) website.

AutoCorrect Preferences

[Edit on GitHub](#)

Oxygen XML Author includes an option to automatically correct misspelled words as you type in **Author** mode. To enable and configure this feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The following options are available:

Enable AutoCorrect

This option is enabled by default. When enabled, while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Author will automatically replace it with the value listed in the **With** column.

Use additional suggestions from the spell checker

If enabled, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Author will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

Spell Check options link	Note: The <i>AutoCorrect</i> feature shares the same options configured in the Language options and Ignore elements sections in the Spell Check preferences page.
Replacements Table section	Use this link to navigate to the Spell Check Preferences page .
	The <i>AutoCorrect</i> feature uses the Replacements table to automatically replace anything that is listed in the Replace column with the value listed in the With column for each language.
Replacements for language drop-down menu	You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the <i>AutoCorrect</i> feature. It is simply the language for the Replacements table.
Replacements Table	You can double-click on cells in either column to edit the listed items. Use the Add button to insert new items and the Remove button to delete rows from the table.
	Note: Any changes, additions, or deletions you make to this table are saved to a path that is specified in the AutoCorrect Dictionaries preferences page .
Smart quotes section	You can also choose to automatically convert double and single quotes to a quotation characters of your choice by using the following options in the Smart quotes section:
	<ul style="list-style-type: none"> • Replace "Single quotes" - Replaces single quotes with the quotation symbols you select with the Start quote and End quote buttons. • Replace "Double quotes" - Replaces double quotes with the quotation symbols you select with the Start quote and End quote buttons.
Global Options	If this option is selected, the options are stored on your local computer, in a folder that is not accessible to other users.
Project Options	If this option is selected, the options are stored in the project file and can be shared with other users. Selecting Project Options will only save your selections in

Enable AutoCorrect, Use additional suggestions from the spell checker, and the options in the **Smart quotes section**. Changes to the Replacements table are not saved in this page. To save changes to the Replacements table at project level you need to specify a custom location in **the User-defined replacements section of the AutoCorrect Dictionaries preferences page** and select **Project Options** from that preferences page instead.

Restore Defaults

Restores the options in this preferences page to their default values and **also deletes any changes you have made to the Replacements table**.

AutoCorrect Dictionaries Preferences

[Edit on GitHub](#)

To set the Dictionaries preferences for the *AutoCorrect* feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Author uses for the *AutoCorrect* feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Author uses for the *AutoCorrect* feature are stored.

Include dictionaries from

Enable this option if you want to specify an additional location for the dictionaries that Oxygen XML Author will use for the *AutoCorrect* feature.

Note: The *AutoCorrect* feature takes into account dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged into a generic dictionary (for example, `en_UK.dat` from the default location is merged with `en_US.dat` from a custom location, and the result is that a third file is created for a generic dictionary called `en.dat`). However, if there is already a generic dictionary (for example, `en.dat`) saved in either the default or custom location, the other specific dictionaries (for example, `en_UK.dat` and `en_US.dat`) will not be merged and the existing generic dictionary will simply be used. Also, if the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location. The user-defined replacements are never merged.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Author User Guide that explains how to [add dictionaries for the AutoCorrect feature](#).

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Tip: To save changes to the *Replacement table (in the AutoCorrect preferences page)* at project level, select a custom location for the **User-defined replacements** and select **Project Options** at the bottom of the page.

Spell Check Preferences

[Edit on GitHub](#)

Oxygen XML Author provides support for spell checking in the **Text** and **Author** editing modes. To configure the **Spell Check** options, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Spell Check**.

The following options are available:

Spell checking engine

Oxygen XML Author includes two spell check engines, *Hunspell* and *Java spell checker*. The two engines come with different dictionaries. When you select an engine here, the list of languages in the **Default language option** changes based on the available dictionaries for the chosen engine.

Automatic spell check

This option is disabled by default. When enabled, Oxygen XML Author automatically checks the spelling as you type and highlights misspelled words in the document.

- **Select editors** - You can select which editors (and therefore which file types) will be automatically spelled checked. File types (such as CSS and DTD), in which automatic spell checking is not usually helpful, are excluded by default.

Spell check highlight color

Use this option to set the color used by the spell check engine to highlight spelling errors.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can *add additional dictionaries to the spell check engines*.

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the `lang` or `xml:lang` attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the `lang` and `xml:lang`

attributes are missing, the selection in the **Default language list** is used.

- **Do not check** - If the lang and xml:lang attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- **Comments**
- **Attribute values**
- **Text**
- **CDATA**

Options section

This section includes the following other options:

Check capitalization

When selected, the spell checker reports capitalization errors (for example, a word that starts with lowercase after *etc.* or *i.e.*).

Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).

Ignore acronyms

Available only for the *Hunspell spell checker*. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, *b2b*).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or

Ignore elements section	file names (for example, <code>www.oxygenxml.com</code> or <code>c:\boot.ini</code>).
Allow compounds words	When selected, all words formed by concatenating two legal words with a hyphen (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen (closed compounds) are also accepted.
Allow general prefixes	Available only for the <i>Java spell checker</i> . When selected, a word formed by concatenating a recognized prefix and a legal word is accepted. For example if <code>mini-</code> is a registered prefix, the spell check engine accepts the word <code>mini-computer</code> .
Allow file extensions	When selected, the spell checker accepts any word ending with recognized file extensions (for example, <code>myfile.txt</code> or <code>index.html</code>).
AutoCorrect options link	You can use the Add and Remove buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported: <ul style="list-style-type: none"> • '/' and '//' separators • '*' wildcard An example of an allowed XPath expression is: <code>/a/*/b</code> . Use this link to navigate to the AutoCorrect preferences page .

Spell Check Dictionaries Preferences
[Edit on GitHub](#)

To set the Dictionaries preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries and term lists (.tdi files) that Oxygen XML Author uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Author uses the Hunspell spell checking engine:

Dictionaries and term lists default folder

Displays the default location where the dictionaries and term lists that Oxygen XML Author uses are stored.

Include dictionaries and term list from

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

Note: The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged into generic ones (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location, and the result is that a third file is created for a generic dictionary called `en.dic`). However, if there is already a generic dictionary (for example, `en.dic`) saved in either the default or custom location, the other specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used. Also, if the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Author User Guide that explains how to [add more dictionaries and term lists](#).

Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

Document Checking Preferences

[Edit on](#)

[GitHub](#)

To configure the **Document Checking** (validation) options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Document Checking**. This preferences page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in editor panel and on the stripe that is displayed at the right side of editor panel. This option applies to both [automatic validation](#) and [manual validation](#).

Validation error highlight color

The color used to highlight validation errors in the document.

Validation warning highlight color	The color used to highlight validation warnings in the document.
Validation success color	The color used to highlight the success indicator of the validation operation in the vertical ruler bar.
Always show validation status	If this option is enabled, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when Automatic validation is enabled and the vertical scroll bar changes position due to an error message being displayed.
Enable automatic validation	This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Author.
Delay after the last key event (s)	The period of keyboard inactivity before starting a new validation (in seconds).

At the bottom of the preferences page you can *choose whether or not the saved options will be shared with other users by selecting Global or Project storage options*.

Format Preferences

[Edit on GitHub](#)

This preferences page contains various formatting options that influence editing and formatting in both the **Text** and **Author** editing modes. To control additional options specifically for the **Author** mode editor, see *Whitespace Handling in Author Mode* on page 311.

Note: These settings apply to the formatting of source documents. The formatting of output documents is determined by the *transformation scenarios that create them*.

To configure the **Format** options, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Format**.

The following options are available:

Detect indent on open

If selected, Oxygen XML Author detects how a document is indented when it is opened. Oxygen XML Author uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can disable this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is enabled, Oxygen XML Author detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip: If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and **Detect line width on open** options are enabled.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Enable this option if all

Indent with tabs

your document have no indentation and you want to keep them that way.

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the [Detect indent on open](#) option.

Indent size

The meaning of this setting depends on the following:

- If the [Detect indent on open option](#) is enabled and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Author uses the number of detected SPACE characters.
- If the [Indent with tabs option](#) is selected, the *indent size* is the width of a TAB character.
- If neither of these options are enabled, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see [Setting an Indent Size to Zero](#) on page 392.

For information about when this setting is used, see [When Indent Size and Line Width Settings are Used in Oxygen XML Author](#) on page 133.

Hard line wrap (Limit to "Line width - Format and Indent")

If enabled, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

Indent on enter

If disabled, when you press the Enter key to insert a line break in the **Textediting** mode, no indentation will be added to the new line.

Enable smart enter

If selected, when you press the Enter key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Detect line width on open

If enabled, Oxygen XML Author automatically detects the line width when the document is opened.

Format and indent the document on open

If enabled, an XML document is formatted and indented before opening it in Oxygen XML Author.

Line width - Format and Indent

Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters. This setting is also used when saving XML content edited in the **Author** editing mode.

Note: To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

Clear undo buffer before Format and Indent

For information about when this setting is used, see [When Indent Size and Line Width Settings are Used in Oxygen XML Author](#) on page 133.

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Author will be used for storing the undo states. If this option is selected, Oxygen XML Author empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

When Indent Size and Line Width Settings are Used in Oxygen XML Author

The values set in the **Indent Size and Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **ENTER** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is enabled and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

To watch our video demonstration about the formatting options offered by Oxygen XML Author, go to http://oxygenxml.com/demo/Autodetect_Formatting.html.

XML Preferences

[Edit on GitHub](#)

To configure the **XML** Formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XML**.

The following options are available:

Format Section

This section includes the following drop-down boxes:

Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

Note: When this option is enabled, the **Break long attributes** option is automatically disabled.

Break long attributes

The **Format and Indent** operation breaks long attribute values.

Indent inline elements

The *inline elements* are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></
  child> </parent>
</root>
```

Indent inline elements enabled:

```
<root>
  text <parent>
    <child/>
  </parent>
</root>
```

Indent inline elements disabled:

```
<root>
  text <parent> <child/
> </parent> </
root>
```

Expand empty elements

The **Format and Indent** operation outputs empty elements with a separate closing tag (for example, `<a attr1="v1">`). When not enabled, the same operation represents an empty element in a more compact form (`<a attr1="v1" />`).

Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

Element Spacing Section

Break line before an attribute name	The Format and Indent operation breaks the line before the attribute name.
--	---

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

Note: The XPath expressions can accept one of the following attribute conditions (default attribute values are not taken into account):

- *element[@attr]* - Matches all instances of the specified element that include the specified attribute.
- *element[not(@attr)]* - Matches all instances of the specified element that do not include the specified attribute.
- *element[@attr = "value"]* - Matches all instances of the specified element that include the specified attribute with the given value.
- *element[@attr != "value"]* - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`

Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.

- `//xs:documentation[@lang = "en"]`

The tabs are as follows:

Preserve space	List of elements for which the Format and Indent operation preserves the whitespaces (such as blanks, tabs, and newlines).
Default space	List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the Format and Indent operation.
Mixed content	The elements from this list are treated as mixed content when

		applying the Format and Indent operation. The lines are split only when whitespaces are encountered.
Schema aware format and indent	Line break	List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line <i>before</i> the element, <i>after</i> , or both.
Indent Section	The Format and Indent operation takes the schema information into account with regards to the <i>space preserve</i> , <i>mixed</i> , or <i>element only</i> properties of an element.	Includes the following options:
	Indent (when typing) in preserve space elements	Normally, the <i>Preserve space</i> elements (identified by the <code>xml:space</code> attribute set to <code>preserve</code> or by their presence in the Preserve space tab of the Element Spacing list) are ignored by the Format and Indent operation. When this option is enabled and you edit one of these elements, its content is formatted.
	Indent on paste - sections with number of lines less than 300	When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, disable this option.

Whitespaces Preferences

[Edit on GitHub](#)

When Oxygen XML Author formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Author allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XML > Whitespaces**.

This table lists the Unicode whitespace characters. Check any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The **Format and Indent** action is applied on an XML document.
- You switch from **Text** mode to **Author** mode.

- You switch from **Author** mode to **Text** mode.

Note: The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

Important: The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

CSS Preferences

[Edit on GitHub](#)

Oxygen XML Author can format and indent your CSS files. To configure the **CSS** formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

Class body on new line

If enabled, the *class* body (including the curly brackets) is placed on a new line. Disabled by default.

Indent class content

When enabled, the *class* content is indented. Enabled by default.

Add space before the value of a CSS property

When enabled, whitespaces are added between the : (colon) and the value of a style property. Enabled by default.

Add new line between classes

If enabled, an empty line is added between two classes. Disabled by default.

Preserve empty lines

When enabled, the empty lines from the CSS content are preserved. Enabled by default.

Allow formatting embedded CSS

When enabled, CSS content that is embedded in XML is also formatted when the XML content is formatted. Enabled by default.

JavaScript Preferences

[Edit on GitHub](#)

To configure the **JavaScript** format options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > JavaScript**.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is enabled by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Author to format embedded JavaScript code, taking precedence over the *Schema aware format and indent* option. This option is enabled by default.

Content Completion Preferences

[Edit on GitHub](#)

Oxygen XML Author provides a **Content Completion Assistant** that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the **Content Completion** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion**. These options control how the **Content Completion Assistant** works.

The following options are available:

Auto close the last opened tag	When enabled, Oxygen XML Author automatically closes the last open tag when you type </>.
Automatically rename/delete/comment matching tags	If you rename, delete, or comment out a start tag, Oxygen XML Author automatically renames, deletes, or comments out the matching end tag. Note: If you select Toggle comment for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.
Enable content completion	Toggles the content completion feature on or off.
Close the inserted element	When you choose an entry from the Content Completion Assistant list of proposals, Oxygen XML Author inserts both start and end tags. The following additional options are available in regards to closing the element: <ul style="list-style-type: none"> • If it has no matching tag - The end tag of the inserted element is automatically added only if it is not already present in the document. • Add element content - Oxygen XML Author inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is <i>associated with the edited XML document</i>. • Add optional content - If enabled, Oxygen XML Author inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema. • Add first Choice particle - If enabled, Oxygen XML Author inserts the first choice particle specified in the DTD, XML Schema, or RELAX NG schema.
Case sensitive search	When enabled, the search in the Content Completion Assistant is case-sensitive when you type a character ('a' and 'A' are different characters). Note: This option is ignored when the current language itself is not case sensitive. For example, the case is ignored in the CSS language.
Position cursor between tags	When enabled, Oxygen XML Author automatically moves the cursor between the start and end tag after inserting the element. This only applies to: <ul style="list-style-type: none"> • Elements with only optional attributes or no attributes at all. • Elements with required attributes, but only when the <i>Insert the required attributes option</i> is disabled.
Show all entities	Oxygen XML Author displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, &).
Insert the required attributes	Oxygen XML Author inserts automatically the required attributes taken from the DTD or XML Schema.

Insert the fixed attributes

If enabled, Oxygen XML Author automatically inserts any FIXED attributes from the DTD or XML Schema for an element inserted with the help of the **Content Completion Assistant**.

Show recently used items

When enabled, Oxygen XML Author remembers the last inserted items from the **Content Completion Assistant** window. The number of items to be remembered is limited by the **Maximum number of recent items shown** list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line.

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the **Content Completion Assistant** window.

Learn attributes values

When enabled, Oxygen XML Author learns the attribute values used in a document.

Learn on open document

Oxygen XML Author automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on CTRL-SPACE (COMMAND-SPACE on OS X))

When enabled, Oxygen XML Author learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space (Command + Space on OS X)** on your keyboard;

Note: In order to be learned, the words need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from last key press until the **Content Completion Assistant** is displayed.

Related information

Configuring the Proposals for Attribute and Element Values on page 1204

Annotations Preferences

[Edit on GitHub](#)

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Author can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > Annotations**.

The following options are available:

Show annotations in Content Completion Assistant

Oxygen XML Author displays the schema annotations of an element, attribute, or attribute value currently selected in the **Content Completion Assistant** proposals list.

Show annotations in tooltip

Oxygen XML Author displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the **Elements** view.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. When this option is disabled the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Author recommends prefixing with the doc : particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

When this option is enabled, Oxygen XML Author uses the following mechanism to collect annotations:

- If at least one doc : comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc : comment is found in the entire DTD, all comments are considered annotations and displayed as such.

When the option is disabled, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

When this option is selected, any element outside the Relax NG namespace, that is `http://relaxng.org/ns/structure/1.0`, is considered annotation and is displayed in the annotation window next to the **Content Completion Assistant** window and in the **Model** view. When this option is not selected, only elements from the Relax NG annotations namespace, that is `http://relaxng.org/ns/compatibility/annotations/1.0` are considered annotations.

Related information

[Schema Annotations in Text Mode](#) on page 376

XPath Preferences

[Edit on GitHub](#)

Oxygen XML Author provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > XPath**.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the **Content Completion Assistant** in XPath expressions that you enter in the `match`, `select`, and `test` XSL attributes and also in the XPath toolbar.
- **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
- **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
- **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip.

- **Function signature window background** - Specifies the background color of the tooltip window.
- **Function signature window foreground** - Specifies the foreground color of the tooltip window.

JavaScript Preferences

[Edit on GitHub](#)

Oxygen XML Author can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > JavaScript**. You can configure the following options:

Enable content completion

Enables the content completion support for JavaScript files.

Use built-in libraries

Allows Oxygen XML Author to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.

Use defined libraries

Oxygen XML Author can also use JavaScript libraries to when making suggestions. List the paths (URIs) of any JavaScript files you want Oxygen XML Author to use when making suggestions.

Note: The paths can contain editor variables such as \${pdu}, or \${oxygenHome}. You can make these paths relative to the project directory or installation directory.

Syntax Highlight Preferences

[Edit on GitHub](#)

Oxygen XML Author supports syntax highlighting of XML in the [Text mode editor](#), JavaScript / JSON, PHP, CSS documents.

To configure syntax highlighting, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that language. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the preview panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

Note: All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are used also in XSD, XSL, RNG documents. The **Preview** area has separate tabs for XML, XSD, XSL, RNG.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

Elements/Attributes by Prefix Preferences

[Edit on GitHub](#)

Oxygen XML Author allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

Note: Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix, and not the whole element or attribute name, to be styled with a particular color, enable the **Draw only the prefix with a separate color** option.

Open/Save Preferences

[Edit on GitHub](#)

Oxygen XML Author lets you control how files are opened and saved. To configure the options for opening and saving documents, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save**.

The following options are available:

Open section

Lock local resources

When this option is enabled and you open a file from the local file system or a shared network drive, Oxygen XML Author locks the file for the current user and the file cannot be modified by other users while the lock exists. However, other users are offered the possibility of editing the file without overwriting it. If they decide to continue, they will be asked to save the changes in a different file or drop them. Newly created files are *locked* when you first save them. If you enable this option with files already opened in Oxygen XML Author, it will *lock* all the currently opened files. If you disable this option with files already opened, it will *unlock* them by deleting the corresponding .lock files.

Support for Special Characters section

When bidirectional text, Asian languages, or other special characters are detected

You can choose how you want Oxygen XML Author to handle bidirectional text, Asian languages, or other special characters when they are detected. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled.
- **Disable support for special characters** - The support for special characters will always be disabled.
- **Prompt for each document** - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document.

Disable special characters support for documents larger than (characters)

Enabling bidirectional text editing support can affect performance on large files. When this option is enabled, bidirectional editing is disabled for files exceeding the specified size, even if the *Enable support for special characters option* is selected.

Save section

Safe save (only for local files)

In the unlikely event of a failure when attempting a **Save** action, this option provides increased protection from corruption of the original file. When this option is enabled, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

Make backup copy on save (only for local files)

If enabled, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is **.bak**, but that can be changed in the **Backup files extension** text field.

	Enable automatic save	If enabled, your documents are automatically saved after a preset time interval that is specified in the Automatic save interval (minutes) drop-down list.
	Save all files before transformation or validation	Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.
	Check errors on save	If enabled, Oxygen XML Author runs a validation that checks your document for errors before saving it.
	Save all files before calling external tools	If enabled, all files are saved before executing an <i>external tool</i> .
Performance section	Optimize loading in the Text edit mode for files over (MB)	File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are <i>several restrictions</i> for memory-intensive operations.
	Show warning when loading large documents	Oxygen XML Author will warn you if you open a file that is bigger than the specified size.
	Optimize loading for documents with lines longer than (Characters)	<i>Line wrap</i> is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see <i>Editing</i>

Documents with Long Lines.

Show warning when loading documents with long lines When selected, Oxygen XML Author will warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, *format and indent the document* after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see *Editing Documents with Long Lines* on page 654.

Clear undo buffer on save

If selected, Oxygen XML Author clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter *out of memory* errors when editing large documents.

Consider application bundles to be directories when browsing (OS X only)

This option is available only on the Mac OS X platform. When selected, the file browser dialog box allows you to browse

inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on Mac OS X).

Note: The same effect can be obtained by setting the `apple.awt.use-file-dialog-packages` property to `true` or `false` in the `Info.plist` descriptor file of the Oxygen XML Author application:

```
<key>apple.awt.use-
file-dialog-
packages</key>
<string>false</
string>
```

Save Hooks Preferences

[Edit on GitHub](#)

Oxygen XML Author includes an option for automatically compiling LESS stylesheets. To set this option, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save > Save Hooks**.

The following option can be enabled or disabled:

Automatically compile LESS to CSS when saving

If enabled, when you save a LESS file it will automatically be compiled to CSS (disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Templates Preferences

[Edit on GitHub](#)

This page simply allows you to navigate to the preference pages for code templates or document templates.

Code Templates Preferences

[Edit on GitHub](#)

[Code templates](#) are code fragments that can be inserted at the current editing position. Oxygen XML Author includes a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates and share them with your colleagues using the template export and import functions.

To configure **Code Templates**, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Templates > Code Templates**.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant**. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant**. HTML markup can be used for better rendering.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

Duplicate	Creates a duplicate of the currently selected code template.
Delete	Deletes the currently selected code template. This action is disabled for the built-in code templates.
Export	Exports a file with code templates.
Import	Imports a file with code templates that was created by the Export action.

You can use the following *editor variables* when you define a code template in the **Content** text box:

- `${caret}` - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${selection}` - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}`
 - To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:
 - `'message'` - The displayed message. Note the quotes that enclose the message.
 - `type` - Optional parameter, with one of the following values:

Parameter	
url	<p>Format: <code> \${ask('message', url, 'default_value')} </code></p> <p>Description: Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Input URL', url)} </code> - The displayed dialog box has the name <code> Input URL </code>. The expected input type is URL. • <code> \${ask('Input URL', url, 'http://www.example.com')} </code> - The displayed dialog box has the name <code> Input URL </code>. The expected input type is URL. The input field displays the default value <code> http://www.example.com </code>.
password	<p>Format: <code> \${ask('message', password, 'default')} </code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Input password', password)} </code> - The displayed dialog box has the name <code> Input password </code> and the input is hidden with bullet symbols. • <code> \${ask('Input password', password, 'abcd')} </code> - The displayed dialog box has the name <code> Input password </code> and the input hidden with bullet symbols. The input field already contains the default <code> abcd </code> value.
generic	<p>Format: <code> \${ask('message', generic, 'default')} </code></p> <p>Description: The input is considered to be generic text that requires no special handling.</p>

Parameter	
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Hello world!')} </code> - The dialog box has a Hello world! message displayed. • <code> \${ask('Hello world!', generic, 'Hello again!')} </code> - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
relative_url	<p>Format: <code> \${ask('message', relative_url, 'default')} </code></p> <p>Description: Input is considered a URL. Oxygen XML Author tries to make the URL relative to that of the document you are editing.</p> <p>Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Author will transform it into an absolute URL.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('File location', relative_url, 'C:/example.txt')} </code> - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.
combobox	<p>Format: <code> \${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN','default'))} </code></p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} </code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <p>Note: In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')} </code></p> <ul style="list-style-type: none"> • <code> \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')} </code>
editable_combobox	<p>Format: <code> \${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN','default'))} </code></p>

Parameter	
	<p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated real value (<code>real_value</code>) or the value inserted when you edit a list entry.</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx') }</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
radio	<p>Format: <code> \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN','default')) }</code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a '<code>rendered_value</code>' and will return an associated <code>real_value</code>.</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx') }</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems. <p>Note: In this example Mac OS X is the default selected value and if selected it would return <code>osx</code> for the output.</p>

- '`default-value`' - optional parameter. Provides a default value.
- `${timeStamp}` - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- `${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java `UUID` class.
- `${id}` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `${cfn}` - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- `${cfne}` - Current file name with extension. The current file is the one currently opened and selected.
- `${cf}` - Current file as file path, that is the absolute file path of the current edited document.
- `${cfld}` - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- `${frameworksDir}` - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${pd}` - Current project folder as file path. Usually the current folder selected in the **Project View**.
- `${oxygenInstallDir}` - Oxygen XML Author installation folder as file path.
- `${homeDir}` - The path (as file path) of the user home folder.
- `${pn}` - Current project name.

- `${env(VAR_NAME)}` - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `${system(var.name)}` editor variable.
- `${system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `${env(VAR_NAME)}` editor variable instead.
- `${date(pattern)}` - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`;

Note: This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about `xs:datetime`, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

Document Templates Preferences

[Edit on GitHub](#)

Oxygen XML Author provides a selection of document templates that make it easier to create new documents in a variety of formats. The list of available templates is presented when you create a new document. You can also [create your own templates](#) and share them with others. You can store your custom file templates in the existing templates folder in the Oxygen XML Author installation directory or store them in a custom directory. If you store them in a custom direction, you need to add that directory to the list of template directories that Oxygen XML Author uses.

To add a template directory, follow these steps:

1. [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Templates > Document Templates**.
2. Use the **New** button to select a location of the new document template folder.

This will add the folder to the list in this preferences page and it will now appear in the [New document wizard](#).

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you create a [corresponding properties file](#), you need to set the type property to `dita`.

You can also use the **Edit** or **Delete** buttons to manage folders in the list, and you can alter the order in which Oxygen XML Author looks in these directories by using the **Up** and **Down** buttons.

Custom Validation Engines Preferences

[Edit on GitHub](#)

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines than can be associated to a particular editor and used for validating documents. To access this page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Custom Validation Engines**.

If you want to add a new custom validation tool or edit the properties of an exiting one, you can use the **Custom Validator** dialog box displayed by pressing the **New** or **Edit** button.

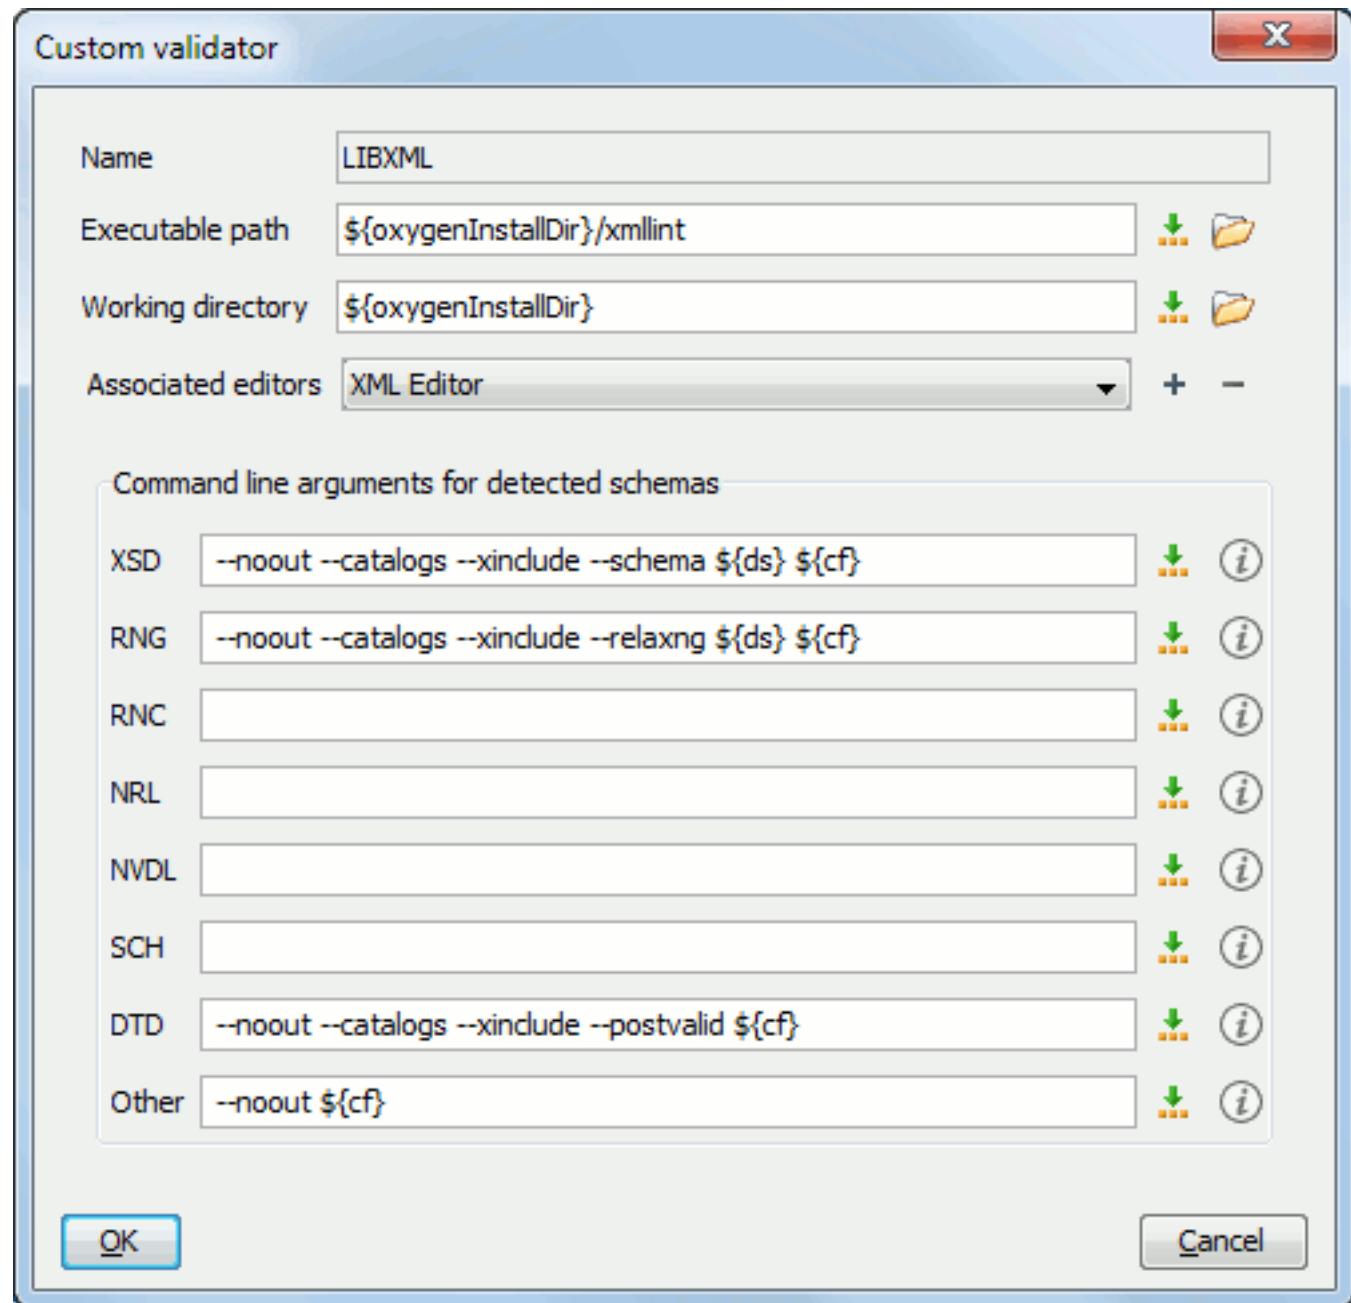

Figure 20: Custom Validator Dialog Box

The **Custom Validator** dialog box allows you to configure the following parameters:

Name

Name of the custom validation engine that will be

displayed in the **Validation** toolbar drop-down menu.

Executable path

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the

Insert Editor Variables button, or the **Browse** button.

Working directory

The working directory of the custom validation tool. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Associated editors

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

Command line arguments for detected schemas

Command line arguments used in the commands that validate the currently edited file against various types of schema (W3C XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables:

- `$/cf{}` - Current file as file path, that is the absolute file path of the current edited document.
- `$/currentFileURL{}` - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- `$/ds{}` - The path of the detected schema as a local file path for the current validated XML document.
- `$/dsu{}` - The path of the detected schema as a URL for the current validated XML document.

Increasing the Stack Size for Validation Engines

[Edit on GitHub](#)

To prevent the appearance of a *StackOverflowException* error, use one of the following methods:

- Use the `com.oxygenxml.stack.size.validation.threads` property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify `1x1024x1024=1048576`.
- Increase the value of the `-Xss` parameter.

Note: Increasing the value of the `-Xss` parameter affects all the threads of the application.

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author](#) on page 234

CSS Validator Preferences

[Edit on GitHub](#)

To configure the **CSS Validator** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **CSS Validator**.

You can configure the following options for the built-in **CSS Validator** of Oxygen XML Author:

- **Profile** - Selects one of the available validation profiles: **CSS 1**, **CSS 2**, **CSS 2.1**, **CSS 3**, **CSS 3 with Oxygen extensions**, **SVG**, **SVG Basic**, **SVG Tiny**, **Mobile**, **TV Profile**, **ATSC TV Profile**. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the *CSS extensions specific for Oxygen* that can be used in *Author mode*. That means all Oxygen specific extensions are accepted in a CSS stylesheet by *the built-in CSS validator* when this profile is selected.
- **Media type** - Selects one of the available mediums: **all**, **aural**, **braille**, **embossed**, **handheld**, **print**, **projection**, **screen**, **tty**, **tv**, **presentation**, **oxygen**.

- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: **All**, **Normal**, **Most Important**, **No Warnings**.
- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. As wildcards you can use:
 - * to match any string.
 - ? to match any character.
- **Recognize browser CSS extensions (applies also to content completion)** - If checked, Oxygen XML Author recognizes (no validation is performed) browser-specific CSS properties. The **Content Completion Assistant** lists these properties at the end of its list, prefixed with the following particles:
 - -moz- for Mozilla.
 - -ms- for Internet Explorer.
 - -o- for Opera.
 - -webkit- for Safari/WebKit.

XML Preferences

[Edit on GitHub](#)

This section describes the panels that contain the user preferences related with XML.

XML Catalog Preferences

[Edit on GitHub](#)

To configure the **XML Catalog** options, *open the Preferences dialog box (Options > Preferences)* and go to **XML > XML Catalog**.

The following options are available:

Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used. Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

Note: If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs it is sometimes useful to see what catalog files are parsed, if they are valid or not, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the XML catalog resolver that will be displayed in the

	<p>Catalogs table at the bottom of the window. You can choose between the following:</p> <ul style="list-style-type: none"> • None - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel. • Unresolved entities - Only the logging messages that track the failed attempts to resolve references are displayed. • All messages - The messages of both failed attempts and successful ones are displayed. 				
Resolve schema locations also through system mappings	If enabled, Oxygen XML Author analyzes both <i>uri</i> and <i>system</i> mappings to resolve the location of schema.				
Process namespaces through URI mappings for XML Schema	Note: This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.				
Use default catalog	If selected, the target namespace of the imported XML Schemas is resolved through the <i>uri</i> mappings. The namespace is taken into account only when the schema specified in the <i>schemaLocation</i> attribute was not resolved successfully.				
Catalogs table	<p>If this option is enabled and Oxygen XML Author cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see How Oxygen XML Author Determines which Catalog to Use on page 612.</p> <p>You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:</p> <table> <tr> <td>Add</td><td>Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, the  Insert Editor Variables button, or the browsing tools in the  Browse drop-down list.</td></tr> <tr> <td>Edit</td><td>Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, the  Insert Editor Variables button, or the browsing tools in the  Browse drop-down list.</td></tr> </table>	Add	Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, the  Insert Editor Variables button, or the browsing tools in the  Browse drop-down list.	Edit	Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, the  Insert Editor Variables button, or the browsing tools in the  Browse drop-down list.
Add	Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, the  Insert Editor Variables button, or the browsing tools in the  Browse drop-down list.				
Edit	Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, the  Insert Editor Variables button, or the browsing tools in the  Browse drop-down list.				

 **Browse** drop-down list.

Delete	Deletes the currently selected catalog from the list.
Up	Moves the selection to the previous resource.
Down	Moves the selection to the following resource.

Note: When you add, delete, or edit catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a *manual Validate action* so that the XML catalog changes take full effect.

You can also add or configure catalogs at framework level from the *Catalogs tab* in the *Document Type configuration dialog box*.

[Controlling the Catalog Resolver](#)

[Working with XML Catalogs](#) on page 610

XML Parser Preferences

[Edit on GitHub](#)

To configure the **XML Parser** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser**.

The configurable options of the built-in XML parser are as follows:

Enable parser caching (validation and content completion)

Enables re-use of internal models when validating and provides content completion in opened XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

Ignore the DTD for validation if a schema is specified

Forces validation against a referenced schema (W3C XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against a W3C XML Schema or a Relax NG schema.

Note: Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

Enable XInclude processing

Enables XInclude processing. If checked, the XInclude support in Oxygen XML Author is turned on for validation, rendering in **Author** mode and transformation of XML documents.

Base URI fix-up

According to the specification for XInclude, processors must add an `xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `xml:base` and / or `xml:lang` is not desired by your application, you can disable this option.

Language fix-up

The processor will preserve language information on a top-level included element by adding an `xml:lang` attribute if its include parent has a different [language] property. If the addition of `xml:lang` is undesired by your application, you can disable the language fix-up.

DTD post-validation

Enable this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you disable this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

XML Schema Preferences

[Edit on GitHub](#)

To configure options in regards to XML Schema, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema**.

This preferences page allows you to configure the following options:

Default XML Schema version

Allows you to select the version of W3C XML Schema to be used as the default. You can choose XML Schema **1.0** or XML Schema **1.1**.

Note: You are also able to set the XML Schema version using the **Customize** option in the [New document wizard](#).

Default XML Schema validation engine

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

Xerces validation features section**Enable full schema constraint checking**

Sets the *schema-full-checking* feature to true. This enables a validation of the parsed XML document against a schema (W3C XML Schema or DTD) while the document is parsed.

Enable honour all schema location feature

Sets the *honour-all-schema-location* feature

		<p>to true. All the files that declare W3C XML Schema components from the same namespace are used to compose the validation model. In case this option is disabled, only the first W3C XML Schema file that is encountered in the XML Schema import tree is taken into account.</p>
Saxon EE validation features section	Enable full XPath 2.0 in assertions and alternative types	<p>When enabled (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.</p>
	Assertions can see comments and processing instructions	<p>Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.</p>
	Multiple schema imports	<p>Forces <code>xs:import</code> to fetch the referenced schema document. By default, the <code>xs:import</code> fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.</p>
	Assertions can see comments and processing instructions	<p>Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).</p>

Relax NG Preferences

[Edit on GitHub](#)

To configure options in regards to Relax NG, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Relax NG**.

The following options are available in this page:

Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

Note: Enabling this option disables the **Check ID/IDREF** option.

Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Schematron Preferences

[Edit on GitHub](#)

To configure options in regards to Schematron, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Schematron**.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should check this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When enabled, Saxon EE is used for xslt2/xslt3 query binding. If this option is disabled, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for quick fixes in Schematron files. This option is enabled by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can

choose between: **xslt1**, **xslt2**, or **xslt3**.

Note: To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `queryBinding` attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in [the Global Preferences page](#) will be used and only the validation messages that match that language will be presented. You can use the [Change application language](#) link to navigate to the preferences page where you can specify the language to be used in the application.
- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.
- **Ignore the language and show all message** - All messages are displayed in whatever language they are defined within the Schematron schema.

- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

Note: In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language they are defined with in the Schematron schema.

Schematron 1.5 Section	XPath Version	
	Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: 1.0 , 2.0 , or 3.0 . This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.	

XProc Preferences

[Edit on GitHub](#)

Oxygen XML Author includes a built-in XProc engine called *Calabash*. You can add or configure external XProc engines by using the **XProc** preferences page. *Open the Preferences dialog box (Options > Preferences)* and go to **XML > XProc**.

When **Show XProc messages** is selected all messages emitted by the XProc processor during a transformation will be presented in the results view.

To add an external engine click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

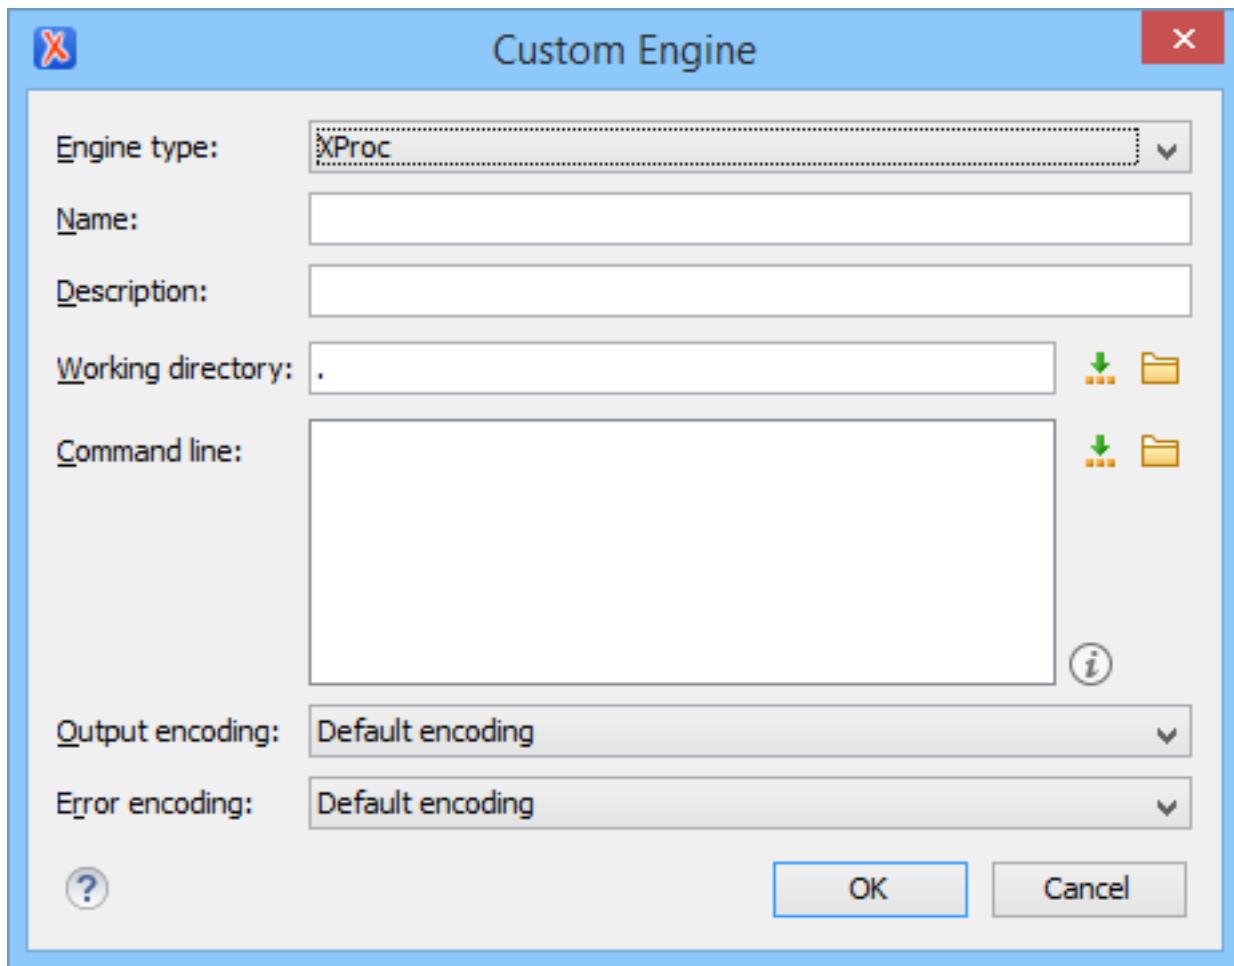

Figure 21: Creating an XProc external engine

The following options can be configured in this dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

Note: You can configure the built-in Saxon processor using the `saxon.config` file. For further details about configuring this file go to <http://www.saxonica.com/documentation9.5/index.html#configuration/configuration-file>. You can configure the built-in Calabash processor by using the `calabash.config` file. These files are located in `[OXYGEN_INSTALL_DIR]\lib\xproc\calabash\lib`. If they do not exist, you have to create them.

XSLT-FO-XQuery Preferences

[Edit on GitHub](#)

To configure options in regards to XSLT, XQuery, and FO processors, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery**. This panel contains only the most generic options for working with XSLT/XSL-FO/XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

Create transformation temporary files in system temporary directory

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

XSLT Preferences

[Edit on GitHub](#)

To configure the **XSLT** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT**.

Oxygen XML Author offers the possibility of using an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Author). To use another XSLT transformer, specify the name of the transformer factory class. Oxygen XML Author sets this transformer factory class as the value of the Java property: `javax.xml.transform.TransformerFactory`.

The XSLT preferences page allows you to customize the following options:

JAXP XSLT Transformer - Value

Allows you to set the value of the `TransformerFactory` Java class.

Saxon6 Preferences

[Edit on GitHub](#)

To configure the **Saxon 6** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon6**.

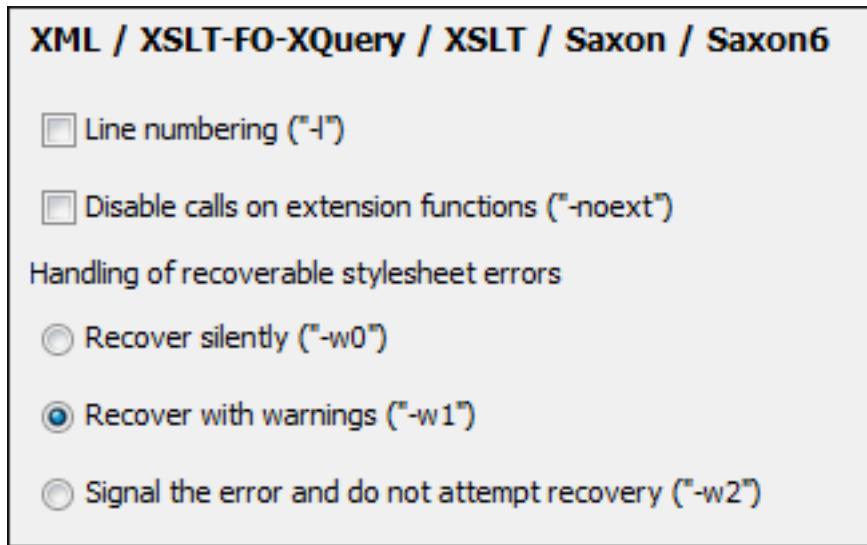

Figure 22: Saxon 6 XSLT Preferences Panel

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If enabled, external function calls are not allowed. Checking this is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
 - **recover silently** - Continue processing without reporting the error.
 - **recover with warnings** - Issue a warning but continue processing.
 - **signal the error and do not attempt recovery** - Issue an error and stop processing.

Saxon-HE/PE/EE Preferences

[Edit on GitHub](#)

To configure global options for XSLT transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE**.

Oxygen XML Author allows you to configure the following XSLT options for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file (" -config ")

Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.

Version warnings (" -versmsg ")

Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

Line numbering (" -l ")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults (" -expand ")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source (" -dtd ")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("`-warnings`")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("`-strip`")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml : space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml : space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Optimization level ("`-opt`")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

The following options are available for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("`-ext`")

If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http:// [URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

The options available specifically for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file ("'-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("'-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("--generateByteCode:(on|off)")

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

Saxon-HE/PE/EE Advanced Preferences

[Edit on GitHub](#)

To configure the **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced**.

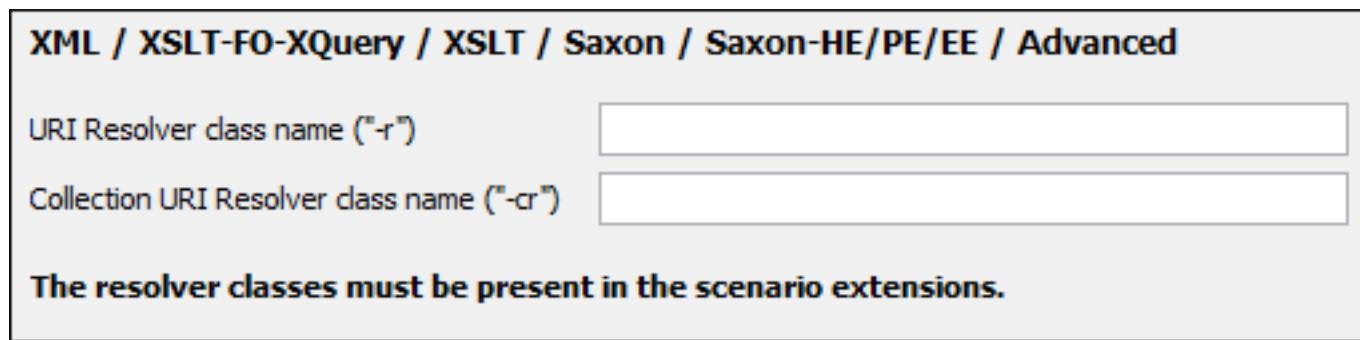

Figure 23: Saxon HE/PE/EE XSLT Advanced Preferences Panel

You can configure the following advanced XSLT options for the Saxon 9.6.0.7 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- **URI Resolver class name ("`-r`")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the `-r` option when run from the command line). The class name must be fully specified and the corresponding `.jar` or `.class` extension must be configured from [the dialog box for configuring the XSLT extension](#) for the particular transformation scenario.
- **Collection URI Resolver class name ("`-cr`")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the `-cr` option when run from the command line). The class name must be fully specified and the corresponding `.jar` or `.class` extension must be configured from [the dialog box for configuring the XSLT extension](#) for the particular transformation scenario.

XSLTProc Preferences

[Edit on GitHub](#)

To configure **XSLTProc** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If checked, XInclude references will be resolved when XSLTProc is used as transformer in [XSLT transformation scenarios](#).
- **Skip loading the document's DTD** - If checked, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** - If checked, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If checked, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If checked, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If checked, Oxygen XML Author will display in the **Warnings** view the version of the `libxml` and `libxslt` libraries invoked by XSLTProc.
- **Show time information** - If checked, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If checked, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If checked, Oxygen XML Author will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If checked, Oxygen XML Author will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If checked, Oxygen XML Author will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If checked, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If checked, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

MSXML Preferences

[Edit on GitHub](#)

To configure the MSXML options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > MSXML**.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

Validate documents during parse phase

If checked, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is checked, the resolution is disabled.

Strip non-significant whitespaces

If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If checked, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Start transformation in this mode

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

MSXML.NET Preferences

[Edit on GitHub](#)

To configure the **MSXML.NET** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > MSXML.NET**.

The options in this preferences page for the MSXML.NET processor are as follows:

Enable XInclude processing

If checked, XInclude references will be resolved when MSXML.NET is used as the transformer in the [XSLT transformation scenario](#).

Validate documents during parse phase

If checked, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is checked, the resolution is disabled.

Strip non-significant whitespaces

If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve

Show time information

transformation performance while, in most cases, creating equivalent output.

If checked, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (`System.Xml.Xsl.XslTransform` class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as '`?>`'. Usually this happens when output encoding is set to ASCII. If this option checked, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&#nnnn;` form).

Allow multiple output documents

This option allows you to create multiple result documents using the [`exsl:document` extension element](#).

Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in `xsl:import` and `xsl:include` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The [`Use named URI resolver class` option](#) specifies a partially or fully qualified URI resolver class name (for example, `Acme.Resolvers.CacheResolver`). Such a name requires additional assembly specification using this option or the [`Assembly GAC name for URI resolver class` option](#), but fully qualified class name (which always includes an assembly specifier) is *all-sufficient*. See MSDN for more info about [`fully qualified class names`](#).

Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the [`global assembly cache`](#) (GAC) where the specified resolver class can be found. See MSDN for more info about [`partial assembly names`](#).

List of extension object class names

This option allows to specify [`extension object`](#) classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly

MSXML.NET supports a rich library of the [`EXSLT`](#) and [`EXSLT.NET` extension functions](#) embedded or in

a *plugged-in* EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the *username:password@domain* format (all parts are optional).

Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the *username:password@domain* format (all parts are optional).

FO Processors Preferences

[Edit on GitHub](#)

Oxygen XML Author includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Author provides an easy way to add two of the most commonly used commercial FO processors: *RenderX XEP* and *Antenna House Formatter*. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Author uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for [DITA OT transformations scenarios](#) and [XML with XSLT transformation scenarios](#).

To configure the options for the FO Processors, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > FO Processors**. The **FO Processors** preferences page is displayed.

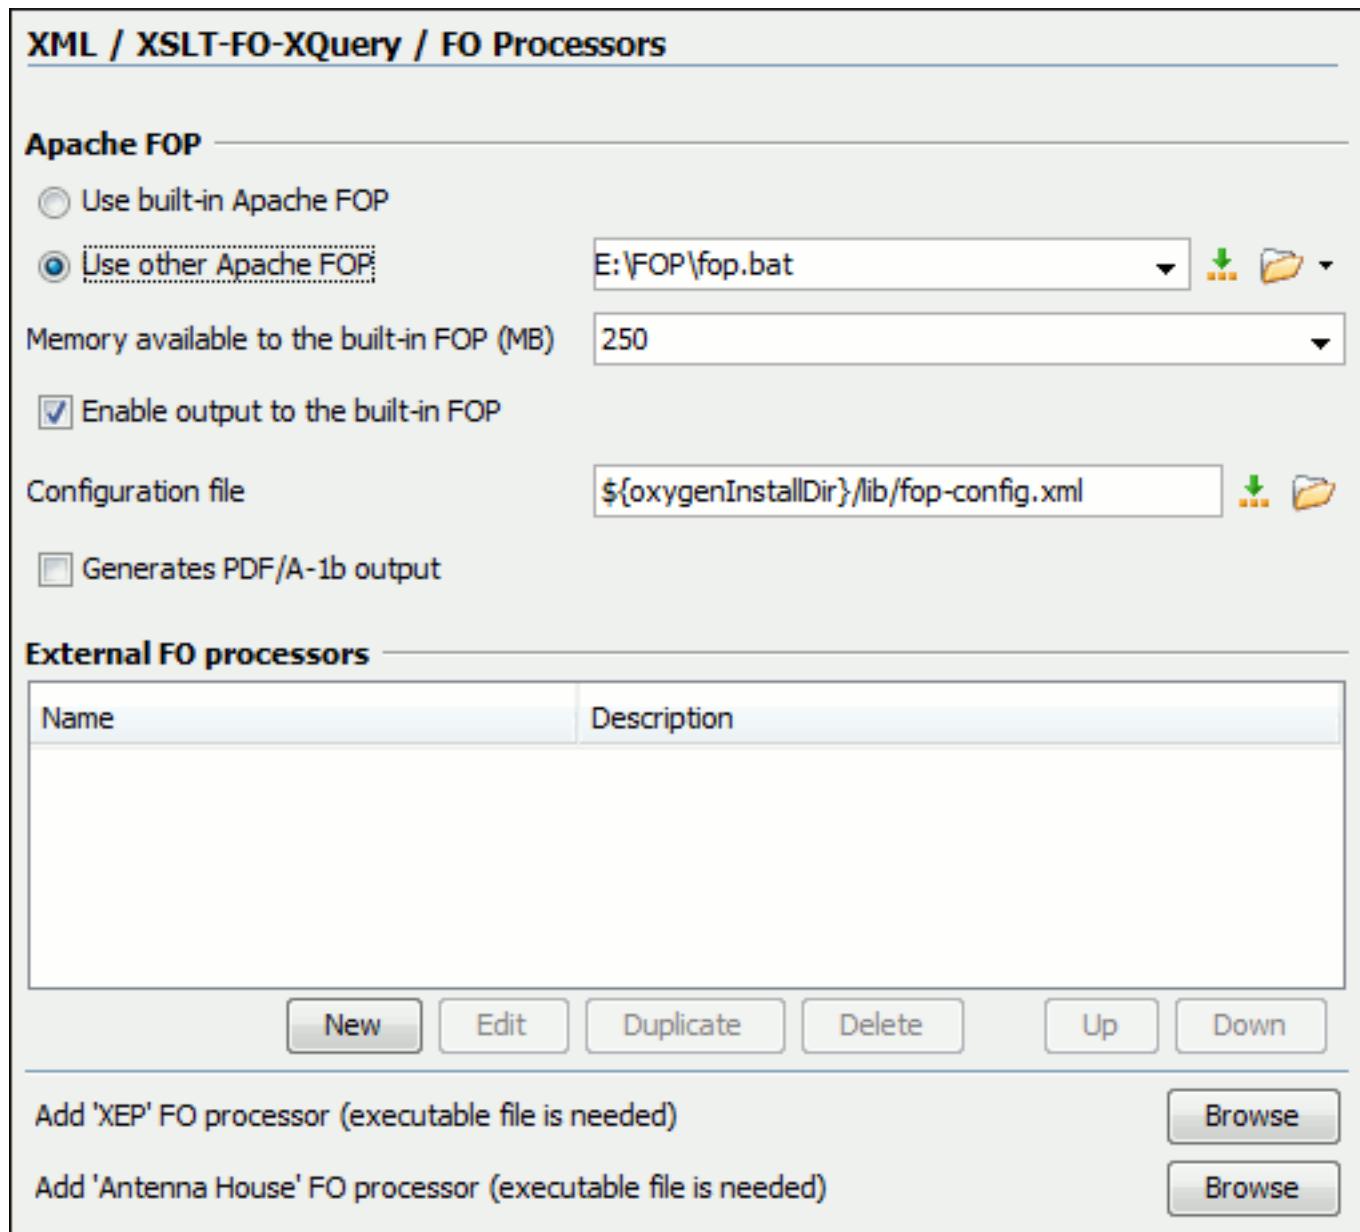

Figure 24: FO Processors Preferences Page

Apache FOP Section

In this section you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Author to use the built-in Apache FOP processor.

Use other Apache FOP

Instructs Oxygen XML Author to use another Apache FOP processor that is installed on your computer. You can specify the path by using the text field, the  **Insert**  **Editor Variables** button, or the  **Browse** button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Author window,

Memory available to the built-in FOP

including warning messages about FO instructions not supported by Apache FOP.

Configuration file for the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.

Generates PDF/A-1b output

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font). You can specify the path by using the  text field, the  **Insert Editor Variables** button, or the  **Browse** button.

When selected, PDF/A-1b output is generated.

Note: All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in [Add a font to the built-in FOP](#).

Note: You cannot use the `<filterList>` key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active.*

External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the *RenderX XEP* or *Antenna House Formatter* commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If *RenderX XEP* is already installed on your computer, you can use this button to choose the XEP executable script (`xep.bat` for Windows, `xep` for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If *Antenna House Formatter* is already installed on your computer, you can use this button to choose the Antenna House executable script (`AHFCmd.exe` or `XSLCcmd.exe` for Windows, and `run.sh` for Linux/Mac OS).

Note: The built-in **Antenna House Formatter GUI** transformation scenario requires that you configure an external FO processor that runs `AHFormatter.exe` (Windows only). In the [external FO Processor configuration dialog box](#), you could use `"${env(AHF63_64_HOME)}\AHFormatter.exe"` `-d ${fo} -s` for the value in the **Command line** field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see <https://github.com/AntennaHouse/focheck/wiki/focheck>.

You can also add external processors or configure existing ones. Press the **New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**, **Duplicate**, **Delete**, **Up**, **Down**) to configure existing external processors.

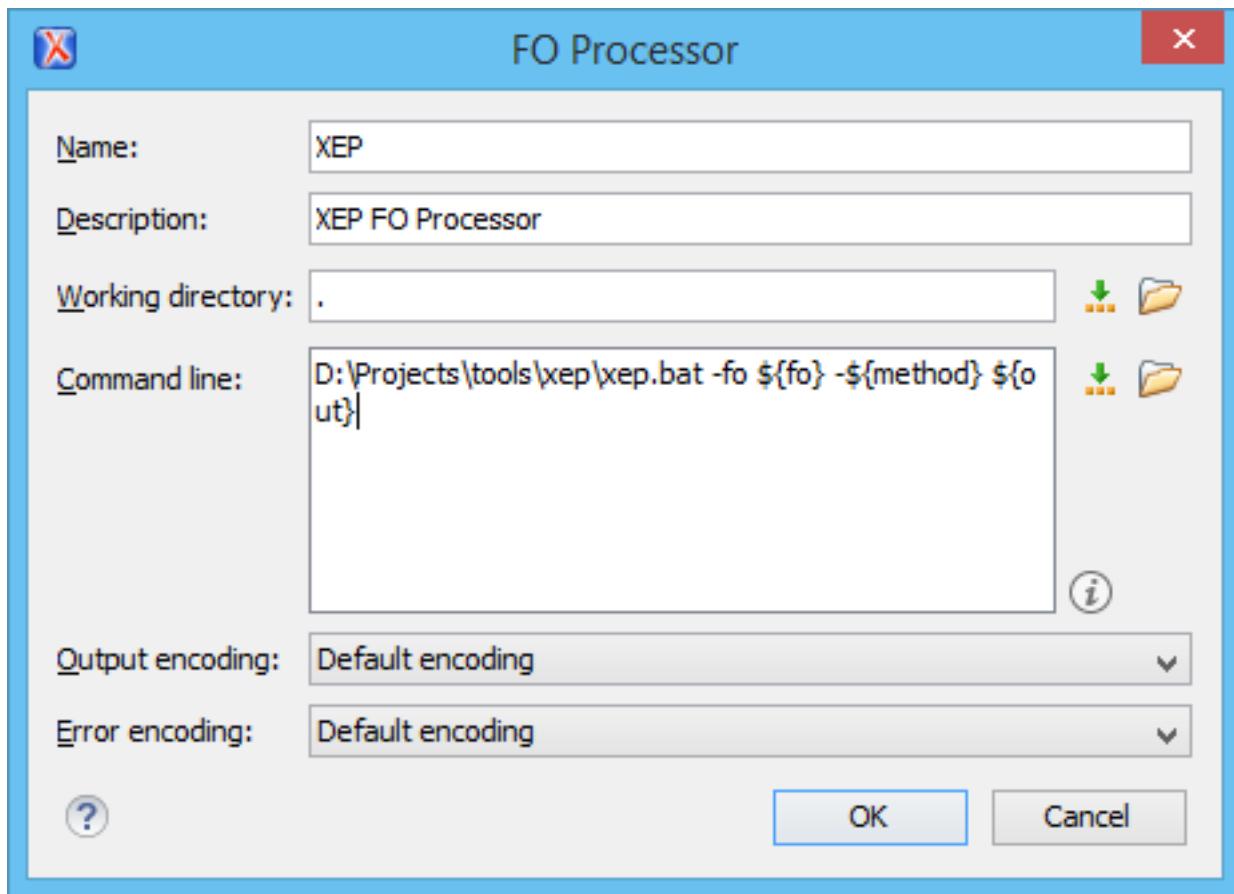

Figure 25: External FO Processor Configuration Dialog Box

The external **FO Processor** configuration dialog box includes the following options:

Name

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory

The directory where the intermediate and final results of the processing is stored. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button. You can use one of the following editor variables:

- **\${homeDir}** - The path to the user home directory.
- **\${cfid}** - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- **\${pd}** - The project directory.
- **\${oxygenInstallDir}** -The Oxygen XML Author installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using

the text field, the  **Insert Editor Variables** button, or the  **Browse** button. You can use one of the following editor variables:

- **`${method}`** - The FOP transformation method: **pdf**, **ps**, or **txt**.
- **`${fo}`** - The input FO file.
- **`${out}`** - The output file.
- **`${pd}`** - The project directory.
- **`${frameworksDir}`** - The path of the `frameworks` subdirectory of the Oxygen XML Author installation directory.
- **`${oxygenInstallDir}`** - The Oxygen XML Author installation directory.
- **`${ps}`** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a results panel at the bottom of the Oxygen XML Author window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a results panel at the bottom of the Oxygen XML Author window.

XPath Preferences

[Edit on GitHub](#)

To configure XPath options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XPath**.

Oxygen XML Author allows you to customize the following options:

Unescape XPath expression

When enabled, the entities of an XPath expressions that you type in the XPath/XQuery Builder and the [XPath toolbar](#) are unescaped during their execution. For example the expression

```
//varlistentry[starts-with(@os, '&#x73;')]
```

is equivalent with:

```
//varlistentry[starts-with(@os, 's')]
```

Multiple XPath results

Enable this option to display the results of an XPath expression in separate tabs in the [Results view](#).

XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Author considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.

- **Use the default namespace from the root element** (default selection) - Oxygen XML Author considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Author considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

Custom Engines Preferences

[Edit on GitHub](#)

You can configure and run XSLT and XQuery transformations with processors other than *the ones which come with the Oxygen XML Author distribution*.

Note:

To configure the **Custom Engines** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > Custom Engines**.

The table in this preferences page displays the custom engines that have been defined. Use the **New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

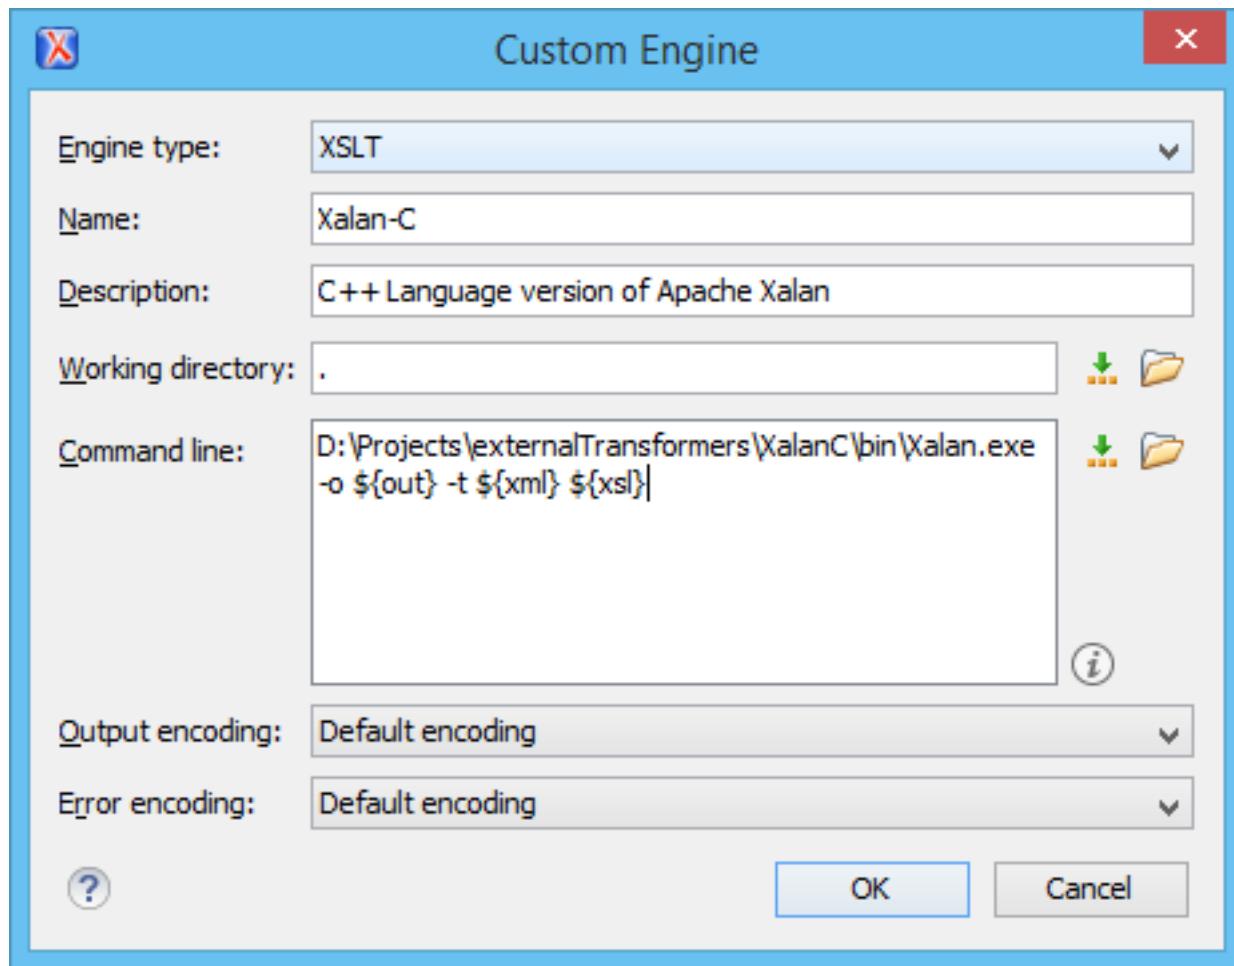

Figure 26: Parameters of a Custom Engine

The following parameters can be configured for a custom engine:

Engine type

Specifies the transformer type. You can choose between XSLT and XQuery engines.

Name

The name of the transformer displayed in the dialog box for editing transformation scenarios.

Description

A textual description of the transformer.

Working directory

The start directory of the executable program for the transformer. The following editor variables are available for making the path to the working directory independent of the location of the input files:

- **\${homeDir}** - The user home directory in the operating system.
- **\${cfid}** - The path to the directory of the current file.
- **\${pd}** - The path to the directory of the current project.
- **\${oxygenInstallDir}** - The Oxygen XML Author install directory.

Command line

The command line that must be executed by Oxygen XML Author to perform a transformation with the

engine. The following editor variables are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **`${xml}`** - The XML input document as a file path.
- **`${xmlu}`** - The XML input document as a URL.
- **`${xsl}`** - The XSL / XQuery input document as a file path.
- **`${xslu}`** - The XSL / XQuery input document as a URL.
- **`${out}`** - The output document as a file path.
- **`${outu}`** - The output document as a URL.
- **`${ps}`** - The platform separator that is used between library file names specified in the class path.

Output Encoding

The encoding of the transformer output stream.

Error Encoding

The encoding of the transformer error stream.

Ant Preferences

[Edit on GitHub](#)

To set Ant preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Ant**. This panel allows you to choose the directory containing the Apache Ant libraries (the so-called *Ant Home*) that Oxygen XML Author uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Author installation kit.
- **Custom** - the path to an Ant distribution of your choice.

Import Preferences

[Edit on GitHub](#)

To configure importing options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Import**. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

Create empty elements for empty values

If checked, an empty value from a database column or from a text file is imported as an empty element.

Create empty elements for null values

If checked, null values from a database column are imported as empty elements.

Escape XML content

Enabled by default, this option instructs Oxygen XML Author to escape the imported content to an XML-safe form.

Add annotations for generated XML Schema

If checked, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd'T'HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and `HH:mm:ss` for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

Table 2: Pattern Letters

Letter	Date or Time Component	Presentation Examples	
G	Era designator	Text	AD
y	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
H	Hour in day (0-23)	Number	0

Letter	Date or Time Component		Presentation Examples
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30
s	Second in minute	Number	55
S	Millisecond	Number	978
z	Time zone	General time zone	Pacific Standard Time; PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- *Text* - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- *Number* - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- *Year* - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- *Month* - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- *General time zone* - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
 - *GMTOffsetTimeZone* - GMT Sign Hours : Minutes
 - *Sign* - one of + or -
 - *Hours* - one or two digits
 - *Minutes* - two digits
 - *Digit* - one of 0 1 2 3 4 5 6 7 8 9

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- *RFC 822 time zone*: The RFC 822 4-digit time zone format is used:
 - *RFC822TimeZone*
 - *TwoDigitHours*

TwoDigitHours must be between 00 and 23.

XML Signing Certificates Preferences

[Edit on GitHub](#)

Oxygen XML Author provides two types of *keystores* for certificates that are used for digital signatures of XML documents: Java KeyStore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A *keystore* file is protected by a password. To configure a certificate *keystore*, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Signing Certificates**. You can customize the following parameters of a *keystore*:

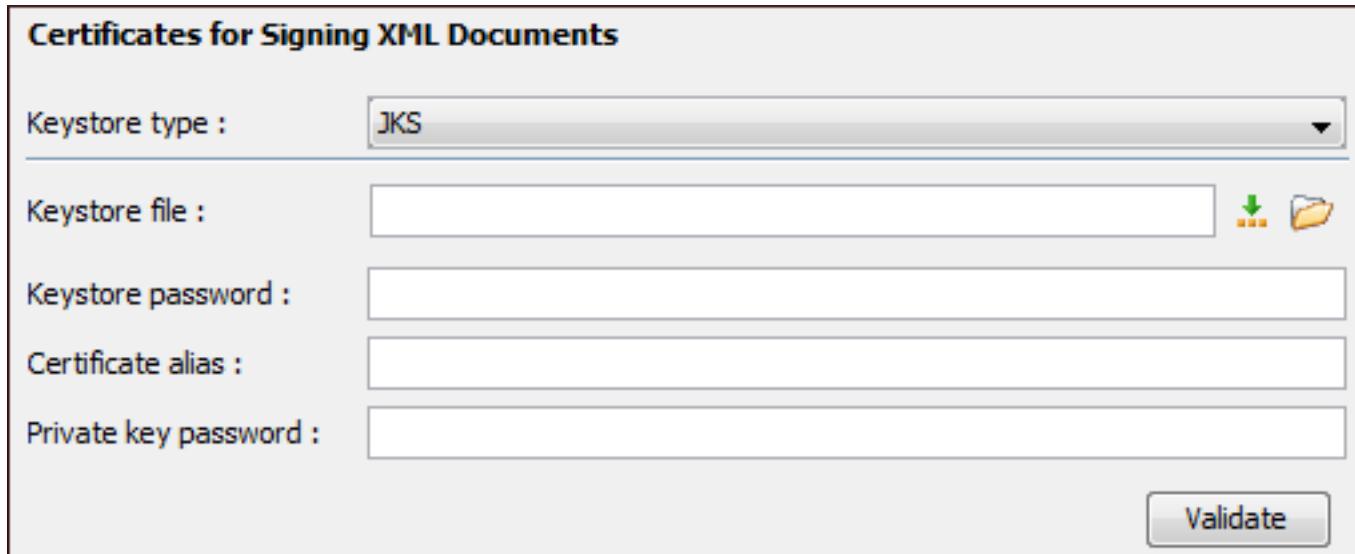

Figure 27: Certificates Preferences Panel

- **Keystore type** - The type of *keystore* that Oxygen XML Author uses (**JKS** or **PKCS-12**).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the *keystore*.
- **Private key password** - The private key password of the certificate (required only for JKS *keystores*).
- **Validate** - Press this button to verify the configured *keystore* and the validity of the certificate.

XML Refactoring Preferences

[Edit on GitHub](#)

To specify a folder for loading the custom XML refactoring operations, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**. The following option is available in this preferences page:

Load additional refactoring operations from

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

DITA Preferences

[Edit on GitHub](#)

To access the DITA Preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **DITA**. This preferences page includes the following sections and options:

DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Author installation) to be used for validating and publishing DITA content. You can select from the following:

Built-in DITA-OT 1.8	If this is set, all defined DITA transformation scenarios will run with DITA-OT 1.8. The builtin DITA OT 1.8 directory is: <code>[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT</code> .
Built-in DITA-OT 2.x (with support for DITA 1.3 and Lightweight DITA)	Starting with Oxygen 18.0, this is the default setting. All defined DITA transformation scenarios will run with DITA-OT 2.x. This also gives you access to DITA 1.3 file templates when you create new documents from templates . The default DITA OT directory is: <code>[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x</code> .
Custom	Allows you to specify a custom directory for your DITA OT distribution.
Location	You can either provide a new file path for the specific DITA OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using

the text field, the  **Insert** button, or the  **Browse** button.

DITA Maps file patterns

Allows you to specify the extension types that will be handled as DITA maps when opened in Oxygen XML Author.

When opening a map

Oxygen XML Author can open a DITA map in the regular editor view or in the [DITA Maps Manager](#). This options allows you to specify how a map will be opened. You can choose one of the following options:

- **Always open in the DITA Maps Manager** - A DITA map file is always opened in the **DITA Maps Manager** view.
- **Always open as XML** - A DITA map file is always opened in the XML editor.
- **Always ask** - When opening a DITA map, you are prompted to choose between opening it in the XML editor panel or in the **DITA Maps Manager** view.

Prefer navigation title for topicref rendering

If enabled and there is a `navtitle` attribute set on a `topicref`, then the `navtitle` is used to render the title of the topic in the **DITA Maps Manager**.

Insert topic reference section

Allows you to specify that when inserting a topic reference (using the [Insert Reference dialog box](#) and [Edit Properties dialog box](#)), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If enabled, the `format` attribute will always be automatically populated with a detected value.
- **Scope** - If enabled, the `scope` attribute will always be automatically populated with a detected value.
- **Type** - If enabled, the `type` attribute will always be automatically populated with a detected value.
- **Navigation title** - If enabled, the `navtitle` attribute will always be automatically populated with a detected value.

Insert link section

Allows you to specify that when a link reference is

inserted (using actions in the  **Link** drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on

the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If enabled, the `format` attribute will always be automatically populated with a detected value.
- **Scope** - If enabled, the `scope` attribute will always be automatically populated with a detected value.
- **Type** - If enabled, the `type` attribute will always be automatically populated with a detected value.

Use '.' instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with ". " (# ./ elementId). For more information, see <https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html>.

Show console output

Allows you to specify when to display the console output log. The following options are available:

- **When build fails** - displays the console output log if the build fails.
- **Always** - displays the console output log, regardless of whether or not the build fails.

Profiling Attributes link

Link to the [Profiling Attributes preferences page](#), where you can configure how profiling and conditional text is displayed in **Author** mode.

Data Sources Preferences

[Edit on GitHub](#)

To configure the **Data Sources** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see [Download Links for Database Drivers](#) on page 189.

Connection Wizards Section

Create eXist-db XML connection

Click this link to open the dedicated [Create eXist-db XML connection dialog box](#) that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Data Sources	
Name	Type
JDBC-ODBC Bridge	Generic JDBC
WebDAV FTP	WebDAV FTP
xDB DS	Documentum xDB
DocumentumDS	Documentum (CMS)

Figure 28: Data Sources Preferences Panel

The following buttons are available at the bottom of the **Data Sources** panel:

New

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

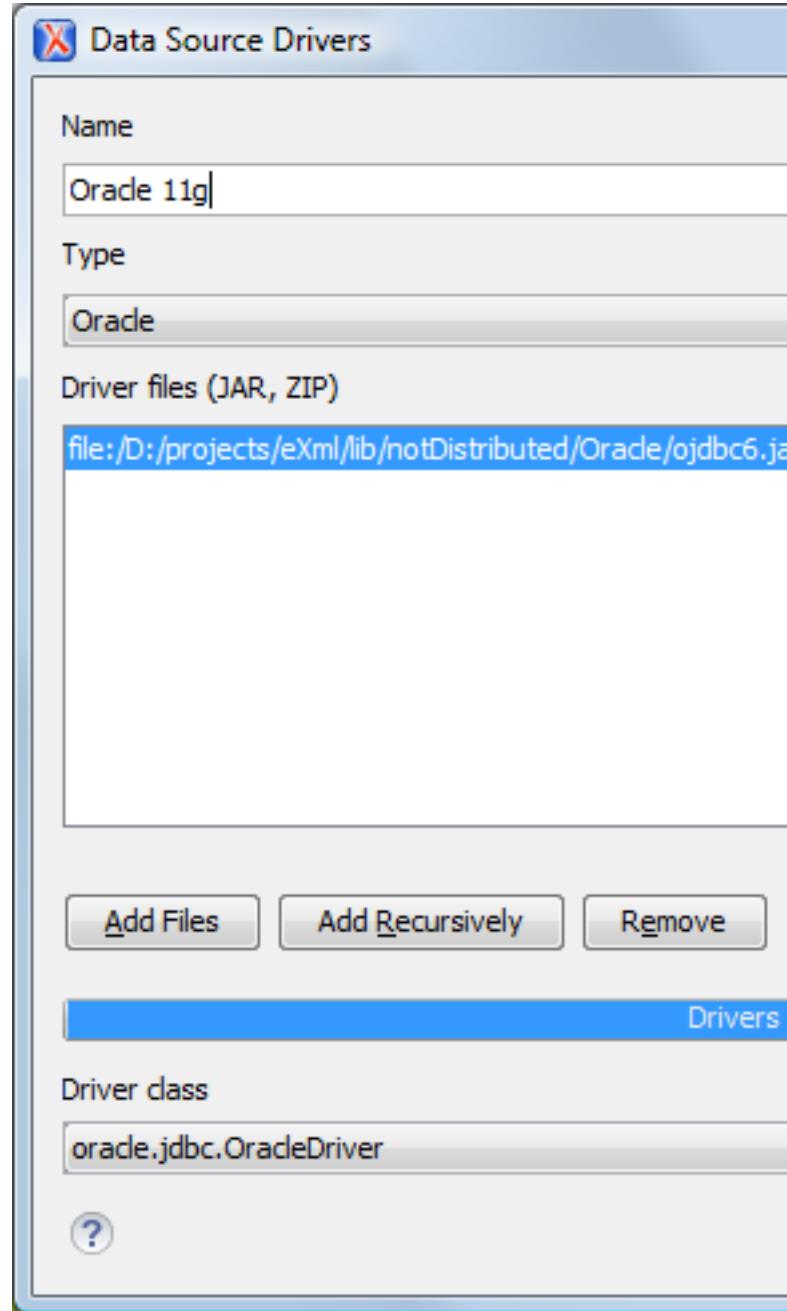

Figure 29: Data Sources Drivers Dialog Box

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
-  **Help button** - Opens the User Manual at *the list of the sections* where the configuration of supported data sources is explained and the

URLs for downloading the database drivers are specified.

- **Driver files (JAR, ZIP)** - Lists *download links for database drivers* that are necessary for accessing databases in Oxygen XML Author.
- **Add Files** - Adds the driver class library.
- **Add Recursively** - Adds driver files recursively.
- **Remove** - Removes the selected driver class library from the list.
- **Detect** - Detects driver file candidates.
- **Stop** - Stops the detection of the driver candidates.
- **Driver class** - Specifies the driver class for the data source driver.

Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

Duplicate

Creates a copy of the selected data source.

Delete

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

Connections		
Browsable	Name	URL
<input checked="" type="checkbox"/>	MySQL Connection	jdbc:mysql://10.0.0.16:3306/test
<input checked="" type="checkbox"/>	DocumentumConnection	http://10.0.0.150:9080
+ 		
Limit the number of cells <input type="text" value="2000"/>		
Maximum number of children for container nodes <input type="text" value="200"/>		

Figure 30: Connections Preferences Panel

The following buttons and options are available at the bottom of the **Connections** panel:

New

Opens the **Connection** dialog box that allows you to configure a new database connection.

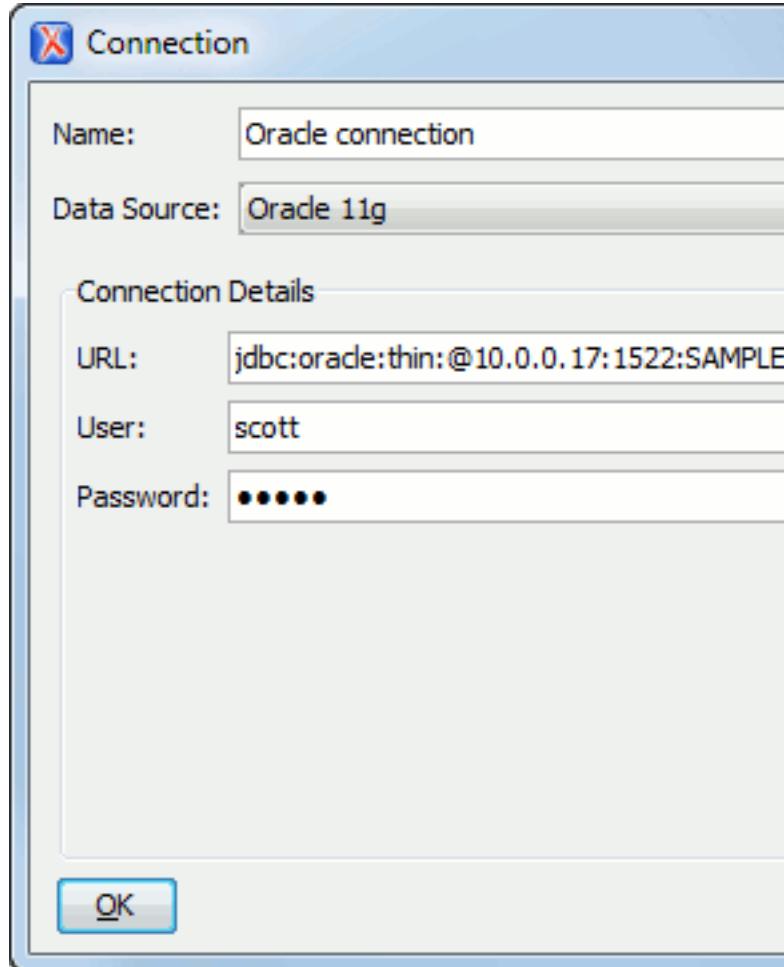

Figure 31: Connection Dialog Box

The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.

**Edit****Duplicate****Delete****Move Up****Move Down****Limit the number of cells****Maximum number of children for container nodes**

- **Collection** - One of the available collections for the specified data source.
- **Environment home directory** - Specifies the home directory (only for a Berkeley database).
- **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

Creates a copy of the selected connection.

Deletes the selected connection.

Moves the selected connection up one row in the list.

Moves the selected connection down one row in the list.

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer** view for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer** view, a warning dialog box will inform you that the table is only partially shown.

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer** view would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. Navigation to other contained resources from the same container is enabled by the *Up* and *Down* buttons in the **Data Source Explorer** view. This limited number is set in the field. The default value is 200 nodes.

Table Filters Preferences[Edit on](#)[GitHub](#)

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer** view. To open this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**
- **Synonym**

- **System Table**
- **Table**
- **View**

Download Links for Database Drivers

[Edit on GitHub](#)

For a list of major relational databases and the drivers that are available for them, see http://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Author:

- **Berkeley DB XML database** - Copy the *jar* files from the Berkeley database install directory into the Oxygen XML Author install directory as described in [the procedure for configuring a Berkeley DB data source](#).
- **IBM DB2 Pure XML database** - Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the *db2jcc.jar* and *db2jcc_license_cu.jar* files in Oxygen XML Author for [configuring a DB2 data source](#).
- **eXist database** - Copy the *jar* files from the eXist database install directory to the Oxygen XML Author install directory as described in [the procedure for configuring an eXist data source](#).
- **MarkLogic database** - Download the MarkLogic driver from [MarkLogic Community site](#).
- **Microsoft SQL Server 2005 / 2008 database** - Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014 go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
- **Oracle 11g database** - Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called *ojdbc6.jar*.
- **PostgreSQL 8.3 database** - Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
- **Documentum xDB (X-Hive/DB) 10 XML database** - Copy the *jar* files from the Documentum xDB (X-Hive/DB) 10 database install directory to the Oxygen XML Author install directory as described in [the procedure](#) for configuring a Documentum xDB (X-Hive/DB) 10 data source.

SVN Preferences

[Edit on GitHub](#)

To configure the options for the SVN client tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN**. Some other preferences for the embedded SVN client tool can be set in the global files called `config` and `servers`. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool ( **SVN Client**) and select **Global Runtime Configuration > Edit 'config' file** or **Global Runtime Configuration > Edit 'servers' file** from the SVN client **Options** menu.

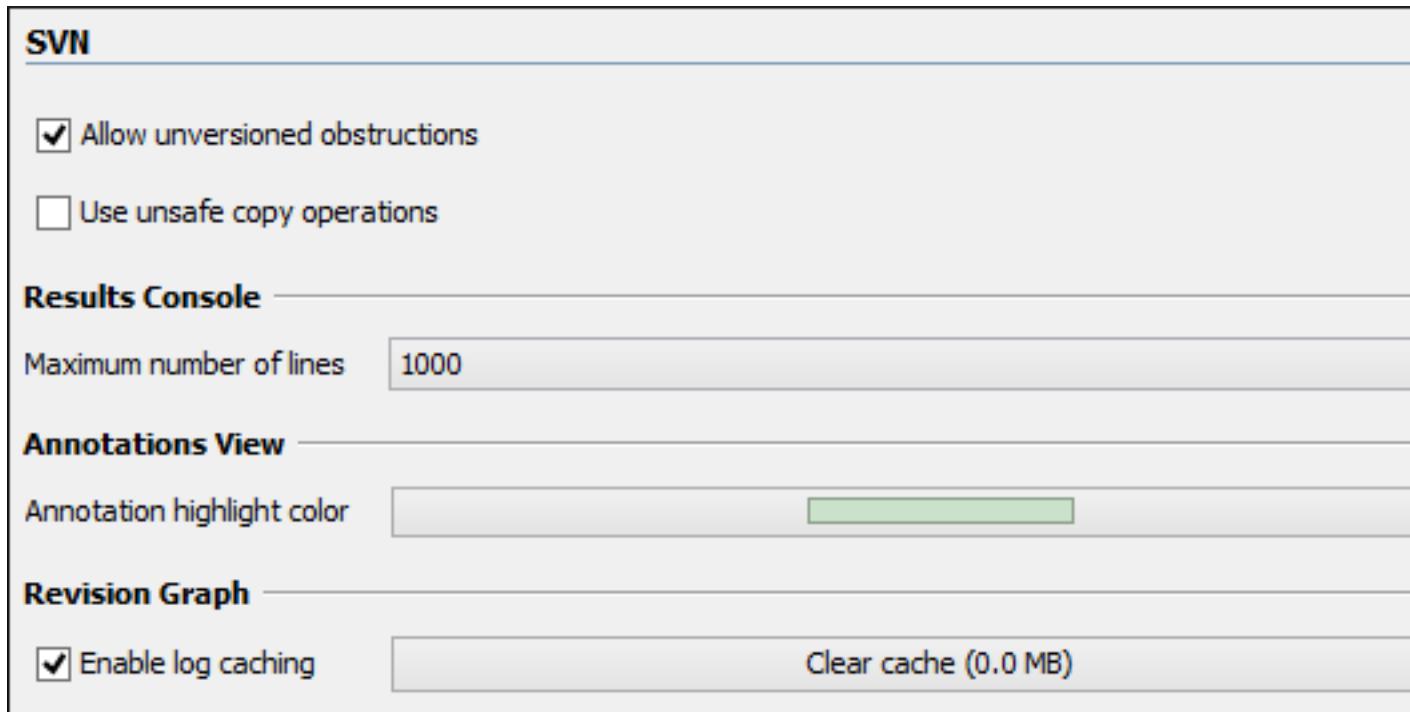

Figure 32: SVN Preferences Panel

The following SVN options can be configured in this preferences page:

Enable symbolic link support (*available only on Mac OS X and Linux*)

Apache Subversion™ has the ability to put a symbolic link under version control, via the usual SVN add command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a `svn:special` property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

Note: Windows file systems have no symbolic links, so a Windows client will not do any such translation and the object appears as a normal file.

Important: It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

Allow unversioned obstructions

Controls how to handle a situation where working copy resources are ignored / unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with those being ignored / unversioned. If the option is enabled, the incoming items will become BASE revisions of the ones already present in the working copy, and those

Use unsafe copy operations

present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is disabled, the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is enabled.

HTTPS encryption protocols (*available if you are using Java version 1.6 or older*)

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

Sets a specific encryption protocol to be used when the *application accesses a repository through HTTPS protocol*. You can choose one of the following values:

- **SSLv3, TLSv1** (default value)
- **SSLv3 only**
- **TLSv1 only**

Results Console

Specifies the maximum number of lines displayed in the **Console** view. The default value is 1000.

Annotations View

Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in *the Annotations view*.

Revision Graph

Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

Working Copy Preferences

[Edit on GitHub](#)

To configure the **Working Copy** preferences, *open the Preferences dialog box (Options > Preferences)* and go to **SVN > Working Copy**. The options in this preferences page are specific to SVN working copies and they include the following:

Working copies location

Allows you to define a location where you keep your working copies. This location is automatically suggested when you checkout a new working copy.

Working copy administrative directory

Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

When loading an old format working copy

You can instruct the SVN client to do one of the following:

- **Always ask** - You are notified when such a working copy is used and you are allowed to choose what action to be taken - to upgrade or not the format of the current working copy.

Enable working copy caching	<ul style="list-style-type: none"> • Never upgrade - Older format working copies are left untouched. No attempt to upgrade the format is made. <p>Note: SVN 1.6 and older working copies still need to be upgraded before loading them.</p>
Automatically refresh the working copy	If checked, the content of the working copies is cached for refresh operations.
Allow moving/renaming mixed revision directories	If checked, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows the last refresh operation) are refreshed from disk. Disabled by default.
When synchronizing with repository	If enabled, Oxygen XML Author will allow you to move or rename a directory even if its child items have a different revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is recommended to leave this option disabled and to Update the subtree to a single revision before moving or renaming it.
Application global ignores	The action that will be executed automatically after the Synchronize action. The possible actions are: <ul style="list-style-type: none"> • Always switch to 'Modified' mode - The Synchronize action is followed automatically by a switch to Modified mode of Working Copy view, if All Files mode is currently selected. • Never switch to 'Modified' mode - Keeps the currently selected view mode unchanged. • Always ask - The user is always asked if they want to switch to Modified mode.
Diff Preferences	<p>Allows you to set file patterns that may include the * and ? wildcards for unversioned files and folders that must be ignored when displaying the working copy resources in <i>the Working Copy view</i>. These patterns are case-sensitive. For example, *.txt matches file.txt, but does not match file.TXT.</p>

To configure the SVN Diff options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff**. The following option is available:

Compare With External Application	Edit on GitHub
	Specifies an external application to be launched for compare operations in the following cases: <ul style="list-style-type: none"> • When two history revisions are compared. • When the working copy file is compared with a history revision. • When a conflict is edited.

The parameters \${firstFile} and \${secondFile} specify the positions of the two compared files in the command line for the external diff application. The parameter

`${ancestorFile}` specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

Important: If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or *tokens* must be double-quoted for the Oxygen XML Author to correctly parse and identify them. For example, `C:\Program Files\compareDir\app name.exe` must be written as `"C:\Program Files\compareDir\app name.exe"`.

Messages Preferences

[Edit on GitHub](#)

The **Messages** preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN > Messages**.

This preferences page allows you to disable the following warning messages:

Show confirmation dialog when using the "Update All" action

Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

Show confirmation dialog for drag and drop actions in Working Copy

This option avoids doing a drag and drop when you just want to select multiple files in the **Working Copy** view.

Show warning dialog when editing conflicts

When the **Edit Conflicts** action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then *proceeds with the visual editing of the conflicting file*.

Show warning dialog when "svn:externals" definitions are ignored

A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as *Update* and *Override and Update*).

Diff Preferences

[Edit on GitHub](#)

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

Files Comparison Preferences

[Edit on GitHub](#)

To configure the **Files Comparison** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Files Comparison**.

Diff / Files Comparison

[Ignore Whitespace](#)

Two-Way Diff

Default algorithm:

Algorithm strength:

Three-Way Diff

Default algorithm:

Algorithm strength:

Show pseudo conflicts

XML Diff

Ignore:

Node/Type	Namespaces/Prefixes	
<input type="checkbox"/> Processing Instruction	<input type="checkbox"/> Namespaces	
<input type="checkbox"/> Comments	<input type="checkbox"/> Prefixes	
<input type="checkbox"/> CDATA	<input type="checkbox"/> Namespace declarations	
<input type="checkbox"/> DOCTYPE	Order	
<input type="checkbox"/> Text	<input type="checkbox"/> Attribute order	

Ignore nodes by XPath:

Merge adjacent differences

Mark end tags as different for modified elements

Ignore expansion state for empty elements

Figure 33: Files Comparison Preferences Page

This preferences page allows you to configure the following options:

Ignore Whitespace

If enabled, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

Note: If the **Ignore Whitespace** checkbox is selected, comparing the `a b` sequence with `a b`, Oxygen XML Author finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing `a b` with `ab` (no whitespace between `a` and `b`), Oxygen XML Author signals a difference.

Two-Way Diff section

Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Author, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the

		expense of speed. It compares two XML files or fragments looking for identical XML nodes.
Three-Way Diff section	Algorithm strength	Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: Low , Medium (default), High and Very High .
	Default algorithm	The default algorithm used for performing a three-way comparison. The following options are available: <ul style="list-style-type: none"> • Auto - Selects the most appropriate algorithm, based on the compared content and its size (selected by default). • Lines - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. • XML Fast - Comparison that works well on large files or fragments, but it is less precise than XML Accurate. • XML Accurate - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.
	Algorithm strength	Controls the amount of resources allocated to the application to perform the

		comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: Low , Medium (default), High and Very High .
XML Diff section	Show pseudo conflicts	Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).
	Ignore	Allows you to specify the types of XML nodes that will be ignored in the file comparison for the XML Fast and XML Accurate algorithms.
	Ignore nodes by XPath	If enabled, you can enter an XPath 2.0 expression to ignore certain nodes from the comparison. The XPath expression specified in this option is used as the default ignore instructions when the application is started. If you enter an XPath 2.0 expression in the similar option on the toolbar that expression will be used instead.
	Merge adjacent differences	If enabled, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If disabled, every difference is represented separately.
	Mark end tags as different for modified elements	If enabled, end tags of modified elements are also presented as differences. Otherwise, only the start

	tags are presented as differences.
Ignore expansion state for empty elements	If enabled, empty elements in both expansion states are considered matched (that is <element/> and <element></element> are considered equal).

Appearance Preferences

[Edit on GitHub](#)

To configure the appearance options for the Files Comparison tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Files Comparison > Appearance**. This preferences page offers the following options:

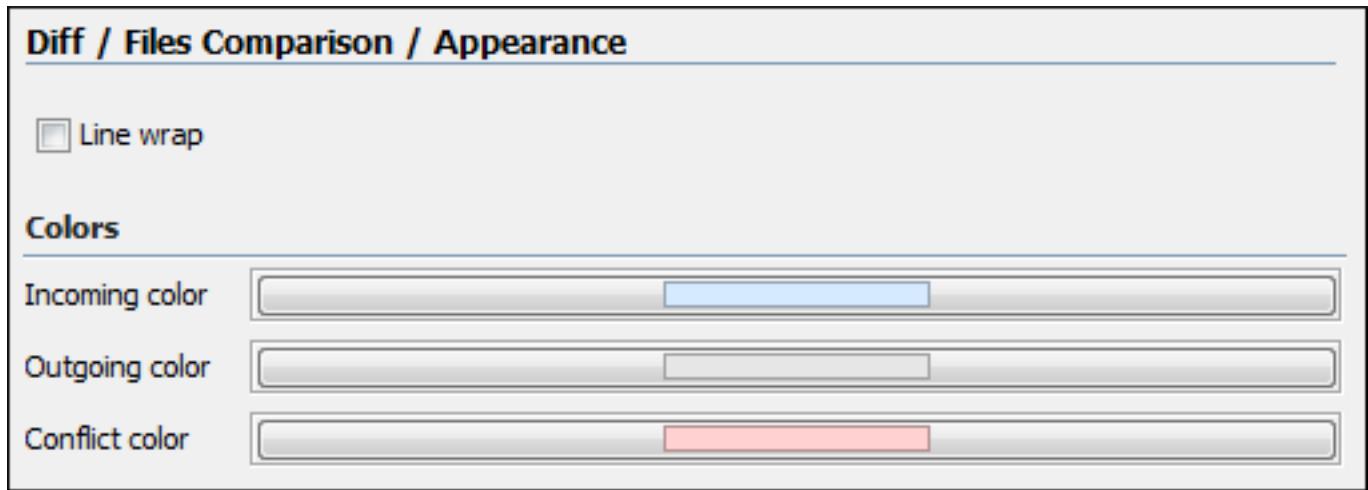

Figure 34: Files Comparison Appearance Preferences Panel

Line wrap

Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

Incoming color

Specifies the color used on the vertical bar for incoming changes.

Outgoing color

Specifies the color used on the vertical bar for outgoing changes.

Conflict color

Specifies the color used on the vertical bar for conflicts between the compared files.

Directories Comparison Preferences

[Edit on GitHub](#)

To configure the **Directories Comparison** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Directories Comparison**.

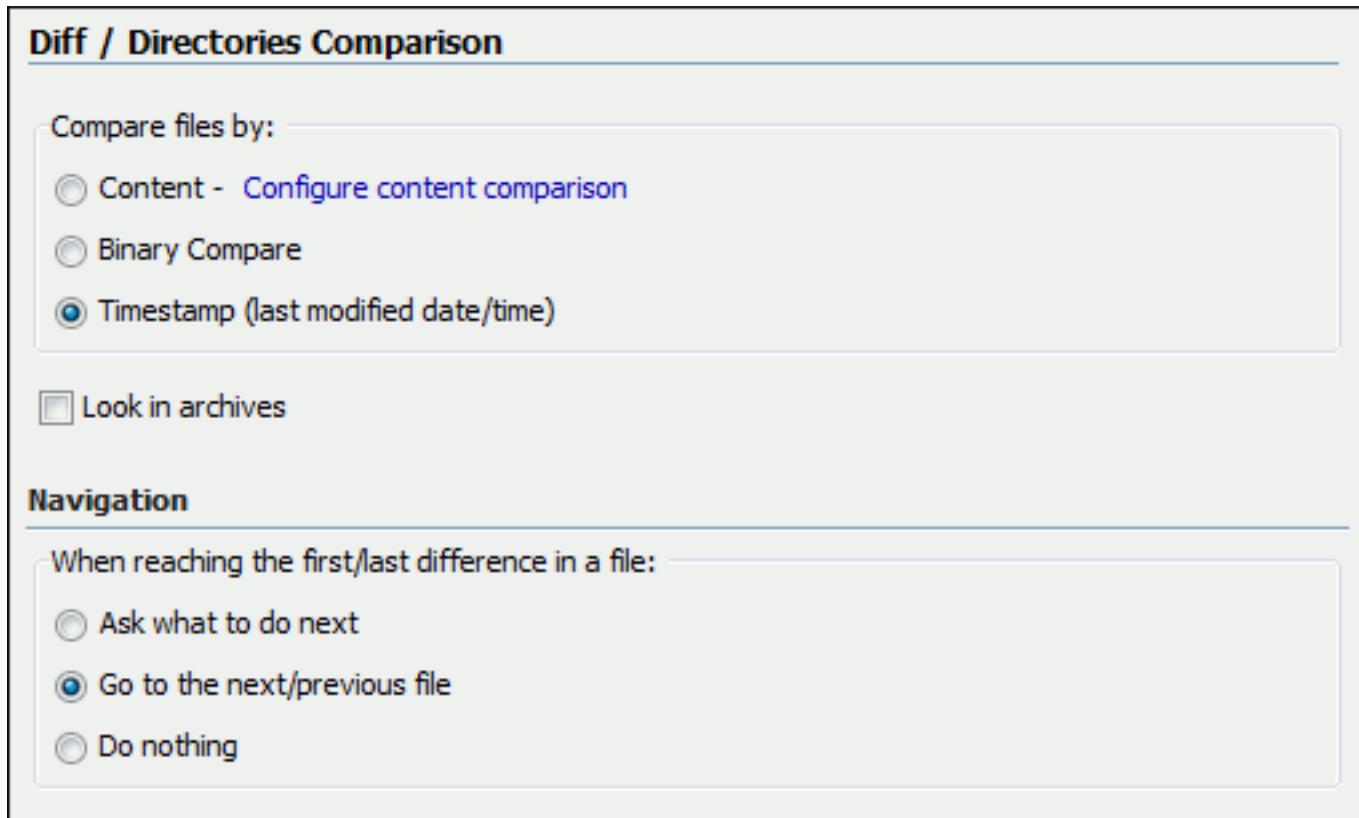

Figure 35: Diff Preferences Page

For the directories comparison, you can specify the following options:

Compare files by

Controls the method used for comparing two files:

- **Content** - The file content is compared using the current *diff algorithm*. This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).

You can use the **Configure content comparison** link to open the *Files Comparison preferences page* where you can configure options for comparing files. However, the **Ignore nodes by XPath** option is ignored when using the **Compare Directories** tool.

- **Binary Compare** - The files are compared at byte level.
- **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.

Look in archives

If checked, *known archive types* are considered directories and their content is compared just like regular files.

Navigation

This options control the behavior of the differences traversal actions (**Go to previous modification**, **Go to next modification**) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

Apearance Preferences

[Edit on GitHub](#)

To configure the appearance options for the Directories Comparison tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Directories Comparison > Appearance**.

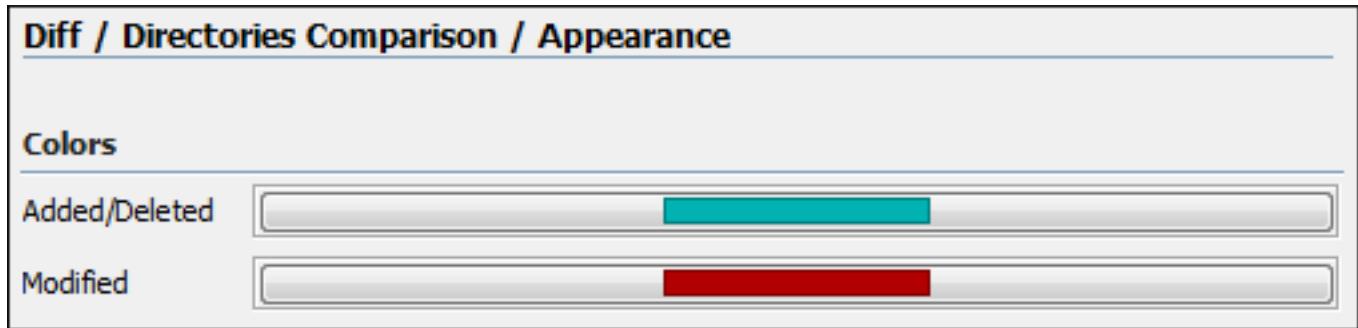

Figure 36: Diff Appearance Preferences Panel

- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

Archive Preferences

[Edit on GitHub](#)

To configure Archive preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Archive**.

The following options are available in the **Archive** preferences page:

Archive backup options

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

Note: Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen

XML Author. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

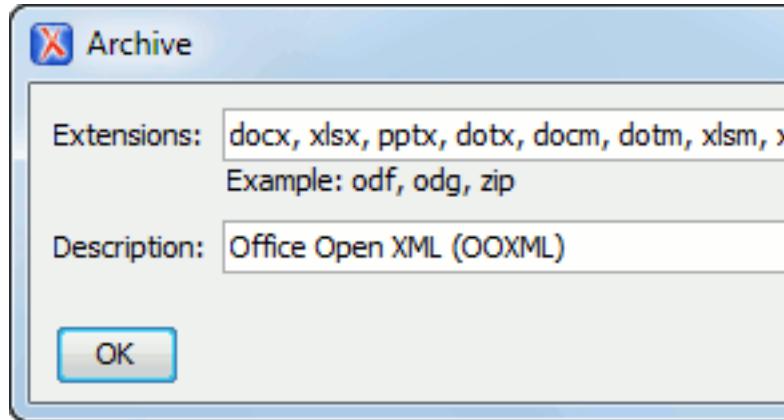

Figure 37: Edit Archive Extension Mappings

Important: You have to restart Oxygen XML Author after removing an extension from the table for that extension to not be recognized as an archive extension.

Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

Plugins Preferences

[Edit on GitHub](#)

You can add plugins that extend the functionality of Oxygen XML Author. The plugins are shipped as separate packages. To check for new plugins, go to http://www.oxygenxml.com/oxygen_sdk.html.

A plugin consists of a separate sub-folder in the `Plugins` folder of the Oxygen XML Author installation folder. This sub-folder must contain a valid `plugin.xml` file in accordance with the `plugin.dtd` file located in the `Plugins` folder.

Oxygen XML Author automatically detects and loads plugins installed correctly in the `Plugins` folder and displays them in the **Plugins** preferences page. To configure plugins, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Plugins**.

You can use the check-boxes in front of each plugin to enable or disable them. To display the properties of a plugin in the second section of the **Plugins** preferences page, click the name of the plugin.

Discover more plugins by using add-ons update sites

Enabled	Plugins
<input checked="" type="checkbox"/>	Acrolinx Plug-in for oXygen
<input checked="" type="checkbox"/>	Capitalize Lines
<input checked="" type="checkbox"/>	XML Comment
<input checked="" type="checkbox"/>	Conversion
<input checked="" type="checkbox"/>	OpenRedirect
<input checked="" type="checkbox"/>	CustomProtocol
<input checked="" type="checkbox"/>	Format with text preserve
<input checked="" type="checkbox"/>	Form Sentences
<input checked="" type="checkbox"/>	Form Words
<input checked="" type="checkbox"/>	LowerCase
<input checked="" type="checkbox"/>	Start Up

Name: Acrolinx Plug-in for oXygen
Status: Enabled
Description: Acrolinx Plug-in for oXygen
Version: 3.0.1 1983
Vendor: Acrolinx
BaseDir: C:\Users\sorin_tudor\AppData\Roaming\com.oxygenxml\extensions\v15.0\plugins\http___updates
Extensions: {
TargetedURLHandler - com.acrolinx.client.oXygen.AcrolinxOxygenPluginCustomTargetedURLStreamHandler
WorkspaceAccess - com.acrolinx.client.oXygen.AcrolinxOxygenPluginExtension
}

To apply these changes, you must restart the application.

Figure 38: Plugins Preferences Panel

Also, you can install a plugin as an add-on. For further details about this, go to [Deploying Add-ons](#)

External Tools Preferences

[Edit on GitHub](#)

A command-line tool can be started in the Oxygen XML Author user interface as if from the command line of the operating system shell. The **External Tools** preferences page allows you to add and configure these external tools that could be used while working with Oxygen XML Author. To access this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by selecting it from the **Tools > External Tools** menu or from the  **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be enabled in the [Configure Toolbars dialog box](#)).

How to Configure an External Tool

To configure an external tool in the **External Tools** preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** -Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the **External Tools** configuration dialog box.

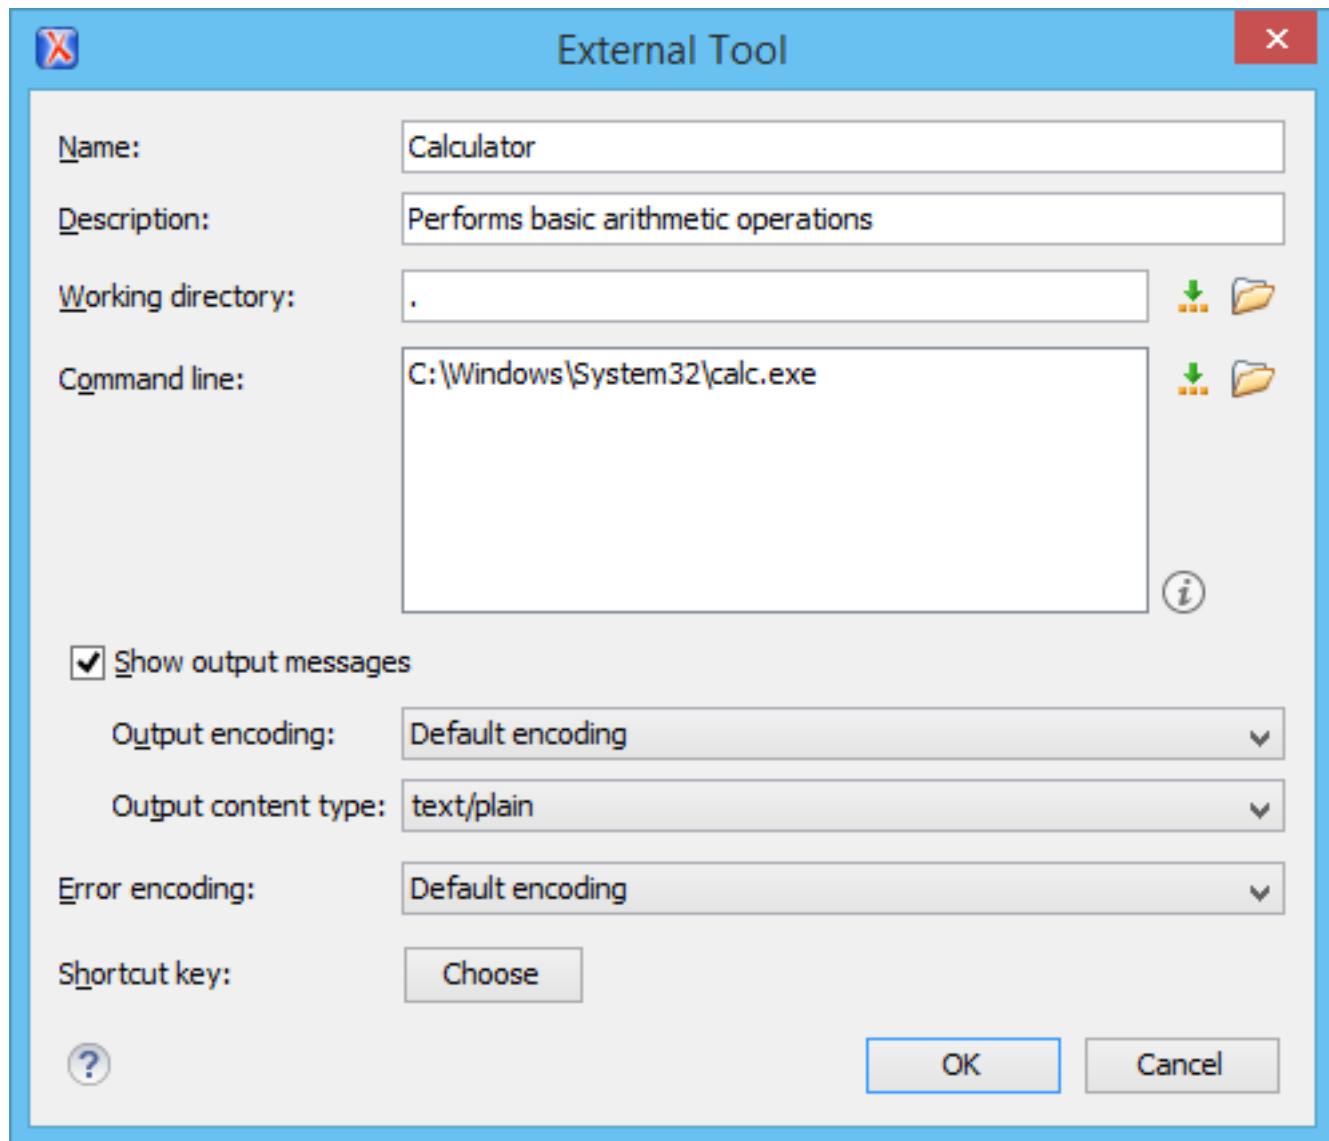

Figure 39: External Tools Configuration Dialog Box

This configuration dialog box includes the following options:

Name The name of tool that will be displayed in the **Tools > External Tools** menu and in the **External Tools** drop-down menu on toolbar.

Description A description of the tool displayed as a tooltip where the tool name is used.

Working directory The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following editor variables: `$(cfid)`, `$(pd)`, `$(oxygenInstallDir)`, `$(homeDir)`, `$(system(var.name))`, `$(date(pattern))`, `$(xpath_eval(expression))`. You can also use the browsing tools to select the directory.

Command line

The command line that will start the external tool. You can specify the path by using the text field, the

 [Insert Editor Variables](#) button, or the  [Browse](#) button. You can use one of the following editor variables: `${homeDir}` , `${home}` , `${cfn}` , `${cfne}` , `${cf}` , `${currentFileURL}` , `${cfid}` , `${cfdu}` , `${tsf}` , `${pd}` , `${pdu}` , `${oxygenInstallDir}` , `${oxygenHome}` , `${frameworksDir}` , `${frameworks}` , `${ps}` , `${timeStamp}` , `${uuid}` , `${id}` , `${afn}` , `${afne}` , `${af}` , `${afu}` , `${afd}` , `${afdu}` , `${ask('message', type, 'default_value')}` , `${dbgXML}` , `${dbgXSL}` , `${env(VAR_NAME)}` , `${system(var.name)}` , `${date(pattern)}` , and `${xpath_eval(expression)}` . You can also use the browsing tools to select a file path.

Show output messages

When this option is enabled, all the messages emitted by the external tool are displayed in the **Results** view. When this option is disabled, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used by Oxygen XML Author to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instruct Oxygen XML Author how to display the generated output. For example, setting the **Output content type** to `text/xml` enables the syntax coloring of XML output.

Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Author to read the error stream.

Shortcut key

You can choose a keyboard shortcut that can be used to launch the external tool.

Menu Shortcut Keys Preferences

[Edit on GitHub](#)

You can use the **Menu Shortcut Keys** preference page to configure shortcut keys for the actions available in Oxygen XML Author. The shortcuts assigned to actions are displayed in the table in this preference page. To configure the shortcut keys, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Menu Shortcut Keys** (or **Options > Menu Shortcut Keys**).

Menu Shortcut Keys		
Name	Category	Shortcut key
Remove all	Bookmarks	Ctrl+F7
Remove all	Breakpoints	Ctrl+Shift+F7
Remove all	Highlights	
Remove all	Results	
Remove comment(s)	Edit	
Remove from Disk	Project	Shift+Delete
Remove from Project	Project	Delete
Remove from version control	Working copy	
Remove highlight(s)	Edit	
Remove selected	Results	Delete
Rename	Archive Browser	F2
Rename	File	F2
Rename	Markup	
Rename	Project	F2
Rename	SharePoint	F2
Repositories	Perspective	

Figure 40: Menu Shortcut Keys Preferences Page

The **Menu Shortcut Keys** preferences page also contains the shortcuts that you define at *document type* level.

Note: A shortcut defined at *document type* level overwrites a default shortcut.

To find a specific action, you can use the filter to search through any of the columns in the table. You can also click on a column header to sort the column.

The table includes the following columns:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action. For example, by default, the *Remove all* action has one shortcut key assigned for *bookmarks* and another one assigned for *breakpoints*.
- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and press the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on Mac OS X only) - Controls the way the HOME and END keys are interpreted. If enabled, the default behavior of these keys is overridden and the cursor only moves on the current line.

File Types Preferences

[Edit on GitHub](#)

Oxygen XML Author offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **File Types**.

The screenshot shows the 'File Types' preferences page. At the top, there's a title bar with the page name. Below it is a table with two columns: 'Extension' and 'Editor'. The table lists various file extensions and their corresponding editors. At the bottom of the table are three buttons: 'New', 'Edit', and 'Delete'. Below the table, there's a section for 'Binary file patterns' with a text input field containing a list of file extensions.

Extension	Editor
bat	Batch Editor
bookmap	XML Editor
c	C Editor
c++	C++ Editor
cc	C++ Editor
cpp	C++ Editor
css	CSS Editor
dita	XML Editor
ditamap	XML Editor
ditaval	XML Editor
dtd	DTD Editor

Binary file patterns

```
.class, *.zip, *.jar, *.rar, *.tar, *.tar.gz, *.tif, *.gif, *.jpg, *.jpeg, *.png, *.bmp
```

Figure 41: File Types Preferences Page

The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor, etc.).

If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in [the preference Encoding for non XML files](#) is used for opening and saving a file of this type.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the [Project view: File/Replace in Files, Check Spelling in Files, Validate](#).

Open/Find Resource Preferences Page

[Edit on GitHub](#)

You can configure various options that pertain to the [Open/Find Resource dialog box](#) and [Open/Find Resource view](#). To access these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Open/Find Resource**.

The following options are available in this **Open/Find Resource** preferences page:

Limit search results to

Specifies the maximum number of results that are displayed in the **Open/Find Resource** dialog box/view.

Enable searching in content

This option is enabled by default and it allows you to use the **Open/Find Resource** dialog box/view to search in content or reviews, as well as in file paths. If this option is disabled, you can only use the **Open/Find Resource** feature to search in file paths.

Content search scope section

Ignore content of these files

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, `*.txt` ignores all the `.txt` files, `*/topics/*` ignores all the files from the `topics` directory, regardless of their depth, and `file:/C:/tmp/*` ignores everything from the `tmp` directory.

Note: The specified pattern must begin with the desired protocol (in our case `file`) and also contain forward slash (/).

Index the content of remote resources

Controls the indexing of resources that are not local. For example, the resources referenced in a DITA map opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, enable this option.

Note: Enabling this option may lead to delays when the indexing is computed.

Content search options section

When searching in content, return

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- **Exact matches** - The search results match the exact whole words that you enter in the search field of the **Open/Find Resource** dialog box/view.
- **Prefix matches** (default) - The search results match documents that contain words starting with the search terms. For instance, searching for "pref page" will also find documents containing "preference page".

Automatically join search terms using:

Allows you to select the default boolean operator that Oxygen XML Author applies when you perform a search. For example, if the AND operator is selected and you search for "car assembly", the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

Enable XML-aware searching

When enabled, you can perform *XML-specific searches* for XML elements and attributes.

Note: Enabling this option may slow down the indexing of your documents and increase the index size on the disk.

Index files with size less than (KB) Since indexing can be slowed down when the *Enable XML-aware searching option* is

active, you can use this option to set a maximum file size to be indexed.

Stop Words

A list of comma separated *stop words*, meaning that the words added in this list are filtered out prior to processing a search query.

[Open/Find Resource Dialog Box](#) on page 340

Custom Editor Variables Preferences

[Edit on GitHub](#)

An editor variable is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the [built-in editor variables](#).

Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. To create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

Custom Editor Variables		
Name	Value	Description
<code> \${startDir}</code>	<code> ../../bin</code>	Start directory of command line validator
<code> \${standardParams}</code>	<code> -c config.xml -v -level 5 -list</code>	List of command line standard parameters

[New](#) [Edit](#) [Delete](#)

Figure 42: Custom Editor Variables Table

Network Connection Settings Preferences

[Edit on GitHub](#)

This section presents the options available in the **Network Connection Settings** preferences pages.

Proxy Preferences

[Edit on GitHub](#)

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the **Proxy** options, *open the Preferences dialog box (Options > Preferences)* and go to **Network Connection Settings > Proxy**. The following options are available:

Proxy section

Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.

Attention: The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome based Linux systems,

but it does not work on KDE based ones as the Java virtual machine does not offer the necessary support yet.

- **Manual proxy configuration - HTTP(S)**
connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

Web Proxy (HTTP/HTTPS) section

Address	The address of the proxy server used for manual configurations.
Port	The port of the proxy server used for manual configurations.
No proxy for	Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, myhost.example.com) or as a domain name (for example, example.com). Use a comma to separate multiple hosts.
User	The user name for authentication with the proxy server.
Password	The password for authentication with the proxy server.

SOCKS Proxy section

Address	The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.
Port	The port of a SOCKS proxy that all connections will pass through.

Using a Proxy Auto-Configuration Script (PAC)

[Edit on GitHub](#)

If you have set up the path to a Proxy auto-configuration script in your system (IE for Windows) Oxygen XML Author cannot detect this setting out of the box.

You can create a new folder (`[OXYGEN_INSTALL_DIR]\lib\endorsed`) in which you should copy two additional Java libraries: `deploy.jar` and `plugin.jar`. These libraries can be found in the

`[OXYGEN_INSTALL_DIR]\jre\lib` folder if the application came with a bundled Java VM (otherwise, in the Java VM installation used to run the application).

HTTP(S)/WebDAV Preferences	Edit on GitHub
To set the HTTP(S)/WebDAV preferences, open the Preferences dialog box (Options > Preferences) and go to Network Connection Settings > HTTP(S)/WebDAV . The following options are available:	
Internal Apache HttpClient Version	Oxygen XML Author uses the Apache HttpClient to establish connections to HTTP servers. For Oxygen XML Author to benefit from particular sets of features provided by different versions, you may choose between v3 and v4.
	Note: For a full list of features, go to http://hc.apache.org/httpclient-3.x/ and http://hc.apache.org/httpcomponents-client-ga/ .
Maximum number of simultaneous connections per host	Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a Denial of Service attack. You can avoid that by lowering the value of this option.
	Note: The minimum value that can be set in this option is 5.
Read Timeout (seconds)	The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.
Enable HTTP 'Expect: 100-continue' handshake (for HTTP/1.1 protocol)	Activates <i>Expect: 100-Continue</i> handshake. The purpose of the <i>Expect: 100-Continue</i> handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the <i>Expect: 100-continue</i> handshake can result in noticeable performance improvement when working with databases. The <i>Expect: 100-continue</i> handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.
Use the 'Content-Type' header field to determine the content type	When checked, Oxygen XML Author tries to determine a resource type using the Content-Type header field. This header indicates the <i>Internet media type</i> of the message content, consisting of a type and subtype. For example:
	<code>Content-Type: text/xml</code>
	When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in <code>.xml</code> is considered to be an XML file.
Automatic retry on recoverable error	When enabled, if an HTTP error occurs when Oxygen XML Author communicates with a server via HTTP (for example, sending or receiving a SOAP request to or

Automatically accept a security certificate, even if invalid

from a Web services server) and the error is recoverable, Oxygen XML Author tries to re-send the request to the server.

Lock WebDAV files on open

When enabled, the HTTPS connections that Oxygen XML Author attempts to establish will accept all security certificates, even if they are invalid.

Important: By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

If checked, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

(S)FTP Preferences
[Edit on GitHub](#)

To configure the (S)FTP options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > (S)FTP**. You can customize the following options:

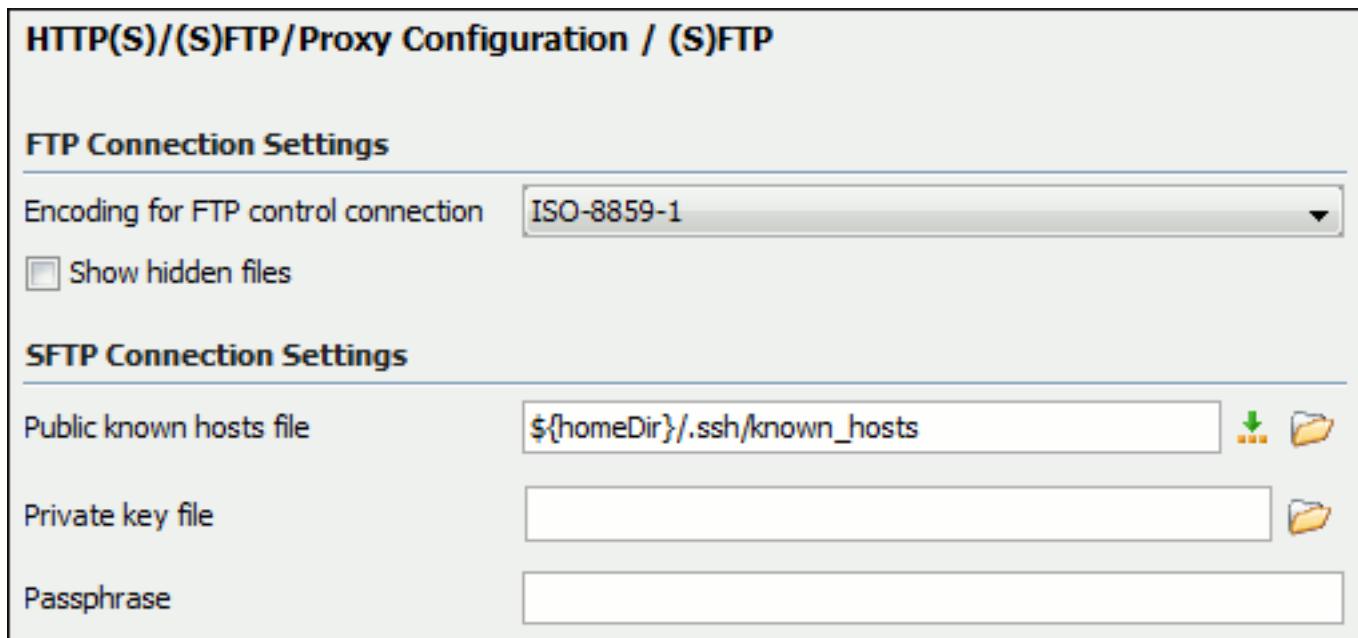

Figure 43: (S)FTP Configuration Preferences Panel

- **Encoding for FTP control connection** - The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Author will use it for communication. Otherwise, it will use ISO-8859-1.
- **Public known hosts file** - File containing the list of all SSH server host keys that you have determined are accurate. The default value is \${homeDir}/.ssh/known_hosts.
- **Private key file** - The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in [the Open URL dialog box](#).
- **Passphrase** - The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in [the Open URL dialog box](#).

Trusted Hosts Preferences

[Edit on GitHub](#)

This preferences page contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Author will allow connections to the listed hosts without requesting user confirmation.

To configure the **Trusted Hosts** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

- **New** - Allows you to manually add a new entry to the list of trusted hosts.

Tip: You can specify a specific port at the end of the URL (for instance, www.example.com:8080). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

- **Delete** - Allows you to remove an entry from the list of trusted hosts.

SSH Preferences

[Edit on GitHub](#)

To configure the **SSH** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Connection settings > SSH**. The following options are available:

- **SSH** - Specifies the command line for an external SSH client that will be used when connecting to a SVN+SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the **Default SVN user** (the same user name as the SSH client user) or **Prompt for a SVN user** for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the plink.exe tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

```
C:\plink-install-folder\plink.exe -l username -pw password -ssh -batch
host_name_or_IP_address_of_SVN_server
```

XML Structure Outline Preferences

[Edit on GitHub](#)

To configure options in regards to the **Outline** view, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML Structure Outline**. It contains the following options:

Preferred attribute names for display

The preferred attribute names when displaying the attributes of an element in the **Outline** view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

Enable outline drag and drop

Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

Views Preferences

[Edit on GitHub](#)

The **Views** preferences page allows you to configure some options in regards to certain views. To edit these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Views**.

The following options are available:

Project view section

Enable drag-and-drop in Project view Enables drag and drop support in the **Project**

Information view section	Maximum number of lines	<p><i>view</i>. It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.</p>
Elements view section	Show only items allowed at cursor position	<p>If enabled, when editing in Author mode, only the elements that are allowed at the current cursor position will be listed in the <i>Elements view</i>. If disabled, two additional tabs (Before and After) will be displayed at the bottom of the view (in Author mode only). These tabs list the elements that are allowed before or after the element at the current cursor position.</p>

Messages Preferences

[Edit on GitHub](#)

The **Messages** preference page allows you to specify whether or not certain messages are displayed. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Messages**.

The following warning messages can be enabled or disabled:

Show confirmation dialog when moving resources	Specifies whether or not to display a confirmation dialog box when you move a resource in the Project view, Data Source Explorer , and Archive Browser . In the confirmation dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select Restore Defaults at the bottom of this preferences page.
Show warning when adding resources already included in the project	Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.
Show warning for document size limit for bidirectional text, Asian languages, and other special characters	Specifies whether or not to display a warning message when an opened file that contains bidirectional characters is too large and bidirectional support is disabled.
Show warning message when changing the text orientation in the editor	Specifies whether or not to display a warning message when you change the text orientation in the editor.
Show warning when editing long expressions in the XPath toolbar	Specifies whether or not to display an information dialog box that allows you to specify if you want to use the

Show MathFlow recommendation	<i>XPath/XQuery Builder</i> view when editing long XPath expressions.
Show SFTP certificate warning dialog	Specifies whether or not to display an information dialog box that recommends using the <i>MathFlow Editor</i> to edit MathML equations.
Show Enterprise license related message when trying to connect to a Microsoft SharePoint server	Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.
Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions	Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.
	Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the Encode Selection or Decode Selection actions for <i>Base64</i> , <i>Base32</i> , or <i>Hex conversions</i> . In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select Restore Defaults at the bottom of this preferences page.

Configuring Options

[Edit on GitHub](#)

A set of options controls the behavior of Oxygen XML Author, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Author includes several distinct layers of option values.

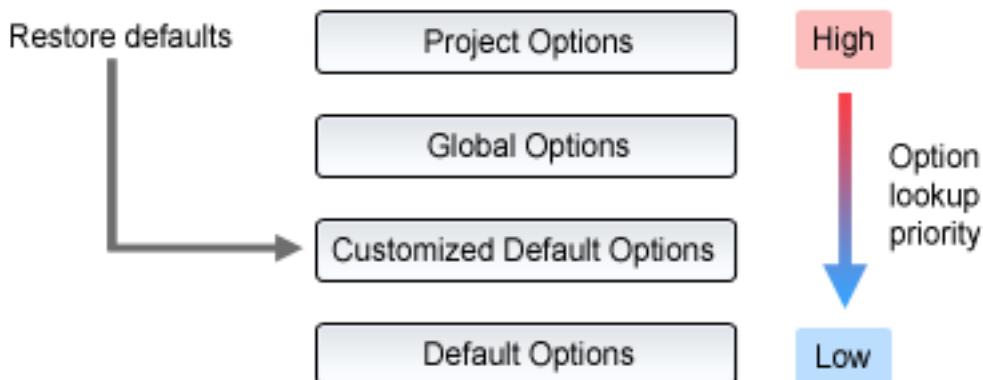

Figure 44: Option Lookup Priority

The option layers are as follows (sorted from high priority to low):

- *Project Options*

Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a common set of formatting

rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- ***Global Options***

Allows individual users to personalize Oxygen XML Author according to their specific needs.

- ***Customized Default Options***

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

Note: Once this layer is set, it represents the initial state of Oxygen XML Author when an end-user uses the ***Restore defaults*** or ***Reset Global Options*** actions.

- ***Default Options***

The predefined default or built-in values, tuned so that Oxygen XML Author behaves optimally in most working environments.

Important: If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Customizing Default Options

[Edit on GitHub](#)

Oxygen XML Author has an extensive set of options that you can configure. When Oxygen XML Author is installed, these options are set to default values. You can provide a different set of default values for an installation using an *XML options file*.

Creating an XML Options File

To create an *options file*, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Author and [open the Preferences dialog box \(Options > Preferences\)](#).
3. Go through the options and set them to the desired defaults. Make sure that **Global Options** is selected in each page.
4. Click **OK** and close the **Preferences** dialog box.
5. Go to **Options > Export Global Options** to create an XML options file.

Using Customized Default Options

There are two methods that you can use to configure an Oxygen XML Author installation to use the customized default options from the created XML options file:

- **Copy the XML Options File to the Installation Directory**

In the `[OXYGEN_INSTALL_DIR]`, create a folder called `preferences` and copy the created XML options file into it (for example, `[OXYGEN_INSTALL_DIR]/preferences/default.xml`).

- **Specify a Path to the XML Options File in a Startup Parameter**

Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the [startup parameters](#). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

```
-Dcom.oxygenxml.default.options=options/default.xml
```

- A system variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${system(CONFIG)}/default.xml
```

- An environmental variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${env(CONFIG)}/default.xml
```

Note: If you are using the *Java Webstart distribution*, use the *optionsDir property* to specify the path of the options file (in this case, the file must be named default.xml), or you can edit the *.jnlp file* that launches the application and set the com.oxygenxml.default.options parameter using a property element, as in the following example:

```
<property name="oxy:com.oxygenxml.default.options" value="http://host/
path/to/default.xml"/>
```

Sharing and Storing Options

[Edit on GitHub](#)

When you configure the Oxygen XML Author options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be shared with others by exporting the global options or by sharing the stored project-level files. The same is true with transformation and validation scenarios.

Figure 45: Controlling the Storage of the Preferences

Global Options

By default, **Global Options** is selected in the preferences pages, meaning that the options are stored on your computer and are not accessible to other users (unless you *export them into an XML options* file that can then be shared).

Global options are stored locally in the following locations:

- **Windows (Vista, 7, 8, 10)** - [user_home_directory]\AppData\Roaming\com.oxygenxml
- **Windows XP** - [user_home_directory]\Application Data\com.oxygenxml
- **Mac OS X** - [user_home_directory]/Library/Preferences/com.oxygenxml
- **Linux/Unix** - [user_home_directory]/.com.oxygenxml

Project Options

If you select **Project Options**, the preferences are stored in the project file and can be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

Notice: Some pages do not have the **Project Options** switch, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

Note: If changes have been made to the options in a preferences page and you switch between **Project Options** and **Global Options**, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

For more information about sharing project files, see *Sharing a Project - Team Collaboration* on page 358.

Importing/Exporting/Resetting Global Options

[Edit on GitHub](#)

Actions for importing, exporting, and resetting global options are available in the **Options** menu. The export operation allow you to save global preferences as an XML options file and the import operation allows you to load the options file. You can use this file to reload saved options on your computer or to *share with others*.

The following actions are available in the **Options** menu:

Reset Global Options

Restores the preference to the factory defaults or to *customized defaults*. This action also resets the transformation and validation scenarios to the default scenarios and clears recently used file templates.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML options file. You can also select a *project-level options file* (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can enable the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML options file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Oxygen XML Author automatically stores your options in an XML options file. Depending on the platform you are using, this file is located in the following directories:

- [user-home-folder]\AppData\Roaming\com.oxygenxml.author for Windows Vista/7/8/10
- [user-home-folder]\Application Data\com.oxygenxml.author for Windows XP
- [user-home-folder]/Library/Preferences/com.oxygenxml.author for OS X
- [user-home-folder]/.com.oxygenxml.author for Linux

The name of the options file of Oxygen XML Author 18.0 is oxyAuthorOptionsSa18.0.xml.

Associating a File Extension with Oxygen XML Author

[Edit on GitHub](#)

To associate a file extension with Oxygen XML Author on Windows:

1. Go to the Windows **Start** menu and open **Control Panel**.
2. Go to **Default Programs**.
3. Click **Associate a file type or protocol with a program**.
4. Click the file extension you want to associate with Oxygen XML Author, then click the **Change program** button.
5. In the subsequent dialog box, browse for and choose Oxygen XML Author.

To associate a file extension with Oxygen XML Author on Mac OS:

1. In **Finder**, select a file and from the contextual menu select **Get Info**.
2. In the **Open With** subsection, select **Other** from the application combo box.
3. Browse to and select Oxygen XML Author.

4. Select the **Always Open With** option, then click **Add**.

Configuring the Layout of the Views and Editors

[Edit on GitHub](#)

All the Oxygen XML Author views available in the Editor Perspective are dockable. To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **X** button at the top-right corner of the view, or with the **Window > Hide current view** action.

You can drag any view to any margin of another view or editor inside the Oxygen XML Author window. Once you create a layout that suites your needs, you can save it from **Window > Export Layout**. Oxygen XML Author creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

Note: The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the *preferences directory* of Oxygen XML Author.

To gain more editing space in the Oxygen XML Author window, click  **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Author window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Author window.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the `personal.xml` file was dragged over the `personal-schema.xml` file. When doing this, a dark gray rectangle marks the rearranged layout.

```

1  <?xml version="1.0" encoding="UTF-8"?>
2  <!DOCTYPE personnel SYSTEM "personal.dtd">
3  <?xmlstylesheet type="text/css" href="personal.css"?>
4  <personnel>
5    <person id="Big.Boss">
6      <name>
7        <family>Boss</family>
8        <given>Big</given>
9      </name>
10     <email>chief@oxygenxml.com</email>
11     <link subordinates="one.worker two.worker three.wor
12   </person>

```

Text Grid Author

```

1  <?xml version="1.0" encoding="UTF-8"?>
2  <?xmlstylesheet type="text/css" href="personal-schema.css"?>
3  <personnel xmlns:xsi="http://www.w3.org/2001/XMLSchema-instantiation"
4    xsi:noNamespaceSchemaLocation="personal.xsd">
5    <person id="Big.Boss">
6      <name>
7        <family>Boss</family>
8        <given>Big</given>
9      </name>
10     <email>chief@oxygenxml.com</email>
11     <link subordinates="one.worker two.worker three.wor
12   </person>

```

Text Grid Author

Figure 46: Drag and Drop Editors

You can also tile or stack all open editors, both in the *Editor Perspective* or in the *Database Perspective*, using the following actions from the **Editor** toolbar or **Window** menu:

Synchronous scrolling

Select this action to scroll through the tiled editors at the same time.

Tile Editors Horizontally

Splits the editing area into horizontal tiles, one for each open file.

Tile Editors Vertically

Splits the editing area into vertical tiles, one for each open file.

Stack Editors

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

Note: When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

You can divide the editing area vertically and horizontally using the following actions available in the **Editor** toolbar and **Window** menu:

- **Split horizontally** - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
- **Split vertically** - Splits the editor vertically. This is useful for comparing and merging content between two documents.
- **Unsplit** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize/Restore Editor Area**.

When the opened documents titles do not fit in the tab strip, the scroll wheel can be used to scroll the editor title tabs to the left or right, the same as the two arrows on the top-right. You can also switch between edited files by using the **Next editor** and **Previous editor** actions from the **Window** menu, or by using their respective keyboard shortcuts (**Ctrl + F6 (Command + F6 on OS X)** and **Ctrl + Shift + F6 (Command + Shift + F6 on OS X)**). These two actions display a small pop-up window that allows you to cycle through all opened files.

To watch our video demonstration about dockable and floating views and editors in Oxygen XML Author, go to http://oxygentools.com/demo/Dockable_Views.html.

Configure Toolbars

[Edit on GitHub](#)

You can configure the toolbars in Oxygen XML Author to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Author**, or **Grid**) and in the current perspective (**Editor** or **Database**). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

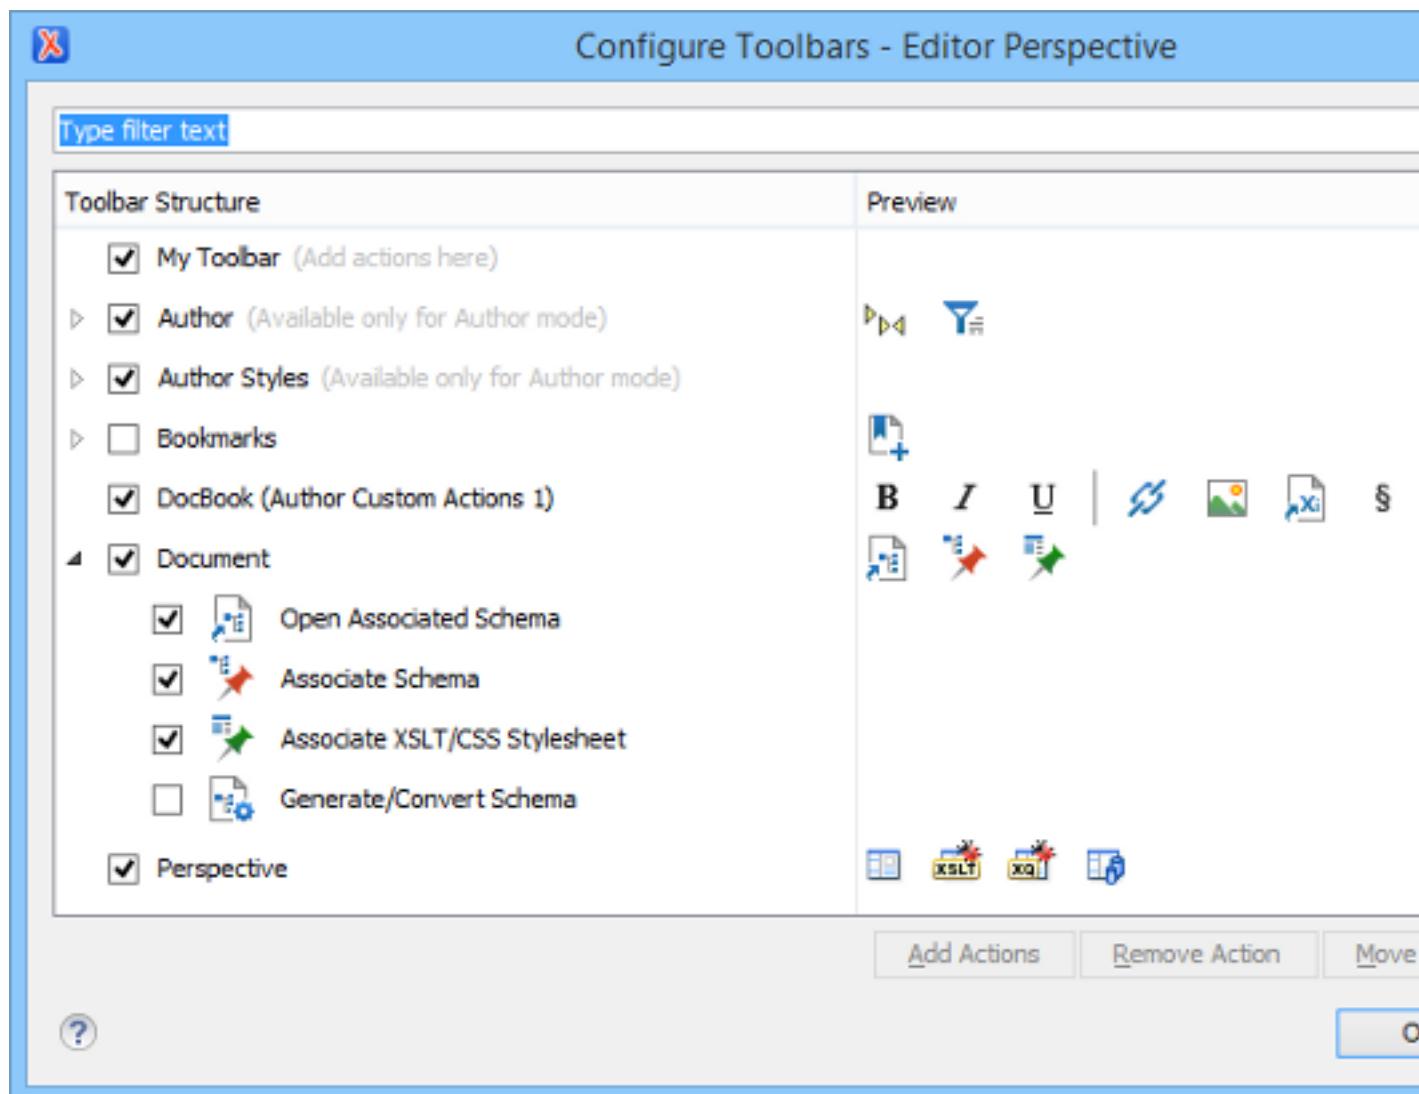

Figure 47: Configure Toolbars Dialog Box

The **Configure Toolbars** dialog box provides the following features:

Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current perspective and editing mode.

Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from frameworks (document type associations) or 3rd party plugins.

Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

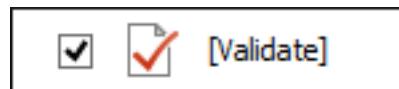

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Author.

Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar"** Toolbar action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

**Configure External Tools Action**

There is a ➤ **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

Note: If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

Scenarios Management
[Edit on GitHub](#)

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, framework option files, or

exported scenario files). The import and export scenario actions are available in the **Options** menu. The following actions are available:

Import Transformation Scenarios	Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.
Export Global Transformation Scenarios	Stores a set of global (not project-level) transformation scenarios in a specialized <i>scenarios</i> file.
Import Validation Scenarios	Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.
Export Global Validation Scenarios	Stores a set of global (not project-level) Validation scenarios in a specialized <i>scenarios</i> file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Transformation Scenarios** and **Import Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

Editor Variables

[Edit on GitHub](#)

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a timestamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Author includes a variety of built-in editor variables. You can also create your own *custom editor variables* by using the [Custom Editor Variables preferences page](#).

You can use the following editor variables in Oxygen XML Author commands of external engines or other external tools, in transformation scenarios, **Author** mode operations, and in validation scenarios:

- `${oxygenHome}` - Oxygen XML Author installation folder as URL.
- `${oxygenInstallDir}` - Oxygen XML Author installation folder as file path.
- `${framework}` - The path (as URL) of the current framework, as part of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${framework(fr_name)}` - The path (as URL) of the `fr_name` framework.
- `${frameworkDir(fr_name)}` - The path (as file path) of the `fr_name` framework.

Note: Since multiple frameworks might have the same name (although it is not recommended), for both `${framework(fr_name)}` and `${frameworkDir(fr_name)}` editor variables Oxygen XML Author employs the following algorithm when searching for a given framework name:

- All frameworks are sorted, from high to low, according to their *Priority* setting from the [Document Type configuration dialog box](#). Only frameworks that have the **Enabled** checkbox set are taken into account.
- Next, if the two or more frameworks have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
 - Frameworks stored in the internal Oxygen XML Author options.
 - Additional frameworks added in the [Locations preferences page](#).
 - Frameworks installed using the add-ons support.
 - Frameworks found in the [main frameworks location \(Default or Custom\)](#).
- `${frameworks}` - The path (as URL) of the `[OXYGEN_INSTALL_DIR]` directory.

- `${frameworkDir}` - The path (as file path) of the current framework, as part of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${frameworksDir}` - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${home}` - The path (as URL) of the user home folder.
- `${homeDir}` - The path (as file path) of the user home folder.
- `${pdu}` - Current project folder as URL. Usually the current folder selected in the **Project View**.
- `${pd}` - Current project folder as file path. Usually the current folder selected in the **Project View**.
- `${pn}` - Current project name.
- `${cfdu}` - Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
- `${cfid}` - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- `${cfn}` - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- `${cfne}` - Current file name with extension. The current file is the one currently opened and selected.
- `${cf}` - Current file as file path, that is the absolute file path of the current edited document.
- `${af}` - The local file path of the ZIP archive that includes the current edited document.
- `${afu}` - The URL path of the ZIP archive that includes the current edited document.
- `${afd}` - The local directory path of the ZIP archive that includes the current edited document.
- `${afdu}` - The URL path of the directory of the ZIP archive that includes the current edited document.
- `${afn}` - The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
- `${afne}` - The file name (with file extension, for example `.zip` or `.epub`, but without parent directory) of the zip archive that includes the current edited file.
- `${currentFileURL}` - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- `${ps}` - Path separator, which is the separator that can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.
- `${timeStamp}` - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- `${caret}` - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${selection}` - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${id}` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java `UUID` class.
- `${env(VAR_NAME)}` - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `${system(var.name)}` editor variable.
- `${system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `${env(VAR_NAME)}` editor variable instead.
- `${makeRelative(base,location)}` - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

Example:

```
 ${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}
```

- `${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}` - To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:

- 'message' - The displayed message. Note the quotes that enclose the message.
- type - Optional parameter, with one of the following values:

Parameter	
url	<p>Format: \${ask('message', url, 'default_value')}</p> <p>Description: Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.</p> <p>Example:</p> <ul style="list-style-type: none"> `\${ask('Input URL', url)}` - The displayed dialog box has the name Input URL. The expected input type is URL. `\${ask('Input URL', url, 'http://www.example.com')}` - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value http://www.example.com.
password	<p>Format: \${ask('message', password, 'default')}</p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> `\${ask('Input password', password)}` - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. `\${ask('Input password', password, 'abcd')}` - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
generic	<p>Format: \${ask('message', generic, 'default')}</p> <p>Description: The input is considered to be generic text that requires no special handling.</p> <p>Example:</p> <ul style="list-style-type: none"> `\${ask('Hello world!')}` - The dialog box has a Hello world! message displayed. `\${ask('Hello world!', generic, 'Hello again!')}` - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
relative_url	<p>Format: \${ask('message', relative_url, 'default')}</p> <p>Description: Input is considered a URL. Oxygen XML Author tries to make the URL relative to that of the document you are editing.</p> <p>Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Author will transform it into an absolute URL.</p> <p>Example:</p> <ul style="list-style-type: none"> `\${ask('File location', relative_url, 'C:/example.txt')}` - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.
combobox	<p>Format: \${ask('message', combobox, ('real_value1':'rendered_value1';...:'real_valueN':'rendered_valueN','default'))}</p>

Parameter	
	<p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated value (<code>real_value</code>).</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} </code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <p>Note: In this example, the default value is indicated by the <code>osx</code> key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')} </code></p> <ul style="list-style-type: none"> • <code> \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')} </code>
editable_combobox	<p>Format: <code> \${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))} </code></p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated real value (<code>real_value</code>) or the value inserted when you edit a list entry.</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} </code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
radio	<p>Format: <code> \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))} </code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a '<code>rendered_value</code>' and will return an associated '<code>real_value</code>'.</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p>

Parameter	
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', radio, ('win':'Microsoft Windows'; 'osx':'Mac OS X'; 'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems. <p>Note: In this example Mac OS X is the default selected value and if selected it would return osx for the output.</p>

- 'default-value' - optional parameter. Provides a default value.
- `${date(pattern)}` - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `YYYY-MM-dd`;

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about xs:datetime, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

- `${dbgXML}` - The local file path to the XML document that is current selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- `${dbgXSL}` - The local file path to the XSL/XQuery document that is current selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- `${tsf}` - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.
- `${dsu}` - The path of the detected schema as a URL for the current validated XML document.
- `${ds}` - The path of the detected schema as a local file path for the current validated XML document.
- `${cp}` - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- `${tp}` - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- `${xpath_eval(expression)}` - Evaluates an XPath 3.0 expression. Depending on the context, the expression can be:
 - *static* - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

Example:

```
 ${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
```

- *dynamic* - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

Example:

```
 ${ask('Set new ID attribute', generic, '${xpath_eval(@id)})')}
```

- `${i18n(key)}` - Editor variable used only at framework level to allow translating names and descriptions of **Author** mode actions in multiple actions. For more details, see [Localizing Frameworks](#) on page 1149.

Custom Editor Variables

[Edit on GitHub](#)

An editor variable can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the [Custom Editor Variables preferences page](#). To create a custom editor variable, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

Related information

[Editor Variables](#) on page 226

Custom System Properties

[Edit on GitHub](#)

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see [Setting a system property](#) on page 235.

Table 3: Custom System Properties

Property	Allowed values	Default value	Purpose
<code>com.oxygenxml.disable.http.protocol.handlers</code>	true or false	false	By default, Oxygen XML Author uses the open source Apache HTTP Client software for HTTP(S) connections. If set to True, the default Java Sun HTTP(S) will be used instead. You will also lose WebDAV support and possibly other related features.
<code>com.oxygenxml.default.options</code>	A URL-type relative or absolute path.	N/A	Provides the path to an XML file containing default application options. For more details, see Customizing Default Options on page 218.
<code>com.oxygenxml.customOptionsDir</code>	A file system absolute path pointing to a folder.	N/A	Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. See Importing/Exporting/Resetting Global Options on page 220.

Property	Allowed values	Default value	Purpose
<code>com.oxygenxml.ApplicationDataFolder</code> (Windows only)	A file system absolute path pointing to a folder.	%APPDATA% %	When the application runs on Windows, you can set this property to change the location where the application considers that the <code>APPDATA</code> folder is located.
<code>com.oxygenxml.editor.frameworks.url</code>	A URL-type absolute path.	OXYGEN_DIR frameworks	Changes the folder where the application considers that the main frameworks are installed. It has the same effect as changing the custom frameworks directory value in the Location preferences page .
<code>com.oxygenxml.MultipleInstances</code>	true or false	false	If set to <code>true</code> , multiple instances of the application are allowed to be started.
<code>com.oxygenxml.xep.location</code>	A file system absolute path pointing to a folder.	N/A	Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the FO Processors preferences page .
<code>com.oxygenxml.additional.classpath</code>	A list of JAR-type resources separated by a classpath separator.	N/A	An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the <code>lib</code> folder.
<code>com.oxygenxml.user.home</code> (Windows only)	A file system absolute path pointing to a folder.	USERPROFILE Folder	Overwrites the user home directory that was implicitly detected for the application.
<code>com.oxygenxml.use.late.delegation.for.author.extensions</code>	true or false	true	All Java extensions in a document type configuration are instantiated in a separate class loader. When <code>true</code> , the JAR libraries used in a certain document type configuration will have priority to resolve classes before delegating to the parent class loader. When <code>false</code> , the parent class loader will take precedence.

Property	Allowed values	Default value	Purpose
<code>com.oxygenxml.stack.size.validation.threads</code>	The number of bytes used for validation threads.	<code>5*1024*1024</code>	Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger <i>Thread</i> stack size to parse complex schemas. The default value should be more than enough.
<code>com.oxygenxml.jing.skip.validation.xhtml.data.attrs</code>	true or false	true	By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.
<code>com.oxygenxml.report.problems.url</code>	User defined URL	N/A	The URL where a problem reported through the Report Problem dialog box is sent. The report is sent in XML format using the <code>report</code> parameter with the POST HTTP method.

Localizing the User Interface

[Edit on GitHub](#)

You can select the language of the Oxygen XML Author user interface. Oxygen XML Author ships with the following languages: English, French, German, Japanese, and Dutch. To change the interface language, go to **Options > Preferences > Global** preferences page, then choose the appropriate language from the **Language** drop-down menu.

You can also localize the interface in another language by [creating an interface localization file](#).

Creating an Interface Localization File

[Edit on GitHub](#)

You can change the language of the Oxygen XML Author user interface by creating an interface localization file. The example in this procedure is based on the Spanish language, and a standard Oxygen XML Author Windows distribution.

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the [ISO 639 standard](#)), followed by an underscore character, and a region code (two or three uppercase letters that conform to the [ISO 3166 standard](#)).
2. Write an email to the Oxygen XML Author support team and ask them to send you the `translation.xml` sample file.

3. Open *translation.xml* in Oxygen XML Author. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a sample of its content:

```
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
  </languageList>
  <key value="New">
    <comment>The File/New action. Creates a new document.</comment>
    <val lang="en_US">New</val>
  </key>
  <key value="New_folder">
    <comment>Creates a folder in the Project View.</comment>
    <val lang="en_US">New Folder</val>
  </key>
  ....
</translation>
```

4. Update the language element to reflect the new language. Set the *description* attribute to Spanish and the *lang* attribute to *es_ES*.
5. For each key element translate the *comment* (optional) and *val* elements. Set the *lang* attribute to *es_ES*.

Note: After you are finished, the file should look like this:

```
<translation>
  <languageList>
    <language description="Español" lang="es_ES"/>
  </languageList>
  <key value="New">
    <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
    <val lang="es_ES">Nuevo</val>
  </key>
  <key value="New_folder">
    <comment>Crea una carpeta en la vista del proyecto.</comment>
    <val lang="es_ES">Nueva carpeta</val>
  </key>
  ....
</translation>
```

6. *Open the Preferences dialog box (Options > Preferences)*, go to **Global**, and enable the **Other language option**. Browse for the *translation.xml* file.
7. Restart the application.

Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author

[Edit on GitHub](#)

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Author *application launchers* or *command-line scripts*. You can also create a *custom startup parameters file*.

Setting Parameters for the Application Launchers

[Edit on GitHub](#)

Increasing the amount of memory that Oxygen XML Author uses on Windows

To increase the memory available to Oxygen XML Author on Windows:

- Browse to the installation directory of Oxygen XML Author.
- Locate the `-Xmx` parameter in the `oxygenAuthor18.0.vmoptions` file.

Note: For 32-bit Windows modify the parameter to `-Xmx1024m` or larger, but not over `-Xmx1200m`. Make sure you do not exceed your physical RAM. For 64-bit Windows modify the parameter to a larger value (for example, `-Xmx2048m`). We recommended you to not use more than half of your existing physical RAM.

Restart Oxygen XML Author. Go to **Help > About** and verify the amount of memory that is actually available (see the last row in the **About** dialog box). If Oxygen XML Author does not start and you receive an error message saying that it could not start the JVM, decrease the `-Xmx` parameter and try again.

For Windows Vista/7/8/10, copy the `oxygenAuthor18.0.vmoptions` to your desktop (or to any other folder with write access), modify it there, then copy it back to the Oxygen XML Author installation folder.

Note: The parameters from the `.vmoptions` file are used when you start Oxygen XML Author with the *oxygen* launcher (or with the desktop shortcut). In case you use the command line script `oxygen.bat/oxygen.sh`, modify the `-Xmx` parameter in the script file.

Increasing the amount of memory that Oxygen XML Author uses on OS X

To increase the memory available to Oxygen XML Author on OS X:

- **Ctrl + Single-Click (Command + Single-Click on OS X)** (or right-click) the Oxygen XML Author icon in **Finder**.
- From the contextual menu, select **Show Package Contents**.
- Go to the `contents` directory and edit the `Info.plist` file.

Note: You can open this file either with the **Property List Editor**, or the **TextEdit**.

- Look for the **VMOptions** key and adjust the `-Xmx` parameter to a larger value (for example, `-Xmx1500m`)

Note: For a Mac kit bundled with Java 8, look for the **VMOptionArray** key and add the `-Xmx` parameter in a new string element from the array element. For example, for 1500 MB use the following:

```
<string>-Xmx1500m</string>
```

Tip: Try not to use more than half of your existing physical RAM if possible.

Setting a system property

To set a system property, edit the application launcher and add a parameter after the `%OXYGEN_JAVA%` token, using the following form:

```
-Dproperty.name=value
```

You can also set a system property through a parameter prefixed with `-Doxy` in the command line used to start the application:

```
oxygenAuthor18.0.exe "-Doxyproperty.name=value"
```

All system properties are displayed in the **System properties** tab of the **About** dialog box.

To view the list of Oxygen XML Author system properties, go to [Custom System Properties](#) on page 231.

Disabling DPI Scaling

Some users may prefer the look of smaller icons in a HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, set the following property in `.vmoptions` (or in the `.bat` script):

```
sun.java2d.dpiaware=false
```

Setting Parameters in the Command Line Scripts

[Edit on GitHub](#)

If you start Oxygen XML Author with the `oxygenAuthor.bat` command line script, you have to add or modify the `-Xmx` parameter to the java command at the end of the script.

For example, to set the maximum amount of Java memory to 600 MB in **Windows**, modify the `-Xmx` parameter like this:

```
java -Xmx600m -Dsun.java2d.noddraw=true ...
```

On **Mac OS X**, the java command should look like this:

```
java "-Xdock:name=Author"\  
-Dcom.oxygenxml.editor.plugins.dir="$AUTHOR_HOME/plugins"\  
-Xmx600m\  
...
```

On **Linux**, the Java command should look like this:

```
java -Xmx600m\  
"-Dcom.oxygenxml.editor.plugins.dir=$AUTHOR_HOME/plugins"\  
...
```

Creating Custom Startup Parameters File

[Edit on GitHub](#)

The startup launchers for Oxygen XML Author and its executable internal tools (**Tree Editor**, **XML Schema Regular Expressions Builder**, **Large File Viewer**, **SVN Client**, **Compare Directories**, and **Compare Files**) include a default `.vmoptions` file that contain some startup parameters (such the `-Xmx` parameter, which is used for allocating memory for that particular application). You can edit the parameters in these `.vmoptions` files so that the applications will launch with your desired values. However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values.

To avoid resetting user-defined startup parameters, you can create custom `.vmoptions` files and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- `custom_commons.vmoptions` - The parameters and their values of this file will be included in all the startup launchers.
- `custom_<app name>.vmoptions` - The `<app name>` is the name of the executable application or tool (for example, `custom_diffFiles.vmoptions` for the **Compare Files** tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Author.

Chapter

5

Perspectives

Topics:

- [*Editor Perspective*](#)
- [*Database Perspective*](#)

The detailed descriptions of the **Editor** and **Database** perspectives.

An Oxygen XML Author perspective is an interface layout geared towards a specific use. The Oxygen XML Author interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Author. You can change the perspective by selecting the respective icons in the top-right corner of Oxygen XML Author or by selecting the perspective from the **Window > Open Perspective** menu.

Editor Perspective

[Edit on GitHub](#)

The **Editor** perspective is the most commonly used perspective and it is the default perspective when you start Oxygen XML Author for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select the **Editor** button in the top-right corner of Oxygen XML Author

(or select **Editor** from the **Window > Open perspective** menu)

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Author. Most of the menus are common for all types of documents. However, Oxygen XML Author also includes some context-sensitive and framework-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, **Author** mode also includes framework-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a *DITA Author Custom Actions* toolbar is available that includes operations that are specific to DITA documents). The *toolbars can be configured* to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Author includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the **Window > Show View** menu. The *layout of the views can also be configured* according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the controls located on the top-right corner of the view (□).

Some of the most helpful views in the **Editor** perspective include the following:

- **Project view** - Enables the definition of projects and logical management of the documents they contain.

- **DITA Maps Manager view** - For DITA frameworks, this view helps you organize, manage, and edit DITA topics and maps.
- **Open/Find Resource view** - Designed to offer advanced search capabilities in various scopes.
- **Outline view** - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** - Displays the messages generated as a result of user actions such as *validations*, *transformation scenarios*, *spell checking in multiple files*, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view** - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an *in-place attribute editor*.
- **Model view** - Presents the current edited element structure model and additional documentation as defined in the schema.
- **Elements view** - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author mode** this view includes tabs that present additional information relative to the cursor location.
- **Entities view** - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios view** - Displays a list with all currently configured transformation scenarios.
- **XPath/XQuery Builder view** - Displays the results from running an XPath expression.

Related information

[Database Perspective](#) on page 239

[Configuring the Layout of the Views and Editors](#) on page 221

[Edit on GitHub](#)

Database Perspective

The **Database** perspective allows you to manage databases. To switch the focus to this perspective, select the

Database Debugger button in the top-right corner of Oxygen XML Author or select **Database** from the **Window > Open perspective** menu.

The **Database** perspective offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.

- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

Supported Databases

Oxygen XML Author supports numerous types of databases, including:

- Oracle Berkeley DB XML Database
- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL 8.3 (Enterprise edition only)
- Documentum xDB (X-Hive/DB) 10 XML Database (Enterprise edition only)
- Documentum (CMS) 6.5 (Enterprise edition only)
- SharePoint (CMS)

Note: For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Author. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Author [go to the Oxygen XML Author website](#).

Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the *Table Explorer view*.
- Handling the values from **XML Type** columns as String values.

Note: The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Author by registering the database driver as a *Generic JDBC* type driver when defining the data source for accessing the database. For more information, see [Database Connection Support](#) on page 915.

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Author editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Author editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip: Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

Toolbars	Contains all actions needed to configure and control the debugging process. The <i>toolbars can be configured</i> to suit your specific needs.
Editor Pane	The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.
Data Source Explorer View	Provides browsing support for the configured connections.
Table Explorer View	Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

[Table Explorer View](#) on page 911

Chapter

6

Editing Modes

Topics:

- [*Text Editing Mode*](#)
- [*Grid Editing Mode*](#)
- [*Author Editing Mode*](#)

Oxygen XML Author includes several editing modes to suit your type of editing.

The main editing area in Oxygen XML Author includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Author offers the following editing modes:

- ***Text*** - This mode presents the source of an XML document.
- ***Grid*** - This mode displays an XML document as a structured grid of nested tables.
- ***Author*** - This mode enables you to edit in a WYSIWYG-like editor.

Text Editing Mode

[Edit on GitHub](#)

The **Text** mode **Author** editor in Oxygen XML Author is designed to be a simple, yet powerful, XML editor. It provides support to help you edit, transform, and debug XML-based documents. It also includes a specialized **Content Completion Assistant**, an *Outline view*, and many other helpful features.

Related information

[Changing the colors displayed in the Text Mode Editor](#) on page 141

Navigating the Document Content in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes some useful features to help you navigate XML documents in **Text** mode.

Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Ctrl + CloseBracket (Command + CloseBracket on OS X)** key to go to the next XML node and **Ctrl + OpenBracket (Command + OpenBracket on OS X)** to go to the previous one.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. To position the cursor at the beginning or end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

Navigating with the Outline View

Oxygen XML Author includes a very useful *Outline view* that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

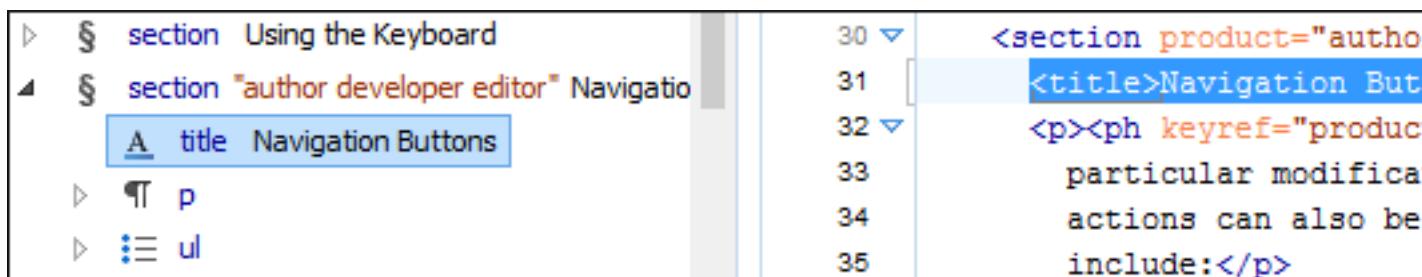

Figure 48: Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

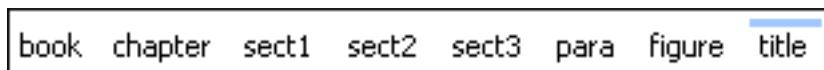

Figure 49: Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, go to **Find > Go to (Ctrl+L (Command+L on OS X))**.

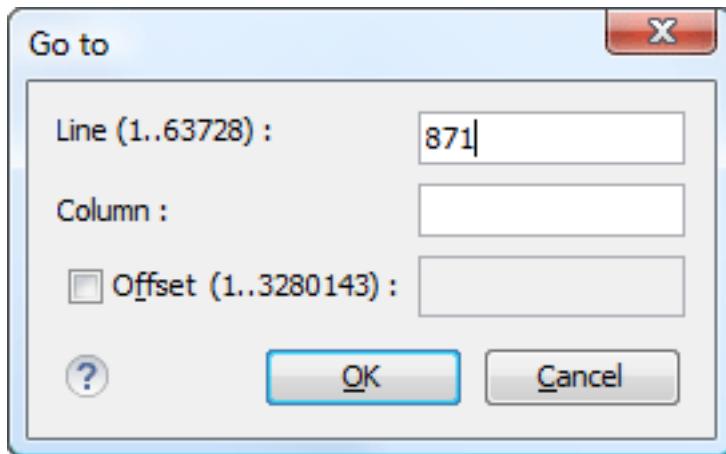

Figure 50: Go to Dialog Box

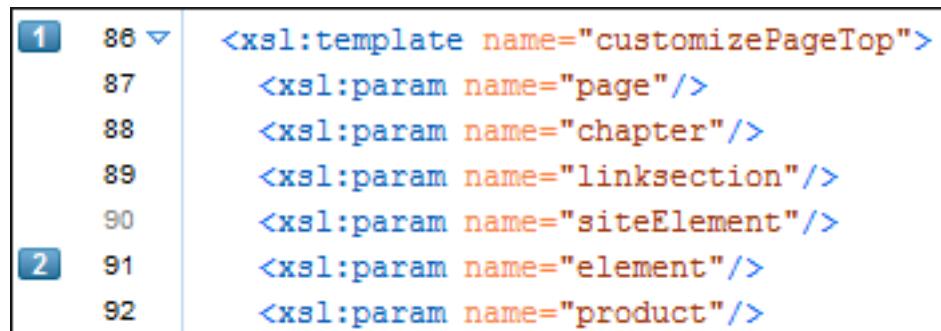

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to

nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

```

1  86 ▾   <xsl:template name="customizePageTop">
2  87      <xsl:param name="page"/>
3  88      <xsl:param name="chapter"/>
4  89      <xsl:param name="linksection"/>
5  90      <xsl:param name="siteElement"/>
6  91      <xsl:param name="element"/>
7  92      <xsl:param name="product"/>

```

Figure 51: Editor Bookmarks

A bookmark can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the  [Create Bookmark \(F9\)](#) action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

Text Mode Views

[Edit on GitHub](#)

There is a large selection of useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

Project View

[Edit on GitHub](#)

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

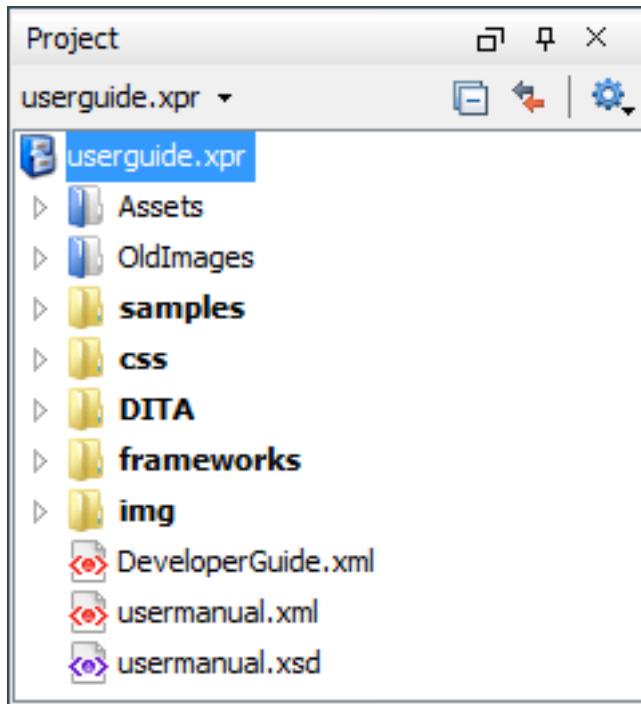

Figure 52: Project View

By default, the view is positioned on the left side of the Oxygen XML Author window, above the [Outline view](#). If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

New Project

Creates a new, empty project.

The following actions are grouped in the upper right corner:

Collapse All

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

Link with Editor

When selected, the project tree highlights the currently edited file, if it is found in the project files.

Note: This button is disabled automatically when you move to the **Debugger** perspective.

Settings

A submenu that contains the following actions:

 Filters

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

Show Full Path

When selected, linked files and folders are presented with a full file path.

Enable Master Files Support

Select this option to enable the *Master Files support*.

Change Search and Refactor operations scope

Allows you to change the collection of documents that define the context of the *search and refactor operations*.

- **Use only Master Files, if enabled** - Restricts Oxygen XML Author to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- *Logical folders* - marked with a blue icon on Windows and Unix/Linux () and a magenta icon on Mac OS X (). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New >**

Logical Folder. The contextual menu action  **Remove from Project** can be used to remove them from the project.

- *Physical folders and files* - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- *Shortcut folders and files* - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

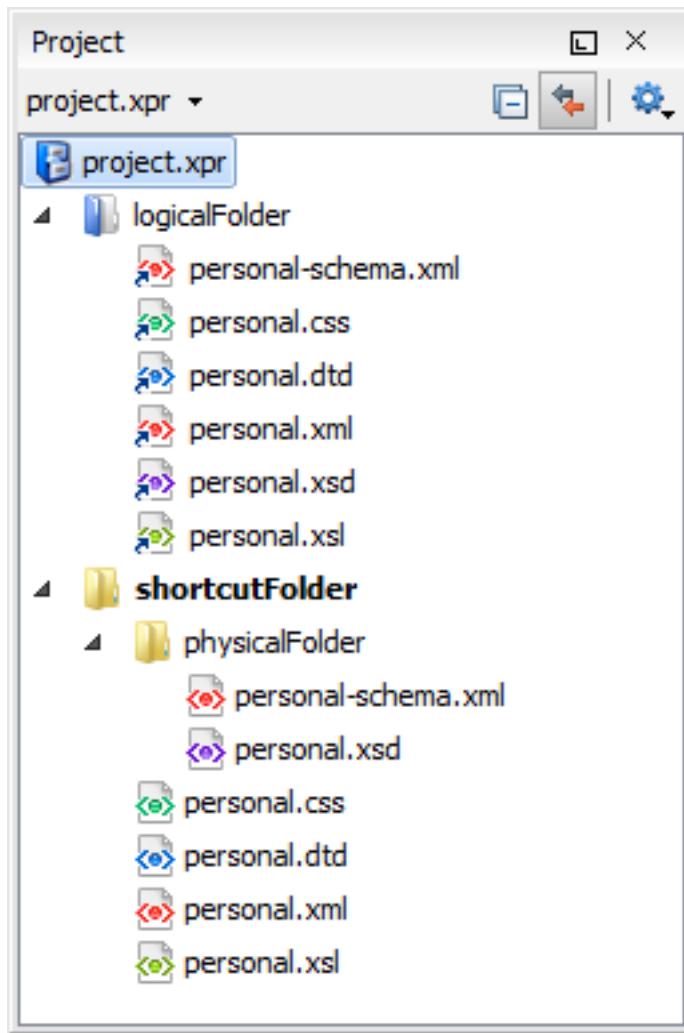

Figure 53: Project View with Examples of all Three Types of Resources

Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

Creates a new, empty project.

Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

 **New > File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

 **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

 **New > Logical Folder**

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - .

New > Logical Folders from Web

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

 **Add Folder**

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

 **Add Files**

Adds links to files on the local file system.

 **Add Edited File**

Adds a link to the currently edited file in the project.

Managing Project Content

Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be enabled in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root. To create a file inside a linked folder, select the **New > File** action from the contextual menu.

Note: The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action  **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action  **Remove from Disk (Shift+Delete)**. The  **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

CAUTION: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Author and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

Moving Files and Folders

You can *move the resources of the project* with drag and drop operations on the files and folders of the tree (the **Enable oXygen consoles** option must be enabled in the [View preferences page](#)).

You can also use the usual Cut, Copy, and Paste actions to move resources in the **Project** view.

Renaming Files and Folders

There are three ways you can *rename an item in the Project view*. Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

Note: The **Rename** action is also available on *logical* files.

Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

Checks if the selected file or files are well-formed.

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a [Validate and Check for Completeness](#) operation.

Validate with Schema

Validates the selected file or files against a specified schema.

Allows you to configure and run a [validation scenario](#).

Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

-  **Apply Transformation Scenario(s)** Obtains the output with one of the built-in scenarios.
-  **Configure Transformation Scenario(s)** Opens a dialog box that allows you to configure pre-defined transformation scenarios.
-  **Transform with** Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

Refactoring Actions (Available for certain document types (such as XML))

Oxygen XML Author includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

- Rename resource** Allows you to change the name of a resource.
- Move resource** Allows you to change the location on disk of a resource.
-  **XML Refactoring** Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.
- Other XML Refactoring Actions** For your convenience, the last 5 *XML Refactoring tool operations* that are used will also appear in this submenu.

Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

- Open** Opens the selected files in the corresponding editor.
- Open with submenu** This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: *DITA Maps Manager*, *Archive Browser*, *MathML Editor*, *Large File Viewer*, *Hex Viewer*, *SVG Viewer*.
- Show in Explorer (or Show in Finder on OS X)** In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.
- Copy Location** Copies an application-specific URL for the selected resource to the clipboard.
-  **Refresh** Refreshes the content and the dependencies between the resources in *the Master Files directory*.
-  **Find/Replace in Files** Allows you to *find and replace text in multiple files*.
-  **XPath in Files** Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.
-  **Open/Find Resource** Opens the *Open/Find Resource dialog box*.
-  **Check Spelling in Files** Allows you to *check the spelling of multiple files*.

Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

Open in SVN Client

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Properties

Displays the properties of the current file in a [Properties](#) dialog box.

Menu Level Actions

The following actions are available in the **Project** menu:

New Project

Creates a new, empty project.

Open Project ([Ctrl + F2 \(Command + F2 on OS X\)](#))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Filters

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Master Files Support

Allows you to enable the [Master Files Support](#) for each project you are working on.

Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

Open/Find Resource View
[Edit on GitHub](#)

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Author layout, next to the **Project** and **DITA Maps Manager** views. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Iris
From Wikipedia, the free encyclopedia. Iris flowers sp
iris is a genus of between 200-300 species of flowerin
plants with showy flowers. It takes its name from the
word for a rainbow , referring to the wide variety of f
colors found...

Project | DITA Map.. | Open/Find..

Figure 54: Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Author project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Note: Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view** at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note: Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for **ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for */*samples*/*.*gif* with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
 - **Clear Index** - Clears the index.
 - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
 - **Options** - Opens the *Open/Find Resource preferences page*.
 - **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
 - **In content** - Select this option to search through the content of your resources.
 - **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
 - **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process

will not be able to match any of them. However, you can configure the list of *stop words* in the [Open/Find Resource preferences page](#).

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

Important: Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in [the editor associated with the type of the file](#).

Note: You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to http://oxygenxml.com/demo/Open_Find_Resource.html.

Outline View in Text Mode

[Edit on GitHub](#)

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be *disabled and enabled from a Preferences page*.

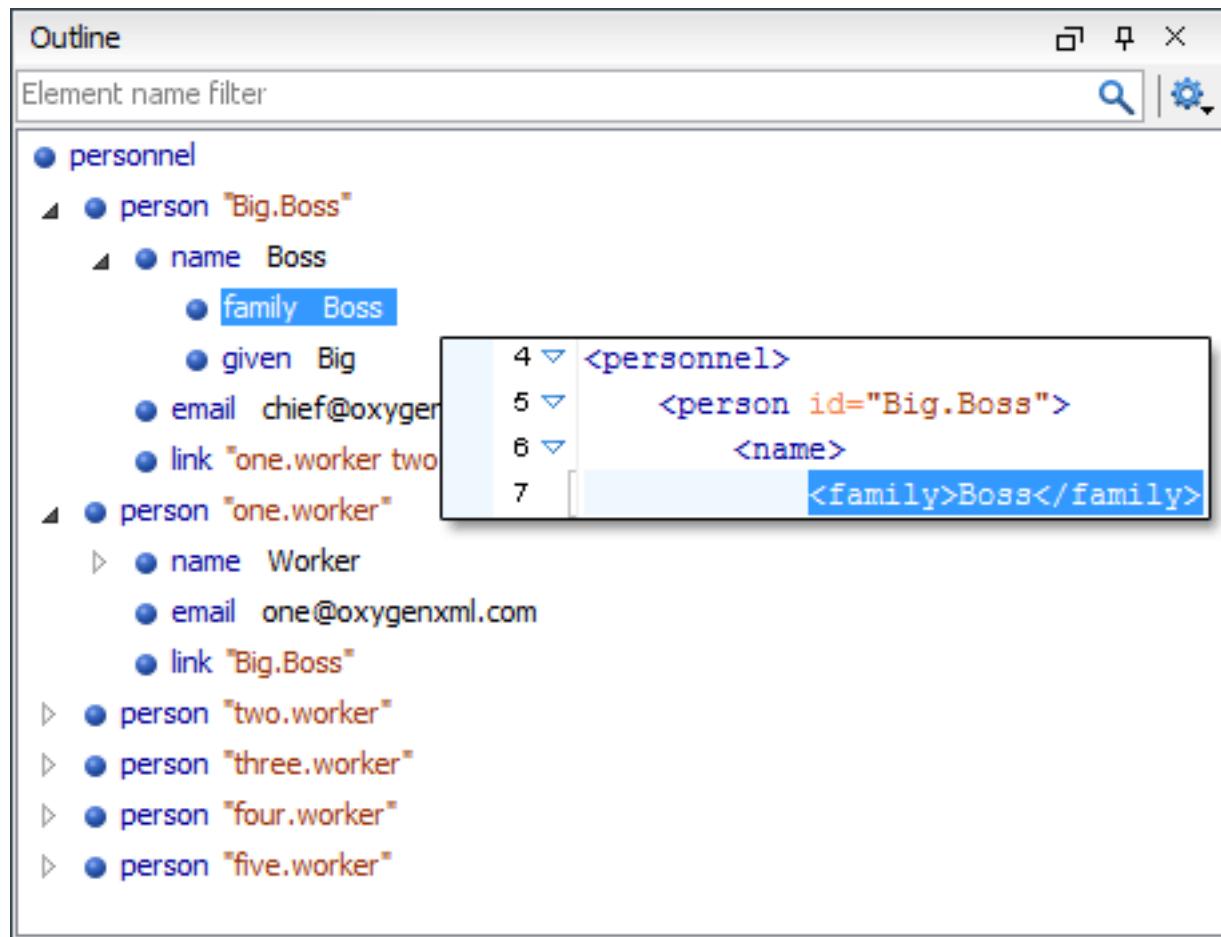

Figure 55: Outline View in Text Mode

Outline View Filters in Text Mode[Edit on GitHub](#)

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Text** mode:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

 **Selection update on cursor move**

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page](#).

Outline View Contextual Menu Actions in Text Mode[Edit on GitHub](#)

The following actions are available from the contextual menu in the **Outline** view in **Text** mode:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If

it is already commented, this action will remove the comment.

Cuts the currently selected component.

Copies the currently selected component.

Deletes the currently selected component.

Expands the structure of a component in the **Outline** view.

Collapses the structure of all the component in the **Outline** view.

Attributes View in Text Mode

[Edit on GitHub](#)

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes with a specified value are rendered with a bold font, and their values with a plain font.
- Note:** The names of the attributes with an empty string value are also rendered bold.
- Default values are rendered with a plain font, painted gray.
 - Empty values display the text "[empty]", painted gray.
 - Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column . If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attributes	
xs:element [http://www.w3.org/2001/XMLSchema] ▶	
Attribute	Value
abstract	false
block	false
default	true
final	
fixed	
id	
name	email
nillable	false
substitutionGroup	
type	xs:string

Figure 56: Attributes View

Expand/Collapse Button

There is an ▶ **Expand/** ▽ **Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the ✖ **Remove** button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the 📁 **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the ↗ **Update** button (or press **Enter**) to add the value to the attribute.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the *Allow only insertion of valid elements and attributes* schema aware option is enabled.

Set empty value

Specifies the current attribute value as empty.

Remove	Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.
Copy	Copies the <code>attrName="attrValue"</code> pair to the clipboard. The <code>attrValue</code> can be: <ul style="list-style-type: none">• The value of the attribute.• The value of the default attribute, if the attribute does not appear in the edited document.• Empty, if the attribute does not appear in the edited document and has no default value set.
Paste	Depending on the content of the clipboard, the following cases are possible: <ul style="list-style-type: none">• If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.• If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.• If the clipboard only contains text, the value of the selected attribute is modified.

Model View

[Edit on
GitHub](#)

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

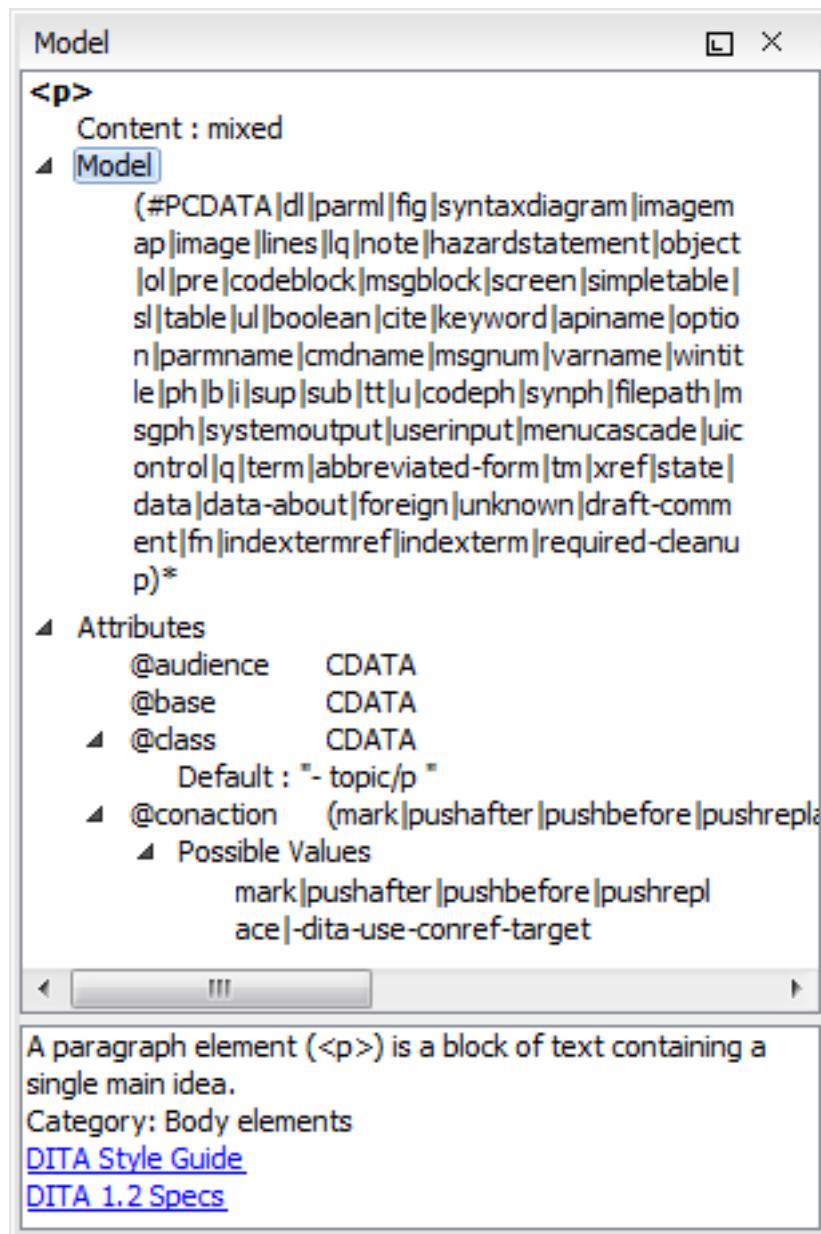

Figure 57: Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

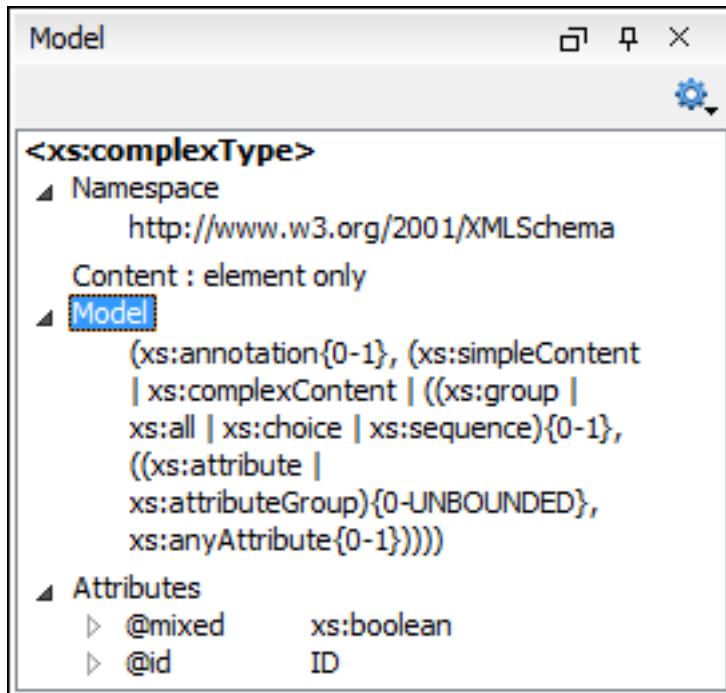

Figure 58: Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

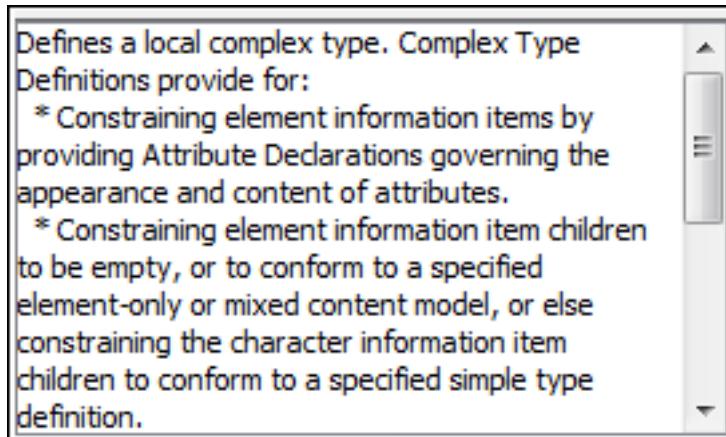

Figure 59: Annotation panel

Elements View in Text Mode

[Edit on GitHub](#)

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position.

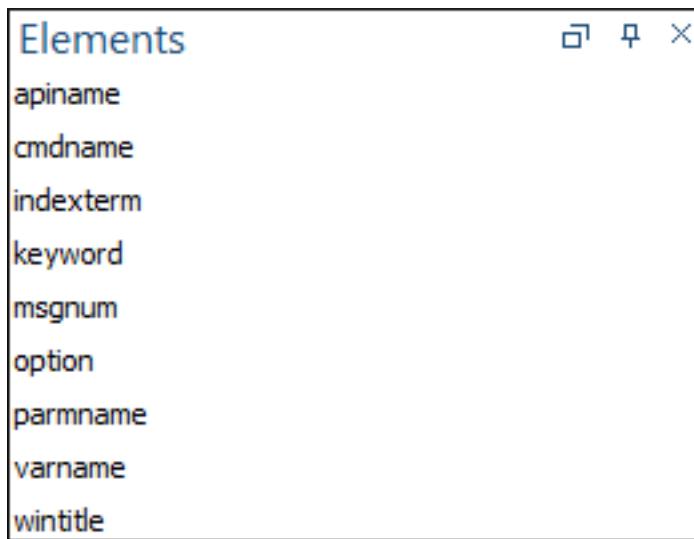

Figure 60: Elements View in Text Mode

Entities View

[Edit on
GitHub](#)

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (<, >, &, ', ").
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note: If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Entities	
Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbspace	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

Figure 61: Entities View

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

[Edit on GitHub](#)

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. Those actions include the following:

- [Validate action](#)
- [Transform action](#)
- [Check Spelling in Files action](#)
- [Find All action from the Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)

- *XPath expression results*
- *SQL results*

Re

Figure 62: Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

Grouping options drop-down menu

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for

the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).
- No grouping rule for the results of [applying an XPath expression](#).

Highlight all results in editor

Oxygen XML Author highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

Note: To customize highlighting behavior, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in the table grid:

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

Previous message

Navigates to the message above the current selection.

Next message

Navigates to the message below the current selection.

Remove selected

Removes selected messages from the view.

Remove all

Removes all messages from the view.

Copies the information associated with the selected messages:

- The file path of the document that triggered the output message.
- The path of the main file (in the case of a *validation scenario*, it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.).
- Name of validating processor.
- Name of *validation scenario*.
- The line and column in the file that triggered the message.

Select All

Extends the selection to all the messages from the view.

Print Results

Sends the complete list of messages to a printer. For each message the included details are the same as the ones for *the Copy action*.

Save Results

Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for *the Copy action*.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for *the Copy action*.

Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the *Check Spelling in Files action*.
- No grouping rule for the results of *applying an XPath expression*.

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Window > Results Menu

The following actions are also available from the **Window > Results** menu:

Save Results	Saves the complete list of messages in a file in text format.
Print Results	Sends the complete list of messages to a printer.
Close	Closes the current tab.
Close All Tabs	Closes all opened tabs.
Close Other Tabs	Closes all other opened tabs, other than the current one.

Syntax Highlight Depending on Namespace Prefix

[Edit on GitHub](#)

The *syntax highlight scheme of an XML file type* allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. *Marking tags with different colors based on the namespace prefix* allows easier identification of the tags.

```

3 ▾   <xsl:template match="name">
4 ▾     <fo:list-item>
5 ▾       <fo:list-item-label end-indent="label-end()">
6         <fo:block text-align="end" font-weight="bold">Full Name</fo:block>
7       </fo:list-item-label>
8 ▾       <fo:list-item-body start-indent="body-start()">
9         <xsl:apply-templates select="*"/>
10        </fo:list-item-body>
11      </fo:list-item>
12    </xsl:template>

```

Figure 63: Example of Coloring XML Tags by Prefix

Presenting Validation Errors in Text Mode

[Edit on GitHub](#)

Oxygen XML Author can be configured to *automatically validate documents* while editing in the **Text** mode, and actions are also available to *manually validate documents* on-request.

A line with a validation error or warning is marked in the editor panel by underlining the error region with a red line, while validation warnings are underlined in yellow. Hovering over a validation error presents a tooltip message with more details about the error and *possible quick fixes* (if available for that error or warning).

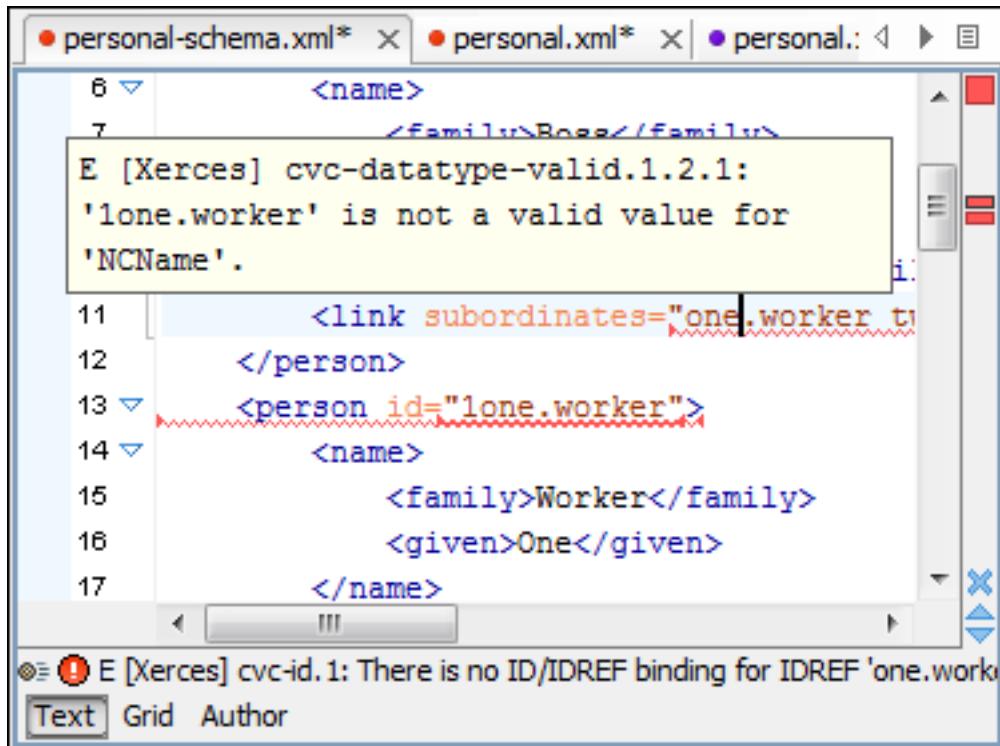

Figure 64: Presenting Validation Errors in Text Mode

Also, the ruler on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The ruler contains the following:

Upper Part of the Ruler

A success indicator square will turn green if the validation is successful, red if validation errors are found, or yellow if validation warnings are found. More details about the errors or warnings are displayed in a tool tip when you hover over indicator square. If there are numerous errors, only the first three are presented in the tool tip.

Middle Part of the Ruler

Errors are depicted with red markers, and warnings with yellow markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the [**Maximum number of validation highlights** option](#).

Clicking a marker will highlight the corresponding text area in the editor. The error or warning message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [Document Checking preferences page](#)).

Bottom Part of the Ruler

Two navigation arrows () allow you to skip to the next or previous error. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and

**Document > Automatic validation > Previous error
(Ctrl + Comma (Command + Comma on OS X)).**

Also, the  button can be used to clear all the error markers.

Status messages from every validation action are logged in the [Information view](#).

If you want to see all the validation error messages grouped in the [Results panel](#), you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

[Validating XML Documents Against a Schema](#) on page 571

Bidirectional Text Support in Text Mode

[Edit on GitHub](#)

Bidirectional documents contain text in both directions, usually involving characters from unique types of alphabets.

If bidirectional text (such as Arabic or Hebrew languages), certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Author displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters.

You can also configure the support for bidirectional text in the **Open/Save** preferences page. To enable or disable this support, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Open/Save**, and choose the appropriate setting in the **Support for Special Characters** section.

Note: Disabling this support may affect text rendering, cursor positioning and navigation, as well as text selection and management operations. If you need to open [very large documents](#), the bidirectional editing support can also be disabled to enhance performance while editing.

Restriction: Bidirectional content in the **Text** mode cannot be rendered using **Bold** or **Italic**.

Related information

[Bidirectional Text Support in Grid Mode](#) on page 275

[Inserting Symbols](#) on page 317

Grid Editing Mode

[Edit on GitHub](#)

The Oxygen XML Author **Grid** editor displays the XML document as a structured grid of nested tables. To activate this mode, select **Grid** at the bottom of the editing area.

Modify Content Without Working with XML Tags

If you are a non-technical user, you can modify the text content of the edited document without working with the XML tags directly. You can expand and collapse the tables using the mouse cursor and also display or hide the elements of the document as nested. The document structure can also be changed easily with drag and drop operations on the grid components.

Changing the Font Size

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

Increase editor font (<u>Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Command + MouseWheelForward on OS X)</u>)	Increases the font size with one point for each execution of the action.
Decrease editor font (<u>Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on OS X)</u>)	Decreases the font size with one point for each execution of the action.
Normal editor font (<u>Ctrl + 0 (Command + 0 on OS X)</u>)	Resets the font size to <i>the value of the editor font set in the Fonts preferences page</i> .

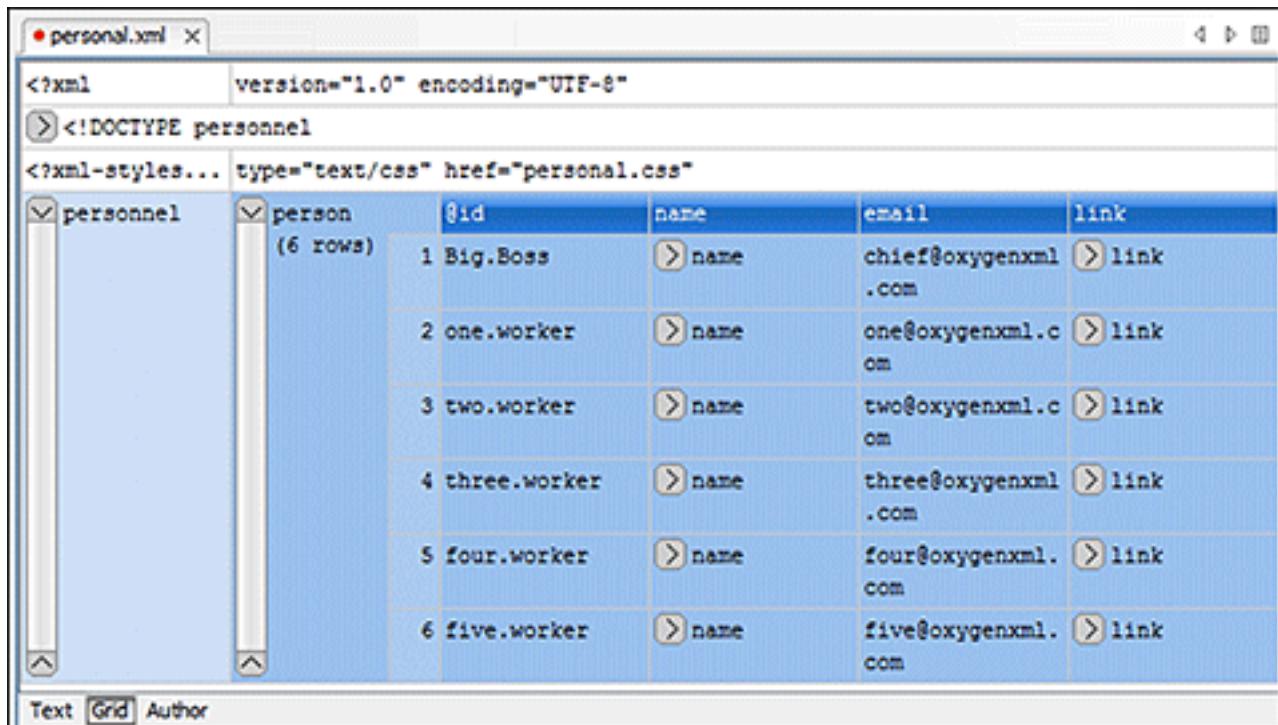

Figure 65: Grid Editing Mode

Switch Editing Modes

To switch back from the **Grid** mode to the **Text** or **Author** mode, use the **Text** and **Grid** buttons from the bottom of the editor. You are also able to perform this switch from **Document > Edit Mode > Grid** and **Document > Edit Mode > Text**.

Content Completion Assistant

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the editor offers a **Content Completion Assistant** for the elements and attributes names and values. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are automatically included.

To display the content completion pop-up menu, you have to start editing (for example, double-click a cell). Pressing **Ctrl + Space (Command + Space on OS X)** on your keyboard also displays the pop-up menu.

xs:annotation	xs:complexType
> xs:annotation	xs:complexType
< xs:annotation > xs:documentation #text	> xs:complexType
Defines text comments in a schema.	xs:appinfo xs:documentation
> xs:annotation	> xs:complexType
> xs:annotation	

Figure 66: Content Completion in Grid Editing Mode

To watch our video demonstration about some of the features available in the **Grid** editor, go to http://oxygentools.com/demo/Grid_Editor.html.

Layouts: Grid and Tree

[Edit on GitHub](#)

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

<?xml version="1.0" encoding="UTF-8"						
test	table	tr (3 rows)	@id	first	last	
			1	10001	Jhon	Doe
			2	10002	Mark	Ewing
			3	10003	Dave	Flint

Figure 67: Grid Layout

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

<?xml	version="1.0" encoding="UTF-8"			
└ test	└ table	└ tr	@id	10001
			first	Jhon
			last	Doe
		└ tr	@id	10002
			first	Mark
			last	Ewing
		└ tr	@id	10003
			first	Dave
			last	Flint

Figure 68: Tree Layout

To switch between the two modes, go to **Document > Grid Layout > Grid mode/Tree mode**.

Grid Mode Navigation

[Edit on GitHub](#)

At first, the content of a document opened in the **Grid** mode is collapsed. Only the root element and its attributes are displayed. The grid disposition of the node names and values is similar to a web form or dialog box. The same set of key shortcuts used to select dialog box components is also available in the **Grid** mode:

Table 4: Shortcuts in the Grid Mode

Key	Action
Tab	Moves the cursor to the next editable value in a table row.
Shift + Tab	Moves the cursor to the previous editable value in a table row.
Enter	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.
UpArrow/PageUp	Navigates toward the beginning of the document.
DownArrow/PageDown	Navigates toward the end of the document.
Shift	Used in conjunction with the navigation keys to create a continuous selection area.
Ctrl (Command on OS X) key	Used in conjunction with the mouse cursor to create discontinuous selection areas.

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on OS X)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on OS X)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on OS X)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on OS X)** scrolls the grid to the right.

An arrow sign displayed at the left of the node name indicates that this node has child nodes. To display the children, click this sign. The expand/collapse actions can be invoked either with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu or from **Document > Grid Expand/Collapse**.

The following actions are available on the **Expand/Collapse** menu:

 Expand All	Expands the selection and all its children.
 Collapse All	Collapses the selection and all its children.
Expand Children	Expands all the children of the selection but not the selection.
Collapse Children	Collapses all the children of the selection but not the selection.
Collapse Others	Collapses all the siblings of the current selection but not the selection.

Bidirectional Text Support in Grid Mode

[Edit on GitHub](#)

If you are editing documents with a bidirectional text orientation, you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation(Ctrl + Shift + O (Command + Shift + O on OS X))** action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note: This change applies only to the text from the cells, and not to the layout of the grid editor.

<?xml version="1.0" encoding="UTF-8"

Author Editing Mode

[Edit on GitHub](#)

The **Author** editing mode in Oxygen XML Author allows you to visually edit XML documents in a visual interface that is similar to a WYSIWYG word processor.

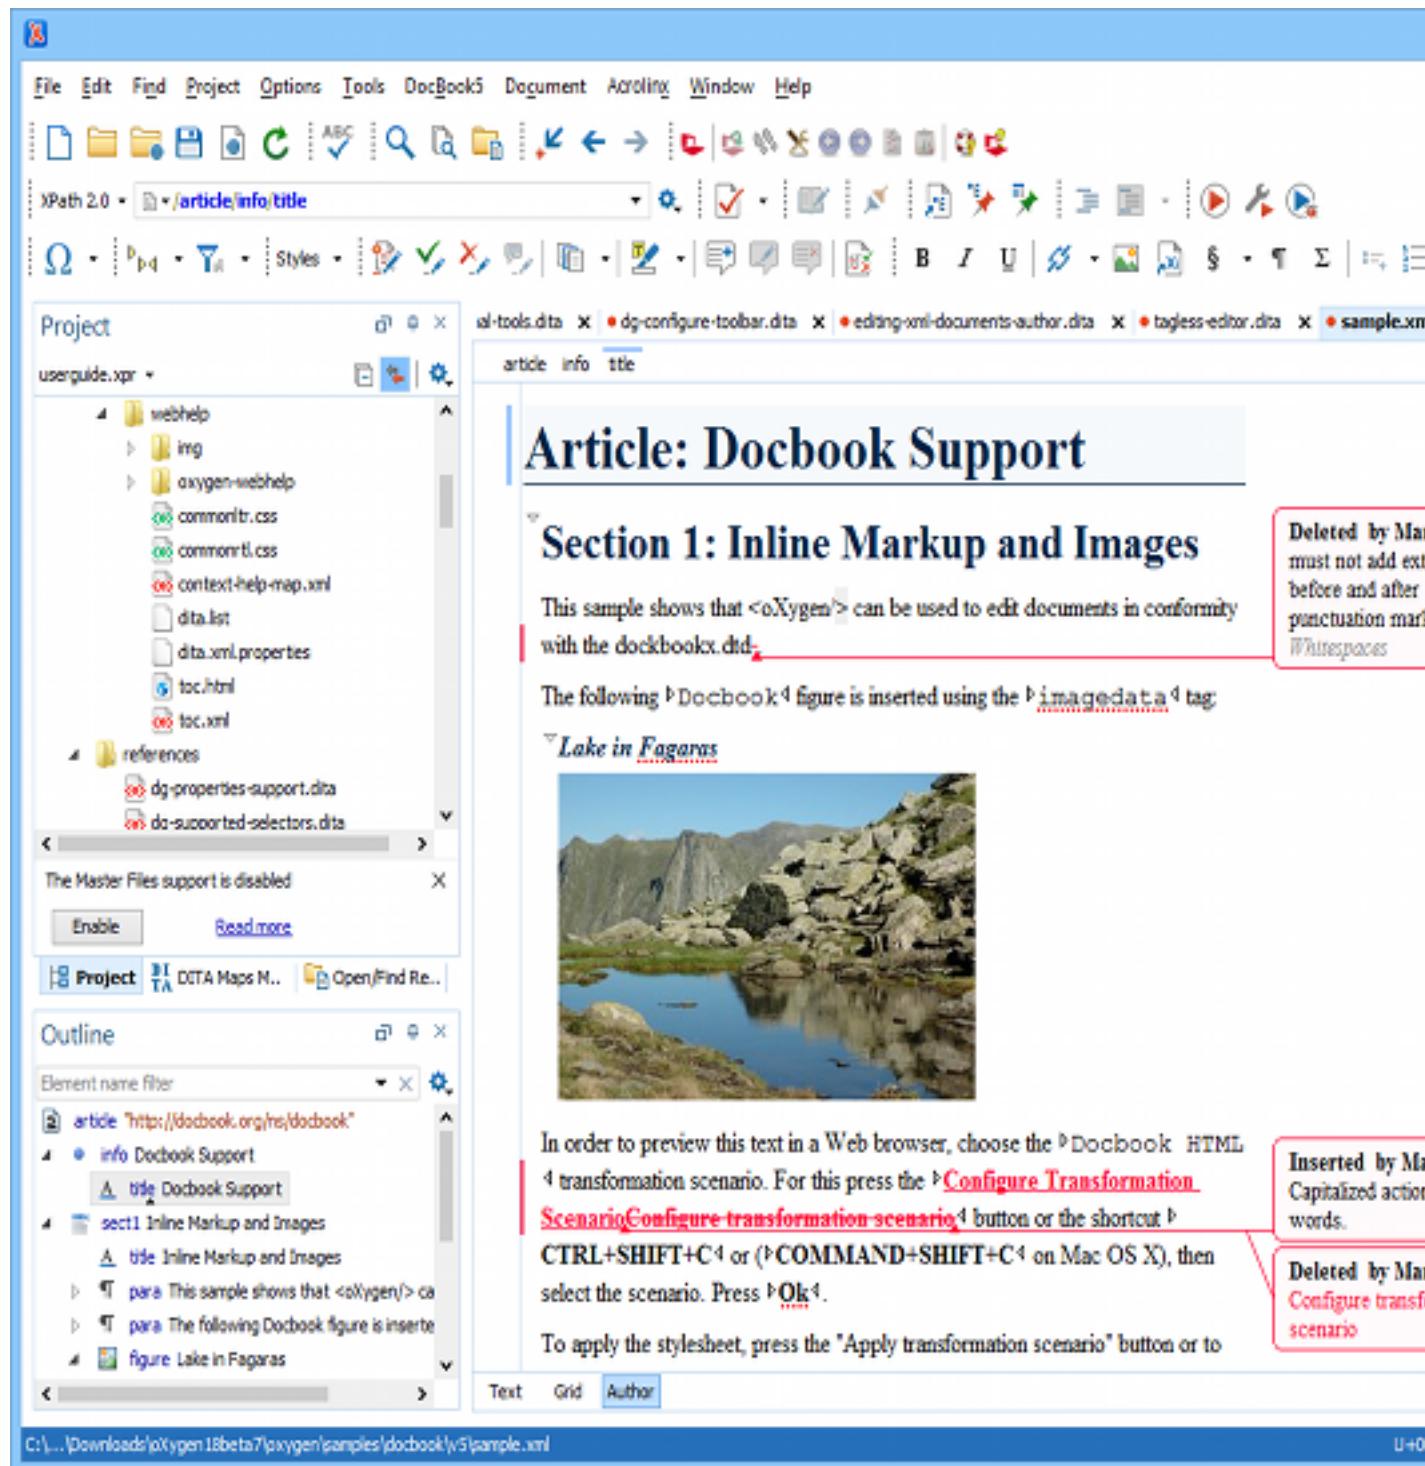

Figure 71: Author Editing Mode

Navigating the Document Content in Author Mode

[Edit on GitHub](#)

Oxygen XML Author includes some useful features to help you navigate XML documents.

Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Tab** key to move the cursor to the next XML node and **Shift + Tab** to go to the previous one. If you encounter a space preserved element when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a space preserved element and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

Navigating with the Outline View

Oxygen XML Author includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

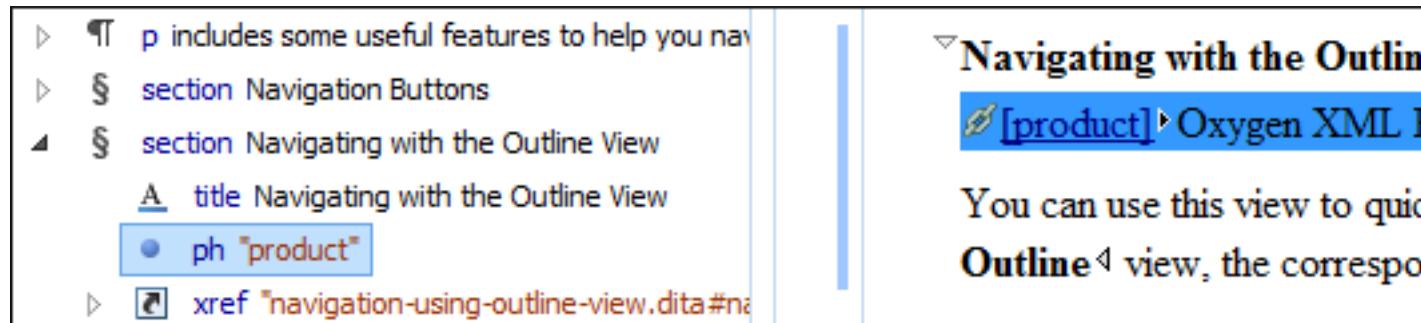

Figure 72: Outline View Navigation in Author Mode

Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

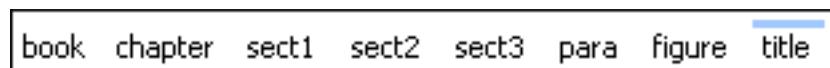

Figure 73: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the **linking support** is useful for navigating between the documents. In the predefined customizations that are

bundled with Oxygen XML Author, links are marked with an icon representing a chain link (). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

Note: Depending on the referenced file type, the target link will either be opened in the Oxygen XML Author or in the default system application. If the target file does not exist, Oxygen XML Author prompts you to create it.

Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the **Options > Menu Shortcut Keys** menu.

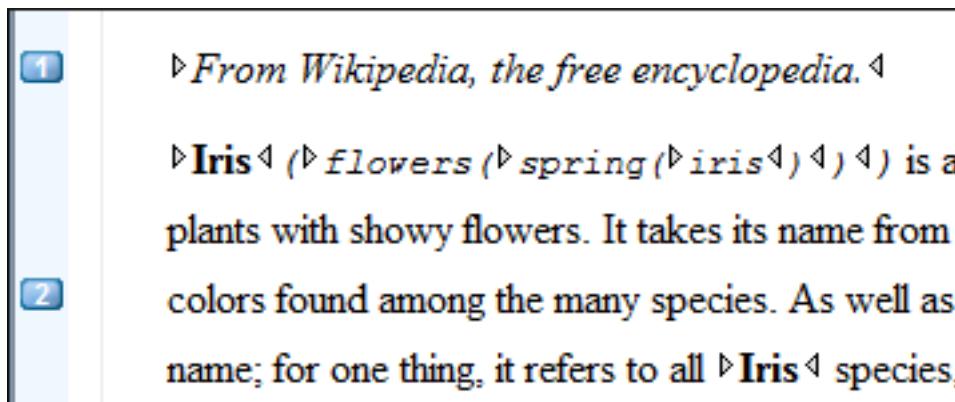

Figure 74: Editor Bookmarks

A bookmark can be inserted in **Author** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl + F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

Author Mode Views

[Edit on GitHub](#)

The content author is supported by special views that are automatically synchronized with the current editing context of the editor panel. The views present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is a large selection of useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Author** mode.

Project View

[Edit on GitHub](#)

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

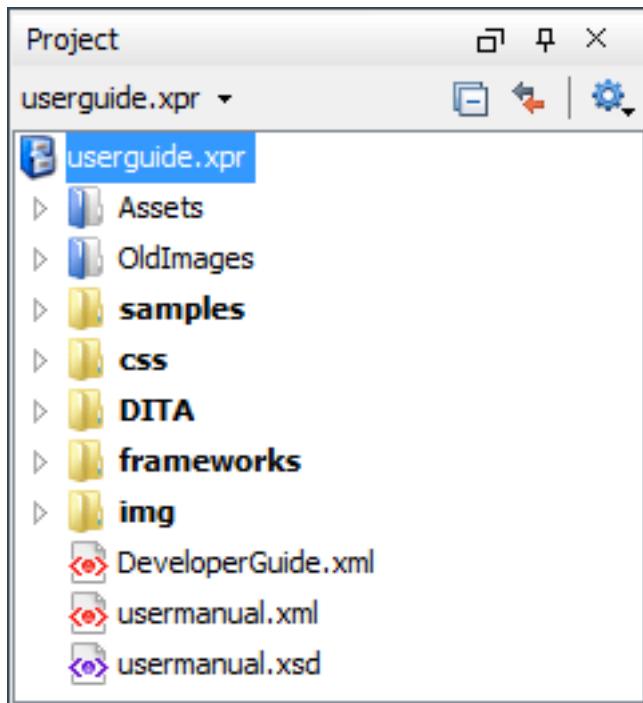

Figure 75: Project View

By default, the view is positioned on the left side of the Oxygen XML Author window, above the **Outline view**. If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

New Project

Creates a new, empty project.

The following actions are grouped in the upper right corner:

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

When selected, the project tree highlights the currently edited file, if it is found in the project files.

Note: This button is disabled automatically when you move to the **Debugger** perspective.

A submenu that contains the following actions:

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

When selected, linked files and folders are presented with a full file path.

Select this option to enable the *Master Files support*.

Allows you to change the collection of documents that define the context of the *search and refactor operations*.

- **Use only Master Files, if enabled** - Restricts Oxygen XML Author to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of

the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- *Logical folders* - marked with a blue icon on Windows and Unix/Linux () and a magenta icon on Mac OS X (). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action  **Remove from Project** can be used to remove them from the project.
- *Physical folders and files* - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action  **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- *Shortcut folders and files* - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions  **Remove from Project** and  **Remove from Disk (Shift+Delete)** are available for shortcuts.  **Remove from Project** just removes the shortcut from the project, while  **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

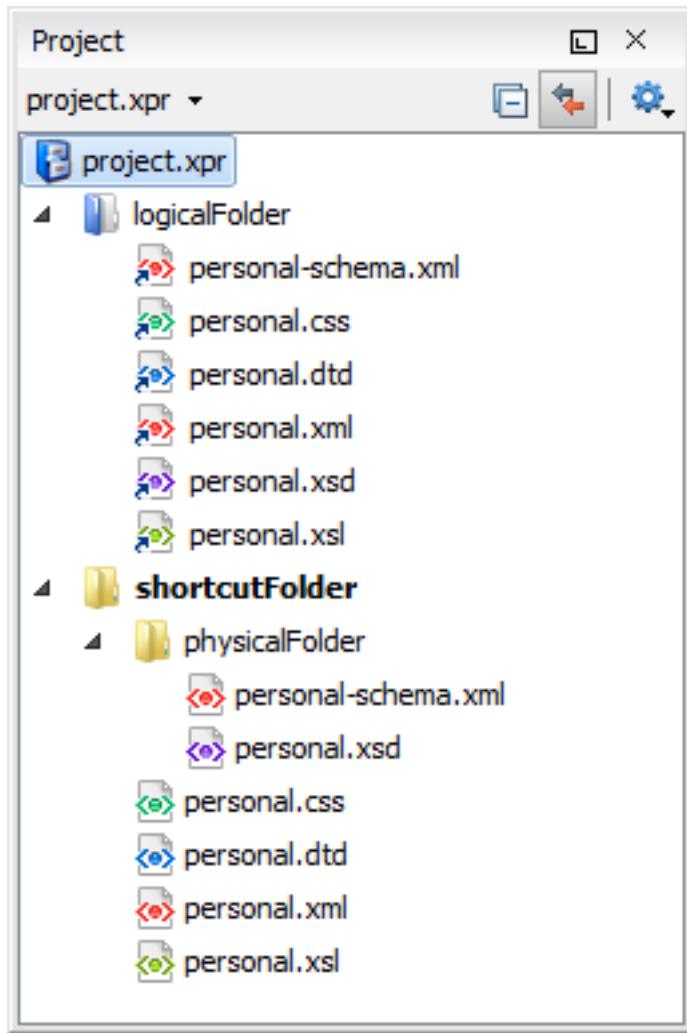

Figure 76: Project View with Examples of all Three Types of Resources

Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

Creates a new, empty project.

Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

New >  Logical Folder

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

New > Logical Folders from Web

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

 Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

 Add Files

Adds links to files on the local file system.

 Add Edited File

Adds a link to the currently edited file in the project.

Managing Project Content*Creating/Adding Files and Folders*

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be enabled in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root. To create a file inside a linked folder, select the **New >  File** action from the contextual menu.

Note: The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the

contextual menu action ** Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action ** Remove from Disk (Shift+Delete)**. The ** Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

CAUTION: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Author and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

Moving Files and Folders

You can [move the resources of the project](#) with drag and drop operations on the files and folders of the tree (the **Enable oXygen consoles** option must be enabled in the [View preferences page](#)).

You can also use the usual ** Cut**, ** Copy**, and ** Paste** actions to move resources in the **Project** view.

Renaming Files and Folders

There are three ways you can [rename an item in the Project view](#). Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

Note: The **Rename** action is also available on *logical* files.

Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a [**Validate and Check for Completeness**](#) operation.

Validate with Schema

Configure Validation Scenario(s)

Validates the selected file or files against a specified schema.

Allows you to configure and run a [*validation scenario*](#).

Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

Refactoring Actions (Available for certain document types (such as XML))

Oxygen XML Author includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

Rename resource

Allows you to change the name of a resource.

Move resource

Allows you to change the location on disk of a resource.

 **XML Refactoring**

Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 *XML Refactoring tool operations* that are used will also appear in this submenu.

Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

Open

Opens the selected files in the corresponding editor.

Open with submenu

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: *DITA Maps Manager*, *Archive Browser*, *MathML Editor*, *Large File Viewer*, *Hex Viewer*, *SVG Viewer*.

Show in Explorer (or Show in Finder on OS X)

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

 **Refresh**

Refreshes the content and the dependencies between the resources in *the Master Files directory*.

 **Find/Replace in Files**

Allows you to *find and replace text in multiple files*.

 **XPath in Files**

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

 **Open/Find Resource**

Opens the *Open/Find Resource dialog box*.

 **Check Spelling in Files**

Allows you to *check the spelling of multiple files*.

 **Format and Indent Files**

Opens the *Format and Indent Files dialog box* that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

 **Open in SVN Client**

Syncro SVN Client tool is opened and it highlights the selected resource in its corresponding working copy.

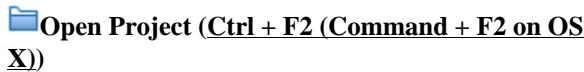

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the *Compare Files* or *Compare Directories* tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

Menu Level Actions

The following actions are available in the **Project** menu:

Save Project As

Enable Master Files Support

Show Project View

Reopen Project

Related information

[Working with EPUB](#) on page 906

Open/Find Resource View

[Edit on GitHub](#)

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Author layout, next to the **Project** and **DITA Maps Manager** views. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can also select 3 files and the tool will automatically be opened in the *three-way comparison mode*. If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Displays the properties of the current file in a **Properties** dialog box.

Creates a new, empty project.

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Allows you to save the current project under a different name.

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

Allows you to enable the *Master Files Support* for each project you are working on.

Opens a dialog box that allows you to define the context of search and refactor operations.

Displays the project view.

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

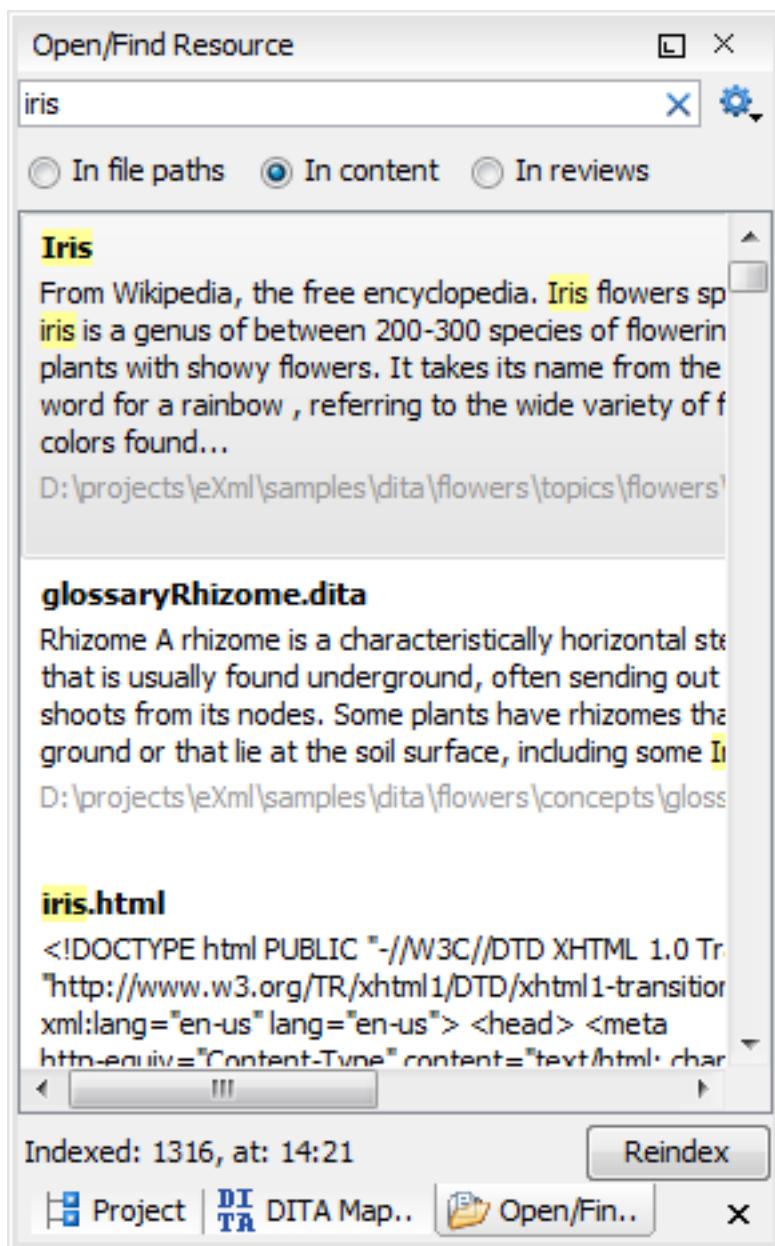

Figure 77: Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Author project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Note: Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the [Results view](#) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow**

(**Command + UpArrow on OS X**) on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note: Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for **ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for */*samples*/*.*gif* with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
 - **Clear Index** - Clears the index.
 - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
 - **Options** - Opens the *Open/Find Resource preferences page*.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the *Open/Find Resource preferences page*.

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

Important: Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

Note: You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to http://oxygenxml.com/demo/Open_Find_Resource.html.

[Open/Find Resource Dialog Box](#) on page 340

Outline View in Author Mode

[Edit on GitHub](#)

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.

- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be *disabled and enabled from a Preferences page*.

Tip: You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.

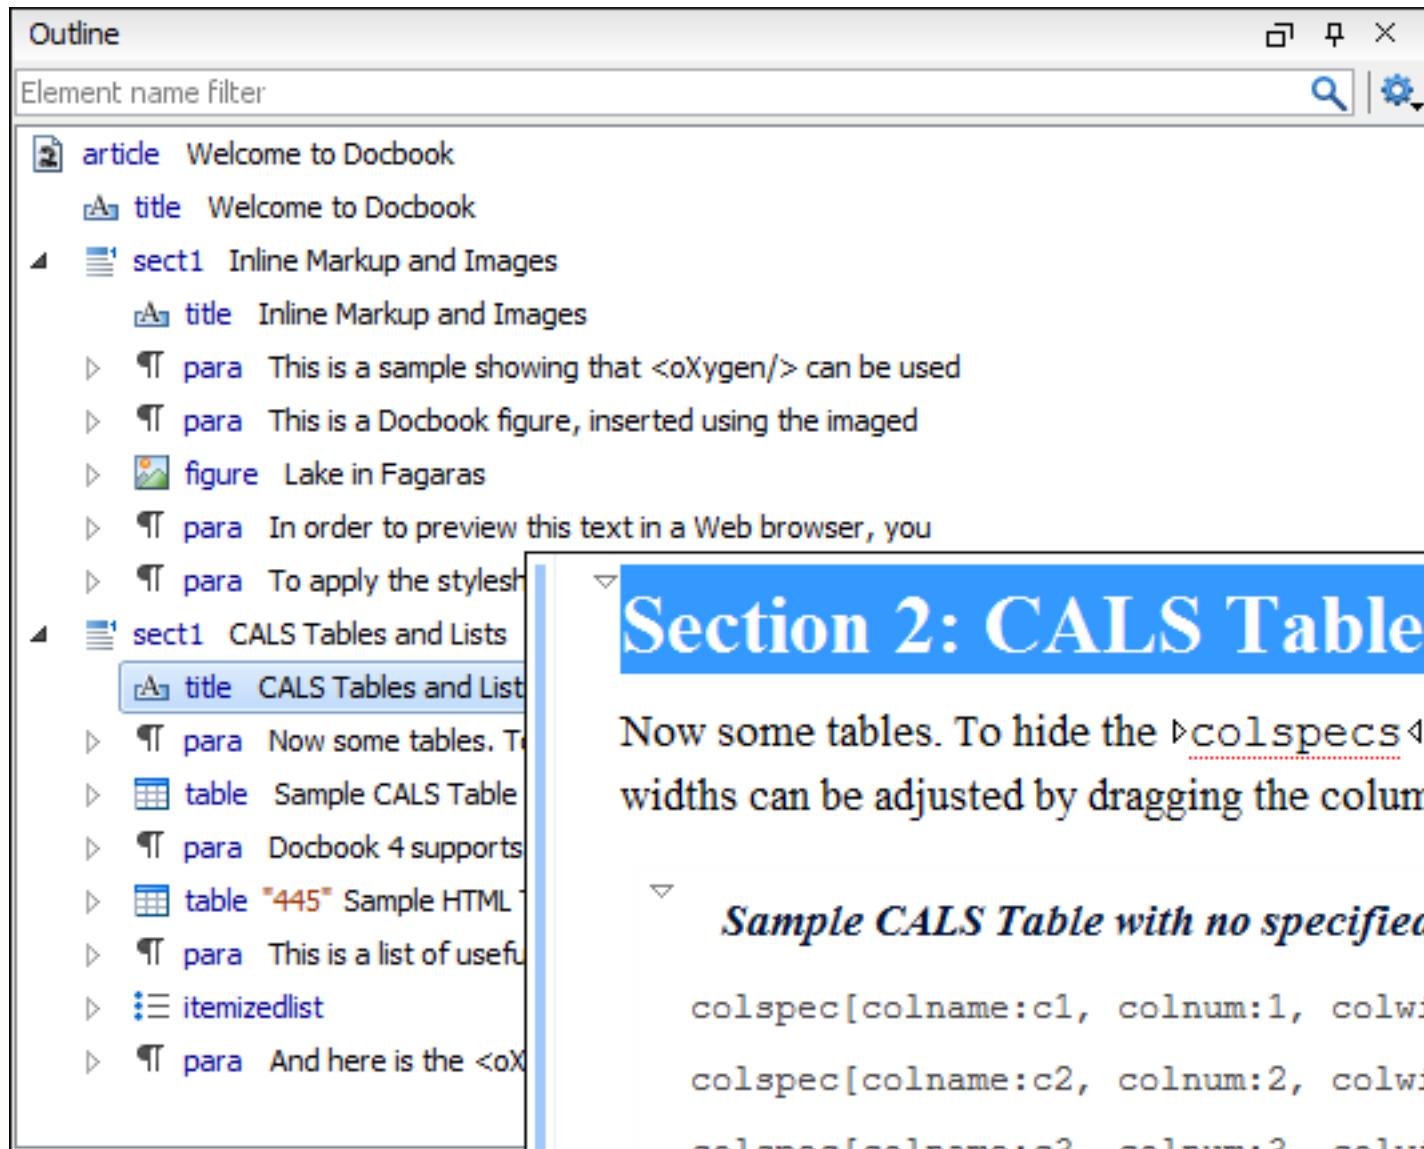

Figure 78: Outline View

Outline View Filters in Author Mode

[Edit on GitHub](#)

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Author** mode:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page](#).

Outline View Contextual Menu Actions in Author Mode

[Edit on GitHub](#)

The contextual menu of the **Outline** view in **Author** mode contains the following actions:

 **Edit Attributes**

Allows you to edit the attributes of a selected node. For more details about this action, see [Attributes View in Author Mode](#) on page 293.

Edit Profiling Attributes

Allows you to change the *profiling attributes* defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

 **Cut**,  **Copy**,  **Paste**,  **Delete** editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content. The **Paste before** and **Paste after** actions allow you to insert a well-formed element before or after the currently selected element. The **Paste as XML** action pastes copied content that is considered to be valid XML, preserving its XML structure.

 **Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If

it is already commented, this action will remove the comment.

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expands the structure tree of the currently selected element.

Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Related information

[Attributes View in Author Mode](#) on page 293

Attributes View in Author Mode

[Edit on GitHub](#)

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the **-oxy-editable** property associated with the element.
- The element is entirely included in a deleted **Track Changes** marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes with a specified value are rendered with a bold font, and their values with a plain font.

Note: The names of the attributes with an empty string value are also rendered bold.

- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as **list** in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

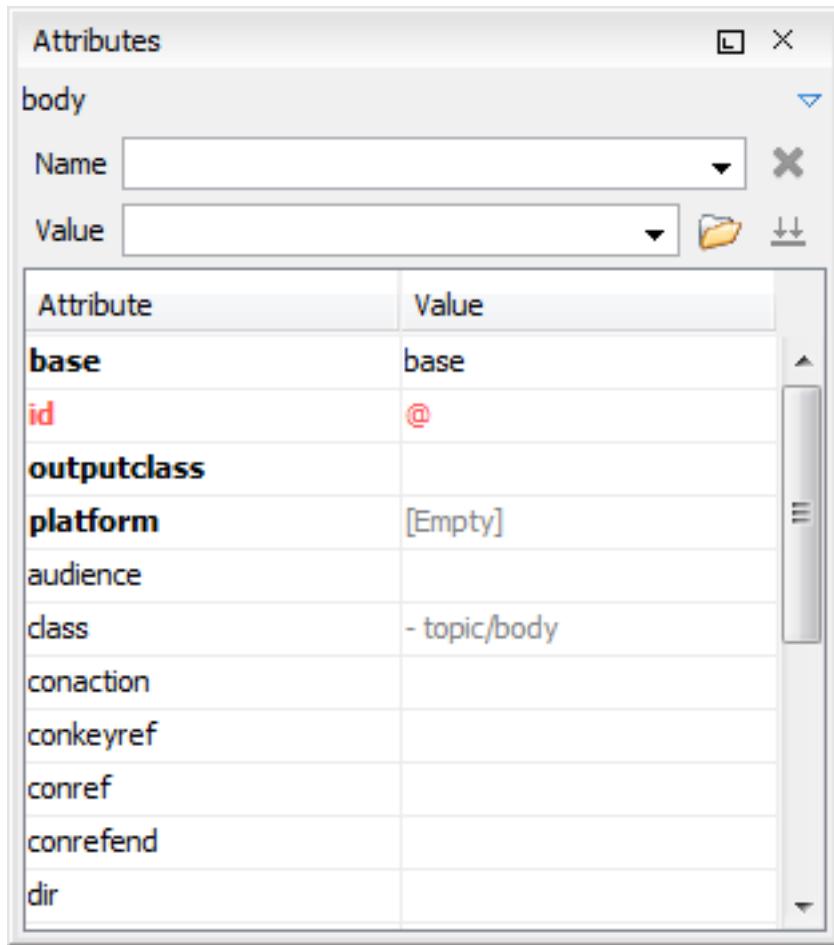

Figure 79: Attributes View

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

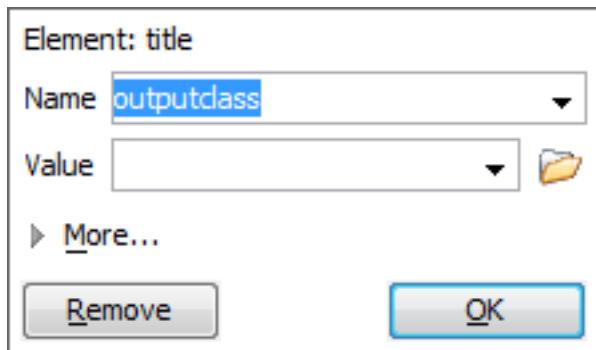

Figure 80: In-place Attributes Editor

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

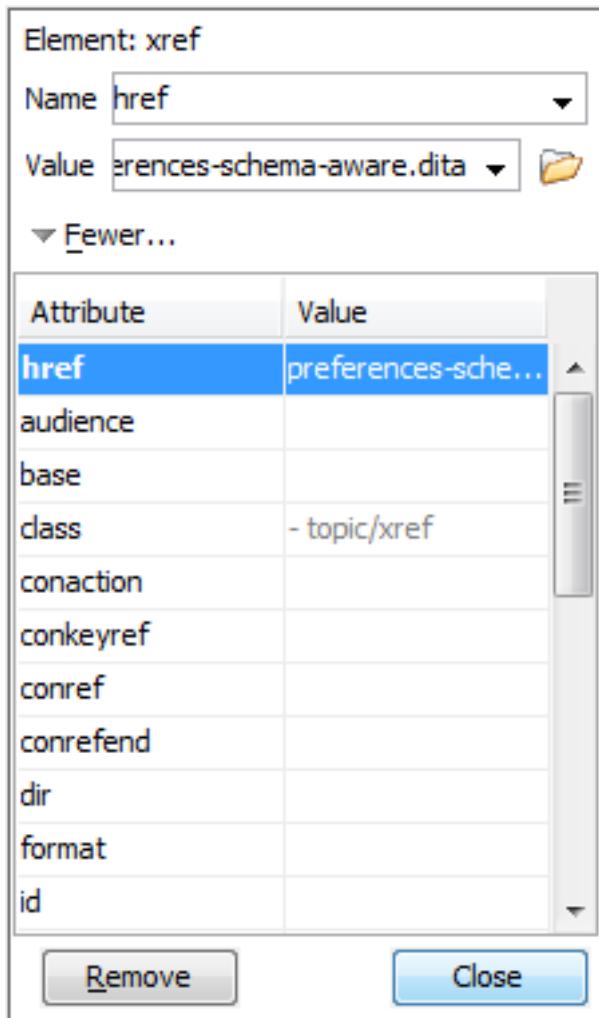

Figure 81: In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

Model View

[Edit on GitHub](#)

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

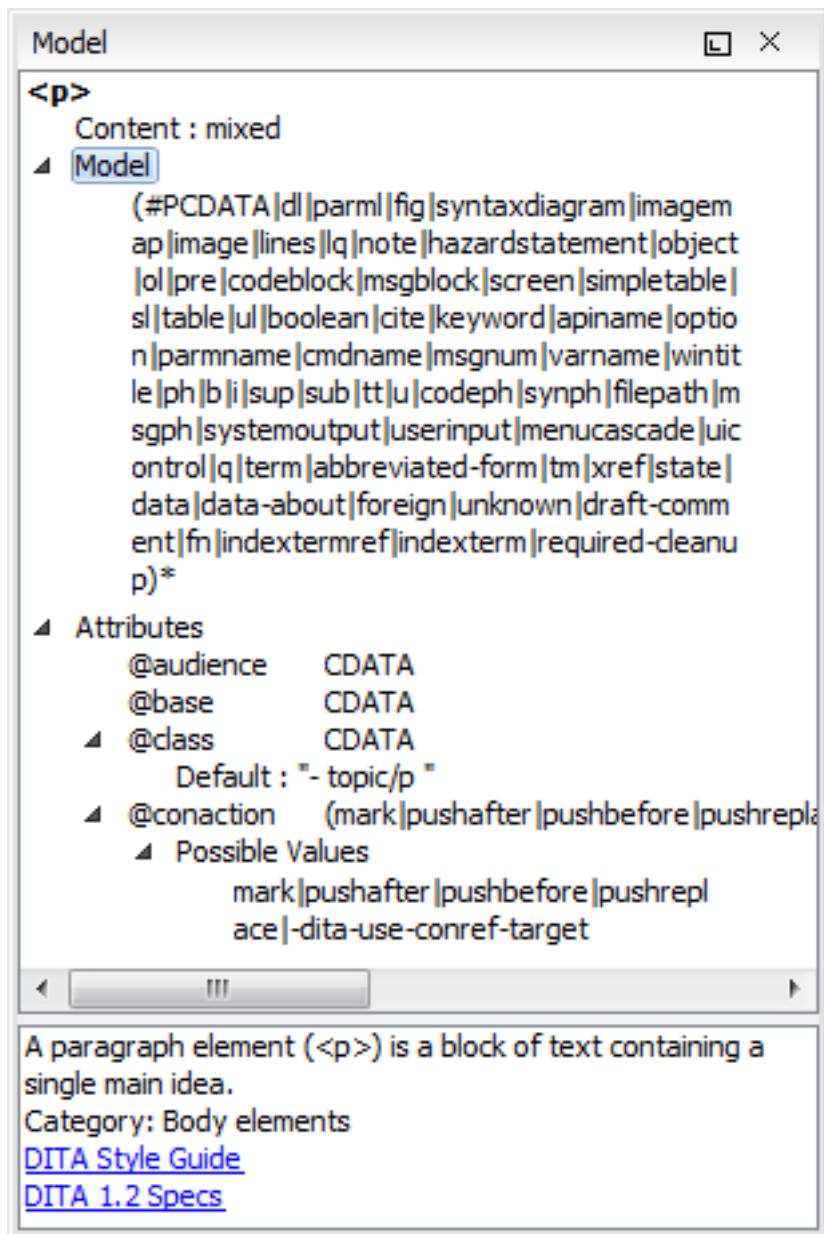

Figure 82: Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

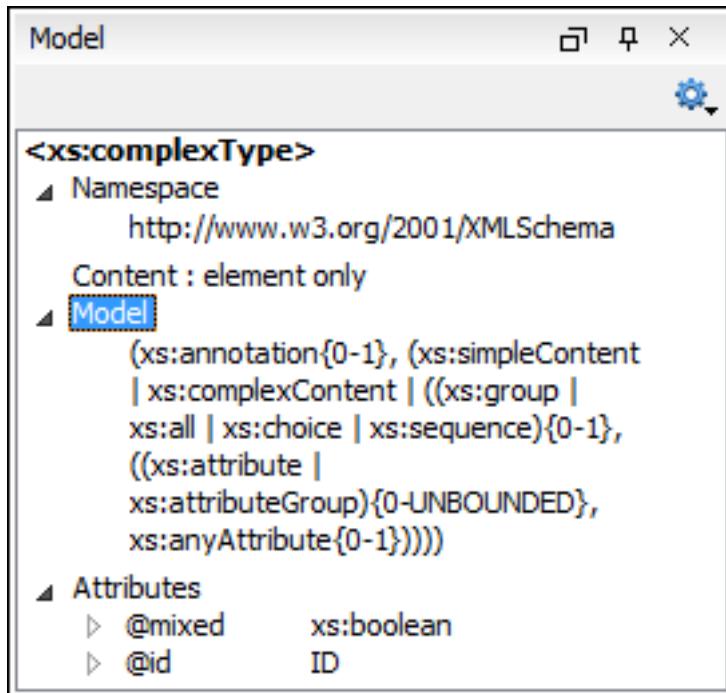

Figure 83: Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

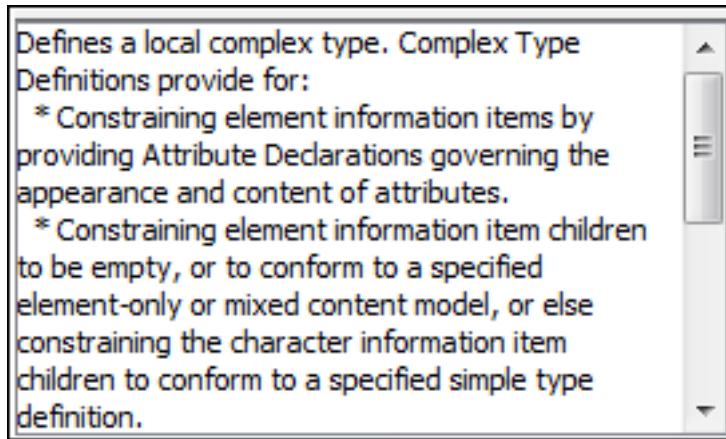

Figure 84: Annotation panel

Elements View in Author Mode

[Edit on GitHub](#)

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are

allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position** option is disabled in the [Views preferences page](#), two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

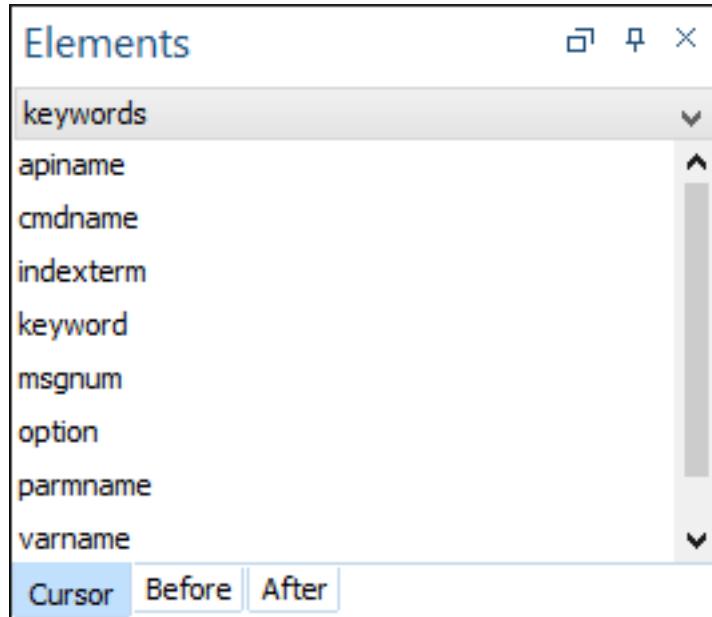

Figure 85: Elements View in Author Mode

Entities View

[Edit on GitHub](#)

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (<, >, &, ', ").
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note: If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Entities	
Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbspace	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

Figure 86: Entities View

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

[Edit on GitHub](#)

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. Those actions include the following:

- [Validate action](#)
- [Transform action](#)
- [Check Spelling in Files action](#)
- [Find All action from the Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)

- *XPath expression results*
- *SQL results*

The screenshot shows the 'Results View' window in Oxygen XML Author. At the top, there's a toolbar with a magnifying glass icon and a dropdown menu labeled 'Find in Files - Result...'. Below the toolbar is a search input field containing 'Results View'. The main area displays a hierarchical tree of XML nodes under the heading 'Description - 12 items'. The first node is 'D:\Projects\>UserGuide\|DITA\topics\batch-transformation.dita (2 items)', which has two children: 'Results View' and 'Results View point to the location of the code that triggered them.'. The second node is 'D:\Projects\>UserGuide\|DITA\topics\editor-perspective.dita (1 item)', which has one child: 'Results view - Displays result messages obtained by performing user ed...'. The third node is 'D:\Projects\>UserGuide\|DITA\topics\xpath-view.dita (1 item)', which has one child: 'The XPath Results View'. The entire tree is displayed in a light gray background with blue links for the node names.

Figure 87: Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

Grouping options drop-down menu

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for

the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [*Check Spelling in Files action*](#).
- No grouping rule for the results of [*applying an XPath expression*](#).

Highlight all results in editor

Oxygen XML Author highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

Note: To customize highlighting behavior, [*open the Preferences dialog box \(Options > Preferences\)*](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in the table grid:

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

Previous message

Navigates to the message above the current selection.

Next message

Navigates to the message below the current selection.

Remove selected

Removes selected messages from the view.

Remove all

Removes all messages from the view.

Copies the information associated with the selected messages:

- The file path of the document that triggered the output message.
- The path of the main file (in the case of a *validation scenario*, it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.).
- Name of validating processor.
- Name of *validation scenario*.
- The line and column in the file that triggered the message.

Select All

Extends the selection to all the messages from the view.

Print Results

Sends the complete list of messages to a printer. For each message the included details are the same as the ones for *the Copy action*.

Save Results

Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for *the Copy action*.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for *the Copy action*.

Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the *Check Spelling in Files action*.
- No grouping rule for the results of *applying an XPath expression*.

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

**Collapse All**

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Window > Results Menu

The following actions are also available from the **Window > Results** menu:

Save Results

Saves the complete list of messages in a file in text format.

Print Results

Sends the complete list of messages to a printer.

Close

Closes the current tab.

Close All Tabs

Closes all opened tabs.

Close Other Tabs

Closes all other opened tabs, other than the current one.

CSS Inspector View[Edit on](#)[GitHub](#)

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

The screenshot shows the CSS Inspector view in Oxygen XML Author. The window title is "CSS Inspector". The main content area displays the following CSS code:

```
*[attr='val'] {
    text-decoration:underline;
}

job {
    display:block;
    color:blue;
    margin-top:2em;
    margin-right:2em;
    margin-left:2em;
    margin-bottom:2em;
    font-weight:bold;
    font-size:large;
    text-decoration:none;
}

Inherited from doc
doc {
    font-family:arial , helvetica , sans-serif;
}
```

The code is organized into sections: one for the rule `*[attr='val']` at line 44 of `test.css`, one for the `job` class at line 35 of `test.css`, and one for the inherited styles from the `doc` element at line 1 of `test.css`. The `text-decoration` property in the first section and the `text-decoration:none` in the `job` class are crossed out, indicating they are overridden.

At the bottom of the window, there is a navigation bar with tabs: Element, :before, :after, Computed, and Path. The "Element" tab is currently selected.

Figure 88: CSS Inspector View

Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Author opens the associated CSS file at the line number where the properties of the rule are defined.

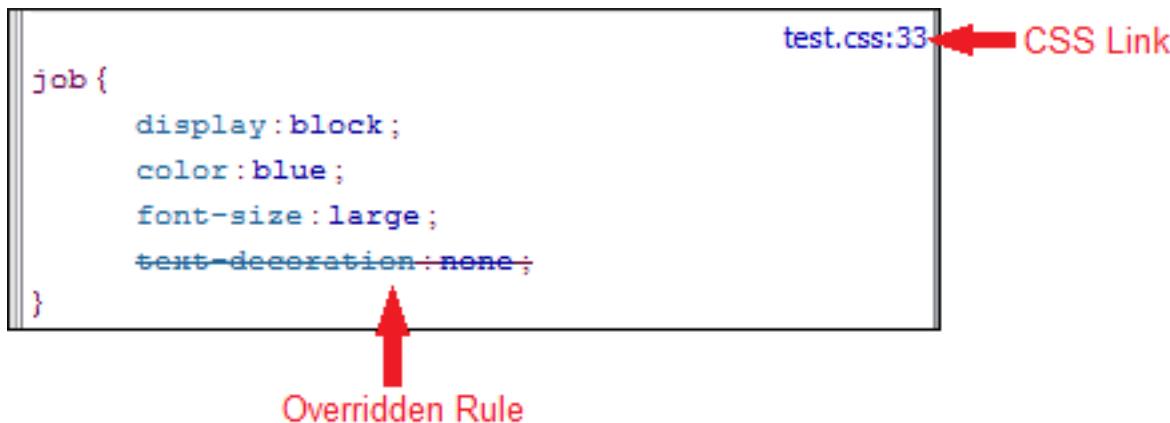

Figure 89: CSS Inspector View - Displaying Rules

The CSS Inspector view contains five tabs:

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:before** - Displays the rules matching the **:before** pseudo-element.
- **:after** - Displays the rules matching the **:after** pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane
- **Show empty rules** - forces the view to show all the matching rules, even if they do not declare any CSS properties (by default, the empty rules are not displayed)

Displaying the Markup

[Edit on GitHub](#)

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the  **Tags Display Mode** drop-down menu (available on the toolbar):

 **Full Tags with Attributes**

Displays full tag names with attributes for both block and in-line elements.

 **Full Tags**

Displays full tag names without attributes for both block and in-line elements.

 **Block Tags**

Displays full tag names for block elements and simple tags without names for in-line elements.

▶ **Inline Tags**

Displays full tag names for in-line elements, while block elements are not displayed.

▶▶ **Partial Tags**

Displays simple tags without names for in-line elements, while block elements are not displayed.

✗ **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

To set a default tags mode, go to [Author preferences page](#) and configure the **Tags Display Mode** options.

Note: The graphical format of the tags is controlled from the associated CSS via the `display` property. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

Displaying Referenced Content

[Edit on GitHub](#)

The references to entities, XInclude, and DITA conrefs are expanded by default in **Author** mode and the referenced content is displayed. You can control this behavior from the [Author preferences page](#). The referenced resources are loaded and displayed inside the element or entity that refers them, however the displayed content cannot be modified directly.

```
<xi:include href="included.xml">
   Edit referenced content
  Included paragraph.
</xi:include>
```

Figure 90: XInclude reference

```
 Edit entity referenced content
*:before{
  color:black;
  background-color:inherit;

  font-family:monospace;
  font-style:normall;
}
```

Figure 91: External entity reference

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the referenced resource in an editor. The referenced resource can be opened quickly by clicking the link (marked with the  icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case the cursor is placed

at the precise location where the action was invoked in the main file). The referenced resource is resolved through the XML Catalog set in **Preferences**.

The referenced content is refreshed:

- Automatically, when it is modified and saved from Oxygen XML Author.
- On demand, by using the *Refresh references action*. Useful when the referenced content is modified outside the Oxygen XML Author scope.

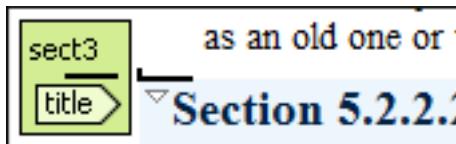

Visual Hints for the Cursor Position

[Edit on GitHub](#)

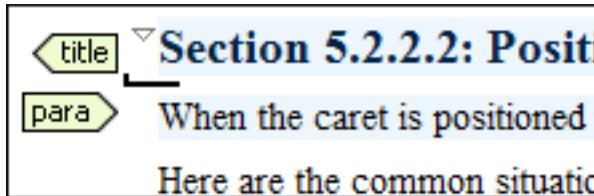

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

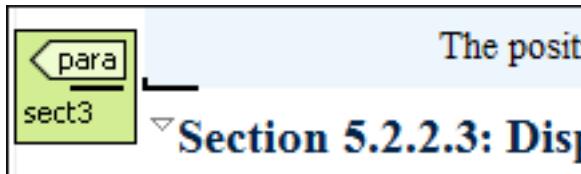

- **Before first block** - The cursor is positioned before the first block child of the current node.

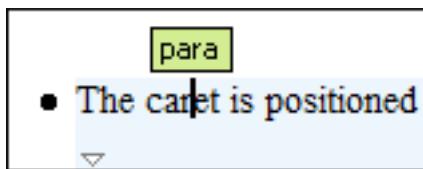

- **Between two block elements** - The cursor is positioned between two block elements.

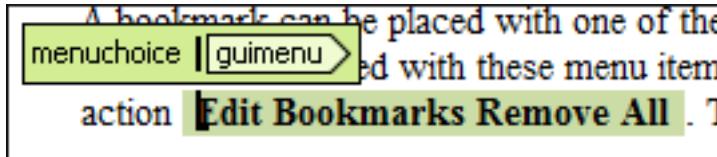

- **After last block** - The cursor is positioned after the last block element child of the current node.

- **Inside a node** - The cursor is positioned inside a node.

- **Before an inline element** - The cursor is positioned inside an element, before an inline child element.

- **Between two inline elements** - The cursor is positioned between two inline elements.

Bookmark can be placed with one of the menu items associated with `guisubmenu`, `guimenuitem`, `menuchoice` or `menuitem`. The cursor can be positioned after an inline element, after an inline child element, or on the **Edit Bookmarks** or **Remove All** buttons.

- After an inline element - The cursor is positioned inside an element, after an inline child element.

A bookmark can be placed with one of the menu items associated with `guimenuitem`, `menuchoice` or `menuitem`. The cursor can be positioned after an inline element, after an inline child element, or on the **Edit Bookmarks** or **Remove All** buttons.

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Author > Cursor Navigation**, and disable the [Show cursor position tooltip option](#). Even if this option is **disabled**, you can trigger the display of the position tooltip by pressing **Shift+F2**.

Note: The position information tooltip is not displayed if [Full Tags with Attributes or Full Tags is selected in the Tags display mode drop-down menu](#).

Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Author displays a transparent preview of the position information, called the *Location Tooltip*:

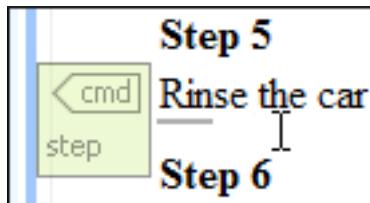

Figure 92: Location Tooltip

Oxygen XML Author displays a *Location Tooltip* when the following conditions are met:

- You are editing the document in one of the following [tags display modes](#): **Inline Tags**, **Partial Tags**, **No Tags**.
- The mouse pointer is moved between block elements.

To activate or deactivate this feature, use the [Show location tooltip on mouse move option](#) in the [Cursor Navigation preferences page](#).

Presenting Validation Errors in Author Mode

[Edit on GitHub](#)

Oxygen XML Author can be configured to [automatically validate documents](#) while editing in the **Author** mode, and actions are also available to [manually validate documents](#) on-request.

Validation errors are marked in **Author** mode with a red underline, while validation warnings are underlined in yellow. Hovering over a validation error presents a tooltip message with more details about the error and [possible quick fixes](#) (if available for that error or warning).

Information about the error is also displayed in the message area on the bottom of the editor panel (clicking the  icon) opens the [Document Checking preferences page](#). Some errors include an  icon that provides a link to a style guide or specification.

The screenshot shows the Oxygen XML Editor interface. At the top, there's a toolbar with various icons. Below the toolbar is a menu bar with 'File', 'Edit', 'View', 'Tools', 'Help'. The main area has a title 'Resources' with a small icon. Below it is a list of links:

- [product] ▷ Oxygen XML Editor ▷ Blog Site ▷
- [product] ▷ Oxygen XML Editor ▷ Forum ▷
- [product] ▷ DITA Style Guide Best Practices for Authors ▷
- ▷ Publishing DITA and DocBook to WebHelp ▷

 A message at the bottom left says 'E [REF] Link or cross reference must contain a valid href or keyref attribute; no link target is specified.' Below the message are three buttons: 'Text', 'Grid', and 'Author' (which is highlighted). On the right side of the editor panel, there's a vertical ruler with several colored squares (green, red, yellow) indicating validation status.

Figure 93: Presenting Validation Errors in Author Mode

Also, the ruler on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The ruler contains the following:

Upper Part of the Ruler

A success indicator square will turn green if the validation is successful, red if validation errors are found, or yellow if validation warnings are found. More details about the errors or warnings are displayed in a tool tip when you hover over indicator square. If there are numerous errors, only the first three are presented in the tool tip.

Middle Part of the Ruler

Errors are depicted with red markers, and warnings with yellow markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the [**Maximum number of validation highlights option**](#).

Clicking a marker will highlight the corresponding text area in the editor. The error or warning message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [**Document checking preferences page**](#)).

Bottom Part of the Ruler

Two navigation arrows () allow you to skip to the next or previous error. The same actions can be triggered from **Document > Automatic validation > Next error**

(**Ctrl + Period (Command + Period on OS X)**) and
Document > Automatic validation > Previous error
(**Ctrl + Comma (Command + Comma on OS X)**).

Also, the  button can be used to clear all the error markers.

Status messages from every validation action are also logged in the ***Information view***.

If you want to see all the validation error messages grouped in the ***Results panel***, you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

[Validating XML Documents Against a Schema](#) on page 571

Whitespace Handling in Author Mode

[Edit on GitHub](#)

When you edit a document in **Author** mode, Oxygen XML Author must serialize the resulting document as XML. Oxygen XML Author serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Author *formats and indents the XML document* according to the current *format and indent settings*.

Minimizing whitespace differences between versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

Entering whitespace in Author mode

Oxygen XML Author controls the entry of whitespace characters in **Author** mode according the *XML whitespace rules*, which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Author is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Author will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its *predefined document types*, Oxygen XML Author is *correctly configured to recognize preserve space elements* and to allow you to enter additional spaces in them.

If you are using a predefined document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is *configured correctly* so that Oxygen XML Author recognizes that the current element is a preserve-space element.

Bidirectional Text Support in Author Mode

[Edit on GitHub](#)

Oxygen XML Author offers support for languages that require right to left scripts. This means that authors editing documents in the **Author** mode can create and edit XML content in Arabic, Hebrew, Persian and others. To achieve this, Oxygen XML Author implements the *Unicode Bidirectional Algorithm*, as specified by the Unicode consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in **Author** mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the **Arrow keys move the cursor in the writing direction** option in the **Cursor Navigation** preferences page is disabled, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

If bidirectional text (such as Arabic or Hebrew languages), certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer) or other special characters (such as combining characters), are detected in a document, Oxygen XML Author displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters.

To watch our video demonstration about the bidirectional text support in the **Author** mode, go to http://oxygenxml.com/demo/BIDI_Support.html.

Tip: If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Author is faster than the standalone version when working with bidirectional text.
- Changing the font. For example, you could try using the **David** font in Hebrew content. If it is not already installed in your operating system, this font is available at: <https://www.microsoft.com/typography/fonts/family.aspx?FID=234>. To change the font in Oxygen XML Author, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Appearance > Fonts**, and change the font in the **Author default font** option.

Controlling the Text Direction Using XML Markup

[Edit on GitHub](#)

Oxygen XML Author Supports the following CSS properties:

Table 5: CSS Properties Controlling Text Direction

direction	Specifies the writing direction of the text. The possible values are <code>ltr</code> (the text direction is left to right), <code>rtl</code> (the text direction is right to left), and <code>inherit</code> (the direction property is inherited from the parent element).
unicodeBidi	Used along with the <code>direction</code> property to create levels of embedded text with different text directions in the same document. The possible values of this property are <code>bidi-override</code> (creates an additional level of embedding and forces all strong characters to the direction specified in the <code>direction</code>), <code>embed</code> (creates an additional level of embedding), <code>normal</code> (does not use an additional level of embedding), and <code>inherit</code> (the value of the <code>unicodeBidi</code> property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like the one below:

XML File:

```
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLPara>
</article>
```

Associated CSS File:

```
myRTLpara{
```

```
    direction:rtl;
    unicode-bidi:embed;
}
```

Oxygen XML Author recognizes the `dir` attribute on any XML document. The supported values are:

<code>ltr</code>	The text from the current element is Left to Right, embedded.
<code>rtl</code>	The text from the current element is Right to Left, embedded.
<code>lro</code>	The text from the current element is Left to Right, embedded.
<code>rlo</code>	The text from the current element is Right to Left, embedded.

The following XML document types make use of the `dir` attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

Note: When the inline element tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the **No Tags** mode versus viewing it in the **Full Tags** mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

[Edit on GitHub](#)

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

Table 6: Directional Formatting Codes

<code>U+202A (LRE)</code>	LEFT-TO-RIGHT EMBEDDING	Treats the following text as embedded left-to-right.
<code>U+202B (RLE)</code>	RIGHT-TO-LEFT EMBEDDING	Treats the following text as embedded right to left.
<code>U+202D (LRO)</code>	LEFT-TO-RIGHT OVERRIDE	Forces the following characters to be treated as strong left-to-right characters.
<code>U+202E (RLO)</code>	RIGHT-TO-LEFT OVERRIDE	Forces the following characters to be treated as strong right-to-left characters.
<code>U+202C (PDF)</code>	POP DIRECTIONAL FORMATTING CODE	Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.
<code>U+200E (LRM)</code>	LEFT-TO-RIGHT MARK	Left-to-right strong zero-width character.
<code>U+200F (RLM)</code>	RIGHT-TO-LEFT MARK	Right-to-left strong zero-width character.

To insert Unicode Direction Formatting Codes, use the ***Character Map*** dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Author offers the support for bi-directional text in all the side views (**Outline** view, **Attributes** view and so on) and text fields.

This chapter explains the editor types available in Oxygen XML Author and how to work with them for editing various types of documents.

Working with Unicode

[Edit on GitHub](#)

Unicode provides a unique number for every character, independent of the platform and language. Unicode is an internationally recognized standard, adopted by industry leaders. The Unicode is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.) and is the official way to implement ISO/IEC 10646.

It is supported in many operating systems, all modern browsers, and many other products. The emergence of the Unicode Standard, and the availability of tools supporting it, are among the most significant recent global software technology trends. Incorporating Unicode into client-server or multiple tiered applications and websites offers significant cost savings over the use of legacy character sets.

As a modern XML Editor, Oxygen XML Author provides support for the Unicode standard enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Author XML Editor uses 16 bit characters covering the Unicode Character set.

As a Java application, Oxygen XML Author includes a default Java input method for typing characters with Unicode codes. However, the default input method does not cover all the Unicode codes (for example, the codes for some accented characters or characters found in East Asian languages). Such characters can be inserted in the editor panel of Oxygen XML Author either with [the Character Map dialog box](#) available from menu **Edit > Insert from Character Map** or by installing a Java input method that supports the insertion of the needed characters. The [installation of a Java input method](#) depends on the platform (Windows, Mac OS X, Linux, etc.) and is the same for any Java application.

Note: Oxygen XML Author may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

Tip: On windows, you can enable the support for CJK (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages.**

Opening and Saving Documents with Unsupported Characters

[Edit on GitHub](#)

When loading documents, Oxygen XML Author reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Author prompts and display the **Available Java Encodings** dialog box that provides a list of all encodings supported by the Java platform.

If the opened document contains an unsupported character, Oxygen XML Author applies [the policy specified for handling such errors](#). If the policy is set to REPORT, Oxygen XML Author displays an error dialog box with a message about the character not allowed by the encoding. If the policy is set to IGNORE, the character is removed from the document displayed in the editor panel. If the policy is set to REPLACE, the character is replaced with a standard replacement character for that encoding.

While in most cases you are using UTF-8, simply changing the encoding name causes the application to save the file using the new encoding.

When saving a document edited in the **Text**, **Grid**, or **Design** modes, if it contains characters not included in the encoding declared in the document prolog, Oxygen XML Author detects the problem and signals it to the user. The user is responsible to resolve the conflict before saving the document.

When saving a document edited in the **Author** mode, all characters that fall outside the detected encoding will be automatically converted to hexadecimal character entities.

To edit documents written in Japanese or Chinese, change the font to one that supports the specific characters (a Unicode font). For the Windows platform, *Arial Unicode MS* or *MS Gothic* is recommended. Do not expect *WordPad* or *Notepad* to handle these encodings. Use *Internet Explorer* or *Word* to examine XML documents.

When a document with a UTF-16 encoding is edited and saved in Oxygen XML Author, the saved document has a byte order mark (BOM) that specifies the byte order of the document content. The default byte order is platform-

dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*) has a different BOM than a UTF-16 document created on a Mac OS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved. This behavior can be changed in Oxygen XML Author from the [Encoding preferences panel](#).

Inserting Symbols

[Edit on GitHub](#)

You can insert symbols by using the **Character Map** dialog box that can be opened with the **Edit > Insert from Character Map** action. If you have *enabled the Symbols toolbar*, you can also use the  "Symbols" drop-down menu to insert some of the most commonly used symbols and selecting **More symbols** from that menu will also open the **Character Map** dialog box.

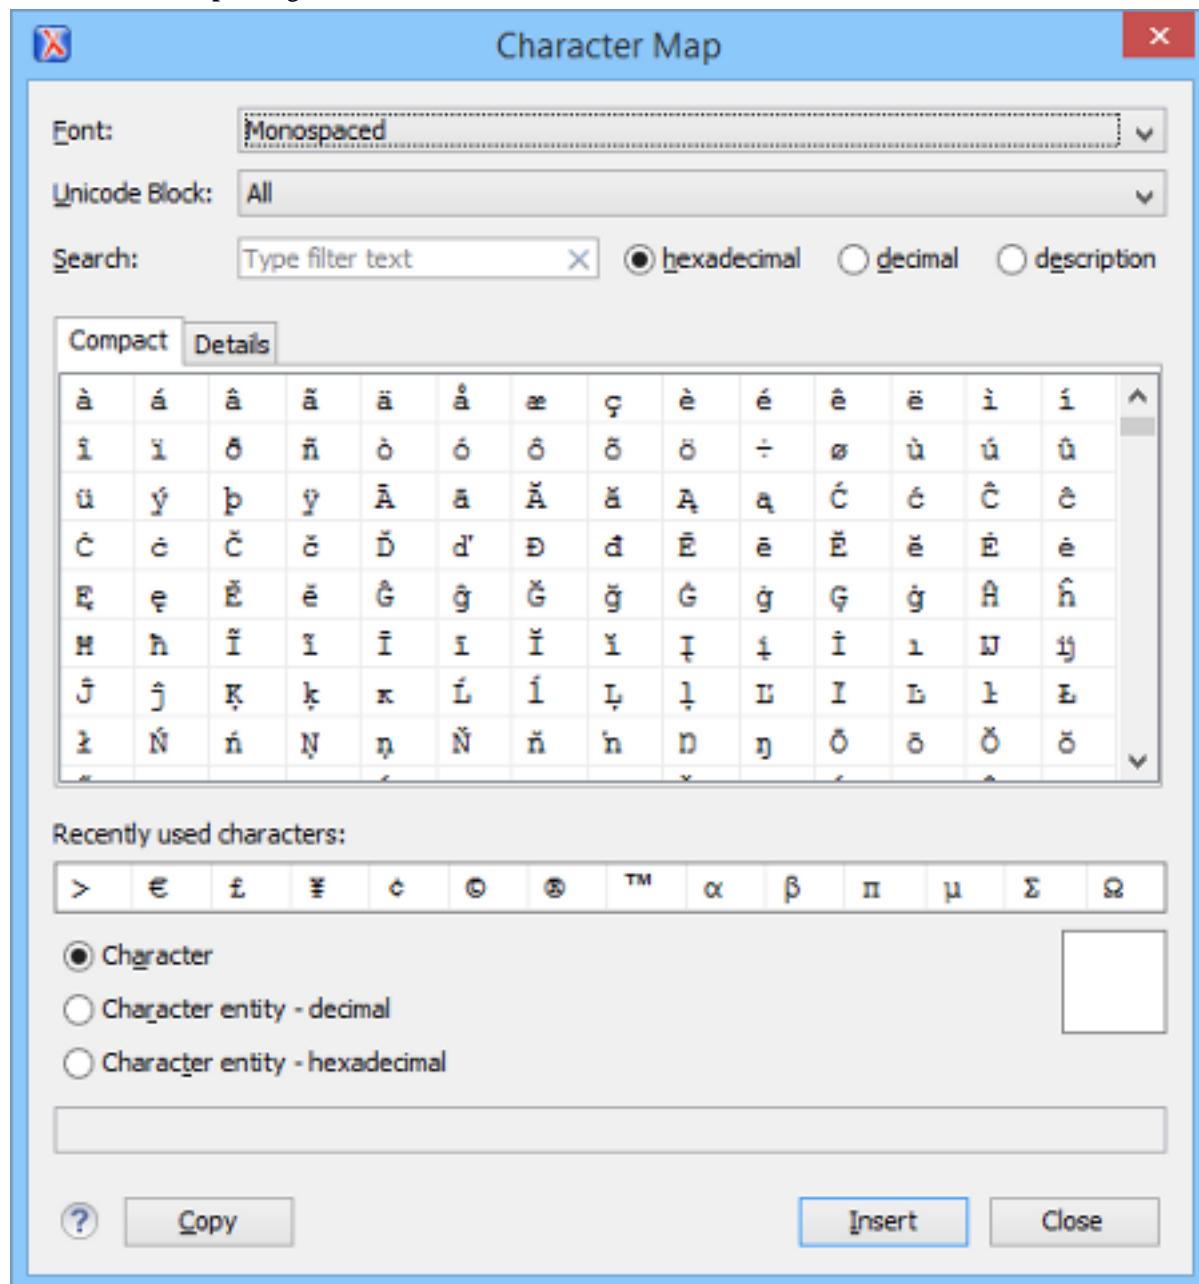

Figure 94: Character Map Dialog Box

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

Font

Use this drop-down list to choose the font for which you want to display characters.

Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

Search

Use this filter to search for a character by one of the following attributes:

- **hexadecimal**
- **decimal**
- **description**

Note: Selecting **description** opens the *Details tab*. If you enter a character description in the **Search** field, **description** is selected automatically.

Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in the **Text** editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in **Text** mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in **Author** mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the **Insert** button to insert the selected character in the current editor at cursor position. You will see the character in the editor if *the editor font* is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

Note: The **Character Map** dialog box cannot be used to insert Unicode characters in the *Grid editor*. Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in **Grid** mode.

Unicode Fallback Font Support

[Edit on GitHub](#)

Oxygen XML Author provides fonts for most common Unicode ranges. However, if you use special symbols or characters that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many Unicode characters as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Author will try to find that symbol in a *fallback* font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol ( - U+267F) into your content in a Windows operating system. By default, Oxygen XML Author does not render this symbol correctly since it is not included in any of the default fonts. It is included in *Segoe UI Symbol*, but this font is not part of the default fonts that come with Oxygen XML Author. To allow Oxygen XML Author to recognize and render the symbol correctly, you can add *Segoe UI Symbol* as a *fallback* font.

Add a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Author installation, use the following procedure:

1. Start Windows Explorer and browse to the `[OXYGEN_INSTALL_DIR]/jre/lib/fonts` directory.
2. Create a directory called `fallback` (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

Tip: You could, for example, copy the *Segoe UI Symbol Regular* font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Author for the changes to take full effect.

Result: Whenever Oxygen XML Author finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the `fallback` folder.

Alternate Solution for Other Platforms

For Mac OS X or other platforms, you could use the following approach:

1. Use a font editor (such as [FontForge](#)) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Author, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance > Fonts**.
4. Click the **Choose** button in the **Editor** option and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Author for the font changes to take full effect.

Creating and Working with Documents

[Edit on GitHub](#)

Oxygen XML Author includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

[Edit on GitHub](#)

Oxygen XML Author includes a handy **New Document** wizard that allows you to customize and create new files from a large list of document types and predefined new file templates. You can also create your own templates and share them with others.

New Document Wizard

[Edit on
GitHub](#)

Oxygen XML Author supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, [open the Preferences dialog box \(Options > Preferences\)](#) and go to [File Types](#).

The **New Document** wizard only creates a skeleton document. It may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type.

New Document Wizard

The **New Document** wizard allows you to create various types of documents and provides some options that help you to configure the new document. To use this wizard to create a new document in Oxygen XML Author, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New**.

Result: The **New Document** wizard is displayed and it groups the supported document types in the following categories:

- **Recently Used** - Contains the list of the most recently used file types.
- **New Document** - Contains the list of all supported document types. This list includes XML, CSS, Text, PHP, JavaScript.
- **Global Templates** - Contains the list of predefined templates as well as user-defined custom templates. You can [create your own custom file templates](#) and add them to the `templates` folder of the Oxygen XML Author installation directory. You can also specify an additional directory to use for the templates in the [Document Templates preferences page](#).
- **Framework Templates** - Contains the list of templates defined in the [Document Type configuration dialog box \(Templates tab\)](#) for each framework.

2. Select the type of document that you want to create.

3. If you want to use the default settings in the creation process, select **Create** at the bottom of the dialog box.

Result: The document is created using the default settings and the new file is opened in the appropriate editor.

4. If you want to configure properties before creating the file, select **Customize**. This action is available for XML, XML Schema, Schematron, and XSL documents.

Result: A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click **Create** to create the file and open it in the appropriate editor.

XML Document File Type

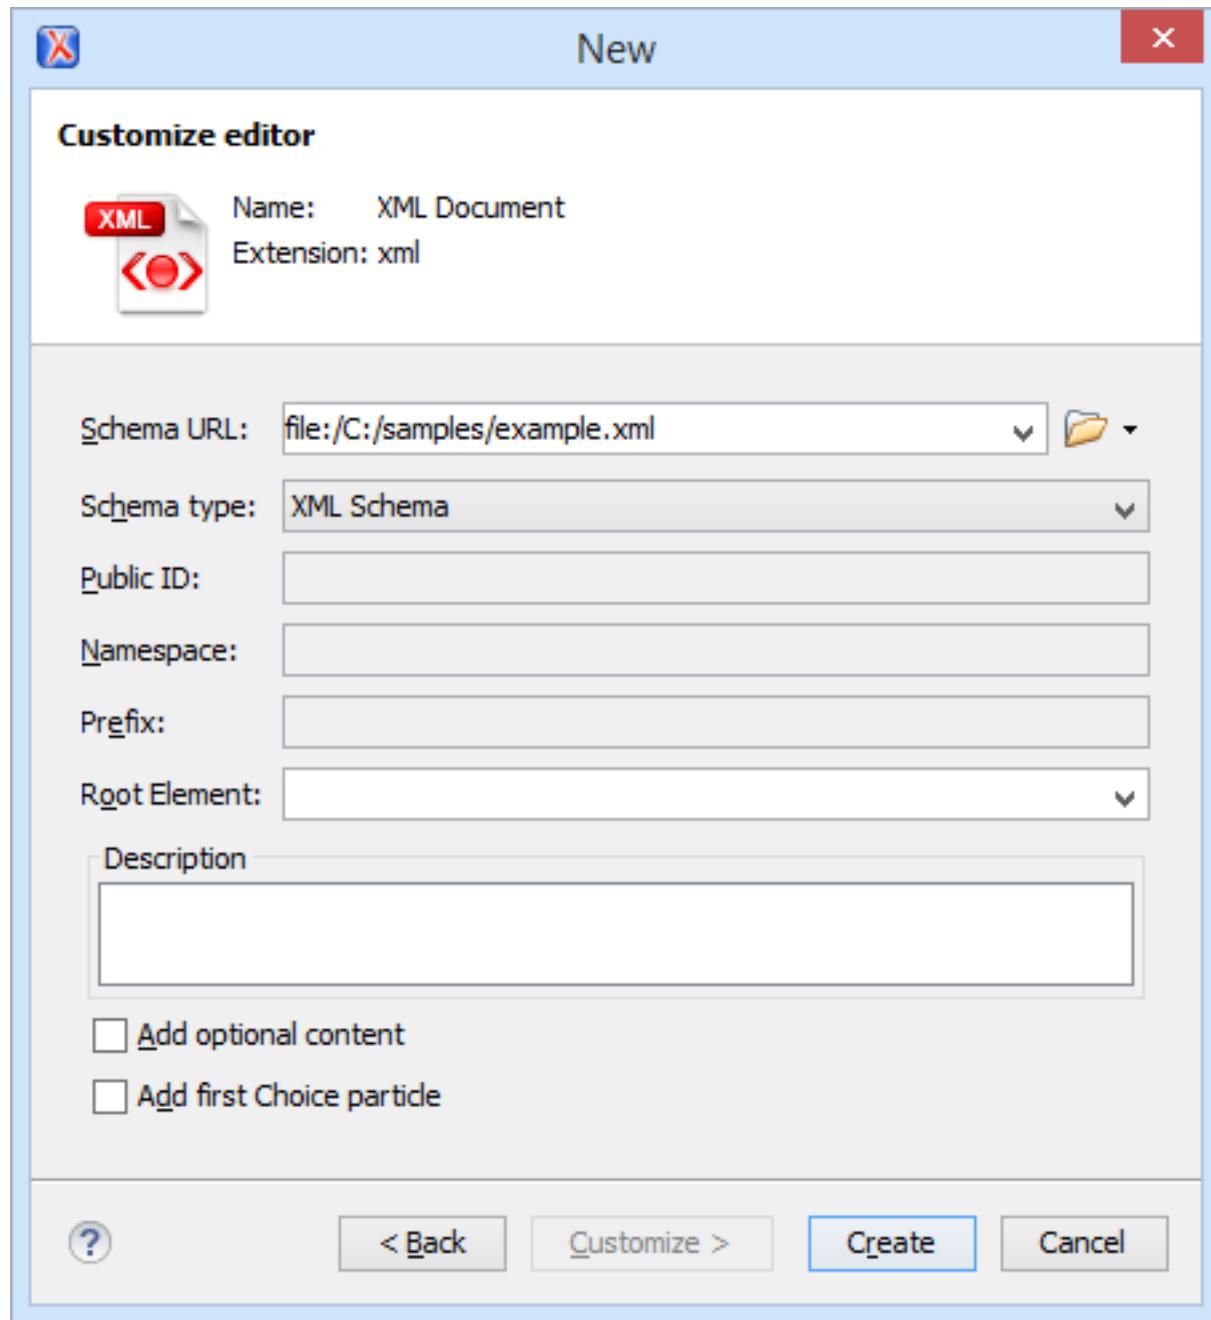

Figure 95: New XML Document Configuration Dialog Box

If you selected  **XML Document** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Schema URL** - Specifies the path to the schema file. When you select a file, Oxygen XML Author analyzes its content and tries to fill in the rest of the dialog box.
- **Schema Type** - Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.
- **Public ID** - Specifies the PUBLIC identifier declared in the document prolog.
- **Namespace** - Specifies the document namespace.
- **Prefix** - Specifies the prefix for the namespace of the document root.

- **Root Element** - Populated with elements defined in the specified schema, enables selection of the element used as document root.
- **Description** - A small description of the selected document root.
- **Add Optional Content** - If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.
- **Add First Choice Particle** - If you select this option, Oxygen XML Author generates the first element of an `xs:choice` schema element in the skeleton XML document. Oxygen XML Author creates this document in a new editor panel when you click **OK**.

XSLT Stylesheet File Type

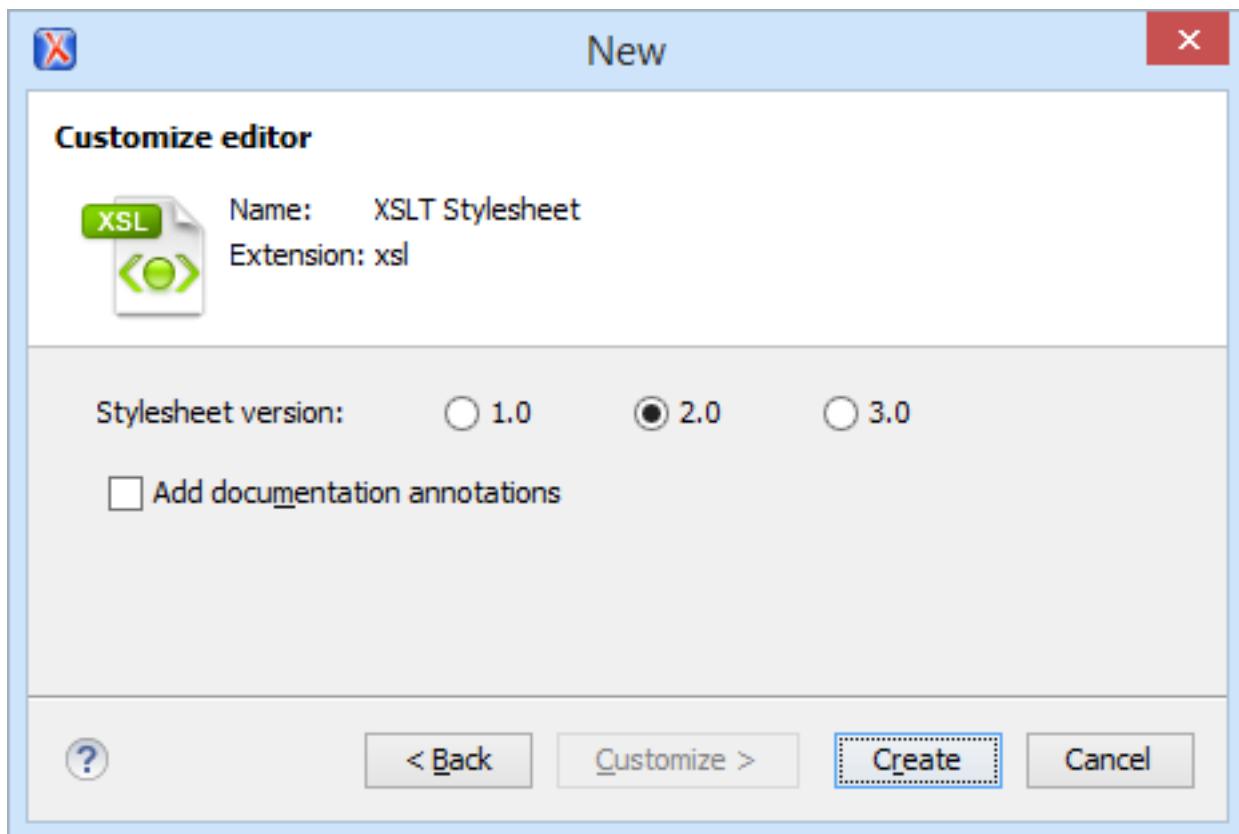

Figure 96: New XSLT Stylesheet Configuration Dialog Box

If you selected  **XSLT Stylesheet** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Stylesheet version** - Allows you to select the Stylesheet version number. You can select from: 1 . 0, 2 . 0, and 3 . 0.
- **Add documentation annotations** - Enable this option to generate the stylesheet annotation documentation.

XML Schema File Type

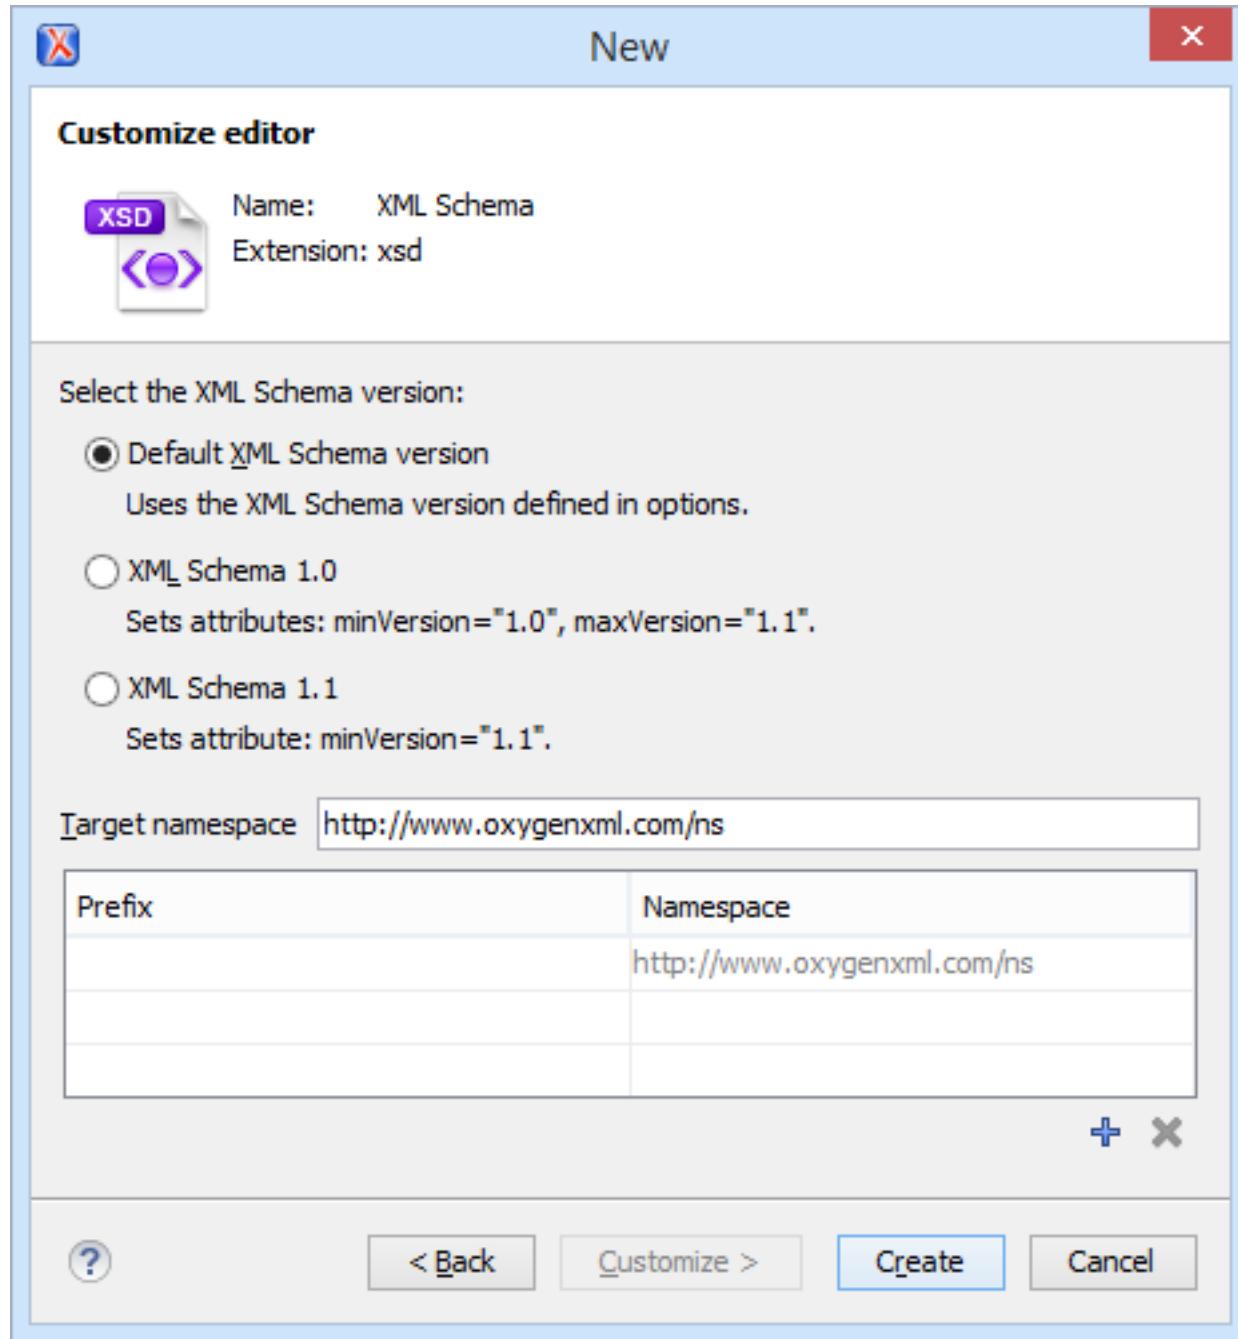

Figure 97: New XML Schema Configuration Dialog Box

If you selected  **XML Schema** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Default XML Schema version** - Uses the XML Schema version defined in the [XML Schema preferences page](#).
- **XML Schema 1.0** - Sets the `minVersion` attribute to `1.0` and the `maxVersion` attribute to `1.1`.
- **XML Schema 1.1** - Sets the `minVersion` attribute to `1.1`.
- **Target namespace** - Allows you to specify the schema target namespace.
- **Namespace prefix declaration table** - This table contains namespace prefix declarations. Table information can be managed using the  **New** and  **Delete** buttons.

Schematron File Type

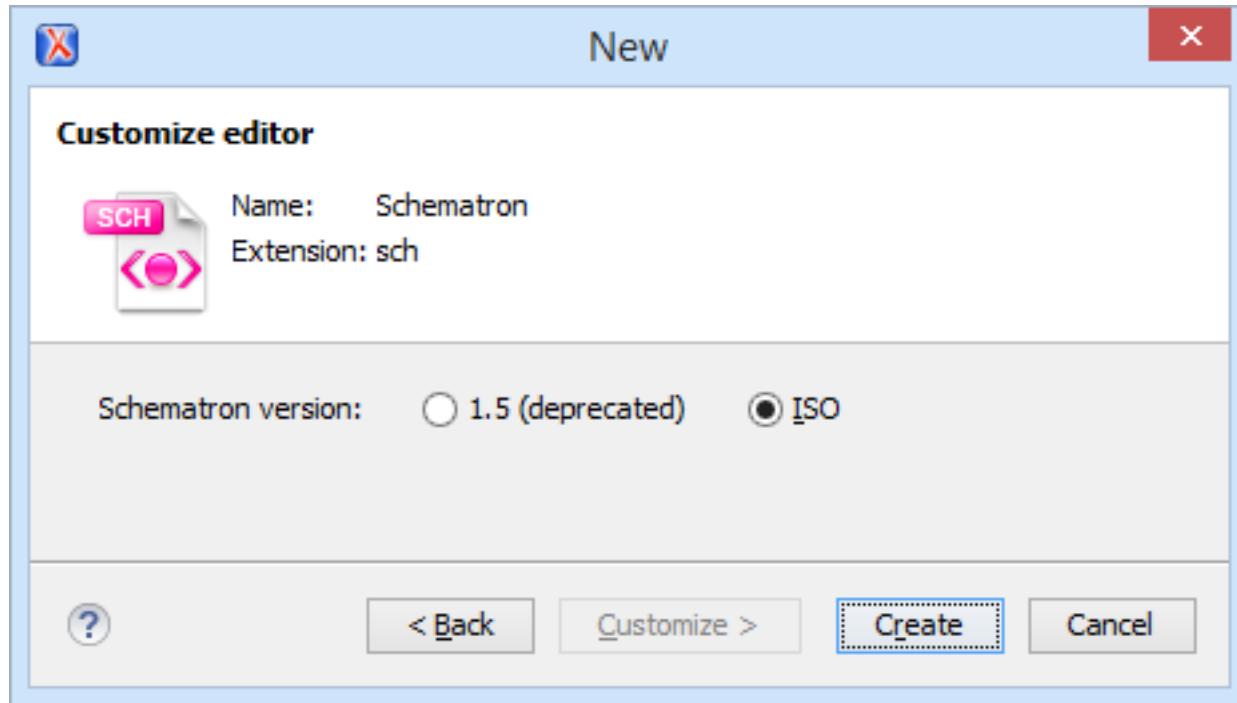

Figure 98: New Schematron Configuration Dialog Box

If you selected  **Schematron** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

- **Schematron version** - Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

Note: Starting with version 16.0 of Oxygen XML Author, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

Creating New Document Templates

[Edit on GitHub](#)

Oxygen XML Author allows you to create your own custom document templates and they will appear in the **Global templates** folder (or another specified folder) within the [New document wizard](#).

Creating a New Document Template

To create your own custom document template and have it appear in the new file wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

Tip: You can use *editor variables* in the template file content and they will be expanded when the files are opened.

2. Save the new file template in one of the following locations:

- The `templates` directory of the Oxygen XML Author installation directory (`[OXYGEN_INSTALL_DIR]/templates`). File templates saved in this directory will appear in the **Global templates** category in the [New document wizard](#).
- You can also use any other directory of your choice, but you must add that directory to the list of templates in the [Document Templates preferences page](#). This user-defined directory will appear in the [New document wizard](#) with the new file templates that you save in it.

Attention: The name that you use to save the template will be the name that appears in the new file wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as **My Custom Template1**).

3. Open the new file wizard (New toolbar button or **File > New**) and you should see your custom template in the appropriate folder. For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you create a corresponding properties file (see the procedure below), you need to set the type property to dita.

[Customizing Document Templates](#) on page 325

Customizing Document Templates

[Edit on GitHub](#)

Oxygen XML Author allows you to customize certain aspects of predefined or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the [New document wizard](#).

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one.

- If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file will specify the paths to the icons that will be used in the new file wizard. You can find some examples in the templates directory of the Oxygen XML Author installation directory to help you get started.

When defining the icons, the properties file should look like this:

```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

Important: For DITA files, the type property needs to be set to dita. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**. For all other types of files, set it to general. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

Note: If you created a new template and chose to use a custom directory for the new template (in [step 2 of the new template procedure](#)), make sure the path to the icons is relative to that directory.

- If you edit an existing template, simply define the icon paths as specified [above](#).
2. Save the properties file in the same directory as the document template.
 3. Open the new file wizard (**File > New**) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you select **New > File** from the contextual menu in the [Project view](#). The prefix or suffix is added to the name of the file in the **File name** field.

- For DITA files, it also applies to the new document dialog box that appears when you select **Append Child > New or Insert After > New** from the **DITA Maps Manager**. The prefix or suffix is added to the name of the file in the **Save as** field.

To add a prefix or suffix to the file names for a document template, follow these steps:

- Create a new properties file or edit an existing one.

- If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`). This properties file will specify the prefix/suffix that will be used to propose the file name in the new file wizards.

When defining the prefix/suffix, the properties file should look something like this:

```
type=general
filenamePrefix=prod_
filenameSuffix=_test
```

Important: For DITA files, the `type` property needs to be set to `dita`. For all other types of files, set it to `general`.

- If you edit an existing template, simply define the prefix/suffix as specified [above](#).
- Save the properties file in the same directory as the document template.
 - Open the new document wizard ([using the methods described above](#)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

[Creating New Document Templates](#) on page 324

[Edit on GitHub](#)

Opening Documents

To open a document in Oxygen XML Author, do one of the following:

- Go to **File > Open (Ctrl + O (Command + O on OS X))** or click the  **Open** toolbar button to display the **Open** dialog box. The start folder of the **Open** dialog box can be either the last folder visited by this dialog box or the folder of the currently edited file. This can be [configured in the user preferences](#).
- Go to **File > Open URL** or click the  **Open URL** toolbar button to display the **Open URL** dialog box that allows you to access any resource identified through a URL (defined by a protocol, host, resource path, and an optional port). The following actions are available in the drop-down action list:
 -  **Browse for local file** - Opens a local file browser dialog box allowing you to select a local file.
 -  **Browse for remote file** - Displays [the Open using FTP/SFTP dialog box](#) that allows you to open a remotely stored document.
 -  **Browse for archived file** - Displays an **Archive Browser** dialog box that allows you to browse the content of an archive and choose a file to open in Oxygen XML Author.
 -  **Browse Data Source Explorer** - Opens a **Data Source Explorer** that allows you to browse the data sources defined in the [Data Sources preferences page](#).

Tip: You can get to the **Data Sources** preferences page, using the **Configure Database Sources** shortcut from the **Open URL** dialog box.

-  **Search for file** - Displays the [Open/Find Resource dialog box](#).
- Click the  **Open/Find Resource** toolbar button to run the same action.
- Go to **File > Reload** to load the last saved file content. All unsaved modifications are lost.
- Go to **File > Reopen** to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the **Clear history** action.

- Select the **Open** action from the contextual menu of the **Project view**. This opens the selected file from the **Project** view.

Related information

[Opening Local Files at Start-up](#) on page 327

Opening the Current Document in System Application

[Edit on GitHub](#)

To open the currently edited document in the associated system application, use the  **View in Browser/System Application** action that is available in the **File** menu and on the **File** toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Opening Local Files at Start-up

[Edit on GitHub](#)

To open a local file at start-up when you open Oxygen XML Author from the command line, add the paths for one or more local files as parameters in the command line:

- `scriptName [pathToXMLFile1] [pathToXMLFile2]` where `scriptName` is the name of the startup script for your platform (`oxygenAuthor.bat` on Windows, `oxygenAuthor.sh` on Unix/Linux, `oxygenAuthorMac.sh` on Mac OS) and `pathToXMLFileN` is the name of a local XML file.

The two possibilities of opening files at startup by specifying them in the command line are explained also if the startup script receives one of the `-h` or `--help` parameters.

Opening a File at a Specific Location Using the Command Line Interface

[Edit on GitHub](#)

Oxygen XML Author offers support for opening a file at a specific position using the command line interface, by transmitting parameters to the Oxygen XML Author batch script file. The following methods are available, depending on how you identify the position that is needed:

1. Specific position values (line and column number, or character offset)

Oxygen XML Author supports the following position parameters:

- `line` - The line number.
- `column` - The column number (has meaning if the `line` parameter is also defined).
- `char` - The character offset.

Examples for Windows:

The following examples show how you can open an XML document in Oxygen XML Author:

```
author.bat  file:samples/personal.xml#line=4
author.bat  file:samples/personal.xml#line=4column=5
author.bat  file:samples/personal.xml#line=4;column=5
author.bat  file:samples/personal.xml#char=334
```

2. Simplified XPath index path

Oxygen XML Author will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form `1/5/7` identifies the seventh child of the fifth child of the root element.

Restriction: Oxygen XML Author will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Author and select the third child of the root element:

```
author.bat file:samples/personal.xml#element(1/3)
```

3. Anchors identified by ID attribute values

Oxygen XML Author will open an XML file and select the element whose `id` attribute value is an exact match of the anchor attached to a command line instruction.

Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Author and select the element that has the `id` element set to `titleID`:

```
author.bat file:samples/personal.xml#titleID
```

Saving Documents

[Edit on GitHub](#)

You can save the document you are editing with one of the following actions:

- **File >  Save.**
- ** Save** toolbar button - If the document was not yet saved, it displays the **Save As** dialog box.
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save To URL** - Displays a **Save to URL** dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). Use the drop-down action list to choose one of the available save actions:
 - ** Browse for local file** - Opens a local file browser dialog box allowing you to save the document locally.
 - ** Browse for remote file** - Displays a **Save to URL** dialog box that allows you to save the document to a remote location (accessible through FTP, SFTP or WebDAV).
 - ** Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to save the document inside an archive.
 - ** Browse Data Source Explorer** - Opens a **Data Source Explorer** that allows you to browse the data sources defined in the [Data Sources preferences page](#).
- Tip:** You can get to the **Data Sources** preferences page, using the **Configure Database Sources** shortcut from the **Save to URL** dialog box.
- ** Search for file** - Displays the [Open/Find Resource dialog box](#).
- **File > Save All** - Saves all open documents. If any document does not have a file, displays the **Save As** dialog box.

Opening and Saving Remote Documents

[Edit on GitHub](#)

Oxygen XML Author supports editing remote files, using the FTP, SFTP, WebDAV , SharePoint, and SharePoint Online for Office 365 protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files a project, or make them subject of XSL and FO transformations.

You can open one or more remote files in [the Open URL dialog box](#).

A WebDAV resource can be locked when it is opened in Oxygen XML Author by checking the **Lock WebDAV files on open option** to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Author displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Author.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Author and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current **WebDAV Connection** details can be saved using the  **Database Perspective** button and then used in the *Data Source Explorer* view.

Open URL Dialog Box

[Edit on GitHub](#)

To open this dialog box, go to **File > Open URL** (or click the  **Open URL** toolbar button), then choose the  **Browse for remote file** option from the drop-down action list.

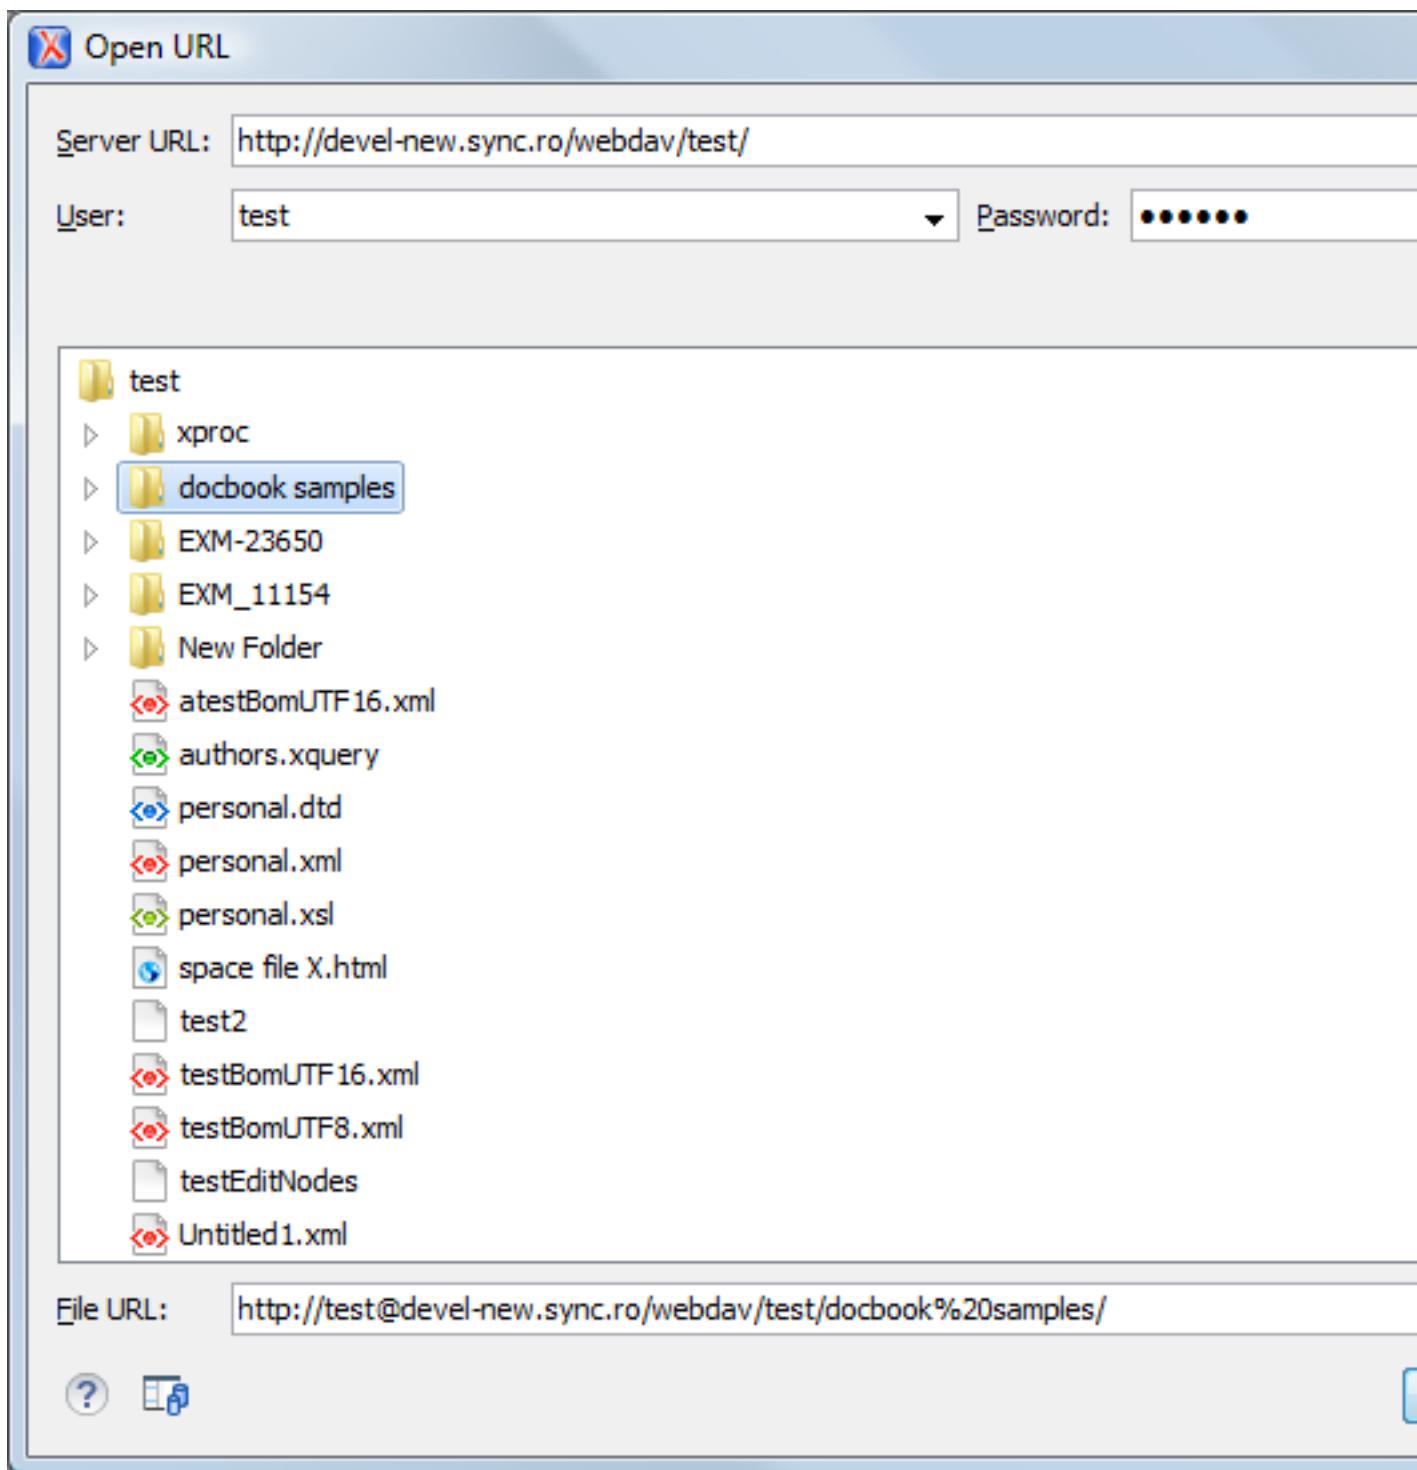

Figure 99: Open URL Dialog Box

The displayed dialog box is composed of the following:

Server URL

Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

Tip: When specifying a URL, follow these rules:

- To access an FTP server, write the protocol, host, and port (if using a non-standard one). For

example, `ftp://server.com` or `ftp://server.com:7800/`.

- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, `https://www.some-webdav-server.com:443/webdav-repository/`.

Important: Make sure that the repository directory ends in a slash "/". For example, `https://www.some-webdav-server.com:443/webdav-repository/`

Autoconnect

If selected, the browse action is performed every time when you open the dialog box.

User and Password

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the **File URL** combo box, and used further in opening/saving the file. If the **Save** option is selected, then the user and password are saved between editing sessions. The password is kept encrypted in the options file.

Note: Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

Connect

When you press this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

Browser view

- If you are browsing a WebDAV or FTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

Note: The file names are sorted in a case-insensitive way.

- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.

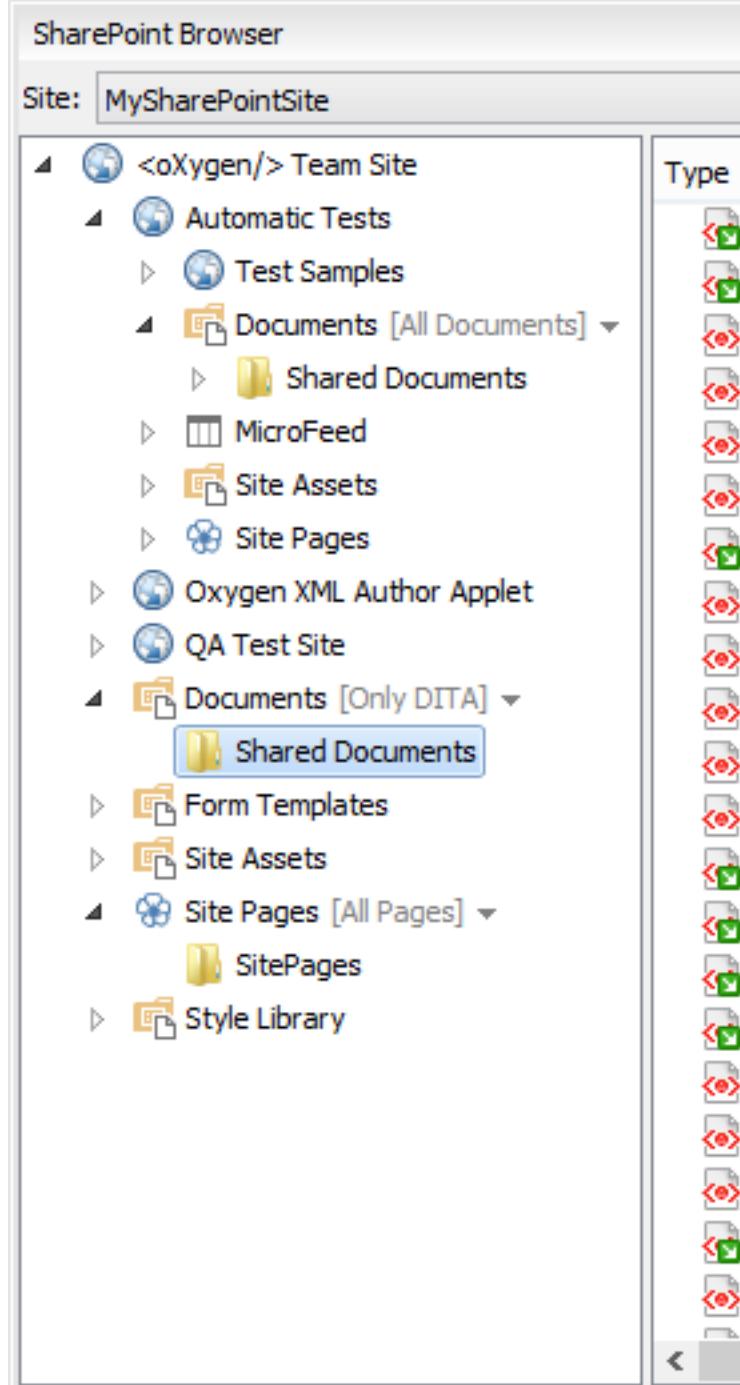

Figure 100: Browsing a SharePoint Repository

The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

Note: The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

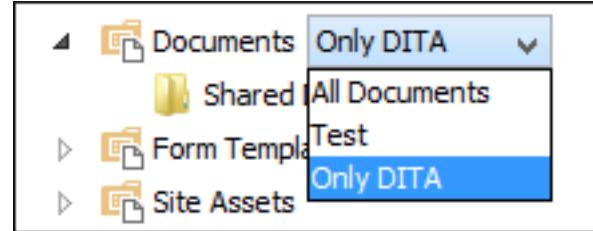

Figure 101: Drop-Down Menu to Select Which Items to Display

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Note: A column can be filtered or sorted only if it was configured this way on the server side.

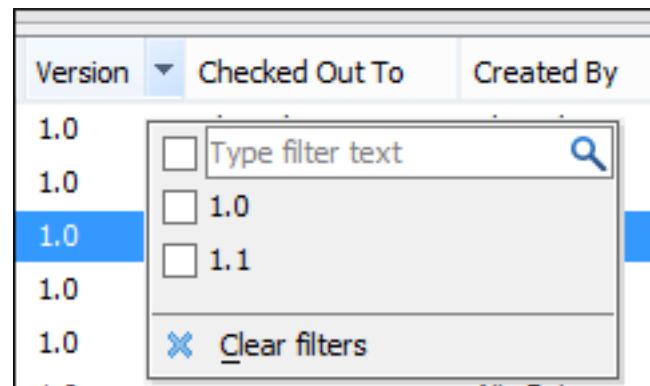

Figure 102: Column Filter

File URL

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as `http://some.site/test.xml` (if the file is accessible through normal HTTP protocol), or `ftp://anonymous@some.site/home/test.xml` (if the file is accessible through anonymous FTP).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

Changing File Permissions on a Remote FTP Server

[Edit on
GitHub](#)

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP/WebDAV file browser dialog box by right-clicking a tree node and selecting the *Change permissions* menu item.

In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the check boxes.

WebDAV over HTTPS

[Edit on
GitHub](#)

If you want to access a WebDAV repository across an unsecure network, Oxygen XML Author allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Author will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Author. This means that Oxygen XML Author can find the certificate in the key store of the Java Runtime Environment in which it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

Troubleshooting HTTPS

[Edit on
GitHub](#)

When Oxygen XML Author cannot connect to an HTTPS-capable server, most likely there is no certificate set in the *Java Runtime Environment (JRE)* that Oxygen XML Author runs into. The following procedure describes how to:

- Export a certificate to a local file using any HTTPS-capable Web browser (for example, Internet Explorer).
- Import the certificate file into the JRE using the keytool tool that comes bundled with Oxygen XML Author.

1. Export the certificate into a local file

- a) Point your HTTPS-aware Web browser to the repository URL.

If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

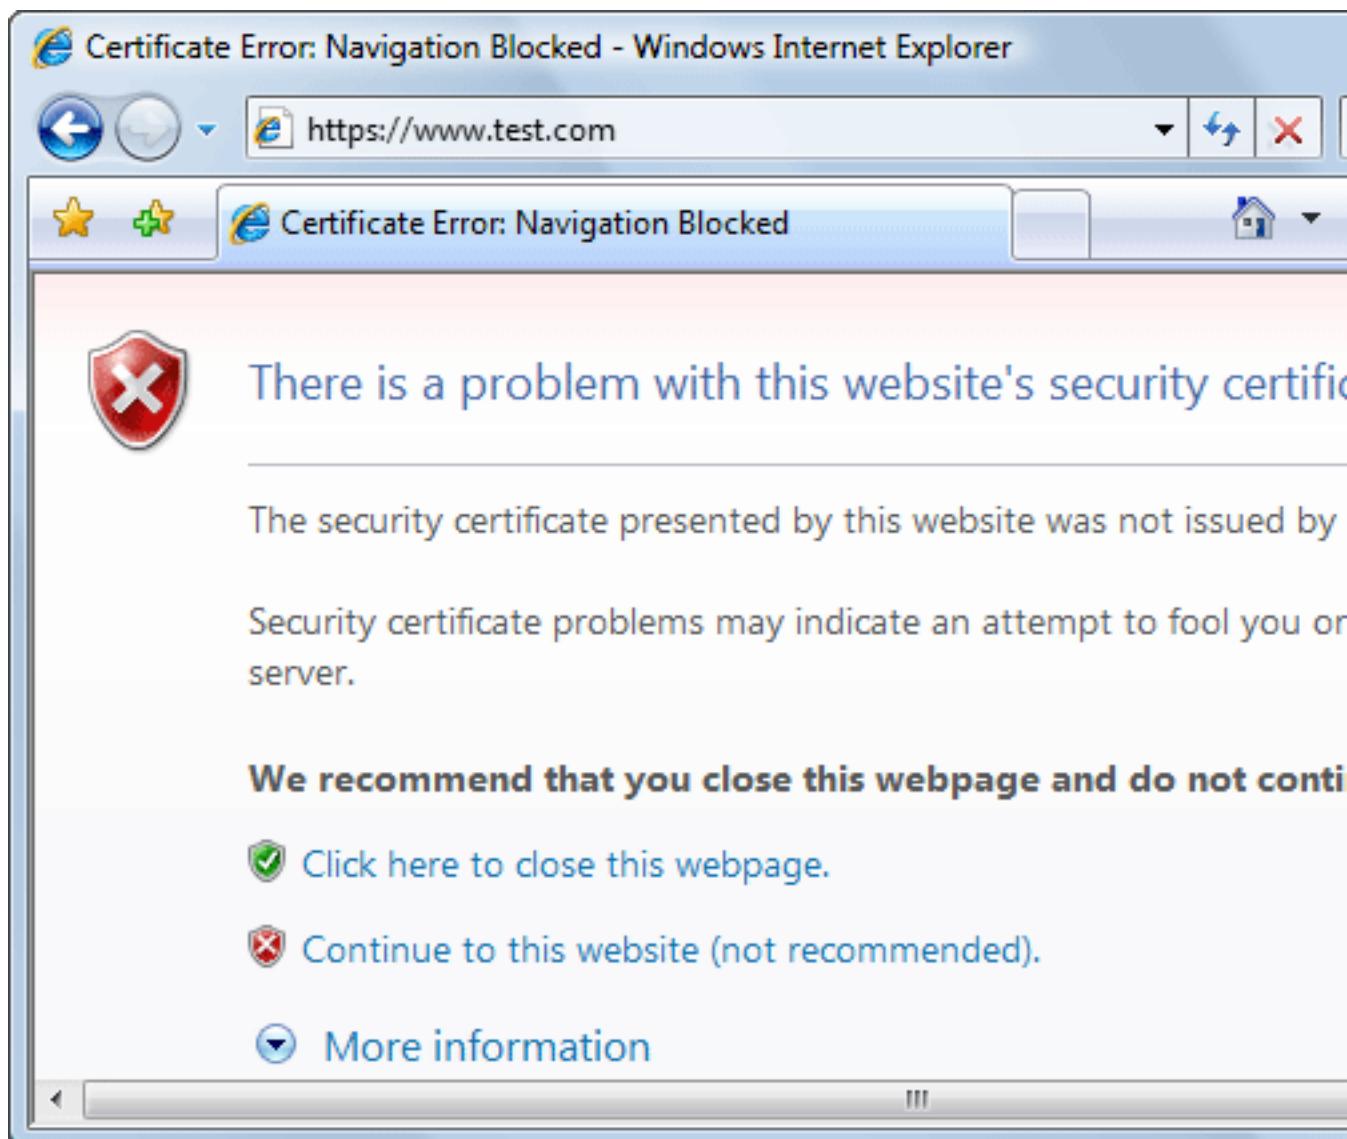

Figure 103: Security alert - untrusted certificate

- b) Go to menu **Tools > Internet Options**.
Internet Options dialog box is opened.
- c) Select **Security** tab.
- d) Select **Trusted sites** icon.
- e) Press **Sites** button.
This will open **Trusted sites** dialog box.
- f) Add repository URL to **Websites** list.
- g) Close the **Trusted sites** and **Internet Options** dialog boxes.
- h) Try again to connect to the same repository URL in Internet Explorer.
The same error page as above will be displayed.
- i) Select **Continue to this website** option.
A clickable area with a red icon and text **Certificate Error** is added to Internet Explorer address bar.
- j) Click the **Certificate Error** area.
A dialog box containing a **View certificates** link is displayed.
- k) Click the **View certificates** link.
Certificate dialog box is displayed.
- l) Select **Details** tab of **Certificate** dialog box.

m) Press **Copy to File** button.

Certificate Export Wizard is started.

n) Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file `server.cer`.

2. Import the local file into the JRE running Oxygen XML Author.

a) Open a text-mode console with administrative rights.

If Oxygen XML Author has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases administrative rights will be required.

b) Go to the `lib/security` directory of the JRE running Oxygen XML Author. You find the home directory of the JRE in the `java.home` property that is displayed in the **About** dialog box (**System properties** tab). On Mac OS X systems, the `lib/security` directory is usually located in `/System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home` directory.

On OS X, if you have installed a distribution of Oxygen XML Author that is not bundled with a JRE, a JRE from Apple is required. The Apple Java version 1.6 stores the certificates in `/System/Library/Java/Support/CoreDeploy.bundle/Contents/Home/lib/security/cacerts` with a symbolic link pointing to it from `/System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home/lib/security/cacerts`.

On OS X, if you have installed a distribution of Oxygen XML Author that bundles the JRE from Oracle, the JRE uses the `.install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts` path within its installation directory.

c) Run the following command:

```
...\\bin\\keytool -import -trustcacerts -file server.cer -keystore cacerts
```

The `server.cer` file contains the server certificate, created during the previous step. `keytool` requires a password before adding the certificate to the JRE `keystore`. The default password is `changeit`. If someone changed the default password, then that person is the only one who can perform the import.

Note: To make Oxygen XML Author accept a certificate even if it is invalid, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Connection settings > HTTP(S)/WebDAV**, and enable the **Automatically accept a security certificate, even if invalid** option.

Tip: If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the `-alias` command line argument, as in the following example:

```
...\\bin\\keytool -import -alias myalias1 -trustcacerts -file server1.cer -keystore cacerts
...\\bin\\keytool -import -alias myalias2 -trustcacerts -file server2.cer -keystore cacerts
```

3. Restart Oxygen XML Author.

[HTTP\(S\)/WebDAV Preferences](#) on page 213

HTTP Authentication Schemes

[Edit on GitHub](#)

Oxygen XML Author supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the [RFC2617 specifications](#).
- **Digest** - The *digest* authentication scheme defined in the [RFC2617 specifications](#).
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

Note: For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

- **Kerberos** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

Single Sign-on

[Edit on GitHub](#)

Oxygen XML Author implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the *Kerberos* protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Author obtains from the operating system.

To turn on the *Kerberos*-based authentication, you need to add the following system property in the `.vmoptions` configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author](#) on page 234

Switching Between Opened Tabs

[Edit on GitHub](#)

There are two actions for cycling through the opened file tabs:

Ctrl + Tab (Command + Tab on OS X)

Switches between the tabs with opened files in the order most recent ones first.

Ctrl + Shift + Tab (Command + Shift + Tab on OS X)

Switches between the tabs with opened files in the reverse order.

Searching Documents

[Edit on GitHub](#)

Oxygen XML Author includes advanced search capabilities to help you locate documents and resources.

Open/Find Resource View

[Edit on GitHub](#)

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Author layout, next to the **Project** and **DITA Maps Manager** views. If the view is not displayed, it can be opened from the **Window > Show View** menu.

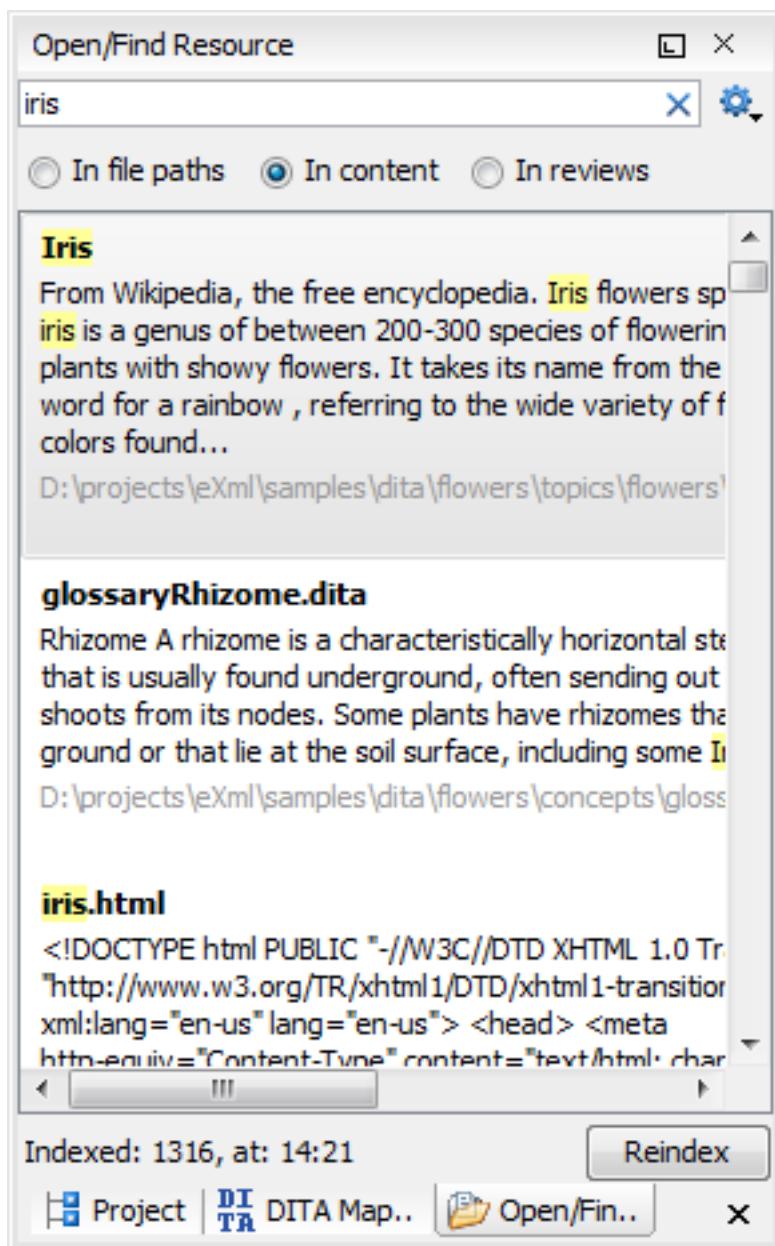

Figure 104: Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Author project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Note: Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the [Results view](#) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow**

(Command + UpArrow on OS X) on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note: Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for **ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for */samples/*.gif with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
 - **Clear Index** - Clears the index.
 - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
 - **Options** - Opens the *Open/Find Resource preferences page*.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the *Open/Find Resource preferences page*.

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

Important: Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

Note: You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to http://oxygenxml.com/demo/Open_Find_Resource.html.

Open/Find Resource Dialog Box

[Edit on GitHub](#)

The **Open/Find Resource** dialog box offers advanced search capabilities. To open the dialog box, go to **Find > Open/Find Resource (Ctrl + Shift + R (Command + Shift + R on OS X))**. You can also click the **Open/Find Resource** toolbar button or use the **Search for file** action that is available in some URL input fields.

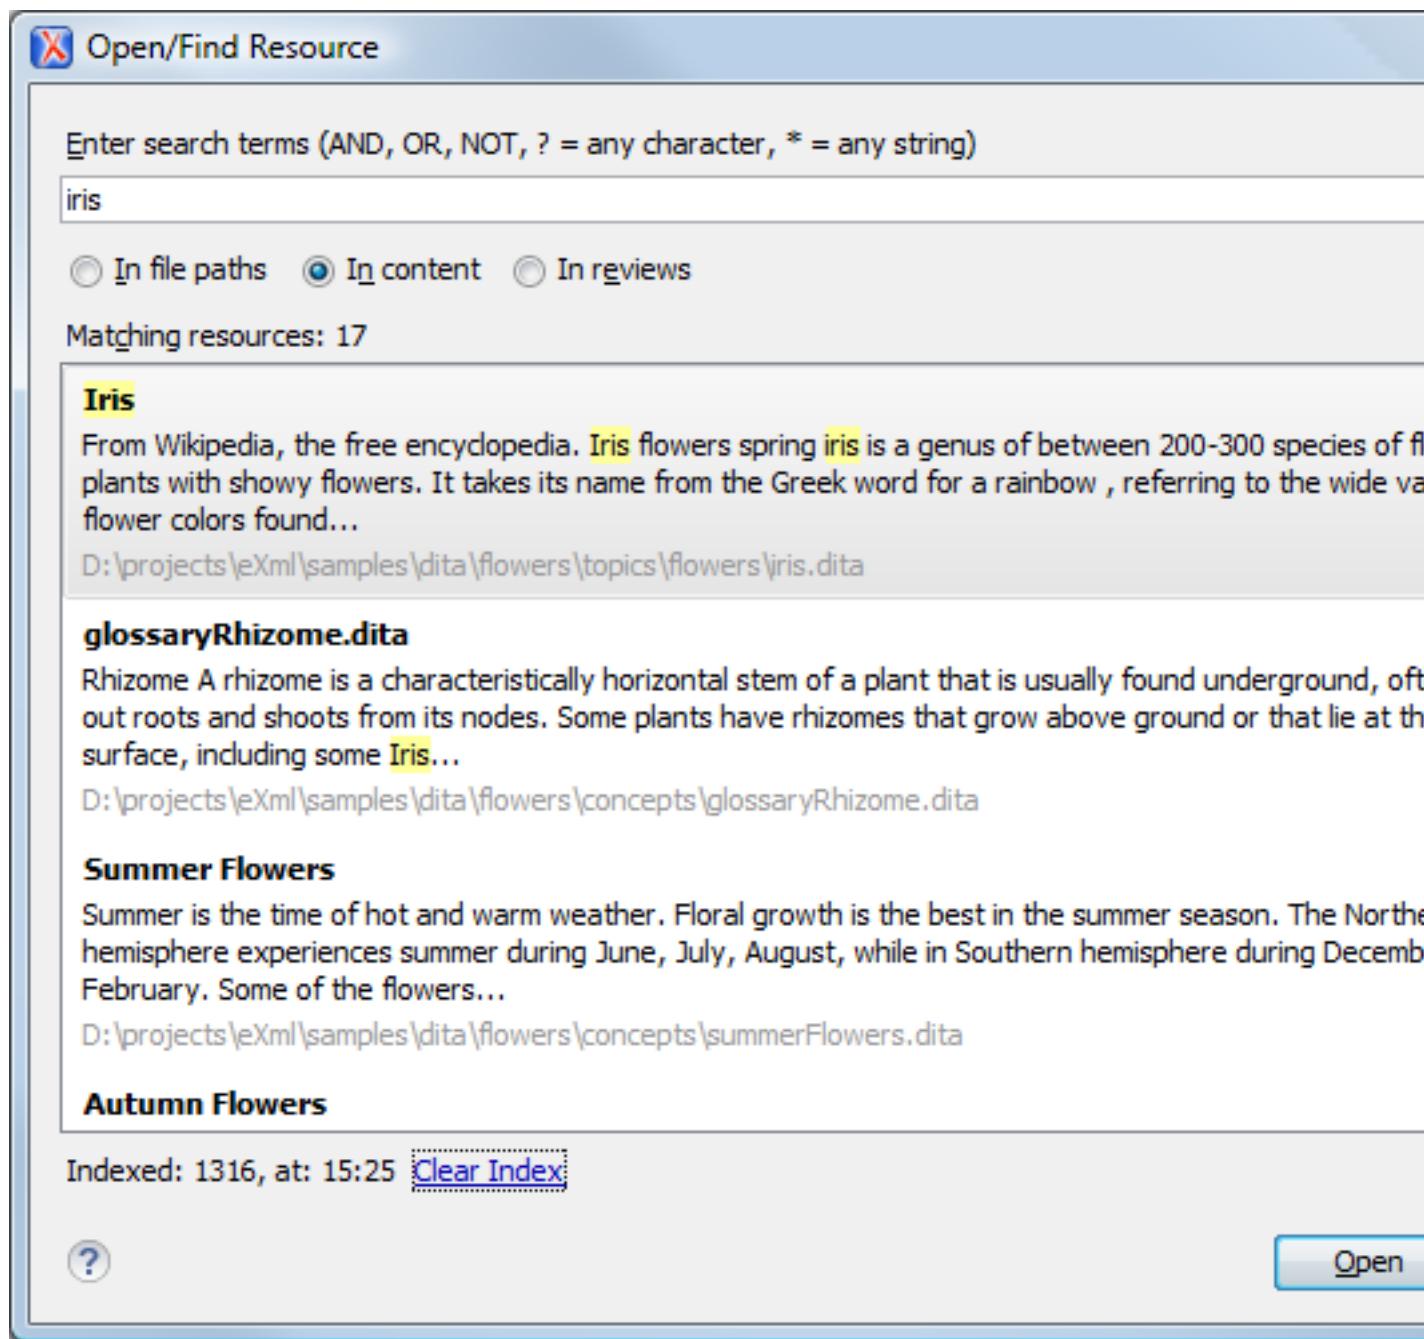

Figure 105: Open/Find Resource Dialog Box

You can use this dialog box to find a file in the current Oxygen XML Author project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing a few letters of the file name or a fragment of the content you are searching for. The **Open/Find Resource** dialog box also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Note: Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Author. The Professional edition offers support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list,

the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view** at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

Note: Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for **ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for */samples/*.gif with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

Options Available in the Dialog Box

The **Open/Find Resource** dialog box includes the following options:

- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Options** - Opens the [Open/Find Resource preferences page](#).
- **Clear Index** - Clears the index.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Author internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the [Open/Find Resource preferences page](#).

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

Important: Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Author project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to http://oxygenxml.com/demo/Open_Find_Resource.html.

Related information

[Open/Find Resource View](#) on page 254

Searching in Content

[Edit on GitHub](#)

To perform a search through the content of your resources, open the **Open/Find Resource dialog box** (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the **Open/Find Resource view** (by default, located on the left side of the editor), select the **in content** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature is powered by *Apache Lucene*. Apache Lucene is a free open source information retrieval software library.

You can use the **Open/Find Resource** feature to either perform a simple text search or a more complex search using the *Apache Lucene - Query Parser Syntax*. Using the *Apache Lucene - Query Parser Syntax* means you can perform any of the following searches:

Term Searches

Use the **Open/Find Resource** view or dialog box to search for plain text:

```
Garden Preparation
```

Element-Specific Searches

Use the **Open/Find Resource** view or dialog box to search for content that belongs to a specific element:

```
title:"Garden Preparation"
```

Wildcard Searches

Use wildcards to make your search more permissive:

```
Garden Prepar?tion
```

Fuzzy Searches

If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to what you introduce in the **Open/Find Resource** view or dialog box. To perform a fuzzy search, use the ~ symbol after the word that you are not sure of:

```
Garden Preparing~
```

Proximity Searches

Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the ~ symbol at the end of your search. For example, to search for the word *Garden* and the word *Preparation* within 6 words of each other use:

```
"Garden Preparation"~6
```

Range Searches

Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between *Iris* and *Lilac*, use:

```
title:{Iris TO Lilac}
```

The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between *Iris* and *Lilac*, but not including *Iris* and *Lilac*. To create an inclusive query use square brackets:

```
title:[Iris to Lilac]
```

Term Prioritising Searches

Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for *Autumn Flowers*, a good idea is to prioritise the word *Autumn* since the word *Flowers* occurs more often. To prioritise a word use the ^ symbol:

```
Autumn^6 Flowers
```

Searches Using Boolean Operators

You can use the **AND**, +, **OR**, -, and **NOT** operators.

To search for documents that contain both the words *Garden* and *Preparation*, use:

```
Garden AND Preparation
```

To search for documents that must contain the word *Garden* and may contain the word *Preparation*, use:

```
+Garden Preparation
```

To search for documents that contain either the word *Garden* or the word *Preparation*, use:

```
Garden OR Preparation
```

To search for documents that contain *Garden Preparation* but not *Preparation of the Flowers*, use:

```
"Garden Preparation" - "Preparation of the Flowers"
```

Searches Using Grouping

To search either for the word *Garden* or *Preparation*, and the word *Flowers*, use:

```
(Garden OR Preparation) AND Flowers
```

Searches Using Element Grouping

To search for a title that contains both the word *Flowers* and the phrase *Garden Preparation*, use:

```
title:(+Flowers +"Garden Preparation")
```

Searching for Special Characters

Sometimes you might need to search your content for special character, such as:

```
+ - && || ! ( ) { } [ ] ^ ~ * ? : \
```

In this case, you should surround your search query with quotes. For example, to search for *(Hydrogen + Oxygen)=Water*, use:

```
"(Hydrogen + Oxygen)=Water"
```

Searching in File Paths

[Edit on GitHub](#)

To perform a search in the file paths of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located on the left side of the editor), select the **In file paths** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:

- Use "*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for **-preferences-page* you will find all the resources that contain the *-preferences-page* fragment in their name. If you search for **/samples/*.gif*, you will find all the .gif images from the samples directory.

Searching in Reviews

[Edit on GitHub](#)

To perform a search in the edits of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located on the left side of the editor), select the **In reviews** option, and in the search field enter the terms that you want to search for.

The following options are available:

- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.
- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time** - Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to **Settings** and disable the **Show Description** option.

Technical Aspects

[Edit on GitHub](#)

When Oxygen XML Author performs the indexing of your resources, the refereed content from your documents is not taken into account. For example, when DITA documents are indexed, the content from the `conref` elements is not parsed. The files that make up the index are stored on disk in the `[user_home_directory]\AppData\Roaming\com.oxygenxml.author\lucene` folder.

Closing Documents

[Edit on GitHub](#)

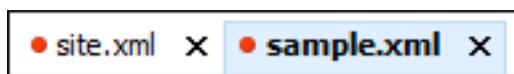

To close open documents, use one of the following methods:

- Click **Close (Ctrl + W (Command + W on OS X))** in the contextual menu of an open tab (or from the **File** menu) to close it.
- Click **Close Other Files** in the contextual menu of an open tab (or from the **File** menu) to close all the open tabs except the selected one.
- Click **Close All (Ctrl + Shift + F4 (Command + Shift + F4 on OS X))** in the contextual menu of an open tab (or from the **File** menu) to close all open tabs.

Contextual Menu of the Current Editor Tab

[Edit on GitHub](#)

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

Close

Closes the currently selected editor.

Close Other Files

If multiple files are opened, this action is available to close all opened editors except for the one you are currently viewing.

Close Files to the Right

Closes all opened editors to the right of the currently selected editor.

Close All	If multiple files are opened, this action is available to close all opened editors.
Reopen last closed editor	Reopens the last closed editor.
Maximize/Restore Editor Area	Collapses all the side views and spans the editing area to cover the entire width of the main window.
Add to project	Adds the file you are editing to the current project.
Add all to project	If multiple files are opened, this action is available to add all the opened files to the current project.
Copy Location	Copies the disk location of the file.
Show in Explorer (Show in Finder on OS X)	Opens the Explorer to the file path of the file.

Viewing File Properties

[Edit on GitHub](#)

The **Properties** view, you can quickly access information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Properties**.

To copy a value from the **Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

Using Projects to Group Documents

[Edit on GitHub](#)

This section explains how to create and work with Projects.

Creating a New Project

[Edit on GitHub](#)

Oxygen XML Author allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also *share your project settings and transformation/validation scenarios* with other users. Use the **Project view** to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select  **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the *Project view*.

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

 **New > File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

 **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

 **New > Logical Folder**

Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

 **Add Folder**

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

 **Add Files**

Adds links to files on the local file system.

 **Add Edited File**

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  **Refresh (F5)** action from the toolbar or contextual menu and the **Project** view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project** view with bold text. To create a file inside a linked folder, select the **New > File** action from the contextual menu. The linked files presented in the **Project** view are marked with a special icon.

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) on page 246.

For more details about how you can share projects with other users, see [Sharing a Project - Team Collaboration](#) on page 358.

Related information

[Using Projects to Group Documents](#) on page 347

Project View

[Edit on GitHub](#)

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

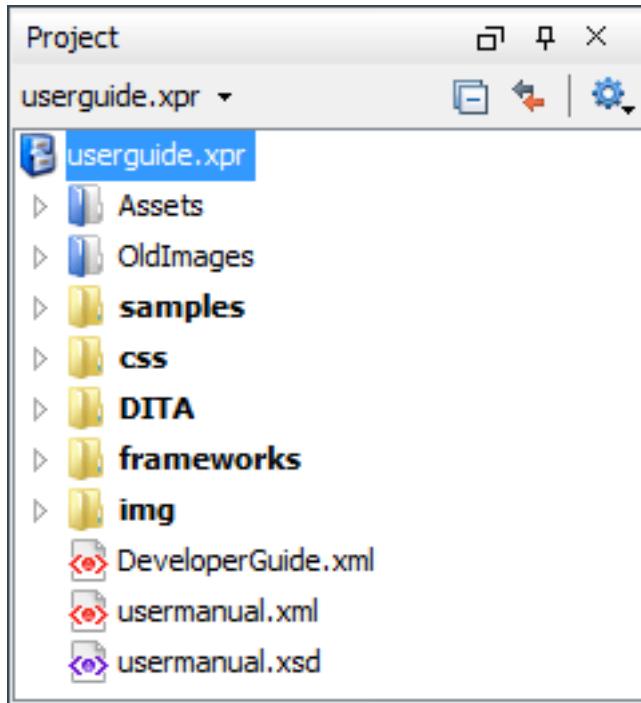

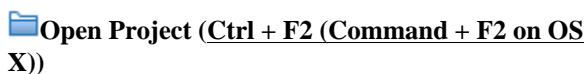

Figure 106: Project View

By default, the view is positioned on the left side of the Oxygen XML Author window, above the [Outline view](#). If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Creates a new, empty project.

The following actions are grouped in the upper right corner:

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the

Enter key or **Left Arrow** to collapse and **Right Arrow** to expand.

When selected, the project tree highlights the currently edited file, if it is found in the project files.

Note: This button is disabled automatically when you move to the **Debugger** perspective.

A submenu that contains the following actions:

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

Show Full Path

When selected, linked files and folders are presented with a full file path.

Enable Master Files Support

Select this option to enable the *Master Files support*.

Change Search and Refactor operations scope

Allows you to change the collection of documents that define the context of the *search and refactor operations*.

- **Use only Master Files, if enabled** - Restricts Oxygen XML Author to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- *Logical folders* - marked with a blue icon on Windows and Unix/Linux (📁) and a magenta icon on Mac OS X (📁). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action **Remove from Project** can be used to remove them from the project.
- *Physical folders and files* - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- *Shortcut folders and files* - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

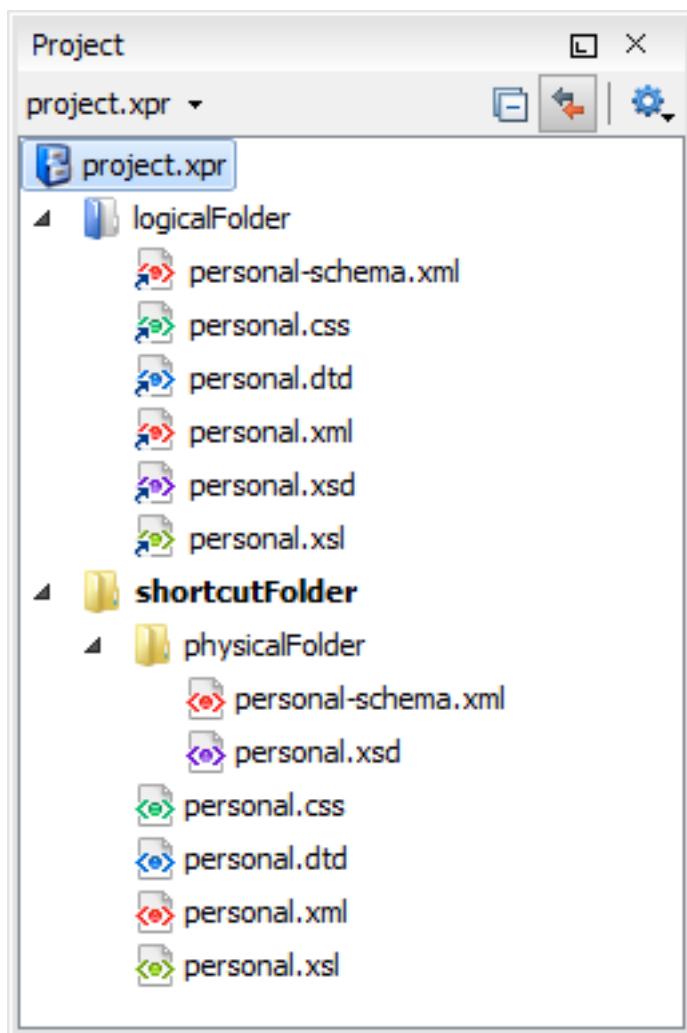

Figure 107: Project View with Examples of all Three Types of Resources

Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

Creates a new, empty project.

Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X -).

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X).

Adds links to files on the local file system.

Adds a link to the currently edited file in the project.

Managing Project Content

Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be enabled in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root. To create a file inside a linked folder, select the **New > File** action from the contextual menu.

Note: The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action  **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action  **Remove from Disk (Shift+Delete)**. The  **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

CAUTION: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Author and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

Moving Files and Folders

You can *move the resources of the project* with drag and drop operations on the files and folders of the tree (the **Enable oXygen consoles** option must be enabled in the [View preferences page](#)).

You can also use the usual  **Cut**,  **Copy**, and  **Paste** actions to move resources in the **Project** view.

Renaming Files and Folders

There are three ways you can *rename an item in the Project view*. Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

Note: The **Rename** action is also available on *logical* files.

Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

 **Check Well-Formedness**

Checks if the selected file or files are well-formed.

 **Validate**

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a [Validate and Check for Completeness](#) operation.

Validate with Schema

Validates the selected file or files against a specified schema.

Allows you to configure and run a *validation scenario*.

Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

Obtains the output with one of the built-in scenarios.

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

Refactoring Actions (Available for certain document types (such as XML))

Oxygen XML Author includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

Allows you to change the name of a resource.

Allows you to change the location on disk of a resource.

Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

For your convenience, the last 5 *XML Refactoring tool operations* that are used will also appear in this submenu.

Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

Opens the selected files in the corresponding editor.

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: *DITA Maps Manager*, *Archive Browser*, *MathML Editor*, *Large File Viewer*, *Hex Viewer*, *SVG Viewer*.

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

Copies an application-specific URL for the selected resource to the clipboard.

Refreshes the content and the dependencies between the resources in *the Master Files directory*.

Allows you to *find and replace text in multiple files*.

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Check Spelling in Files

Format and Indent Files

Open in SVN Client

Compare

Properties

Menu Level Actions

The following actions are available in the **Project** menu:

New Project

Open Project (Ctrl + F2 (Command + F2 on OS X))

Save Project As

Validate all project files

Filters

Enable Master Files Support

Change Search and Refactor operations scope

Opens the [Open/Find Resource dialog box](#).

Allows you to [check the spelling of multiple files](#).

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Displays the properties of the current file in a **Properties** dialog box.

Creates a new, empty project.

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Author XPR project file from the file explorer into the **Project** panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Allows you to save the current project under a different name.

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

Allows you to enable the [Master Files Support](#) for each project you are working on.

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

Related information

[Working with EPUB](#) on page 906

Moving/Renaming Resources in the Project View

[Edit on GitHub](#)

The **Project** view allows you to move or rename files in the current project.

Moving Resources

To move a file or directory in the **Project** view, drag and drop it to the new location in the tree structure or use the **Cut** and **Paste** actions from the contextual menu or **Edit** menu (you can also use the **Copy** and **Paste** actions from the contextual menu or **Edit** menu to copy resources to a new location).

You can also move certain types of files (such as XML) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, based upon the selected scope. You can *select or configure the scope* by using the button.

Renaming Resources

To quickly rename a file or a directory, use the in-place editing either by pressing **F2** or by selecting **Rename** from the contextual menu.

You can also rename certain types of files (such as XML) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Enable this option to update the references to the resource you are renaming. You can *select or configure the scope* by using the button.

Problems Updating References of Moved/Renamed Resources

[Edit on GitHub](#)

In some cases the references of a moved or a renamed resource can not be updated. For example, when a resource is resolved through an XML catalog or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Author displays a warning dialog box.

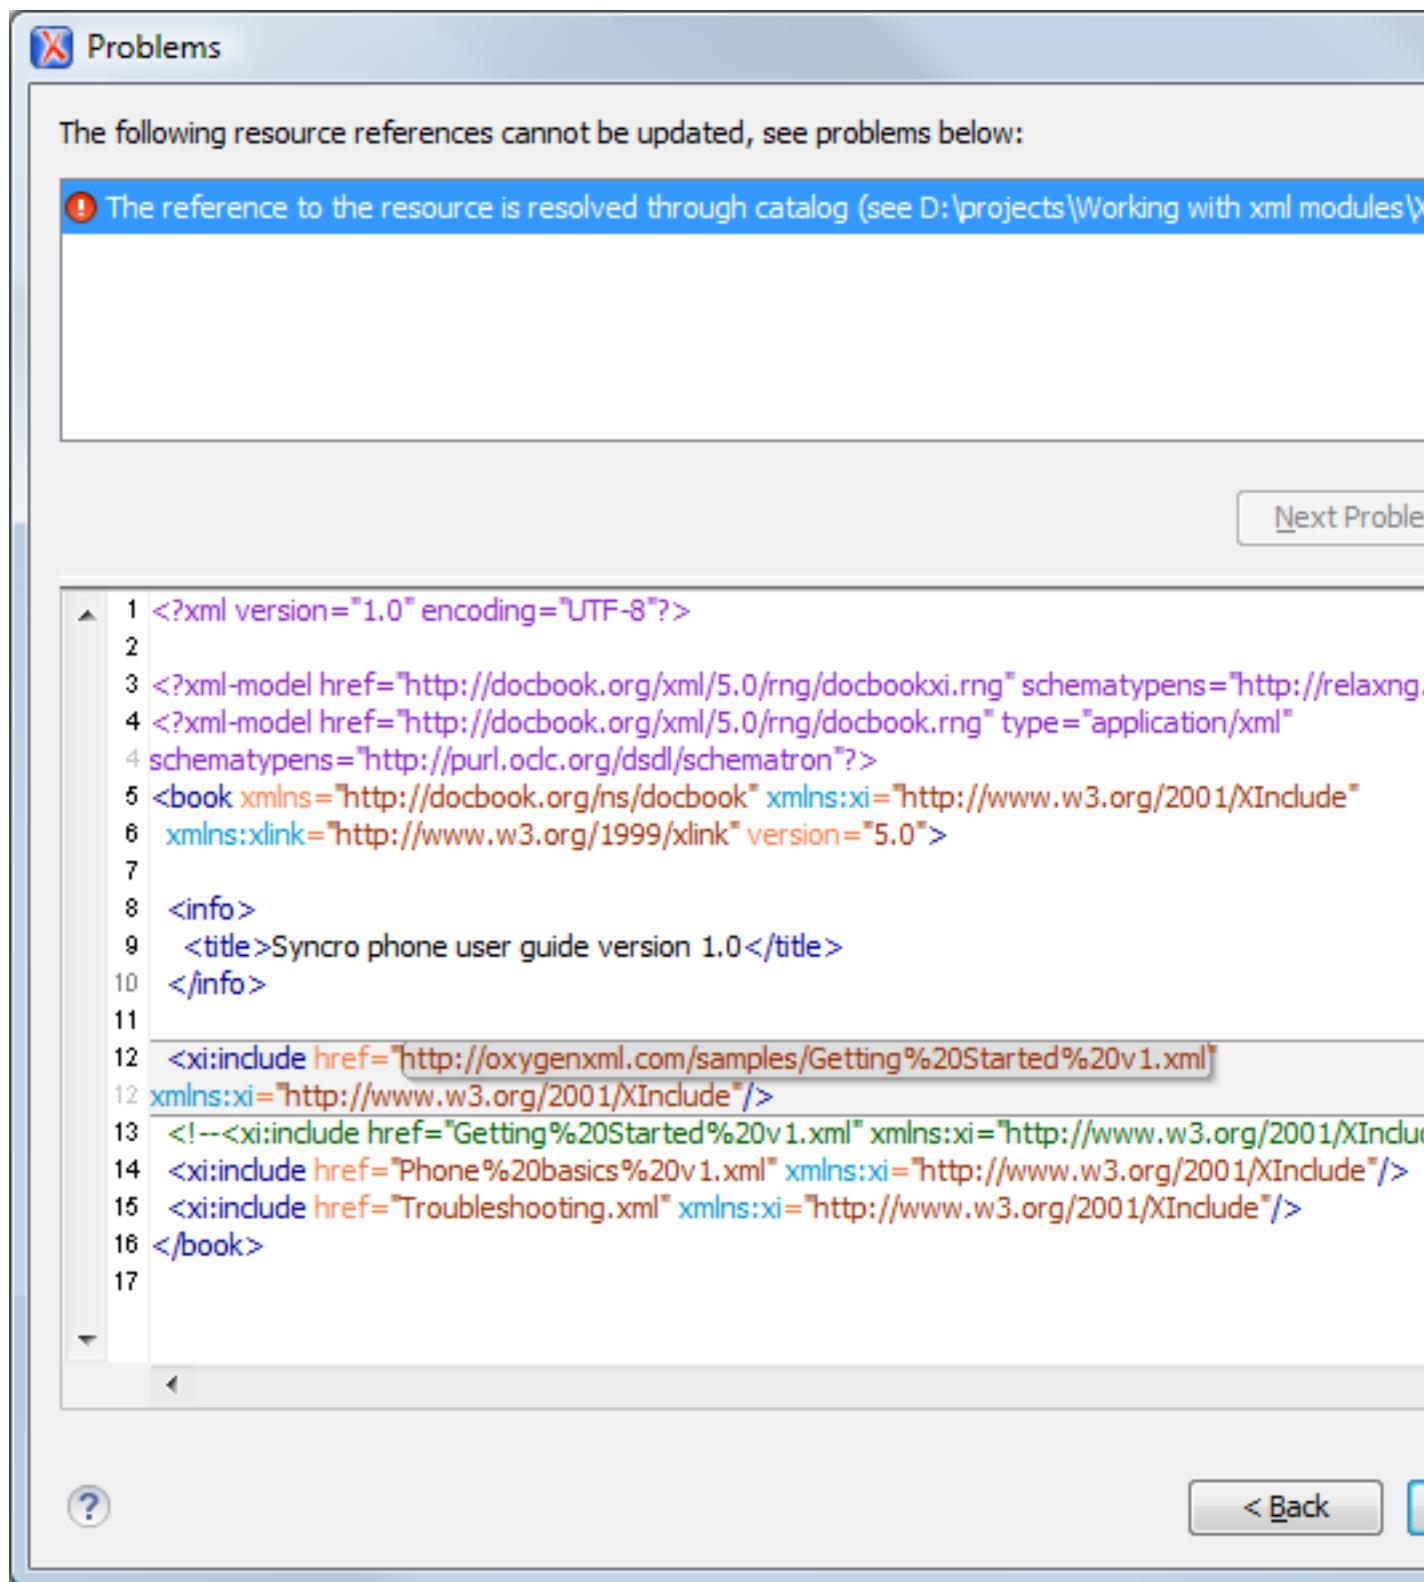

Figure 108: Problems Dialog Box

[Image Preview from the Project View](#)

[Edit on GitHub](#)

Images and SVG files from the **Project** view can be previewed in a separate panel.

To preview an image, either double-click the image name or click the **Preview** action from the contextual menu of the **Project** view. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the **Preview** panel using the actions from the contextual menu, you can scale the image to its original size (1:1 action) or scale it down to fit in the view's available area (**Scale to fit** action).

To preview an *SVG file*, click the **Preview** action from the **Project** view's contextual menu. Once the SVG is displayed in the **Preview** panel, the following actions are available on the contextual menu: **Zoom in**, **Zoom out**, **Rotate** and **Refresh**.

Note: You can drag an image from the **Image Preview** view and drop it in a DITA, DocBook, or TEI document.

Sharing a Project - Team Collaboration

[Edit on GitHub](#)

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Author also allows you to store preferences, transformation scenarios, and validation scenarios in a *project file* (.xpr file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team will have access to the same resources stored in the project file.

Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can create a project-level options file by storing them in a *project file* (.xpr file extension). To do so, follow these steps:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In *the Project view*, create a project or open an existing one.
3. *Open the Preferences dialog box (Options > Preferences)*.
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** in each page.

Note: Some pages do not have the **Project Options** switch, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

Note: The project file extension (.xpr) must be preserved when the file is distributed to others.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a *project file* (.xpr file extension) by following these steps:

1. In *the Project view*, create a project or open an existing one.
2. When you create a new transformation scenario or edit an existing one, there is a **Storage** option. Switch the storage preference to **Project Options** in each transformation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Note: The project file extension (.xpr) must be preserved when the file is distributed to others.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a *project file* (.xpr file extension) by following these steps:

1. In *the Project view*, create a project or open an existing one.
2. When you create a new validation scenario or edit an existing one, there is a **Storage** option. Switch the storage preference to **Project Options** in each validation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Note: The project file extension (.xpr) must be preserved when the file is distributed to others.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Syncro SVN Client (Apache Subversion™)

To assist you with team collaboration and sharing projects, Oxygen XML Author includes an embedded *SVN (Subversion) Client*. Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team.

It can be accessed from the **Tools** menu and can be used for synchronizing your working copy with a central repository.

It can also be started by selecting the  **Open in SVN Client** action from the contextual menu of the **Project** view. This action opens the Syncro SVN Client and shows the selected project file in the **Working Copy** view.

Minimize Differences Between Versions Saved on Multiple Computers

[Edit on GitHub](#)

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:

1. Create an Oxygen XML Author project file that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Format**, configure the appropriate options in this page, then go to **Editor > Format > XML** and configure the options there.
3. Save the configured options into your project file by selecting **Project Options** in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the **Project** view.
6. Open and save your XML files in the **Author** mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

Defining Master Files at Project Level

[Edit on GitHub](#)

This chapter details the *Master Files Support* available in Oxygen XML Author. A *Master File* typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects.

Oxygen XML Author allows you to define *master files* at project level. These *master files* are automatically used by Oxygen XML Author to determine the context for operations such as validation, content completion, refactoring, or search for XML modules. Oxygen XML Author maintains the hierarchy of the *master files*, helping you to determine the editing context.

To watch our video demonstration about the **Master Files Support** for XML documents, go to [Working with Modular XML Files](#).

Master Files Benefits

[Edit on GitHub](#)

Using the *Master Files* support in Oxygen XML Author includes the following benefits:

- When the module is validated, Oxygen XML Author automatically identifies the *master files* that include the module and validates all of them.
- The **Content Completion Assistant** presents all the components that are collected from the *master files* for the modules they include.
- The *master files* that are defined for the current module determines the *scope of the search and refactoring actions*. Oxygen XML Author performs the search and refactoring actions in the context that the *master files* determine, thus improving the speed of execution.

Enabling the Master Files Support

[Edit on GitHub](#)

Oxygen XML Author stores the *master files* in a folder located in the **Project** view, as the first child of the project root. The *Master Files Support* is disabled by default. To enable it, select **Enable Master Files Support** from the

 **Settings** menu in the top-right corner of the **Project** view. You can also select **Enable Master Files Support** from the contextual menu of the **Master Files** directory, or from the contextual menu of the project itself. Oxygen XML Author allows you to enable or disable the *Master Files Support* for each project you are working on.

When the **Master Files Support** is disabled, Oxygen XML Author displays a window tip located at the bottom of the project view. This window contains an **Enable** button and a **Read more** link. Clicking the **read more** link takes you to the user guide. Clicking the **Enable** button opens the **Enable Master Files** dialog box. This dialog box contains general information about the **Master Files Support** and allows you to enable it. You can also use the **Detect and Enable** option to detect the *master files* from the current project.

Warning: Once you close this window tip, Oxygen XML Author hides it for all projects. You can make the window tip reappear by [resetting Oxygen XML Author to its default settings](#). However, doing so will result in you losing your customized options.

Detecting Master Files

[Edit on GitHub](#)

Oxygen XML Author allows you to detect the *master files* using the  **Detect Master Files** option. This action applies to the folders you select in the project. To detect *master files* over the entire project, do one of the following:

- Right-click the root of the project and select  **Detect Master Files**.
- Use the  **Detect Master Files from Project** option, available in the contextual menu of the **Master Files** folder.

Both of these options display the **Detect Master Files** wizard. The detected *master files* are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible master files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *master files*.
- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any of the files presented on the first level of a cycle is a possible *master file*.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *master files*.

To set them as *master files*, simply enable their check-boxes. Oxygen XML Author marks all the children of a *master file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *master files*. A module can be accessed from multiple *master files*.

The *master files* that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a *master file* is to delete it from the **Master Files** folder.

The next panel displays a list with the selected *master files*. Click the **Finish** button to add the *master files* in the **Master Files** folder.

You can use the **Select Master Files** option to automatically mark all *master files*. This action sets all the resources from the **Possible Master Files** category and the first resource of each **Cycle** as *master files*.

Tip: We recommend that you to only add top-level files (files that are at the root of the include/import graph) in the **Master Files** directory. Keep the file set to a minimum and only add files that import or include other files.

Attention: If the **Master Files Support** is disabled, the **Master Files** directory is rendered only if it contains *master files*.

Adding Files to the Master File Directory

[Edit on GitHub](#)

The **Master Files** directory only contains logical folders and linked files. To add files in the **Master Files** directory, use one of the following methods:

- Right-click a file from your project and select **Add to Master Files** from the contextual menu.
- Select **Add Files** or **Add Edited File** from the contextual menu of the **Master Files** directory.
- Drag and drop files into the **Master Files** directory.
- From the contextual menu of the **Resource Hierarchy Dependencies** view, use the **Add to Master Files** action.

You can view the *master files* for the current resource in the **Properties** dialog of the **Project** view and the *master files* for the current editor in the **Properties** and **Information** views.

Project Validation and Transformation

[Edit on GitHub](#)

The *Master Files Support* is also useful for project-level validation and transformation. When you hover the cursor over a file in the **Master Files** directory, Oxygen XML Author displays the **Validate** and **Transform** buttons at the right of the file. Select one of these buttons to run a transformation or validation scenario. If the current node is selected, Oxygen XML Author executes a batch transformation and validation. If the current node is not selected, Oxygen XML Author executes the validation and transformation for the current node only. The behavior of these actions is the same as the behavior of the *corresponding actions that are available in the contextual menu*.

Note: The tooltip of the **Validate** and **Transform** buttons displays the associated scenarios that you can apply.

When you hover the cursor over the `Master Files` directory itself, Oxygen XML Author also displays a  **Help** button. Use this button (or press **F1** on your keyboard) to open the **Help** section regarding the *Master Files Support*.

Contextual Menu of the Master Files

[Edit on GitHub](#)

The contextual menu of the `Master Files` directory contains the following actions:

New

Allows you to create a **File**, **Logical Folder**, or **Project**.

Allows you to add *master files* to the `Master Files` directory.

Use this option to add the currently edited file to the `Master Files` directory.

Open

Opens all the files of the `Master Files` directory.

Pastes the files you copy in the `Master Files` directory.

Rename

Allows you to rename a file in the `Master Files` directory.

Refreshes the content of the `Master Files` directory.

Opens the *Find/Replace dialog box*.

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Opens the *Open/Find Resource dialog box*.

Opens the *Check Spelling in Files dialog box*.

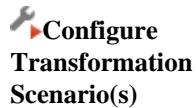

Opens the *Format and Indent Files dialog box* that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

Transform

Provides access to one of the following actions:

Applies the transformation scenarios associated with the `Master Files` directory.

Opens the *Configure Transformation Scenario dialog box*.

Opens the **Transform with** dialog box that allows you to select the transformation scenario you want to execute.

Validate

Provides access to one of the following actions:

 Check Well-Formedness	Allows you to check if a document is <i>Namespace Well-Formed XML</i> .
 Validate	Oxygen XML Author performs the validation of the <i>master files</i> .
Validate with Schema	Opens the Validate with dialog box. Oxygen XML Author performs the validation of the <i>master files</i> using a schema.
 Configure Validation Scenario(s)	Opens the <i>Configure Validation Scenario dialog box</i> .
 Detect Master Files from Project	Enables automatic detection of <i>master files</i> .
Enable Master Files Support	Select this option to enable the Master Files Support .

Editing XML Documents

[Edit on GitHub](#)

This section explains the various features in Oxygen XML Author for editing XML documents. It includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

Related information

[Text Editing Mode](#) on page 244

[Author Editing Mode](#) on page 276

[Grid Editing Mode](#) on page 271

Editing XML Documents in Text Mode

[Edit on GitHub](#)

This section includes features and actions for editing XML documents in the **Text** mode of Oxygen XML Author.

Navigating the Document Content in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes some useful features to help you navigate XML documents in **Text** mode.

Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the [Ctrl + CloseBracket \(Command + CloseBracket on OS X\)](#) key to go to the next XML node and [Ctrl + OpenBracket \(Command + OpenBracket on OS X\)](#) to go to the previous one.

To navigate one word forward or backwards, use [Ctrl + RightArrow \(Command + RightArrow on OS X\)](#), and [Ctrl + LeftArrow \(Command + LeftArrow on OS X\)](#), respectively. To position the cursor at the beginning or end of the document you can use [Ctrl + Home \(Command + Home on OS X\)](#), and [Ctrl + End \(Command + End on OS X\)](#), respectively.

Navigation Buttons

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

Navigating with the Outline View

Oxygen XML Author includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 109: Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

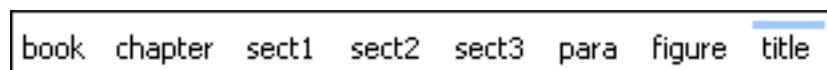

Figure 110: Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, go to **Find > Go to (Ctrl+L (Command+L on OS X))**.

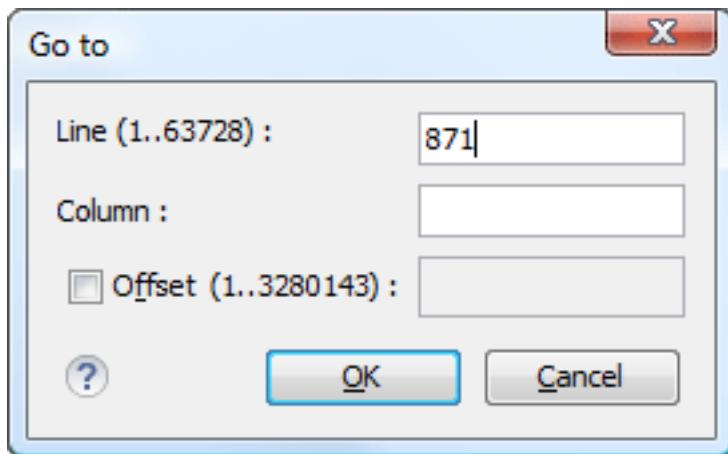

Figure 111: Go to Dialog Box

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

```

1 86 ▾ <xsl:template name="customizePageTop">
 87   <xsl:param name="page"/>
 88   <xsl:param name="chapter"/>
 89   <xsl:param name="linksection"/>
 90   <xsl:param name="siteElement"/>
2 91   <xsl:param name="element"/>
 92   <xsl:param name="product"/>

```

Figure 112: Editor Bookmarks

A bookmark can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

Smart Editing in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start <tag>, the corresponding closing </tag> is automatically inserted and the cursor is placed between the two (<tag>|</tag>).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Author will mirror-edit the name of the matching end tag. This feature can be controlled from the [Content Completion option page](#).
- **Auto-breaking the edited line** - The [Hard line wrap option](#) automatically breaks the edited line when its length exceeds the maximum line length [defined for the format and indent operation](#).
- **Indent on Enter** - The [Indent on Enter option](#) indents the new line inserted when you press **Enter**.
- **Smart Enter** - The [Smart Enter option](#) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
 - If the click position is on a start tag or end tag, then the element name is selected.
 - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
 - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
 - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
 - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
 - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
 - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
 - If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
 - Otherwise, it selects the entire current line of text.

Editing Content in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes numerous shortcut actions to help you edit content in the **Text** editing mode.

Changing the Font Size

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Command + MouseWheelForward on OS X))	Increases the font size with one point for each execution of the action.
Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on OS X))	Decreases the font size with one point for each execution of the action.
Normal editor font (Ctrl + 0 (Command + 0 on OS X))	Resets the font size to the value of the editor font set in the Fonts preferences page .

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on OS X))

Reverses a maximum of 200 editing actions (configurable with the **Undo history size option** in the **Editor** preferences page) to return to the preceding state.

Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))

Note: Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on OS X))

Selects the entire content of the current document.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Author also includes the following other miscellaneous shortcut actions in **Text** mode:

Ctrl + Delete (Command + Delete on OS X)

Deletes the next word.

Ctrl + Backspace (Command + Backspace on OS X)

Deletes the previous word.

Ctrl + W (Command + W on OS X)

Cuts the previous word.

Ctrl + K (Command + K on OS X)

Cuts to end of line.

Ctrl + Single-Click (Command + Single-Click on OS X)

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: *schemaLocation*, *noNamespaceSchemaLocation*, *href* and others.
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Editing XML Markup in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

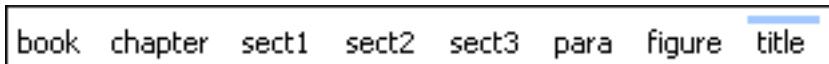

Figure 113: Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Removes the selected element and copies it to the clipboard.

Copies the selected element to the clipboard.

Deletes the currently selected element.

Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow

Moves the current node or selected nodes after the subsequent node.

Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

 **Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Author will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

 **Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

 **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

 **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

 **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

 **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Elements submenu

Contains predefined XML refactoring operations that pertain to elements. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Fragments submenu	Unwrap element	Allows you to remove the surrounding tags of elements, while keeping the content unchanged.
	Wrap element	Allows you to surround elements with element tags.
	Wrap element content	Allows you to surround the content of elements with element tags.
		Contains predefined XML refactoring operations that pertain to XML fragments. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
	Insert XML fragment	Allows you to insert an XML fragment.
	Replace element content with XML fragment	Allows you to replace the content of elements with an XML fragment.
	Replace element with XML fragment	Allows you to replace elements with an XML fragment.

Folding XML Elements in Text Mode

[Edit on GitHub](#)

When working with a large document, the **folding support** in Oxygen XML Author can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the folding feature is enabled in Oxygen XML Author, but it can be disabled in the **Text** preferences page with the [Enable folding option](#).

Figure 114: Folding of XML Elements in Text Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Author. The next time you open the document the folds are restored to its last state.

Folding Actions in Text Mode

Element folds are marked with a small triangle (▽ / ▷) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad on OS X))	Folds all the elements except the current element.
Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))	Folds the child elements that are indented one level inside the current element.
Expand Child Folds	Unfolds all child elements of the currently selected element.
Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))	Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Author, go to <http://oxygentools.com/demo/FoldingSupport.html>.

Drag and Drop in Text Mode

[Edit on GitHub](#)

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in **Text** mode.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on Mac OS X)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects certain text, depending on the position of the click in the document. See *Smart Editing Double-Click* for the specifics.

Triple-Click

Selects entire regions of text, depending on the position of the click in the document. See the *Smart Editing Triple-Click* for the specifics.

Rectangular Selection Shortcuts

Oxygen XML Author also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

Attention: The rectangular selection shortcuts will not work if the *Line Wrap option* is enabled in the **Text** preferences page.

The following shortcuts can be used to create a rectangular selection:

Alt + Mouse Click + Mouse Movement (Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)

Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse.

Shift + Alt + Left/Right Arrow Keys (Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)

Release **Alt (Alt + Meta on Mac OS X)** to enter the *in-place editing mode*.

Shift + Alt + Up/Down Arrow Keys (Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X)

Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)

Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Shift + Alt + Home (Shift + Alt + Meta + Home on Mac OS X)

Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Alt + End (Shift + Alt + Meta + End on Mac OS X)

Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

Shift + Alt + PageUp (Shift + Alt + Meta + PageUp on Mac OS X)

Begins a rectangular selection at the cursor position and extends it to the end of the current line.

Shift + Alt + PageDown (Shift + Alt + Meta + PageDown on Mac OS X)

Begins a rectangular selection at the cursor position and extends it up one screen page.

Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

In-Place Editing Mode

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on Mac OS X, release both **Alt & Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.

Content Completion Assistant in Text Mode

[Edit on GitHub](#)

Oxygen XML Author includes an intelligent **Content Completion Assistant** that offers rapid, in-line identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Author shows the available entries that are valid in the current editing context.

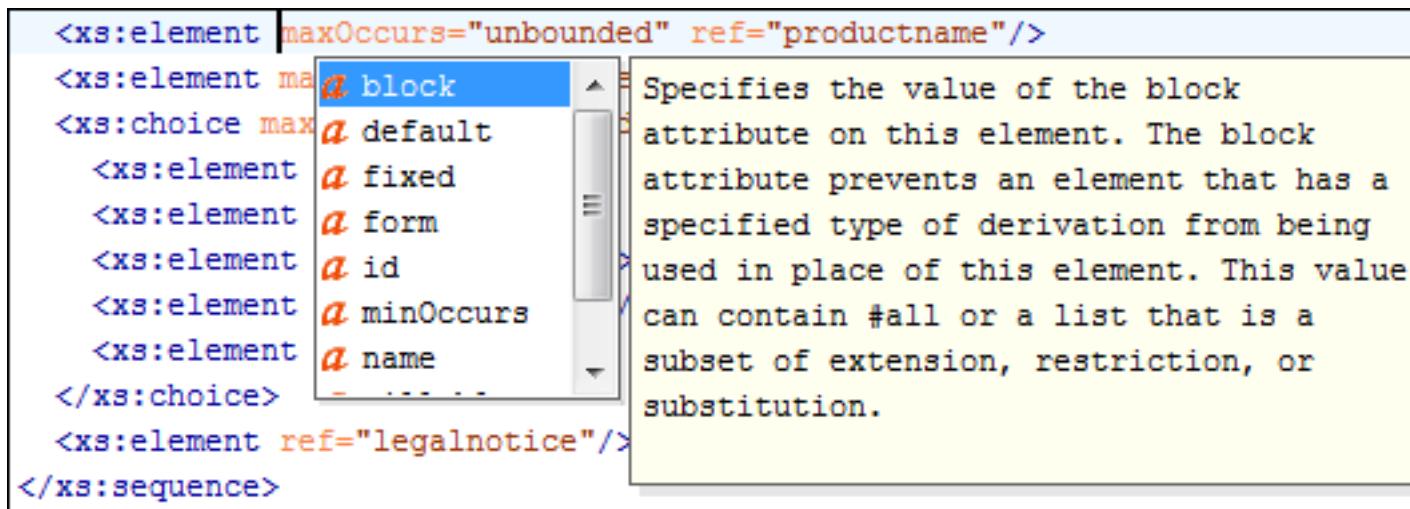

Figure 115: Content Completion Assistant

The **Content Completion Assistant** feature is schema-driven (XML Schema, DTD, and RELAX NG) and status information about the detected schema is logged in the *Information view*.

The **Content Completion Assistant** is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Content Completion**, and disable the **Enable content completion** option.

Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the [Activation delay of the proposals window \(ms\)](#) option from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. Elements can be selected in the list by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Note: When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the [Add Element Content option](#) (in the **Content Completion** preferences page) is enabled. The **Content Completion Assistant** can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the [Add optional content](#) and [Add first Choice particle](#) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the `>` character of the start tag, if the element allows attributes, to enable rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable,

the assistant is closed to enable manual insertion. The values of the attributes can be learned from the same elements in the current document

- After the > character of the start tag if the element has no attributes.

Where the Content Completion Assistant is Displayed

The Content Completion Assistant is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

- The items that populate the **Content Completion Assistant** depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.
- Note:** The **Content Completion Assistant** is able to offer elements defined both by XML Schemas version 1.0 and 1.1.
- The number and type of elements displayed by the **Content Completion Assistant** is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.
 - A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Author checks the uniqueness and correctness of the *ID* attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.
 - Values of all the *xml:id* attributes are handled as *ID* attributes. They are collected and displayed by the **Content Completion Assistant** as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.
 - For documents that use an XML Schema or Relax NG schema, the content assistant offers proposals for attributes and elements values that have an enumeration of tokens as the type. Also, if a default value or fixed value is defined in the XML Schema used in validation for an attribute or element, then that value is offered in the **Content Completion Assistant** window.

Related information

[Customizing the Content Completion Assistant](#) on page 1204

Set Schema to be Used for Content Completion in Text Mode

[Edit on GitHub](#)

The list of proposals in the **Content Completion Assistant** depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the **Content Completion Assistant** is specified in the following methods, in the order of their precedence:

- The schema specified explicitly in the document. In this case, Oxygen XML Author reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The default schema declared in the [Document Type configuration dialog box](#) that matches the edited document.

Schema Annotations in Text Mode

[Edit on GitHub](#)

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The **Content Completion Assistant**.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the **F2** shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** option in the **Annotations** preferences page. When this options is disabled, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace. However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, enable the **Use all Relax NG annotations as documentation** option in the **Annotations** preferences page.

Collecting Annotation from DTDs

For DTD, Oxygen XML Author defines a custom mechanism for annotations using comments enabled from the **Prefer DTD comments that start with "doc:" as annotations** option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Content Completion Helper Views

[Edit on GitHub](#)

Information about the current element being edited is also available in various views, such as the **Model** view, **Attributes** view, **Elements** view, and **Entities** view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view, provide spatial and insight information about the edited document and the current element.

Model View

[Edit on GitHub](#)

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

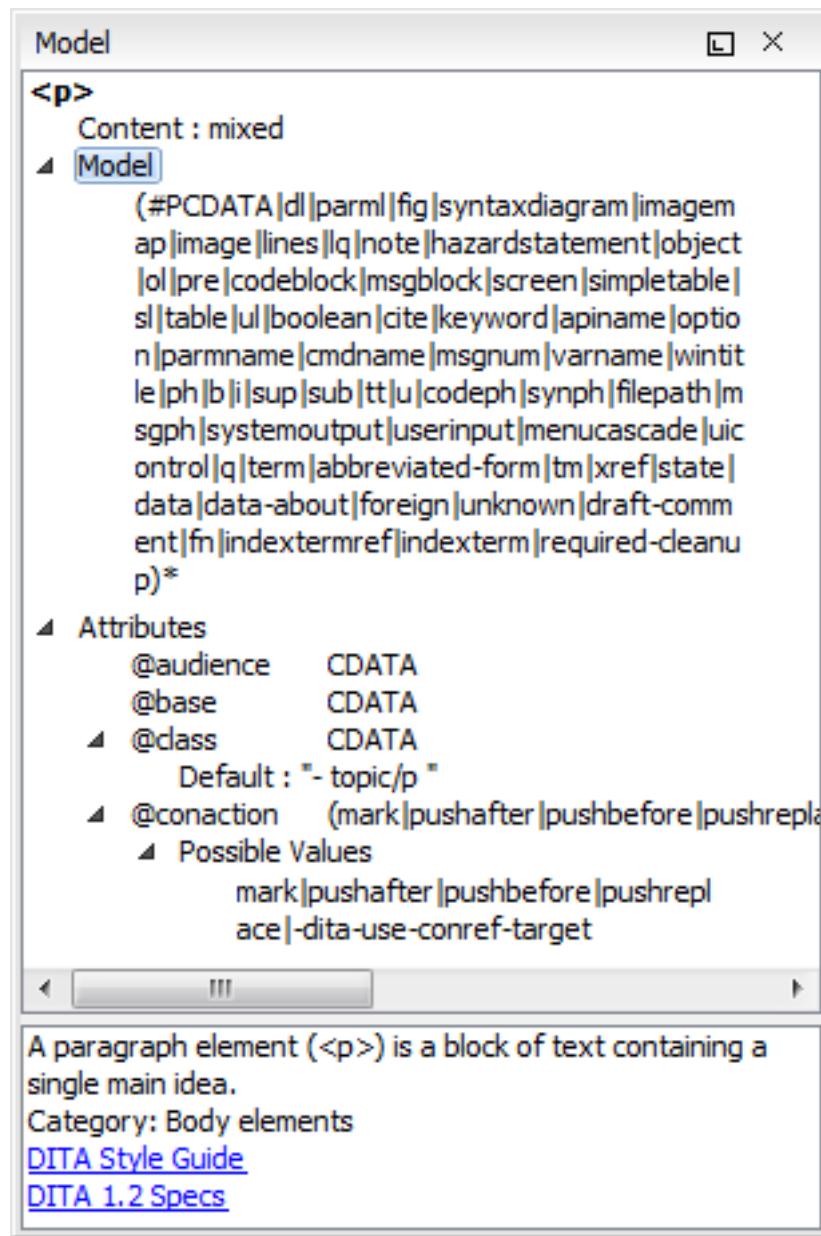

Figure 116: Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

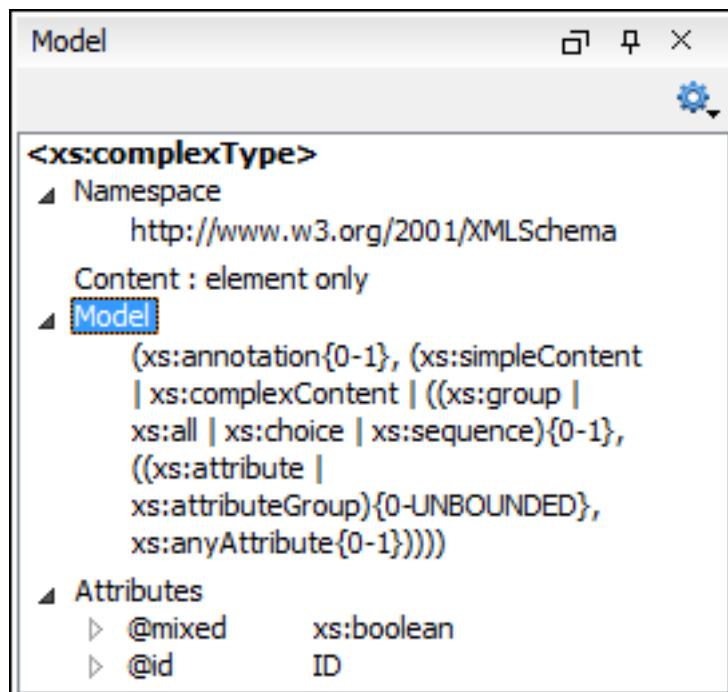

Figure 117: Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

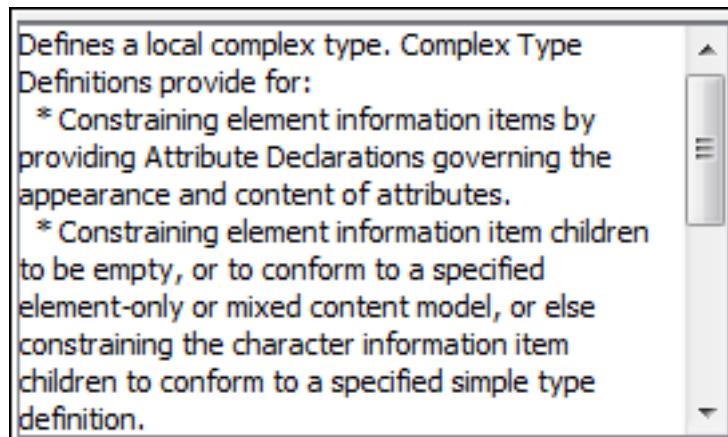

Figure 118: Annotation panel

Attributes View in Text Mode[Edit on GitHub](#)

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes with a specified value are rendered with a bold font, and their values with a plain font.
- Note:** The names of the attributes with an empty string value are also rendered bold.
- Default values are rendered with a plain font, painted gray.
 - Empty values display the text "[empty]", painted gray.
 - Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attribute	Value
abstract	false
block	false
default	true
final	
fixed	
id	
name	email
nillable	false
substitutionGroup	
type	xs:string

Figure 119: Attributes View

Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the  Remove button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  Browse button to select a URL for the value of an attribute. After you have entered or selected a value, use the  Update button (or press **Enter**) to add the value to the attribute.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the *Allow only insertion of valid elements and attributes* schema aware option is enabled.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (**Delete**) or (**Backspace**) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Elements View in Text Mode[Edit on GitHub](#)

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position.

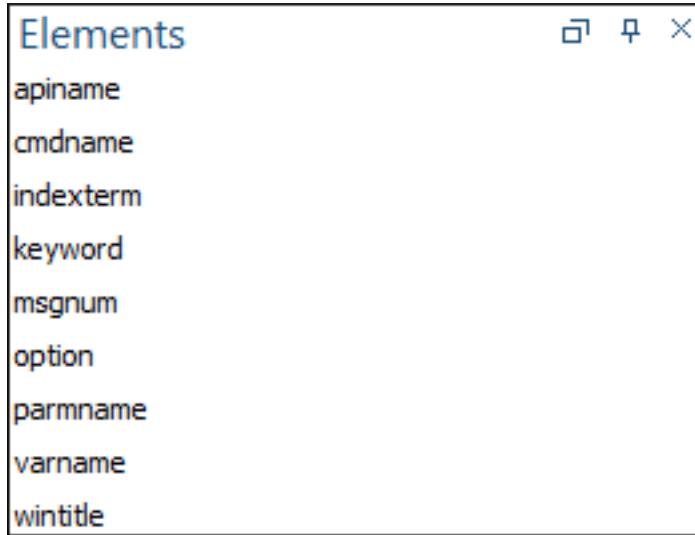

Figure 120: Elements View in Text Mode

Entities View[Edit on GitHub](#)

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (<, >, &, ', ").
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note: If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Entities	
Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbspace	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

Figure 121: Entities View

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

[Edit on GitHub](#)

Code templates are code fragments that can be inserted quickly at the current editing position . Oxygen XML Author includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the **Content Completion Assistant** is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to http://oxygentools.com/demo/Code_Templates.html.

Outline View in Text Mode

[Edit on
GitHub](#)

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (**Ctrl (Command on OS X)**) key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be *disabled and enabled from a Preferences page*.

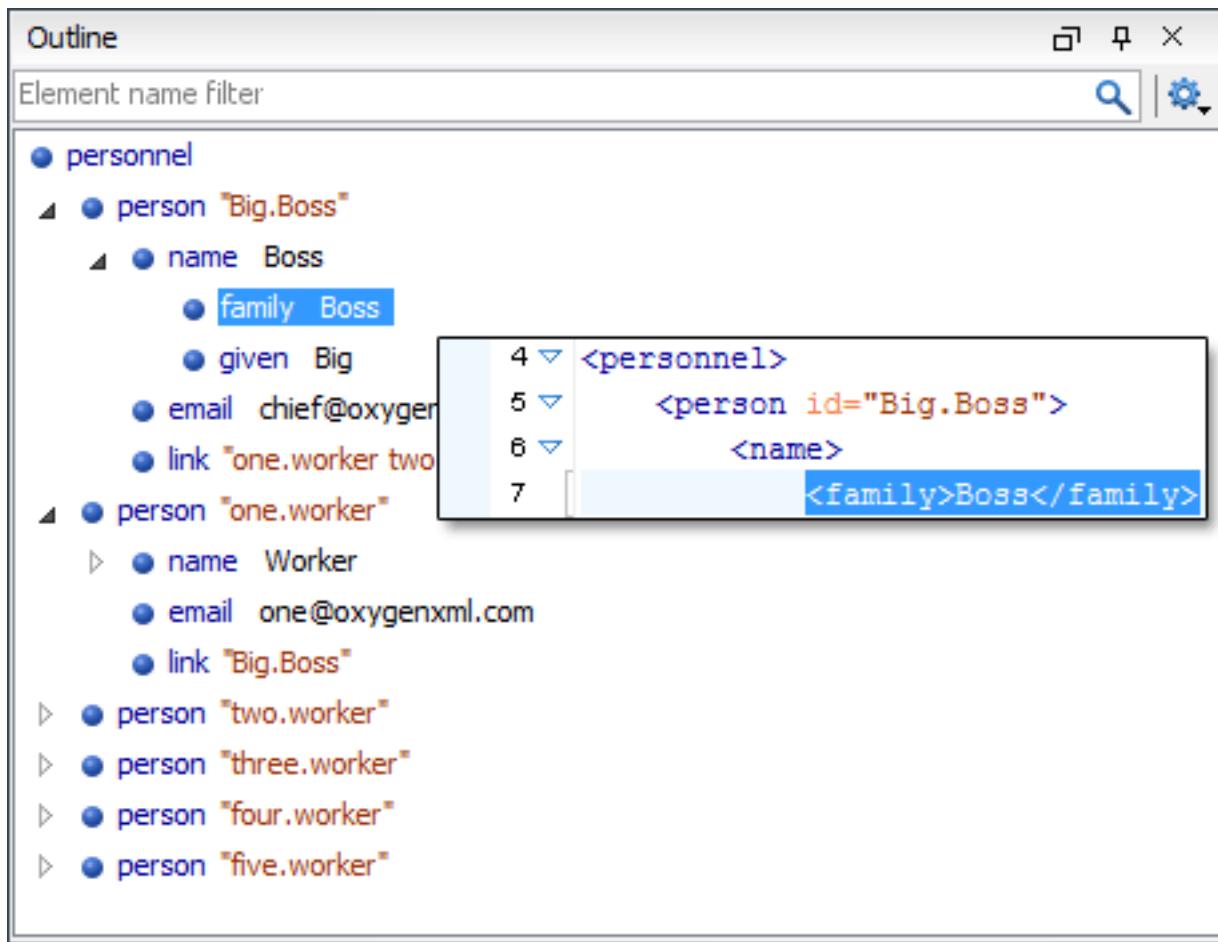

Figure 122: Outline View in Text Mode

Outline View Filters in Text Mode

[Edit on GitHub](#)

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view when editing in **Text** mode:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

 Show comments and processing instructions	Show/hide comments and processing instructions in the Outline view.
 Show element name	Show/hide element name.
 Show text	Show/hide additional text content for the displayed elements.
 Show attributes	Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel .
 Configure displayed attributes	Displays the XML Structured Outline preferences page .

Outline View Contextual Menu Actions in Text Mode[Edit on GitHub](#)

The following actions are available from the contextual menu in the **Outline** view in **Text** mode:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

**Cut**

Cuts the currently selected component.

**Copy**

Copies the currently selected component.

**Delete**

Deletes the currently selected component.

**Collapse All**

Expands the structure of a component in the **Outline** view.

Collapses the structure of all the component in the **Outline** view.

Quick Assist Support for IDs and IDREFS[Edit on GitHub](#)

The Quick Assist support is activated automatically when you place the cursor inside and ID or an IDREF. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the quick assist menu from the contextual menu or by pressing **Alt 1 (Meta Alt 1 on Mac OS X)** on your keyboard.

The following actions are available:

Rename in File

Related information

[Working with Modular XML Files in the Master Files Context](#) on page 606

Inserting or Opening a File at Cursor Location

[Edit on GitHub](#)

When editing content in **Text** mode, the following actions (in regards to inserting, opening, or comparing files) are available in the **Document > File** menu:

Insert File

Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in [the Compare Files tool](#).

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation](#). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

Opens the [Select the scope for the Search and Refactor operations](#) dialog box.

Renames the ID you are editing and all its occurrences from the current file.

Searches for the declaration and references of the ID located at the cursor position in the current document.

Adjusting the Transparency of XML Markup

[Edit on GitHub](#)

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Author offers the option of reducing the visibility of the markup by increasing their transparency when displayed in **Text** mode. To change

the level of transparency, use the  [Tags Transparency Selector] drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using [the Configure Toolbars action](#). There are several levels of transparency that can be adjusted to make the content more or less visible:

- **Normal contrast** - Resets the transparency level back to normal.
- **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
- **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
- **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.

Locking and Unlocking XML Markup

[Edit on GitHub](#)

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be disabled/enabled with the  **Lock / Unlock the XML tags** action available in **Text** editing mode from:

- The **Document > Source** menu.
- The **Source** submenu from the contextual menu.

You can set the default lock state for all opened editors using the [Lock the XML tags option in the Text preferences page](#).

Formatting and Indenting XML Documents

[Edit on GitHub](#)

Oxygen XML Author creates XML documents using several [edit modes](#). In **Text mode**, you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Author must decide how to format and indent the XML. Oxygen XML Author will also format and indent your XML for you in **Text** mode if you use one of the Format and Indent options:

- **Document > Source >  Format and Indent** - Formats and indents the whole document.
- **Document > Source >  Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source >  Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

A number of settings affect how Oxygen XML Author formats and indents XML. Many of these settings have to do with how whitespace is handled.

Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph)

and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>
NO Free man shall be taken or imprisoned, or be stripped of his Freedom, or
Liberties, or
free Customs, or be outlawed, or exiled, or any otherwise destroyed; nor
will we not pass
upon him, nor condemn him, but by lawful judgment of his Peers, or by
the <xref
href="http://en.wikipedia.org/wiki/
Law_of_the_land" format="html" scope="external">Law of the land</xref>.
We will sell to no man, we will not deny or defer to any man either Justice
or Right.
</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. Thus, the paragraph above could be written all on one line with no spaces between the start tag and the first word or between the last word and the end tag and the XML parser would see it as exactly the same paragraph. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.

How Oxygen XML Author determines when whitespace is significant

When Oxygen XML Author formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Author needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Author assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. This generally applies to elements that contain text content only. This content can be normalized by removing insignificant whitespace. Insignificant

Mixed content

whitespace may then be added to format and indent the content.

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello. This is  
s <strong>big</strong>  
  
<emphasis>deal</emphasis>.  
</p>
```

In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end tag and the beginning <emphasis> tag should be normalized to a single space, not zero spaces.

Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Author consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Author consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Author consults information from the following sources:

`xml:space`

If the XML element contains the `xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

CSS whitespace property

If the CSS stylesheet controlling the **Author** mode editor applies the `white-space: pre` setting to an element, it is promoted to the preserve space category.

CSS display property

If a text node contains only white-spaces:

- If the node has a parent element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS `display` property set to `table` then the node is assigned to the ignore space category.

Schema aware formatting

If a schema is available for the XML document, Oxygen XML Author can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value `preserve`.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for **Author** mode, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Edit modes > Author > Schema aware**, and enable/disable the ***Schema aware normalization, format and indent*** option.
- To turn it on or off for the **Text** editing mode, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Format > XML**, and enable/disable the ***Schema aware format and indent*** option.

Preserve space elements list

If an element is listed in the [***Preserve space tab of the Element Spacing list***](#) in the [***XML formatting preferences***](#), it is promoted to the preserve space category.

Default space elements list

If an element is listed in the [***Default space tab of the Element Spacing list***](#) in the [***XML formatting preferences***](#), it is promoted to the default space category

Mixed content elements list

If an element is listed in the [***Mixed content tab of the Element Spacing list***](#) in the [***XML formatting preferences***](#), it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements. In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the [Schema Aware Editing option](#) in the **Schema-Aware** preferences page.

How Oxygen XML Author formats and indents XML

You can control how Oxygen XML Author formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- [Format preferences page](#)
- [XML Formatting preferences page](#)
- [Whitespaces preferences page](#)

When Oxygen XML Author formats and indents XML

Oxygen XML Author formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Author** mode.
- When switching from **Author** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the [Format and indent when passing from grid to text or on save option](#) is selected in the **Grid** preferences page.

Setting an Indent Size to Zero

[Edit on GitHub](#)

Oxygen XML Author will automatically [format and indent](#) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

Note: Changing the indent size does not override the rules that Oxygen XML Author uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Author to maintain a zero indent when editing or formatting those documents:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format**.
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Author will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Author will use the indent closest to what it detects in the document.

Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. *Open the Preferences dialog box (Options > Preferences) and go to Editor > Format.*
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

Warning: Setting the indent size to zero can change the meaning of some file types, such as Python source files.

Format and Indent (Pretty Print) Multiple Files

[Edit on GitHub](#)

Oxygen XML Author provides support for formatting and indenting (*pretty printing*) multiple files at once. This action is available for any document in XML format, as well as for CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project** view or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

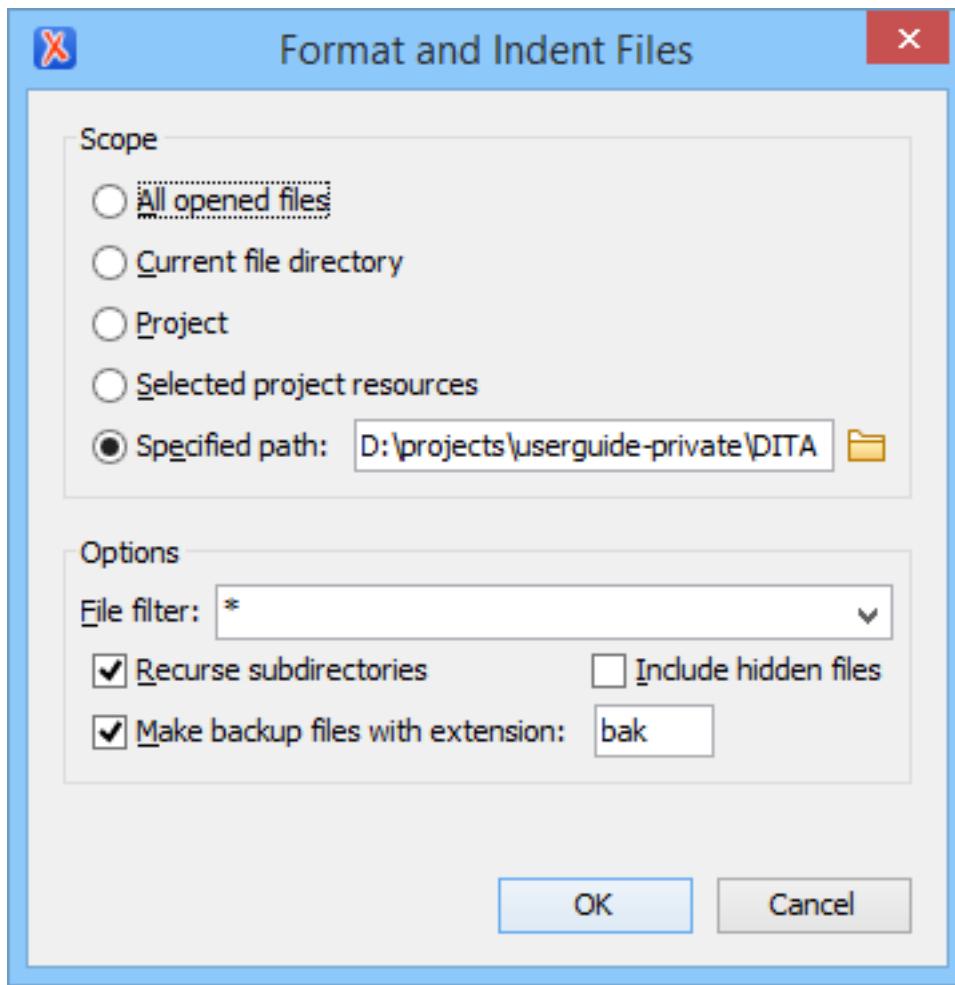

Figure 123: Format and Indent Files Dialog Box

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty print* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - *Pretty prints* the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the *pretty print* is also performed in the hidden files.
- **Make backup files with extension** - When enabled, Oxygen XML Author makes backup files of the modified files. The default extension is **.bak**, but you can change the extension as you prefer.

Managing Highlighted Content

[Edit on GitHub](#)

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Author includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights multiple results, you can select the **Manage Highlighted Content** action from the contextual menu of any highlight in the document, and the following options are available in its submenu:

- **Modify All** - Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.
- **Note:** If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the **Find/Replace** operation, or continue the operation.
- **Surround All** - Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.
- **Remove All** - Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

- **Modify All Matches** - Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Highlight ID Occurrences in Text Mode

[Edit on GitHub](#)

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note: Highlighted ID declarations are rendered with a different color than highlighted ID references.

Contextual Menu Actions in Text Mode

[Edit on GitHub](#)

When editing XML documents in **Text** mode, Oxygen XML Author provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

Executes the typical editing actions on the currently selected content.

Copy XPath

Copies the XPath expression of the current element or attribute from the current editor to the clipboard.

→!Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

Go to Matching Tag <u>(Ctrl + Shift + G)</u>	Moves the cursor to the end tag that matches the start tag, or vice versa.
Go after Next Tag (<u>Ctrl + CloseBracket (Command + CloseBracket on OS X)</u>)	Moves the cursor to the end of the next tag.
Go after Previous Tag (<u>Ctrl + OpenBracket (Command + OpenBracket on OS X)</u>)	Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

Element	Selects the entire element at the current cursor position.
Content	Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.
Attributes	Selects all the attributes of the element at the current cursor position.
Parent	Selects the parent of the element at the current cursor position.

Source submenu

This submenu includes the following actions:

Shift Right (Tab)	Shifts the currently selected block to the right.
Shift Left (Shift + Tab)	Shifts the currently selected block to the left.
Indent selection (Ctrl + I (Command + I on OS X))	Corrects the indentation of the selected block of lines if it does not follow the current <i>indenting preferences</i> .
Escape Selection	Escapes a range of characters by replacing them with the corresponding character entities.

&•Unescape Selection	Replaces the character entities with the corresponding characters.
Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))	Pretty prints the element that surrounds the current cursor position.
To Upper Case	Converts the content selection to upper case characters.
To Lower Case	Converts the content selection to lower case characters.
Capitalize Lines	It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.
Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))	Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.
Base64 Encode/Decode submenu	This submenu include the following actions for encoding or decoding <i>base64</i> schemes:
Import File to Encode and Insert	Encodes a file and then inserts the encoded content into the current

document
at the
cursor
position.

**Decode
Selection
and Export
to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode
Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the *Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page* will be used. Likewise,

the same
is true if
the *Show
the dialog
box for
choosing
the
encoding
for Base64,
Base
32, Hex
conversions*
option is
disabled
in the
Messages
preference
page.

Decode Selection	Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the <i>Encoding for Base64, Base32, Hex conversions option in the Encoding preferences</i>
-------------------------	--

page will be used. Likewise, the same is true if the *Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.*

Base32 Encode/Decode submenu This submenu include the following actions for encoding or decoding *base32* schemes:

Import File to Encode and Insert Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection Replaces a selection of text with the result of encoding that selection.

By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [*Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page*](#) will be used. Likewise, the same is true if the [*Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.*](#)

Decode Selection	Replaces a selection of text with the result
-------------------------	--

of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future.

In this case, the encoding that is specified in the

Encoding for Base64, Base32, Hex conversions

option in the Encoding preferences page will be used.

Likewise, the same is true if the *Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions*

option is disabled in the Messages preference page.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding *hex* schemes:

Import File to Encode and Insert Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the *Encoding*

for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.

Decode Selection	Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is
-------------------------	--

specified
in the
Encoding
for Base64,
Base32,
Hex
conversions
option
in the
Encoding
preferences
page will
be used.
Likewise,
the same
is true if
the *Show*
the dialog
box for
choosing
the
encoding
for Base64,
Base
32, Hex
conversions
option is
disabled
in the
Messages
preference
page.

**Join and Normalize
Lines (Ctrl + J
(Command + J on OS X))**

For the current selection,
this action joins the
lines by replacing the
line separator with a
single space character.
It also normalizes the
whitespaces by replacing
a sequence of such
characters with a single
space.

**Insert new line after
(Ctrl + Alt + Enter
(Command + Alt + Enter
on OS X))**

This action has the same
result as moving the cursor
to the end of the current
line and pressing the
ENTER key.

 **Insert XInclude**

Displays a dialog box
that allows you to browse
and select the content
to be included and
automatically generates
the corresponding
XInclude instruction.

Note: In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files chapter1.xml and chapter2.xml inserts the following section in the DOCTYPE:

```
<!
ENTITY chapter1 SYSTEM "chap
<!
ENTITY chapter2 SYSTEM "chap
```

Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

Canonicalize

Opens the **Canonicalize** dialog box that allows you to select a canonicalization algorithm to standardize the format of the document.

Sign

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences

of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Show Definition (Ctrl + Shift + Enter)

Moves the cursor to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “<http://www.w3.org/2001/XMLSchema-instance>” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute.

Refactoring submenu

This submenu includes the following actions:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. For example, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Author will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

 **Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

 **Surround with Tags
(Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start

and end tags are inserted at the cursor position.

- If the ***Position cursor between tags option*** is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the ***Position cursor between tags option*** is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

 **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

 **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

 **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for

the selected refactoring operation.

**Add/
Change
attribute** Allows you to change the value of an attribute or insert a new one.

**Delete
attribute** Allows you to remove one or more attributes.

**Rename
attribute** Allows you to rename an attribute.

**Replace in
attribute
value** Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Elements submenu

Contains predefined XML refactoring operations that pertain to elements. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Delete
element** Allows you to delete elements.

**Delete
element
content** Allows you to delete the content of elements.

**Insert
element** Allows you to

		insert new elements.
Rename element	Allows you to rename elements.	
Unwrap element	Allows you to remove the surrounding tags of elements, while keeping the content unchanged.	
Wrap element	Allows you to surround elements with element tags.	
Wrap element content	Allows you to surround the content of elements with element tags.	
Fragments submenu	Contains predefined XML refactoring operations that pertain to XML fragments. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.	
Insert XML fragment	Allows you to insert an XML fragment.	
Replace element content with XML fragment	Allows you to replace the content of elements with an	

Manage IDs submenu	XML fragment.
Replace element with XML fragment	Allows you to replace elements with an XML fragment.
Rename in	Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and <i>choose the scope of the rename operation</i> . For a preview of the changes you are about to make, click Preview . This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.
Rename in File	Renames the ID you are editing and all its occurrences from the current file.
Search References	Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the <i>Select the scope for the Search and Refactor operations</i> dialog box, this scope will be used instead.
Search References in	Searches for the references of the ID. Selecting this action opens the <i>Select the scope for the Search and Refactor operations</i> .
Search Declarations	Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using

		the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.
Search Declarations in	Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations .	
 Search Occurrences in file	Searches for the declaration and references of the ID in the current document.	
Quick Assist (<u>Alt + 1 (Command + Alt 1 on OS X)</u>)	Available when the cursor is inside an ID or IDREF, this action opens the Quick Assist window that allows you to select some search and refactoring actions for the selected ID or IDREF.	
Open submenu	The following actions are available in this submenu:	
	Open File at Cursor	Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.
	Open File at Cursor in System Application	Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.
Compare	Opens the current file in the Compare Files tool .	
Resource Hierarchy	Opens the Resource Hierarchy/Dependencies view that allows you to see the resource hierarchy for an XML document.	

Resource Dependencies

Opens the **Resource Hierarchy/Dependencies** view that allows you to see the resource dependencies for an XML document.

Editing XML Documents in Grid Mode[Edit on GitHub](#)

This section includes features and actions for editing XML documents in the **Grid** mode of Oxygen XML Author.

Editing Actions in Grid Mode[Edit on GitHub](#)

A variety of editing actions are available in **Grid** mode from the contextual menu, the **Document** menu, the toolbar, and with shortcut keys. This section explains some of those useful editing actions.

Sorting a Table Column[Edit on GitHub](#)

You can sort certain table columns by using the  **Sort Ascending** or  **Sort Descending** actions that are available on the toolbar or from the contextual menu.

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

Inserting a Row in a Table[Edit on GitHub](#)

You can add a new row using the **Copy/Paste** actions, or by selecting  **Insert row** from the contextual menu or the toolbar.

For a faster way to insert a new row, move the selection over the row header, and then press **Enter**. The row header is the zone in the left of the row that holds the row number. The new row is inserted below the selection.

Inserting a Column in a Table[Edit on GitHub](#)

You can insert a column after the selected column by using the  **Insert column** action from the contextual menu or the toolbar.

Clearing the Content of a Column[Edit on GitHub](#)

You can clear all the cells from a column by using the **Clear content** action from the contextual menu.

Adding Nodes[Edit on GitHub](#)

You can add nodes before, after, or as a child of the currently selected node by using the various actions in the following submenus of the contextual menu:

- **Insert before** - Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

- **Insert after** - Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.
- **Append child** - Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

Duplicating Nodes

[Edit on GitHub](#)

You can quickly create new nodes by duplicating existing ones. The **Duplicate** action is available in the contextual menu and in the **Document > Grid Edit** menu.

Refresh Layout

[Edit on GitHub](#)

When using drag and drop to reorganize the document, the resulting layout can be different from the expected one. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the  **Refresh selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

Start and Stop Editing a Cell Value

[Edit on GitHub](#)

To edit the value of a cell, simply select the grid cell and press **(Enter)** or you can use the  **Start Editing** action found in the **Document > Grid Edit** menu.

To stop editing a cell value, press **(Enter)** again or use the  **End Editing** action found in the **Document > Grid Edit** menu.

To cancel the editing without saving the current changes in the document, press the **(Esc)** key.

Drag and Drop in the Grid Editing Mode

[Edit on GitHub](#)

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**. For more information, see [Copy and Paste in the Grid Editor](#).

Copy and Paste in the Grid Editing Mode

[Edit on GitHub](#)

The selection in the **Grid** mode is a bit complex compared to the selection in a text component. It consists of a currently selected cell and additional selected cells. These additional cells are either selected with the cursor, or implied by the currently selected cell. To be more specific, consider that you click the name of the column (this becomes the current selected cell), but the editor automatically extends the selection so that it contains all the cells from that column. The currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

Pasting Content Within Grid Mode

You can paste the copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

-  **Paste (Ctrl + V (Command + V on OS X))** - Pastes the content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes the content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into the **Text** editor or other applications. When copying from the **Grid** into the **Text** editor or other text based applications, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

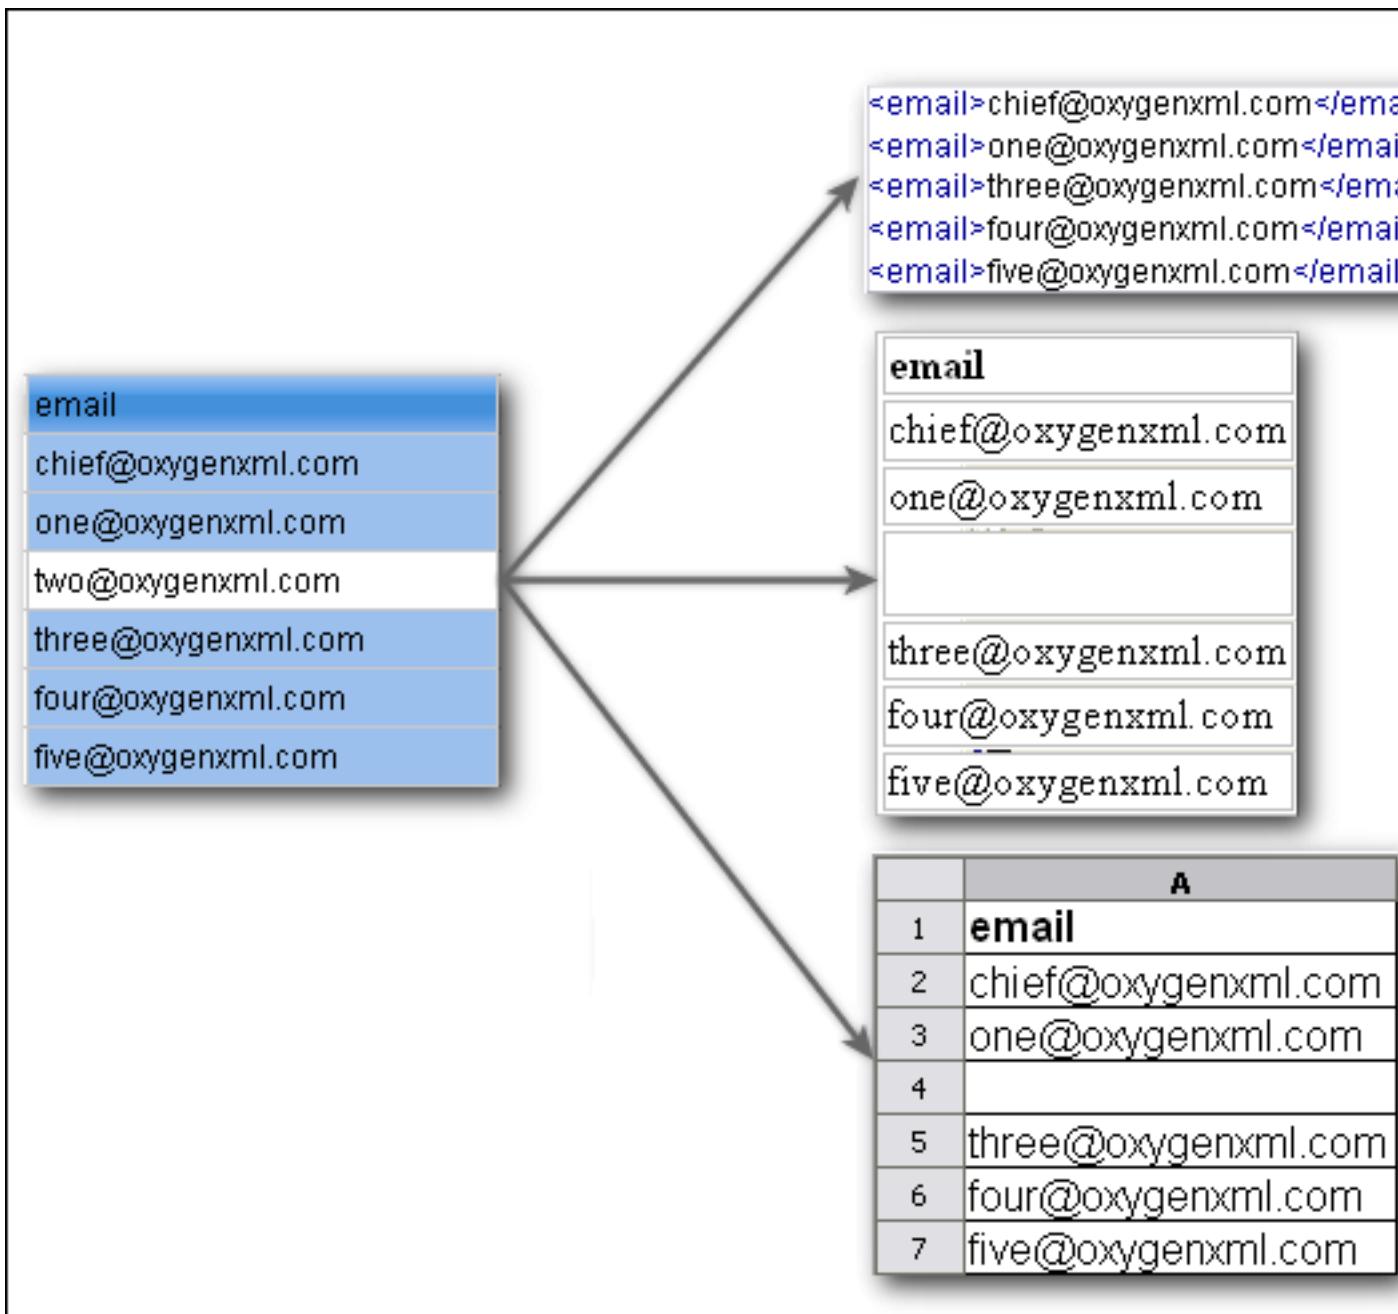

Figure 124: Copying from Grid to Other Editors

Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

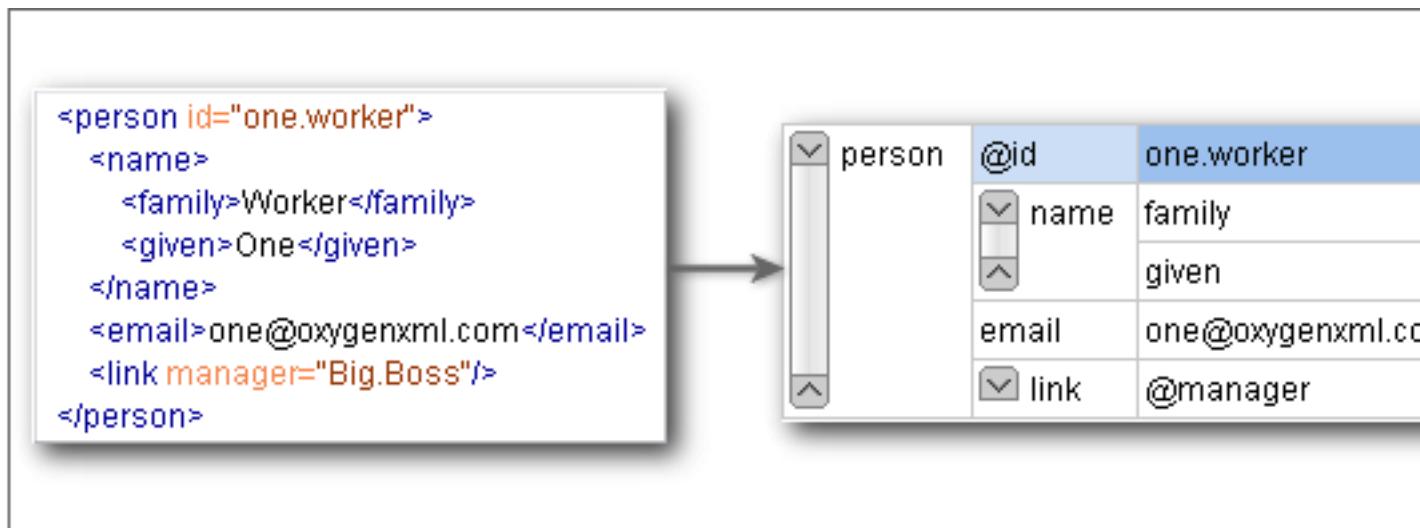

Figure 125: Pasting XML Data into Grid

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

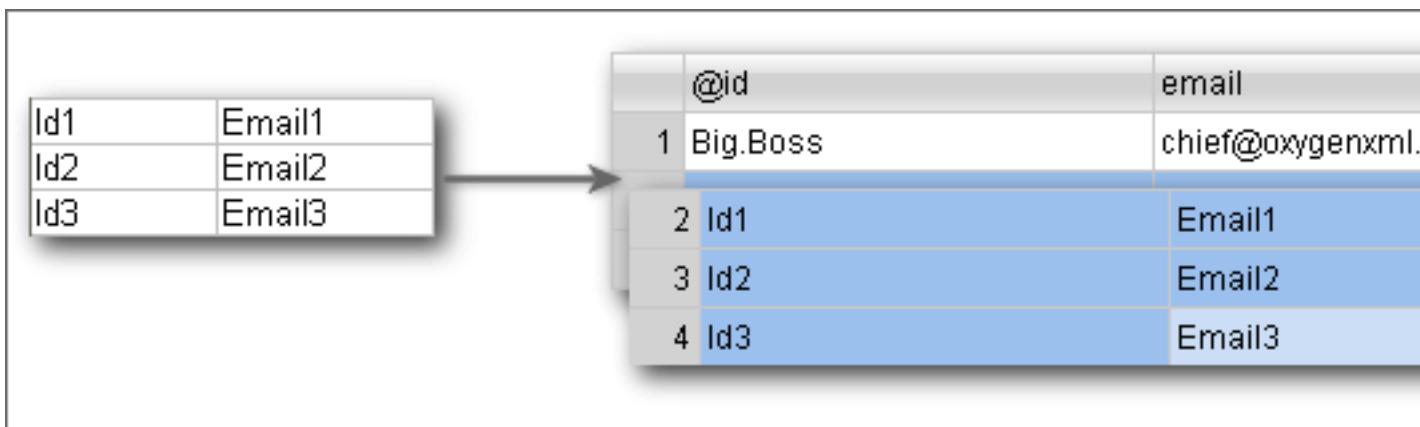

Figure 126: Pasting Tab-Separated Values into Grid

Editing XML Documents in Author Mode

[Edit on GitHub](#)

This section includes details about editing the text content and markup of XML documents in **Author** mode.

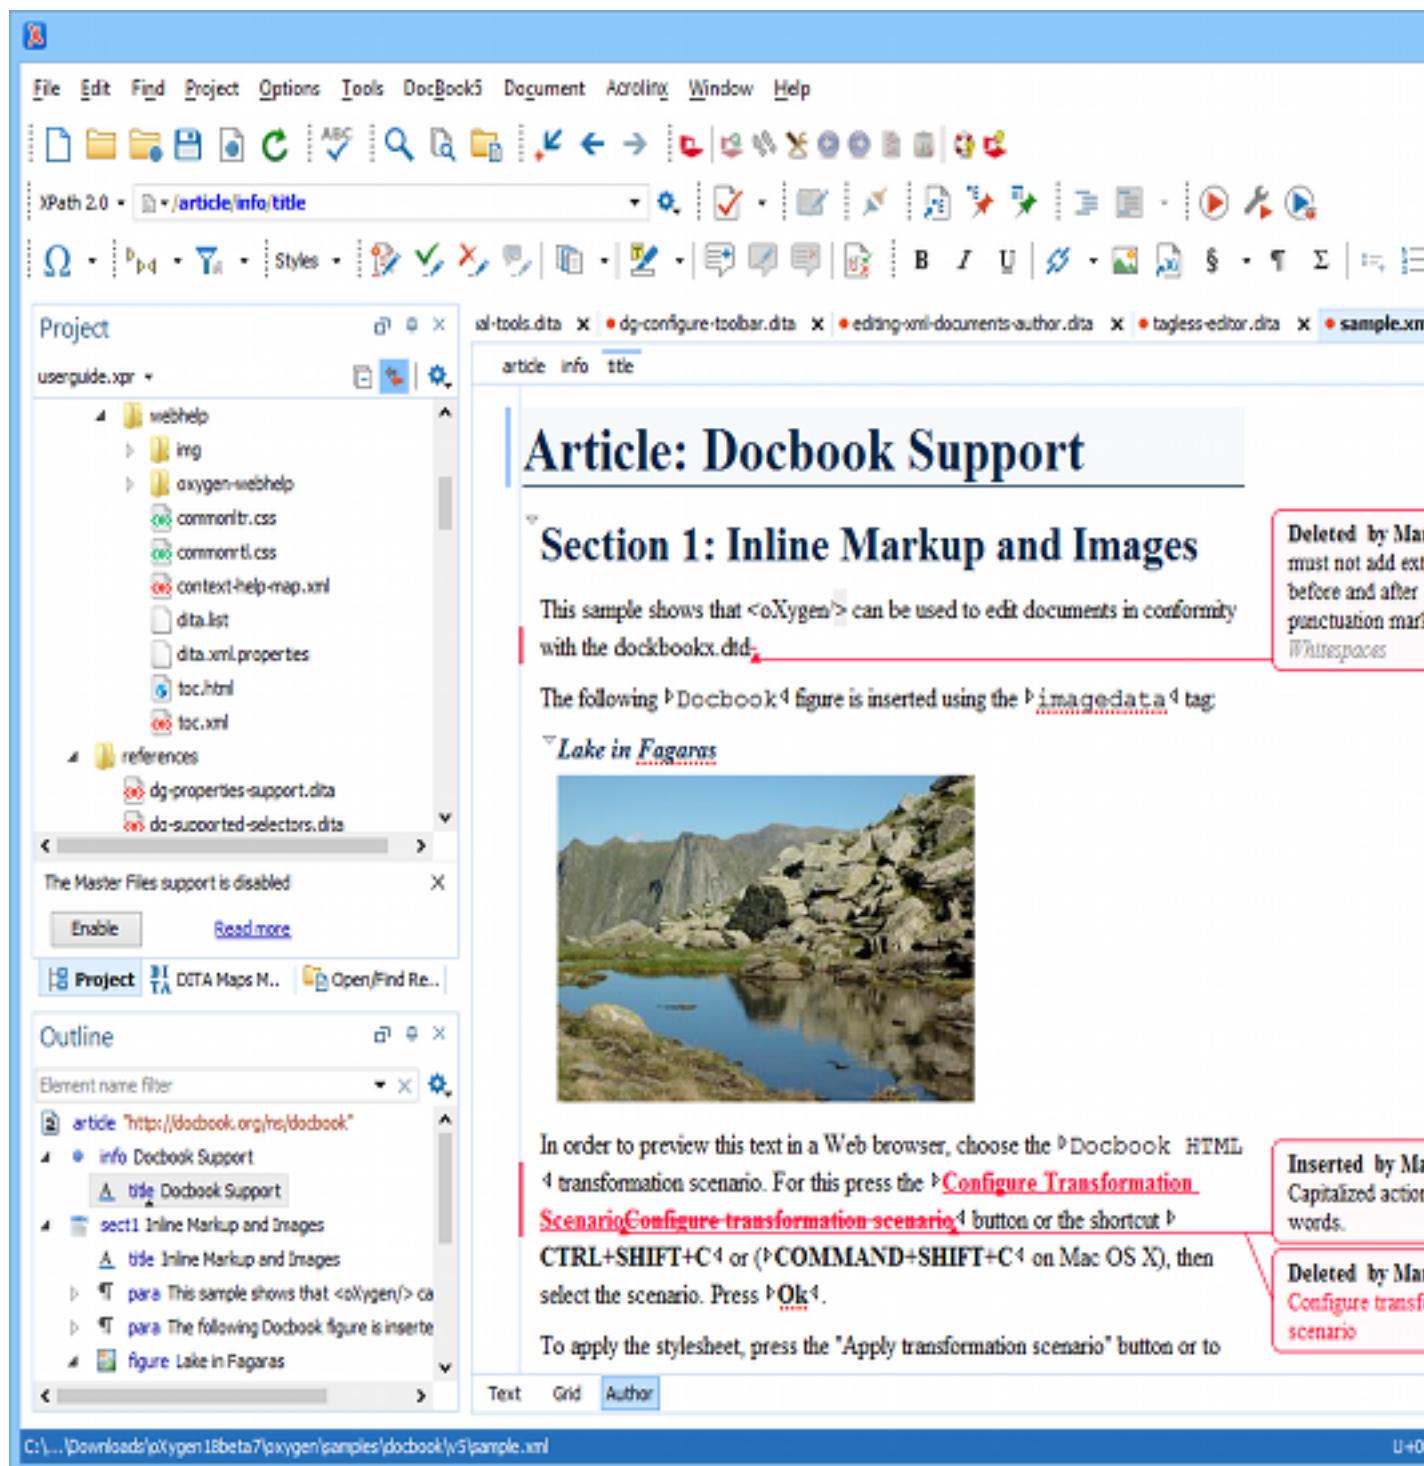

Figure 127: Author Editing Mode

Author Mode User Roles

[Edit on GitHub](#)

There are two main types of users for the **Author** mode: *framework developers* and *content authors*.

Framework Developers

A *framework developer* is a technical person with advanced XML knowledge who defines the framework for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

Content Authors

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

Document Type Association (Framework)

The framework that is set up by the developer is also called a *document type association* and defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- XML catalogs.
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Author includes some ready-to-use predefined document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

Rendering XML Documents in Author Mode

[Edit on GitHub](#)

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in a visual editor. For more information about schema association, see [Associate a Schema to a Document](#) on page 601. The **Author** mode renders the content of the XML documents visually, based on a CSS stylesheet associated with the document.

Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `xmlstylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, [you should create a new document type \(framework\)](#).

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```
<?xml-stylesheet type="text/css" href="test.less"?>
```

Note: XHTML documents need a `link` element, with the `href` and `type` attributes in the head child element, as specified in the [W3C CSS specification](#). XHTML example:

```
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

Tip: You can also insert the `xmlstylesheet` processing instruction by using the  **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **Document > XML Document** menu.

- Configure a *Document Type Association* by adding a new CSS or LESS file in the settings. To do so, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Edit the appropriate framework, open the **Author** tab, then the **CSS** tab. Press the  **New** button to add a new CSS or LESS file.

Note: The Document Type Associations are read-only, so you need to extend an existing one.

You can read more about associating a CSS to a document in the section about [customizing the CSS of a document type](#).

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

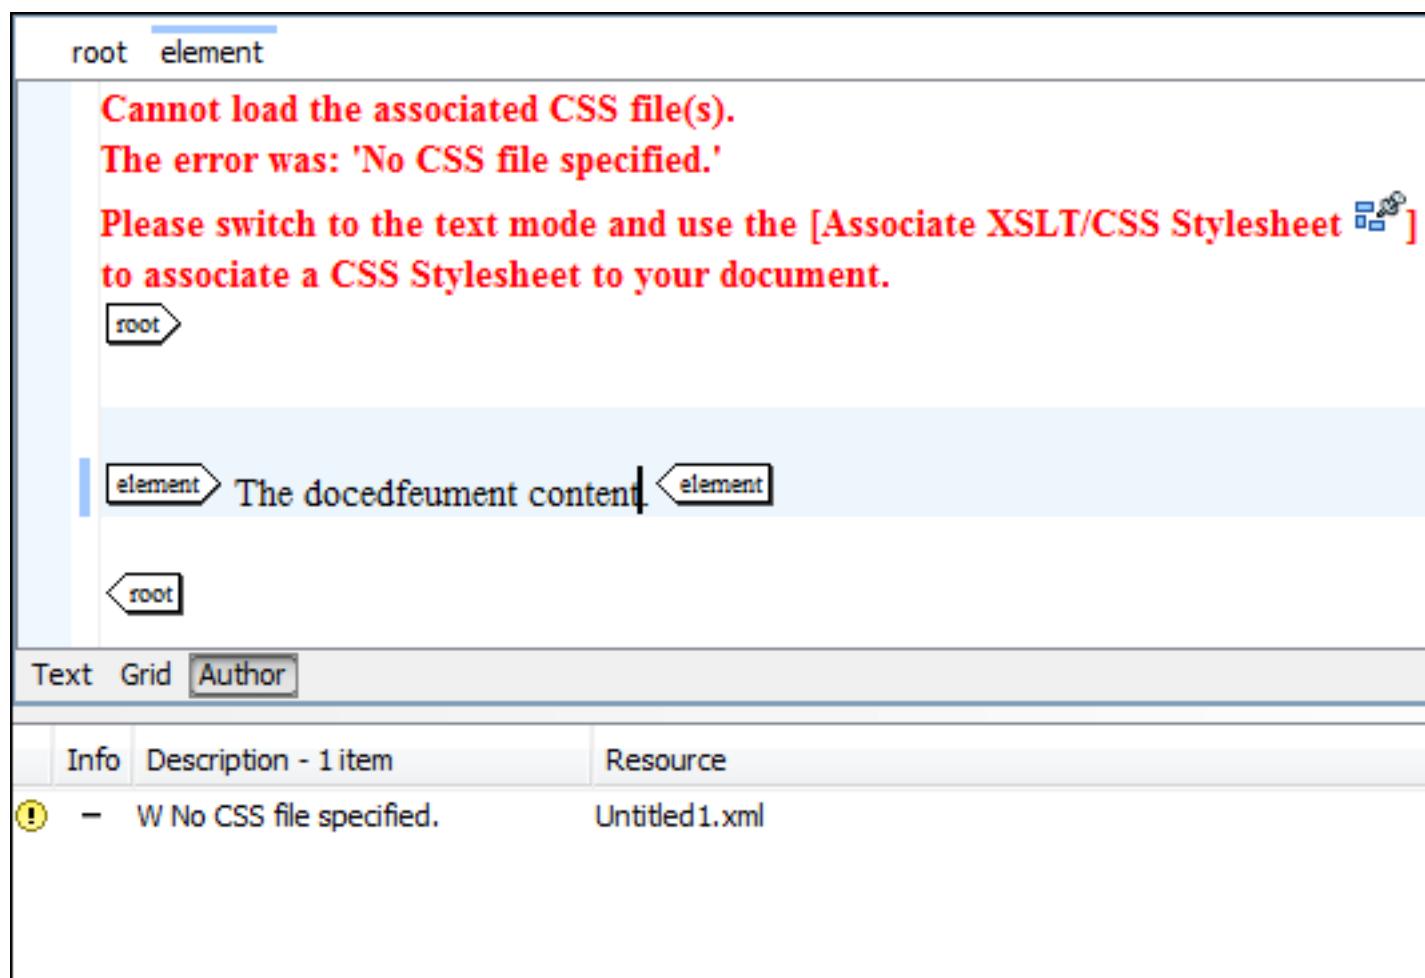

Figure 128: Document with no CSS association default rendering

Selecting and Combining Multiple CSS Styles

Oxygen XML Author provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate)* CSS style and multiple *alternate* CSS styles. This makes it easy to change the look of the document.

Tip: For information about configuring the **Styles** drop-down menu, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

You can select a *main* CSS stylesheet that styles the whole document and then apply *alternate* styles, as layers, to specific parts of the document. In the subsequent figure, a DITA document has the **Century** style selected for the *main* CSS and the *alternate* styles **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

The screenshot shows the Oxygen XML Author interface with a DITA document titled "care.dita". The document structure is visible in the top navigation bar: "topic" and "body". The main content area contains several paragraphs and a table.

Key elements in the content:

- A yellow callout box with the text: "Use a generic DITA topic only if the content cannot be placed into one of the other topic types like **task**, **concept**, **reference**, etc."
- A yellow callout box with the text: "The topic title must clearly convey the content found in the topic."
- The title "Care and Preparation" is displayed in large red text.
- Below the title are buttons for "[Title Alternatives]", "[Short Description]", "OR", "[Abstract]", and "[Prolog]."
- A paragraph about gardening: "When caring for your flower garden you want to feed your plants properly. Proper nutrition is key to successful gardening, landscaping, and healthy flowers. You have to balance the soil structure with nutrients and regulate the pH to cover your needs. The truth is that many flower gardens fail because they just don't get enough of you."
- An expandable section starting with "A DITA table that can encode any complex table structure." It includes a heading "Flowers" and three table row definitions with columns for name, number, width, and align.
- A table with three rows and four columns:

Flower	Type	Soil
Chrysanthemum	perennial	well drained
Gardenia	perennial	acidic

The right side of the interface shows a "Styles" panel with various style categories listed, each with a checked checkbox.

Figure 129: Styles Drop-down Menu in a DITA Document

Navigating the Document Content in Author Mode

[Edit on GitHub](#)

Oxygen XML Author includes some useful features to help you navigate XML documents.

Using the Keyboard

Oxygen XML Author allows you to quickly navigate through a document using the **Tab** key to move the cursor to the next XML node and **Shift + Tab** to go to the previous one. If you encounter a space preserved element when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a space preserved element and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

Navigation Buttons

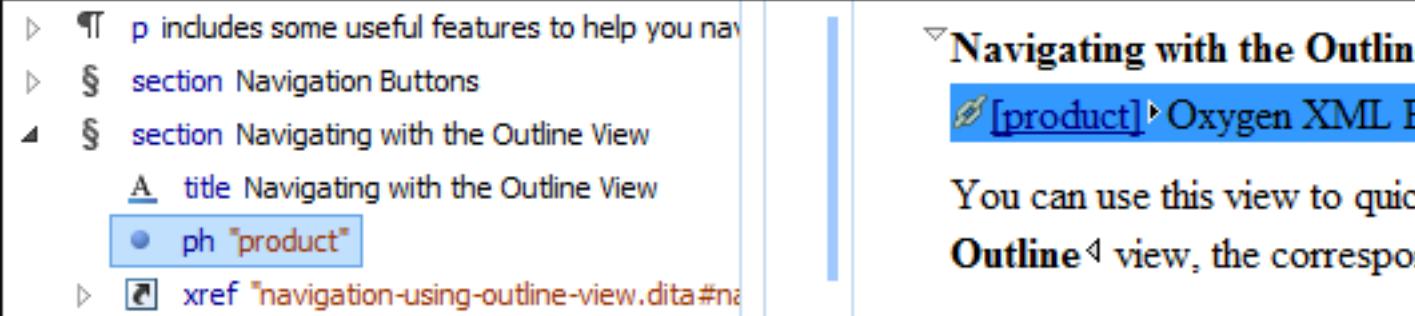

Oxygen XML Author includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

Navigating with the Outline View

Oxygen XML Author includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

The screenshot shows the Oxygen XML Author interface with the 'Outline' view open. On the left, there's a tree view of the XML structure. A node under 'Navigation Buttons' is selected, highlighted with a blue border. On the right, there's a preview pane displaying text related to the outline view.

Figure 130: Outline View Navigation in Author Mode

Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

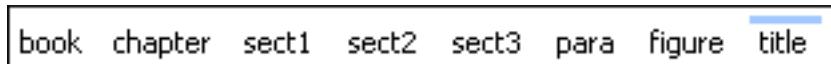

Figure 131: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the **linking support** is useful for navigating between the documents. In the predefined customizations that are

bundled with Oxygen XML Author, links are marked with an icon representing a chain link (). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

Note: Depending on the referenced file type, the target link will either be opened in the Oxygen XML Author or in the default system application. If the target file does not exist, Oxygen XML Author prompts you to create it.

Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the **Options > Menu Shortcut Keys** menu.

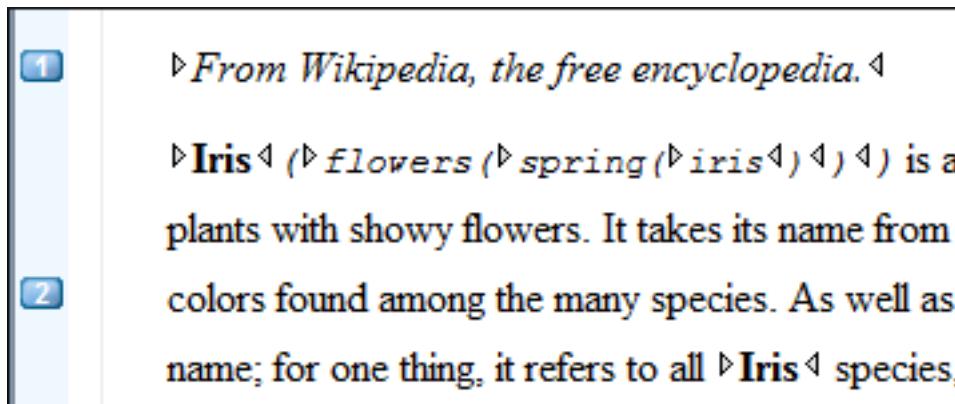

Figure 132: Editor Bookmarks

A bookmark can be inserted in **Author** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl + F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

Displaying the Markup

[Edit on GitHub](#)

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the  **Tags Display Mode** drop-down menu (available on the toolbar):

 **Full Tags with Attributes**

Displays full tag names with attributes for both block and in-line elements.

 **Full Tags**

Displays full tag names without attributes for both block and in-line elements.

 **Block Tags**

Displays full tag names for block elements and simple tags without names for in-line elements.

 **Inline Tags**

Displays full tag names for in-line elements, while block elements are not displayed.

 **Partial Tags**

Displays simple tags without names for in-line elements, while block elements are not displayed.

 **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

To set a default tags mode, go to [Author preferences page](#) and configure the **Tags Display Mode** options.

Note: The graphical format of the tags is controlled from the associated CSS via the *display* property. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

Editing Content in Author Mode

[Edit on GitHub](#)

The **Author** mode in Oxygen XML Author allows you to create, review, and edit structured content in a visual editor that is similar to common word processors. To enter this mode, click the **Author** button at the bottom of the editing area. This mode includes a large variety of user-friendly authoring features to help even novice users work with XML content, including numerous toolbar, menu, and shortcut actions, drag and drop support, smart paste support, and some specialized content editing features.

Changing the Font Size

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Command + MouseWheelForward on OS X))

Increases the font size with one point for each execution of the action.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on OS X))

Decreases the font size with one point for each execution of the action.

Normal editor font (Ctrl + 0 (Command + 0 on OS X))

Resets the font size to *the value of the editor font set in the Fonts preferences page*.

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on OS X))

Reverses a maximum of 200 editing actions (configurable with the **Undo history size option** in the **Editor** preferences page) to return to the preceding state.

Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))

Note: Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on OS X))

Selects the entire content of the current document.

Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

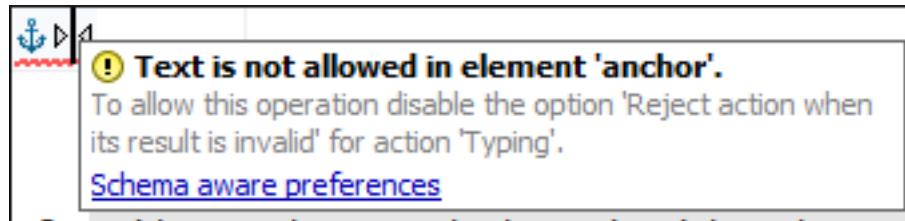

Figure 133: Editing in empty element warning

To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and disable the **Reject action when its result is invalid** option in the **Typing** actions section.

To watch our video demonstration about the basic functionality of the **Author** mode, go to http://oxygenxml.com/demo/WYSIWYG_XML_Editing.html.

[Contextual Menu Actions in Author Mode](#) on page 552

Editing XML Markup in Author Mode

[Edit on GitHub](#)

Oxygen XML Author includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

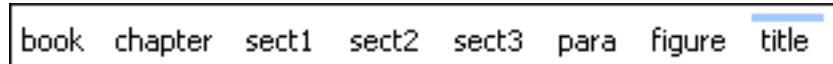

Figure 134: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

Edit Attributes

Opens the *in-place attributes editor* that allows you to easily edit the attributes of an element.

Edit Profiling Attributes

Allows you to select the *profiling attributes* that apply to a certain element.

Append child

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

Insert before

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

Insert after

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

Paste

Copies the selected element to the clipboard, while preserving the styles of the copied content.

Paste before

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste after

Insert a well-formed element (from the clipboard) before the currently selected element.

Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

Delete

Deletes the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the **Rename** dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip: The tag names displayed in the *breadcrumb* can be customized with an **Author** mode extension class that implements the `AuthorBreadcrumbCustomizer` API. See the [Oxygen SDK](#) for more details.

Move Nodes

You can move XML nodes in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Tip: The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

Promote/Demote List Item Nodes

You can easily promote or demote list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes the current list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)

Demotes the current list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Join Elements

Joins two adjacent *block* elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Tip: Specifically, the **Delete** or **Backspace** keys can be used to join block elements in the following situations:

- The cursor is located before the end position of the first element and **(Delete)** key is pressed.
- The cursor is located after the end position of the first element and **(Backspace)** key is pressed.
- The cursor is located before the start position of the second element and **(Delete)** key is pressed.
- The cursor is located after the start position of the second element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned

at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Tip: Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **(Delete)** key is pressed.
- The cursor is located after the start position of the element and **(Backspace)** key is pressed.
- The cursor is located before the end position of the element and **(Delete)** key is pressed.
- The cursor is located after the end position of the element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Removes all the XML markup inside the selected block of content and keeps only the text content.

Tip: You can use the **(Delete)** or **(Backspace)** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Elements submenu

Contains predefined XML refactoring operations that pertain to elements. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element	Allows you to rename elements.
Unwrap element	Allows you to remove the surrounding tags of elements, while keeping the content unchanged.
Wrap element	Allows you to surround elements with element tags.
Wrap element content	Allows you to surround the content of elements with element tags.

Fragments submenu

Contains predefined XML refactoring operations that pertain to XML fragments. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Insert XML fragment	Allows you to insert an XML fragment.
Replace element content with XML fragment	Allows you to replace the content of elements with an XML fragment.
Replace element with XML fragment	Allows you to replace elements with an XML fragment.

Editing Attributes in Author Mode

[Edit on GitHub](#)

You can easily edit attributes in **Author** mode by using the [Attributes View](#) and Oxygen XML Author also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*:  **Full Tags with Attributes**,  **Full Tags**,  **Block Tags**, or  **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

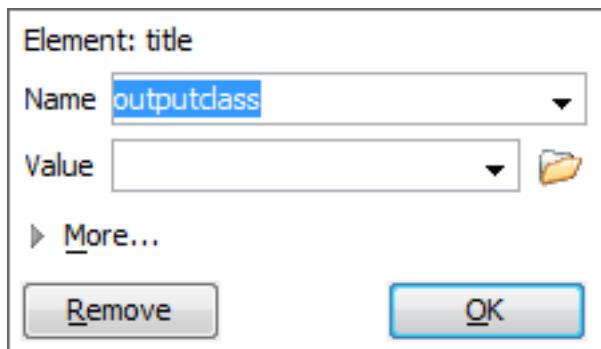

Figure 135: In-place Attributes Editor

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

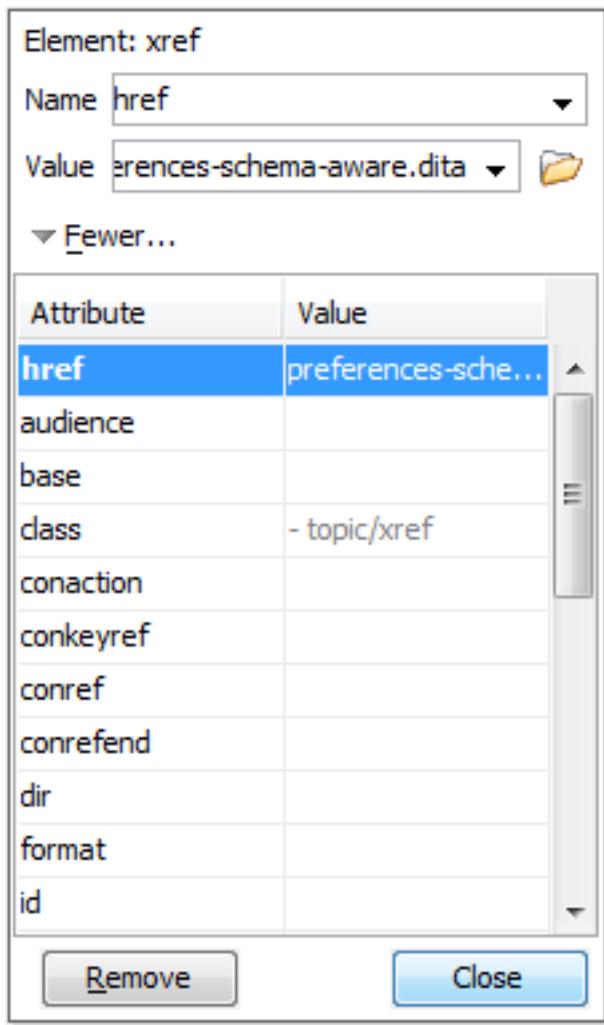

Figure 136: In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

Folding XML Elements in Author Mode

[Edit on GitHub](#)

When working with a large document, the **folding support** in Oxygen XML Author can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

▶ Configuring ⚒ [product] ▶ Oxygen XML Editor ↻

▼ Video Tutorials

The ⚒ [product] ▶ Oxygen XML Editor ↻ website includes many video tutorials that demonstrate how to use Oxygen XML Editor. These videos present many of the features that are available in ⚒ [product], such as how to complete specific tasks or how to use the various features.

Figure 137: Folding of XML Elements in Author Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Author, meaning the next time you open the document the folds are restored to its last state.

Folding Actions in Author Mode

Foldable elements are marked with a small triangle (▾ / ▸) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the **Folding** sub-menu of the contextual menu or from the **Document > Folding** menu:

Toggle Fold (or you can simply click on the ▾ / ▸ arrow)	Toggles the state of the current fold.
Collapse Other Folds (<u>Ctrl + NumPad/ (Command + NumPad/ on OS X)</u>)	Folds all the elements except the current element.
Collapse Child Folds (<u>Ctrl + NumPad. (Command + NumPad. on OS X)</u>)	Folds the child elements that are indented one level inside the current element.
Expand Child Folds	Unfolds all child elements of the currently selected element.
Expand All (<u>Ctrl + NumPad* (Command + NumPad* on OS X)</u>)	Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Author, go to <http://oxygenxml.com/demo/FoldingSupport.html>.

Drag and Drop in Author Mode

[Edit on GitHub](#)

The Oxygen XML Author **Author** mode includes support for dragging and dropping content in XML documents.

When editing content in **Author** mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

Related information

[Smart Paste Support](#) on page 436

Smart Paste Support

[Edit on](#)

[GitHub](#)

The **Author** editing mode includes a *Smart Paste* feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Author, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Author preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

Smart Paste Options

By default, the *Smart Paste* features are enabled in Oxygen XML Author. There are several options in the [Schema Aware preferences page](#) that control the *Smart Paste* feature:

- **Smart paste and drag and drop** - This option determines whether or not Oxygen XML Author will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is enabled by default.
- **Reject action when its result is invalid** - If you enable this option, Oxygen XML Author will not let you paste content into a position where it would be invalid. This option is disabled by default.
- **Convert external content on paste** - This option determines whether or not Oxygen XML Author will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is enabled by default.
- **Convert even when pasting inside space-preserve elements** - If you enable this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a `codeblock`). This option is disabled by default.

Smart Paste Supported Document Types

The *Smart Paste* feature is supported for the following document types (frameworks):

- DITA
- DocBook 4
- DocBook 5
- TEI P4
- TEI P5
- XHTML
- JATS

To watch our video demonstration about the Smart Paste support, go to http://oxygenxml.com/demo/Smart_Paste_Copy_Paste_from_Web_Office_Documents_to_DITA_DocBook_TEI_XHTML_Documents.html.

[Customizing Smart Paste Support](#) on page 1167

Content Completion Assistant in Author Mode

[Edit on GitHub](#)

One of the most useful features in **Author** mode is the content completion support. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

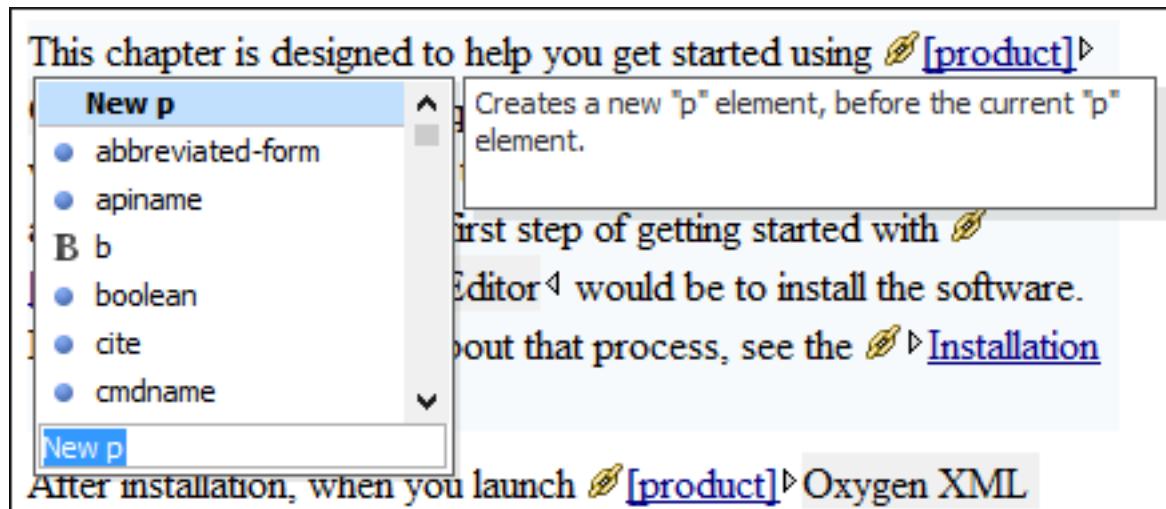

Figure 138: Content Completion Assistant in Author Mode

The **Content Completion Assistant** is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Content Completion**, and disable the **Enable content completion option**.

Using the Content Completion Assistant in Author Mode

To activate the feature in **Author** mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space (Command + Space on OS X)**
- **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. Elements can be selected in the list by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Author** mode, simply press **Enter**.

Types of Proposals Listed in the Content Completion Assistant

The **Content Completion Assistant** offers the following types of proposed actions:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert [code templates](#).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags mode**), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

- If the [Show all possible elements in the content completion list option from the Schema-Aware preferences page](#) is enabled, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

Note: By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the [Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page](#).

Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the **Content Completion Assistant** in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the **Content Completion Assistant** is a **New <Element>** item. Selecting this item will insert an empty element.

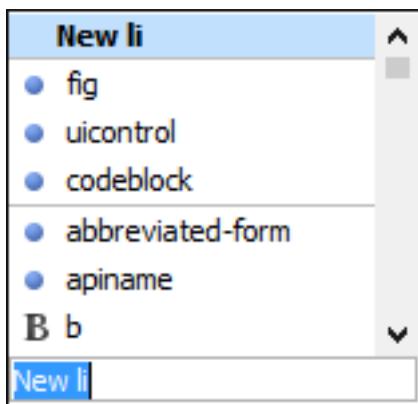

Figure 139: Example (New [Element Name])

- If the cursor is positioned somewhere inside the element, the first entry in the **Content Completion Assistant** is a **Split <Element>** item. In most cases, you can only split the closest block element to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

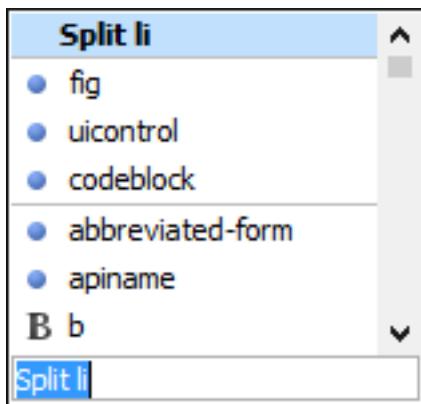

Figure 140: Example (Split [Element Name])

- If the cursor is positioned inside a space preserved element (for example, a *code block*), the first choice in the **Content Completion Assistant** is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

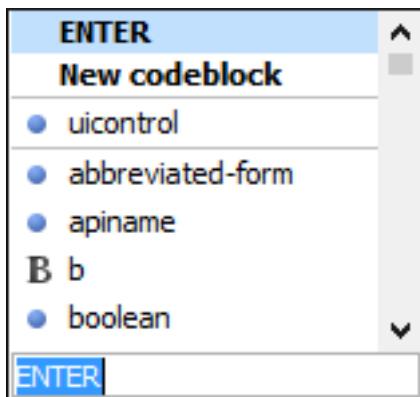

Figure 141: Example ('ENTER' New Line)

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags mode**), it will allow you to rename the element.

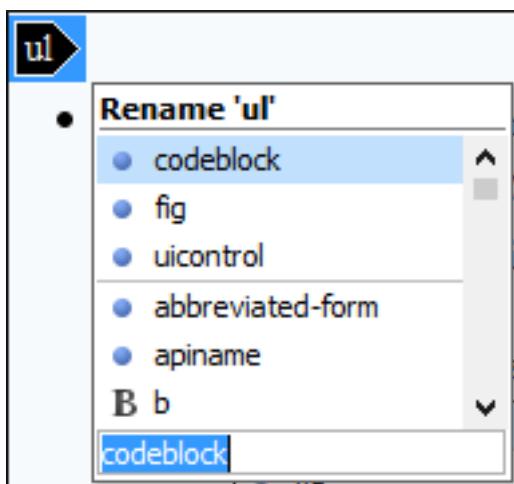

Figure 142: Example (Rename)

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

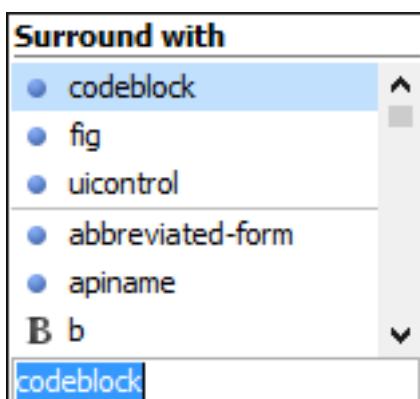

Figure 143: Example (Surround)

Related information

[Customizing the Content Completion Assistant](#) on page 1204

Set the Schema to be Used for Content Completion

[Edit on GitHub](#)

The proposals that are presented in the **Content Completion Assistant** depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the **Content Completion Assistant** is specified in the following methods, in the order of their precedence:

- The schema specified explicitly in the document. In this case, Oxygen XML Author reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The schema declared in the *Schema tab of the Document Type configuration dialog box* for the particular document type.

Schema Annotations in Author Mode

[Edit on GitHub](#)

A *schema annotation* is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the **Content Completion Assistant**.

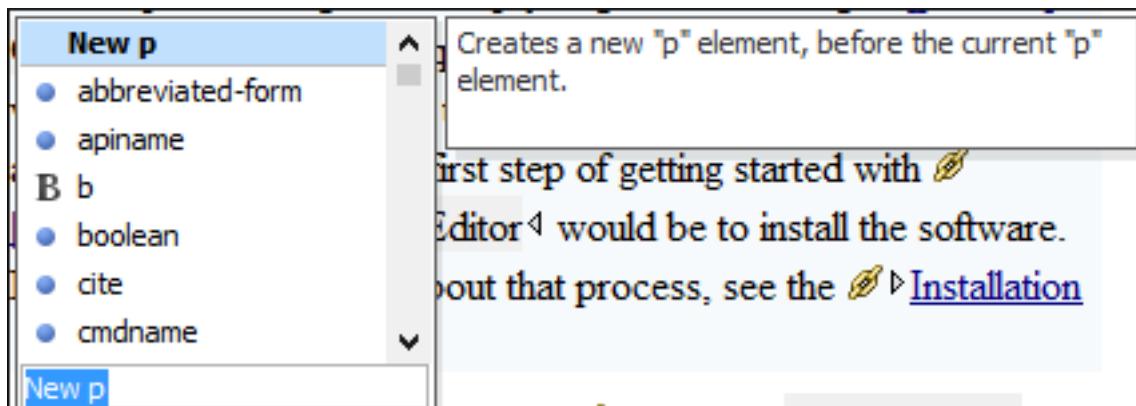

Figure 144: Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the *Show annotations in Content Completion Assistant* option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the *Show annotations using HTML format, if possible* option in the **Annotations** preferences page. When this option is disabled, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Author looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace. However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, enable the ***Use all Relax NG annotations as documentation*** option in the **Annotations** preferences page.

Collecting Annotation from DTDs

For DTD, Oxygen XML Author defines a custom mechanism for annotations using comments enabled from the ***Prefer DTD comments that start with "doc:" as annotations*** option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Related information

[Customizing the Rendering of Elements](#) on page 1211

Content Completion Helper Views

[Edit on GitHub](#)

Information about the current element being edited is also available in various views, such as the **Model** view, **Attributes** view, **Elements** view, and **Entities** view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view, provide spatial and insight information about the edited document and the current element.

Model View

[Edit on GitHub](#)

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

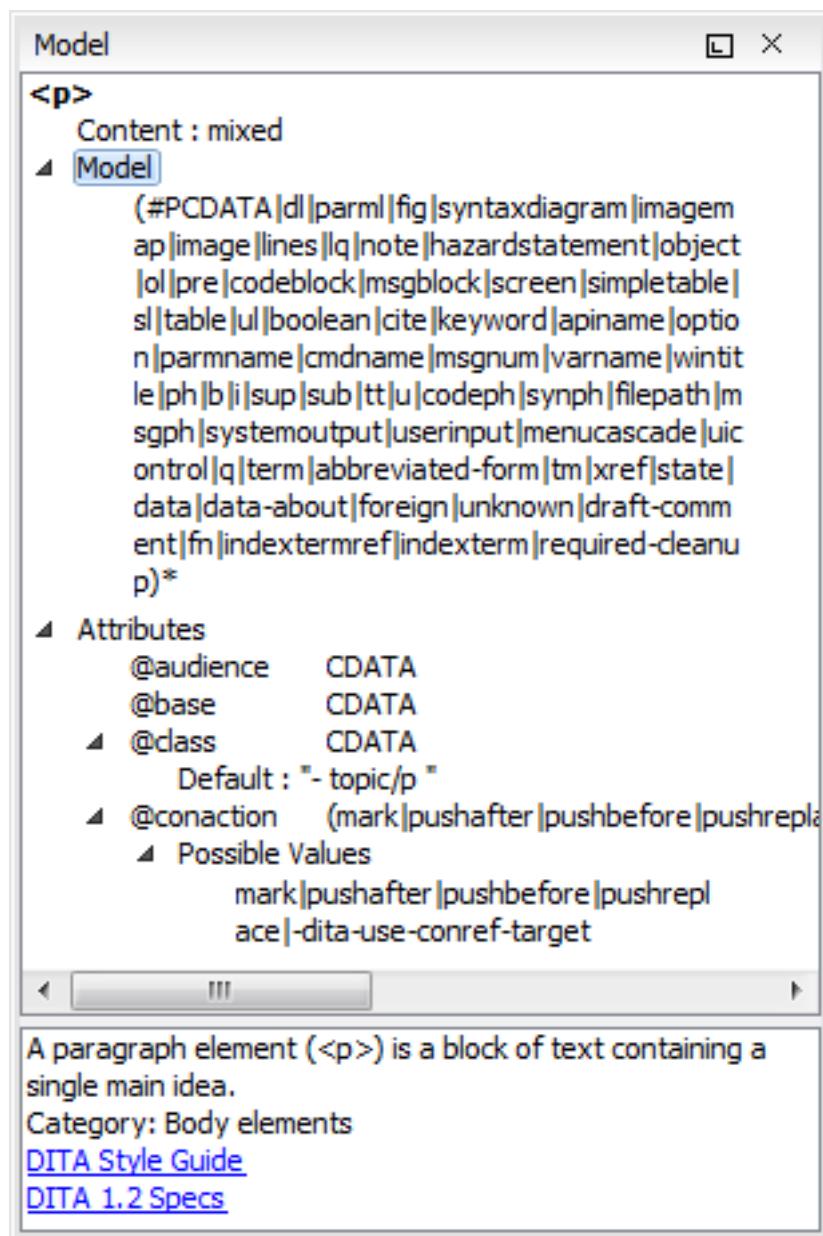

Figure 145: Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

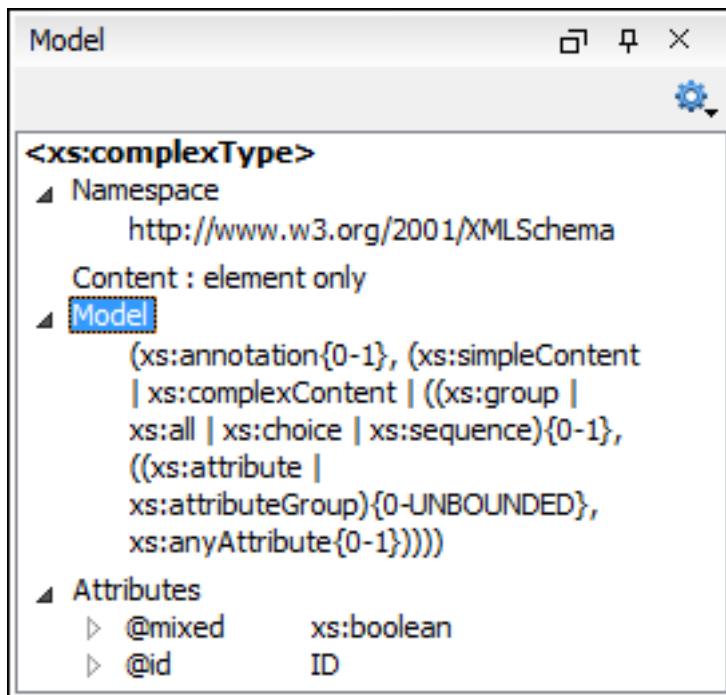

Figure 146: Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

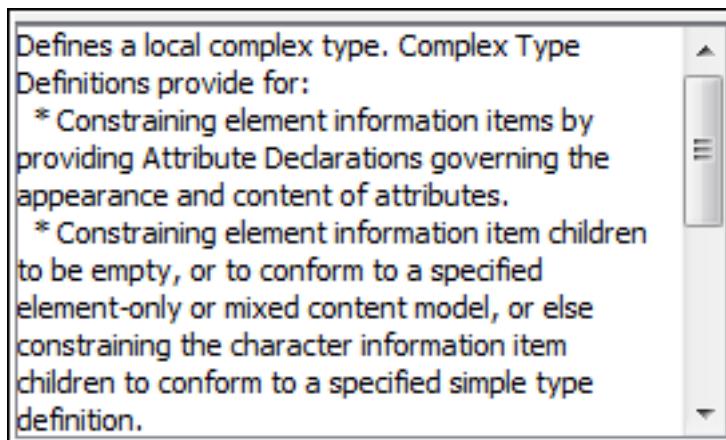

Figure 147: Annotation panel

Attributes View in Author Mode

[Edit on GitHub](#)

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the **-oxy-editable** property associated with the element.
- The element is entirely included in a deleted **Track Changes** marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes with a specified value are rendered with a bold font, and their values with a plain font.
- Note:** The names of the attributes with an empty string value are also rendered bold.
- Default values are rendered with a plain font, painted gray.
 - Empty values display the text "[empty]", painted gray.
 - Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as **list** in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attribute	Value
base	base
id	@
outputclass	
platform	[Empty]
audience	
class	- topic/body
conaction	
conkeyref	
conref	
conrefend	
dir	

Figure 148: Attributes View

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Author includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full**, **Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

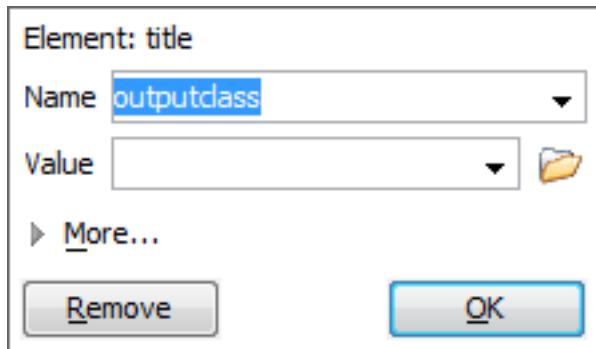

Figure 149: In-place Attributes Editor

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

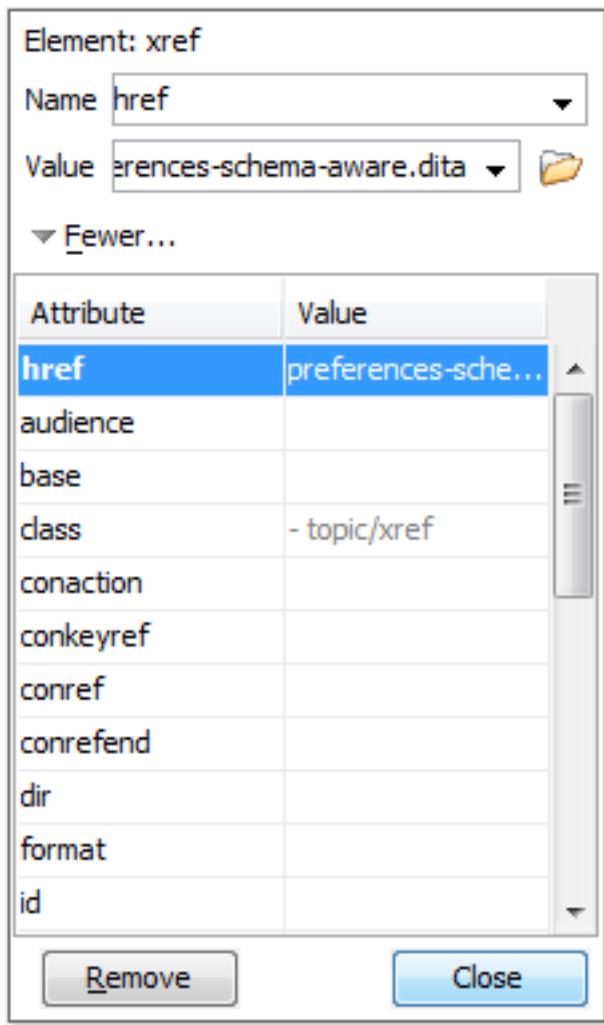

Figure 150: In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

Elements View in Author Mode

[Edit on GitHub](#)

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position** option is disabled in the [Views preferences page](#), two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

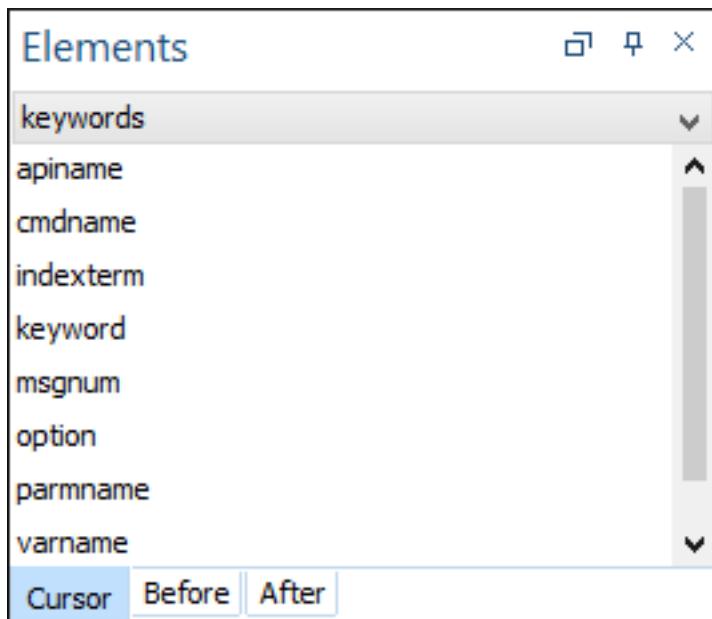

Figure 151: Elements View in Author Mode

Entities View

[Edit on GitHub](#)

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (<, >, &, ', ").
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note: If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Entities	
Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbspace	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

Figure 152: Entities View

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

[Edit on GitHub](#)

Code templates are code fragments that can be inserted quickly at the current editing position . Oxygen XML Author includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the **Content Completion Assistant** is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to http://oxygentools.com/demo/Code_Templates.html.

Outline View in Author Mode

[Edit on
GitHub](#)

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (**Ctrl (Command on OS X)**) key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be *disabled and enabled from a Preferences page*.

Tip: You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.

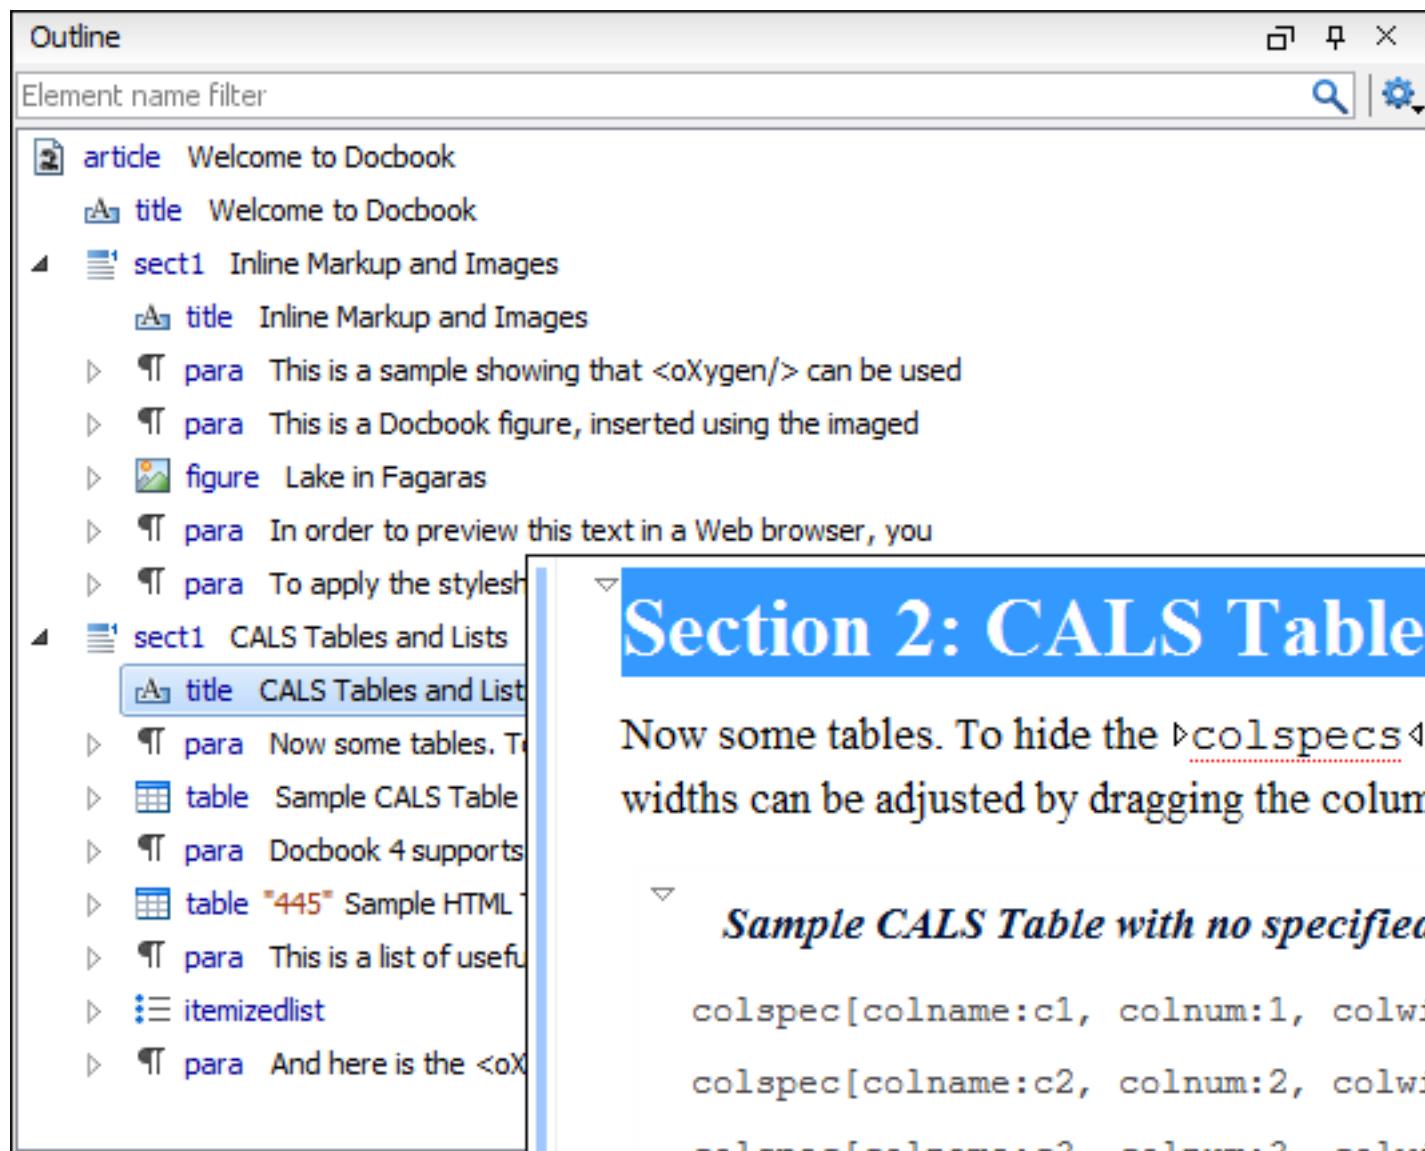

Figure 153: Outline View

Outline View Filters in Author Mode

[Edit on GitHub](#)

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view when editing in **Author** mode:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

 Show element name	Show/hide element name.
 Show text	Show/hide additional text content for the displayed elements.
 Show attributes	Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel .
 Configure displayed attributes	Displays the XML Structured Outline preferences page .

Outline View Contextual Menu Actions in Author Mode

[Edit on GitHub](#)

The contextual menu of the **Outline** view in **Author** mode contains the following actions:

 **Edit Attributes**

Allows you to edit the attributes of a selected node. For more details about this action, see [Attributes View in Author Mode](#) on page 293.

Edit Profiling Attributes

Allows you to change the *profiling attributes* defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

 **Cut**,  **Copy**,  **Paste**,  **Delete** editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content. The **Paste before** and **Paste after** actions allow you to insert a well-formed element before or after the currently selected element. The **Paste as XML** action pastes copied content that is considered to be valid XML, preserving its XML structure.

 **Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

 **Rename Element**

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

 **Expand More**

Expands the structure tree of the currently selected element.

 **Collapse All**

Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

[Attributes View in Author Mode](#) on page 293

Finding and Replacing Text

[Edit on GitHub](#)

You can search for a specific word or string of characters using the following features:

- [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [Quick Find toolbar](#)
- [Find all Elements dialog box](#)

Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

Reviewing Documents

[Edit on GitHub](#)

Oxygen XML Author includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

Tracking Document Changes

The **Track Changes** feature is a way to keep track of the changes you make in a document. **Track Changes** highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the [Track Changes feature is activated](#), insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The tracked changes are also displayed in the [Review view](#) and you can also choose to present the changes in [callouts](#) by enabling [Track Changes Deletions](#) and [Track Changes Insertions](#) in the [Callouts preferences page](#).

Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in [callouts](#) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the [Review preferences page](#).

Highlighting Content

Oxygen XML Author includes a highlighting feature that allows you to create digital markers to emphasise important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Author includes a [Review view](#) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The **Review** view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the **Comments option** is enabled in the [Callouts preferences page](#), comment callouts will also be included (same with tracked change callouts if their corresponding options are enabled in the [Callouts preferences page](#)).

Managing Tracked Changes

[Edit on GitHub](#)

Oxygen XML Author includes a *Track Changes* feature that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the [Review view](#).

The *Track Changes* feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the [Review view](#) and [Attributes view](#).

To watch our video demonstration about the *Track Changes* support, go to http://oxygenvml.com/demo/Change_Tracking.html.

Types of Tracked Changes

The types of tracked changes include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

Important: If you copy content in **Author** mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

Activating the Change Tracking Feature

To activate the *Track Changes* feature for the current document, use any of the following methods:

- Click the  **Track Changes** button on the toolbar.
- Select  **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.

- Select **Track Changes** from the **Edit > Review** menu.

When **Track Changes** is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the [Review preferences page](#), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Docbook 4 supports **XHTML** tables:

Sample XHTML Table with fixed width and proportional column widths

```
col[span:1, width:2.08*]
col[span:1, width:0.46*]
```

Person Name	Age
Jane	26
Bart	24
Alexander	<ins>22</ins>
<ins>John</ins>	25

They belong are all students of the computer science department

Inserted by John Doe
 Wed Apr 08 16:10:32 EEST 2009

This is a list of useful **XML** links:

Figure 154: Change Tracking in Author Mode

When hovering over a change a tooltip displays information about the author and modification time.

Change Tracking Contextual Menu Actions

You can right-click any change in **Author** mode to access the following contextual menu actions:

Accept Change(s)

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change(s)

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are

rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

You can accept or reject multiple changes at once by selecting a block of content that contains the changes and then **Accept Change(s)** or **Reject Change(s)** from the contextual menu or toolbar.

Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

Enables or disables the track changes support for the current document.

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the **Author** mode.
- **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
- **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.

-  **View Original** -this mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. You cannot edit the document in this mode. Attempting to do so switches the view mode to **View All Changes**.

Note: If you use  **View Final** mode and  **View Original** mode, callouts are not displayed for comments or changes. To display callouts, use the  **View All Changes/Comments** mode.

Highlight

Enables or disables the *Highlight tool*. Use the

Highlight drop-down menu to select a new color.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Edit Comment

Opens the **Edit Comment** dialog box that allows you to edit the selected comment. You cannot edit a comment if you are not the author who inserted the original comment. Note that you cannot edit a comment that was added by another user, so in that case, the action is

Show Comment and the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the *Review view*.

Tracked Change Callouts

You can also choose to display insertion and deletion changes in callouts in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by enabling **Track Changes Deletions** and **Track Changes Insertions** in the [Callouts preferences page](#). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see [Author Callouts](#) on page 465.

Tracked Changes in the Review View

The **Review** view is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see [Review View](#) on page 473.

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validations or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an *insertion* change is stored in a document:

```
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?
oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a *deletion* change is stored in a document:

```
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300"
content="belong"?>
```

[Review View](#) on page 473

Tracked Changes Behavior

[Edit on GitHub](#)

The behavior of the **Track Changes** feature depends on the context, the type of change, and whether or not it is activated.

Inserting Content

If the **Track Changes** feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the **Track Changes** feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an **INSERT**.
- Making an insertion in an **Insert** change results in the following:
 - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an **INSERT** by the current author.
 - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If we insert in regular content, the current inserted content appears marked as an **Insert** change.

Surrounding Content

If the **Track Changes** feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
 - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.

- If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

Deleting Characters

If the **Track Changes** feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in nothing happening.
- Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the **INSERT** change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the **Track Changes** feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in the following:
 - If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
 - If another author created the **Delete** change, nothing happens.
- Deleting content in an existing **Insert** change results in the following:
 - If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
 - If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
- Deleting in regular content results in the content being marked as **Delete** change by the current author.

Deleting Selections of Content

If the **Track Changes** feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the **Track Changes** feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
 - If the **Insert** is made by the same author, the change disappears and the content is deleted.
 - If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

Copying Content

If the **Track Changes** feature is disabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the **Track Changes** feature is enabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the **Track Changes** feature is disabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the **Track Changes** feature is enabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Tracked Changes Limitations

[Edit on GitHub](#)

There are some inherent limitations to the change tracking feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the **Track Changes** feature enabled. For example, some of the table-related actions ( Delete Row(s),  Delete Column(s),  Join Cells,  Split Cell) ignore the **Track Changes** feature when executing the action.

Tracked Changes XML Markup

[Edit on GitHub](#)

Depending on the type of edits, the following track changes markup appears in the document source code when you

activate the **Track Changes** feature:

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Insertion	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp
Split	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type= "split"
Surround	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type= "surround"
Deletion	<?oxy_delete?>	-	author, timestamp, content
Comment	<?oxy_comment_start?>	<?oxy_comment_end?>	author, timestamp, comment, mid
Attribute Change	<?oxy_attributes?>	-	id, type, oldValue, author, timestamp

If a comment intersects another, the mid attribute is used to correctly identify start and end processing instruction markers.

Intersecting Comments Markup

```
<?oxy_comment_start author="Andrew"
timestamp="20130111T151520+0200" comment="Do we have a task
about pruning trees?"?>Unpruned
<?oxy_comment_start author="Matthew"
timestamp="20130111T151623+0200" comment="What time of the year
do they flower?" mid="3"?>lilacs<?oxy_comment_end?>
flower reliably every year<?oxy_comment_end mid="3"?>
```

Managing Comments

[Edit on
GitHub](#)

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and tracked changes is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as callouts (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, enable the **Comments option** in the [Callouts preferences page](#). Comments are also displayed in the [Review view](#).

thanks to the work of prolific breeder Victor Lemoine.

► **Lilacs** flower on old wood, and produce more flowers if unpruned. ► **Salvia** is the largest [genus]► **genus**, with approximately 900 species of shrubs, herbaceous perennials, and annuals.

Commented [John]
What kind of grow conditions do lilacs

Commented [Mark]
correct term is Lan

Figure 155: Comments in Author Mode

Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.

Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the **Add Comment** action from the toolbar (or in the **Review** submenu of the contextual menu).

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in **Author** mode, select the **Show/Edit Comments** action from the toolbar (or in the **Review** submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select  **Remove Comment(s)** from the toolbar (or in the **Review** submenu of the contextual menu).

Tip: When adding or editing a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Managing Comments in Callouts

As long as the **Comments option** is enabled in the [Callouts preferences page](#), comments are also displayed in **callouts**. By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Edit Comment

Opens the **Edit Comment** dialog box that allows you to edit the selected comment. You cannot edit a comment if you are not the author who inserted the original comment. Note that you cannot edit a comment that was added by another user, so in that case, the action is  **Show Comment** and the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

Tip: When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Managing Comments in the Review View

The **Review** view is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the **Review** view, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Opens the **Edit Comment** dialog box that allows you to edit the selected comment. You cannot edit a comment if you are not the author who inserted the original comment. Note that you cannot edit a comment that was added by another user, so in that case, the action is **Show Comment** and the dialog box just displays the comment without the possibility of editing it.

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Show only reviews by '<author name>'

Filters the comments to only show comments for the particular author.

Remove all Comments

Removes all comments from the document.

Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300"
comment="Do not change this content"?>
    Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200"
comment="We should not forget about recycling the oil and oil filter!"
parentID="vws_x4l_1v" mid="4"?>
```

[Author Callouts](#) on page 465

[Review View](#) on page 473

Managing Highlights

[Edit on GitHub](#)

Use the **Highlight** tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that need additional editing or to draw the attention of others to particular content.

To watch our video demonstration about using the **Highlight** tool, go to http://oxygentools.com/demo/Highlight_Tool.html.

Using the Highlight Tool

You can find the **Highlight** action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:

1. Click the **Highlight** icon on the toolbar.

Step Result: The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the **Highlight** icon and select the color that you want to use for the highlighting.
3. Select the content you want to highlight. To mark multiple parts of a document, press and hold **Ctrl (Meta on Mac OS)** and select the parts you want to highlight.
4. To exit the highlighting mode, press **Esc**, click the **Highlight** icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press **Ctrl + A (Command + A on OS X)** if you want to select all of the text.
2. Click the small arrow next to the **Highlight** icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.
3. To exit the highlighting mode, press **Esc**, click the **Highlight** icon, or start editing the document.

Note: Oxygen XML Author preserves the highlighting of a document between working sessions.

Review View

The **Review** view is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

Remove Highlight

Removes the selected highlight.

Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

Remove All Highlights

Removes all highlights from the document.

Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>The
highlights are
stored<?oxy_custom_end?>
```

Author Callouts

[Edit on](#)
[GitHub](#)

A *callout* is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Author uses callouts to present comments and tracked change modifications that you or other members of your team have added to the document.

To watch our video demonstration about the Callouts support, go to <http://oxygentools.com/demo/CalloutsSupport.html>.

Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the [Review preferences page](#). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Author automatically assigns a color based upon the [Colors for automatic assignment list](#).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, enable the [Show all connecting lines option](#) in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Winter Flowers

Winter is the season of cold weather. The season occurs during December - February in Northern hemisphere. In the Southern hemisphere winter occurs during June - August.

Some of the flowers blooming in winter are:

Acashia, Alstromeria, Amaryllis, Carnation, Chrysanthemums, Cyclamen, Evergreens, Gerbera Daisy, Ginger, Helleborus, Holly berry, Lily, Asiatic Lily, Casa Blanca Lily, Narcissus, Orchid, Pansy, Pepperberry, Phlox, Protea, Queen Ann's Lace, Roses, Star of Bethlehem, Statice.

Deleted [Mary]: Delete any extra spacing before and after punctuation marks.

Deleted [Mary]: Also use a single space between words.

Commented [John]: We should include one more topic with information about Narcissus.

Commented [Bob]: It's a good idea to add more plants (consider including also Roses).

Figure 156: Multiple Author Callouts

Note: Oxygen XML Author displays callouts only if  View All Changes/Comments or  View Only Changes/

Comments by is selected in the  *Track Changes Visualization Modes drop-down menu. Oxygen XML Author does not display callouts in  View Final and  View Original modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserve elements that contain long fragments (such as a DITA *codeblock* element or *programlisting* in DocBook). To help you view the text under the covered area, Oxygen XML Author applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

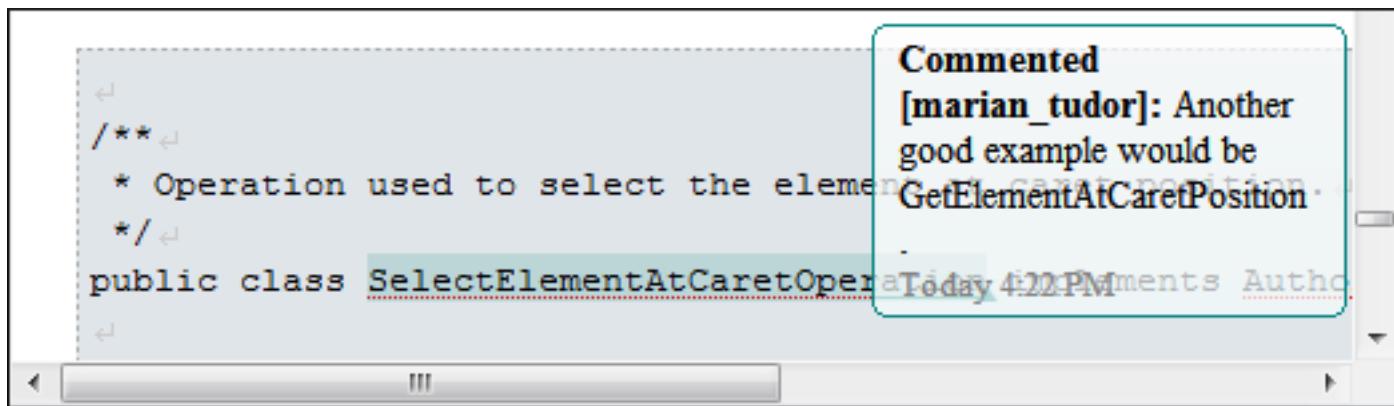

Figure 157: Transparent Callout

Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the [Initial Width option](#) in the [Callouts preferences page](#).

You can also adjust the maximum number of lines to be shown in the callouts using the [Text Lines Count Limit option](#). Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

Type of Callouts in Oxygen XML Author

Oxygen XML Author uses callouts to display comments and tracked changes that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the [Callouts preferences page](#). You can choose to enable the following types of review callouts:

- Comments
- Tracked Change Deletions
- Tracked Change Insertions

Comment Callouts

As long as the [Comments option](#) is enabled in the [Callouts preferences page](#), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also enable the [Show review time option](#) to include timestamp information in the comment callouts.

And above all, remember that many flower gardens fail because they just don't get enough of your attention.

Figure 158: Comment Callouts

There are several types of comments that can be added in **Author** mode:

Author Review Comments	Comments that you associate with specific content. To insert this
-------------------------------	---

type of comment, select the content and use the

 **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).

Comments Added to Tracked Changes

Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select  **Comment Change**.

Replies to Comments

You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in the its callout and select **Reply**. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

Figure 159: Callout for a Comment with Replies

Tip: When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Author will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Tracked Change Deletion Callouts

As long as the **Track Changes Deletions option** is enabled in the **Callouts preferences page**, deletions that are made while the *Track Changes* feature is enabled are displayed in callouts. A deletion callout contains the type of callout (**Deleted**) and the name of the author that made the deletion. You can also enable the **Show deleted content in callout option** to display the actual deleted content in the callout. Additionally, you can enable the **Show review time option** to include timestamp information in the deletion callouts.

This sample shows that <oXygen/> can be used to edit documents in conformity with the dockbook

Figure 160: Deletion Callouts

Tracked Change Insertion Callouts

As long as the **Track Changes Insertions option** is enabled in the **Callouts preferences page**, insertions that are done while the *Track Changes* feature is enabled are displayed in callouts. An insertion callout contains the

type of callout (**Inserted**) and the name of the author that inserted the content. You can also enable the **Show inserted content in callout option** to display the actual deleted content in the callout. Additionally, you can enable the **Show review time option** to include timestamp information in the deletion callouts.

Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu of an insertion or deletion callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking

comments or changes that have been addressed, leaving only those that still need some attention.

 **Accept Change**

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

 **Reject Change**

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

 **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

 **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the

entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Edit Comment

Opens the **Edit Comment** dialog box that allows you to edit the selected comment. You cannot edit a comment if you are not the author who inserted the original comment. Note that you cannot edit a comment that was added by another user, so in that case, the action is  **Show Comment** and the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Edit Reference

If the fragment that contains a callout is a reference, use this option

to go to the reference and edit the callout.

Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

Printing Callouts

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

Review View

The **Review** view is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see [Review View](#) on page 473.

[Managing Tracked Changes](#) on page 454

[Managing Comments](#) on page 461

[Review View](#) on page 473

Review View

[Edit on GitHub](#)

The **Review** view is a framework-independent panel, available both for built-in and custom XML document frameworks. It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes using a single view.

The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

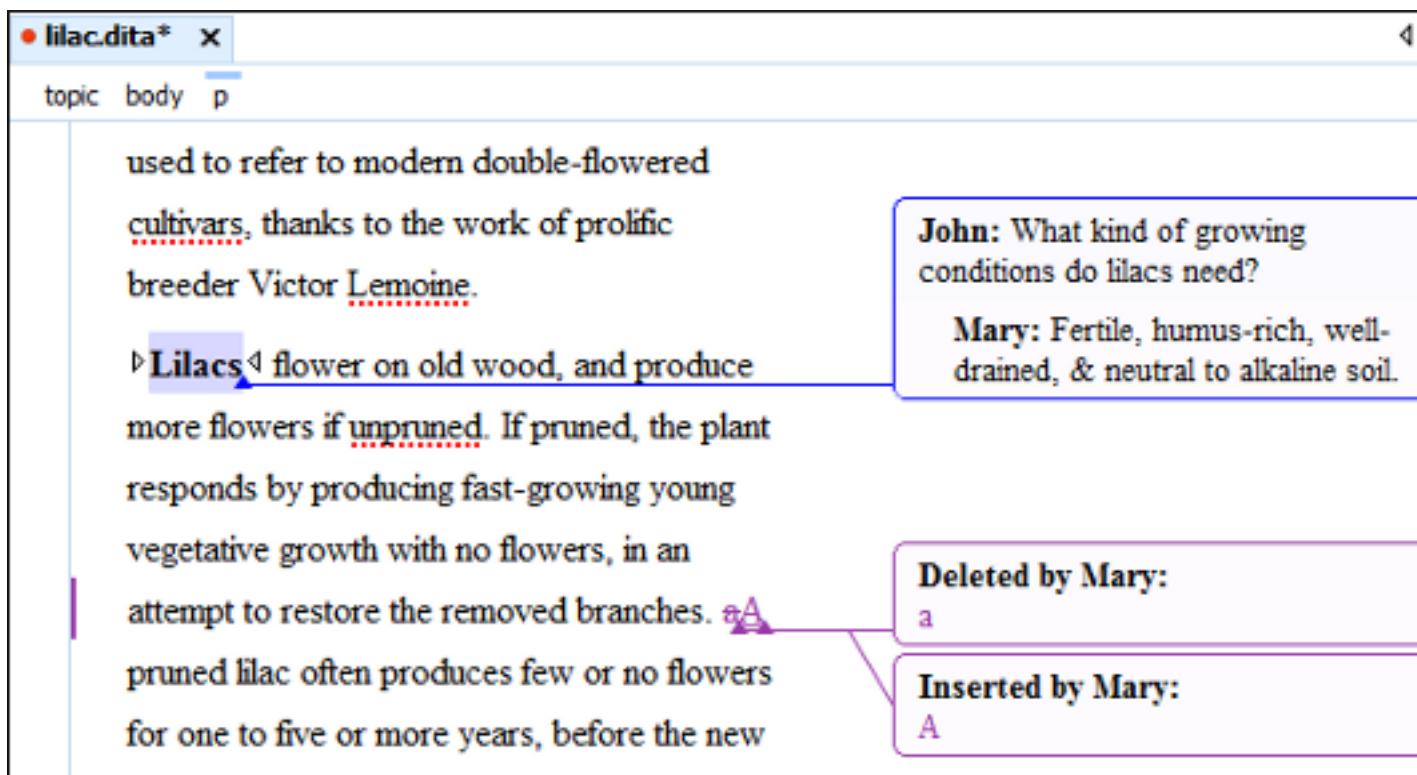

Figure 162: Review View

To watch our video demonstration about the **Review** view, go to http://oxygentools.com/demo/Review_Panel.html.

Activating the Review View

To activate the **Review** view, do one of the following:

- Click the **Manage reviews** button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.
- Open it from the **Window > Show View** menu.

Review View Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. Use the small arrow symbol from the right side of the search field to display the search history.

The **Settings** menu includes the following options:

- **Show highlights** - Controls whether or not the **Review** view displays the highlighting in your document.
- **Show comments** - Controls whether or not the **Review** view displays the comments in the document you are editing.
- **Show track changes** - Controls whether or not the **Review** view displays the inserted and deleted content in your document.
- **Show review time** - Displays the time when the edits from the **Review** view were made.
- **Configure review options** - Opens the [Review preferences page](#) where you can configure various options for review information.

Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the **Review** view:

Remove

Available for highlights and comments presented in the **Review** view and it removes the particular highlight or comment from your document and moves to the next change.

Accept

Available for inserted and deleted content presented in the **Review** view and it accepts the particular change in your document and moves to the next change.

Reject

Available for inserted and deleted content presented in the **Review** view and it rejects the particular change in your document and moves to the next change.

Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the **Review** view:

Reply

Opens the **Reply** dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

Mark as Done

This toggles the comment or change as being done in the contextual menu and grays it out in the callout. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

Show Comment

Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

Edit Comment

Available for comments you have added and you can use this action to edit a comment.

Remove Comment

Use this action to remove the selected comment.

Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

Remove All Comments

Use this action to remove all the comments that appear in the edited document.

Change Color

Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

Remove Highlight

Use this action to remove the selected highlight.

Remove Highlights with the Same Color

Use this action to remove all the highlights with the same color from the entire document.

Remove All Highlights

Use this action to remove all the highlights in your document.

Accept Change

Accepts the selected change and moves to the next change.

 **Reject change**

Rejects the selected change and moves to the next change.

 **Comment change**

Available for insertions or deletions and you can use this option to add a comment for the particular change.

Accept all changes

Accepts all the changes made to a document.

Reject all changes

Rejects all the changes made to a document.

[Author Callouts](#) on page 465

Profiling and Conditional Text

[Edit on GitHub](#)

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appear in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for *expert* users and another section for *novice* users, while unmarked sections are included in all renditions.

Oxygen XML Author allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in **Author** mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

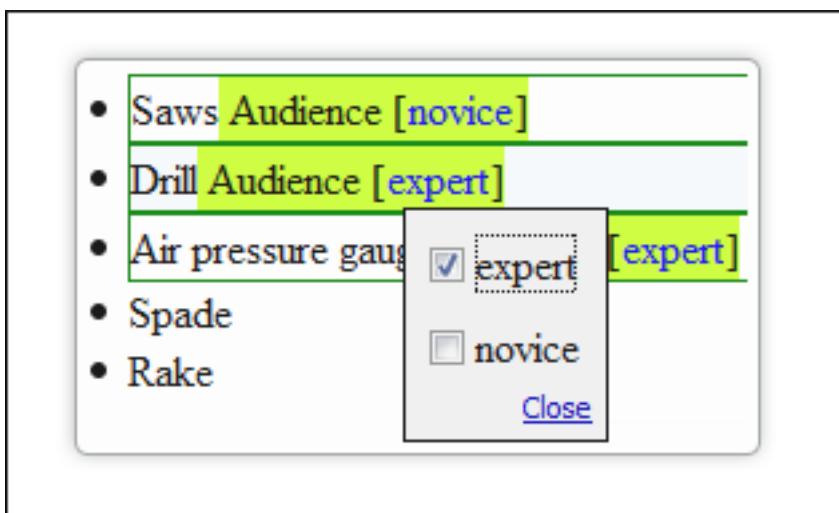

Figure 163: Example: Profiling Content

Oxygen XML Author includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs. You can also define your own profiling attributes for each document type (framework) and your profiling configuration can be shared amongst content authors through the project file.

Related information

[Customize Profiling Conditions](#) on page 1171

Managing Profiling Attributes

[Edit on GitHub](#)

Oxygen XML Author includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework). You can then apply the profiling attributes to content in **Author** mode to see how the profiling will affect the output.

Create Profiling Attributes

To create custom profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. *Open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Author > Profiling/ Conditional Text**.
3. In the *Profiling Attributes section*, press the **New** button.

Step Result: The **Profiling Attribute** configuration dialog box is opened.

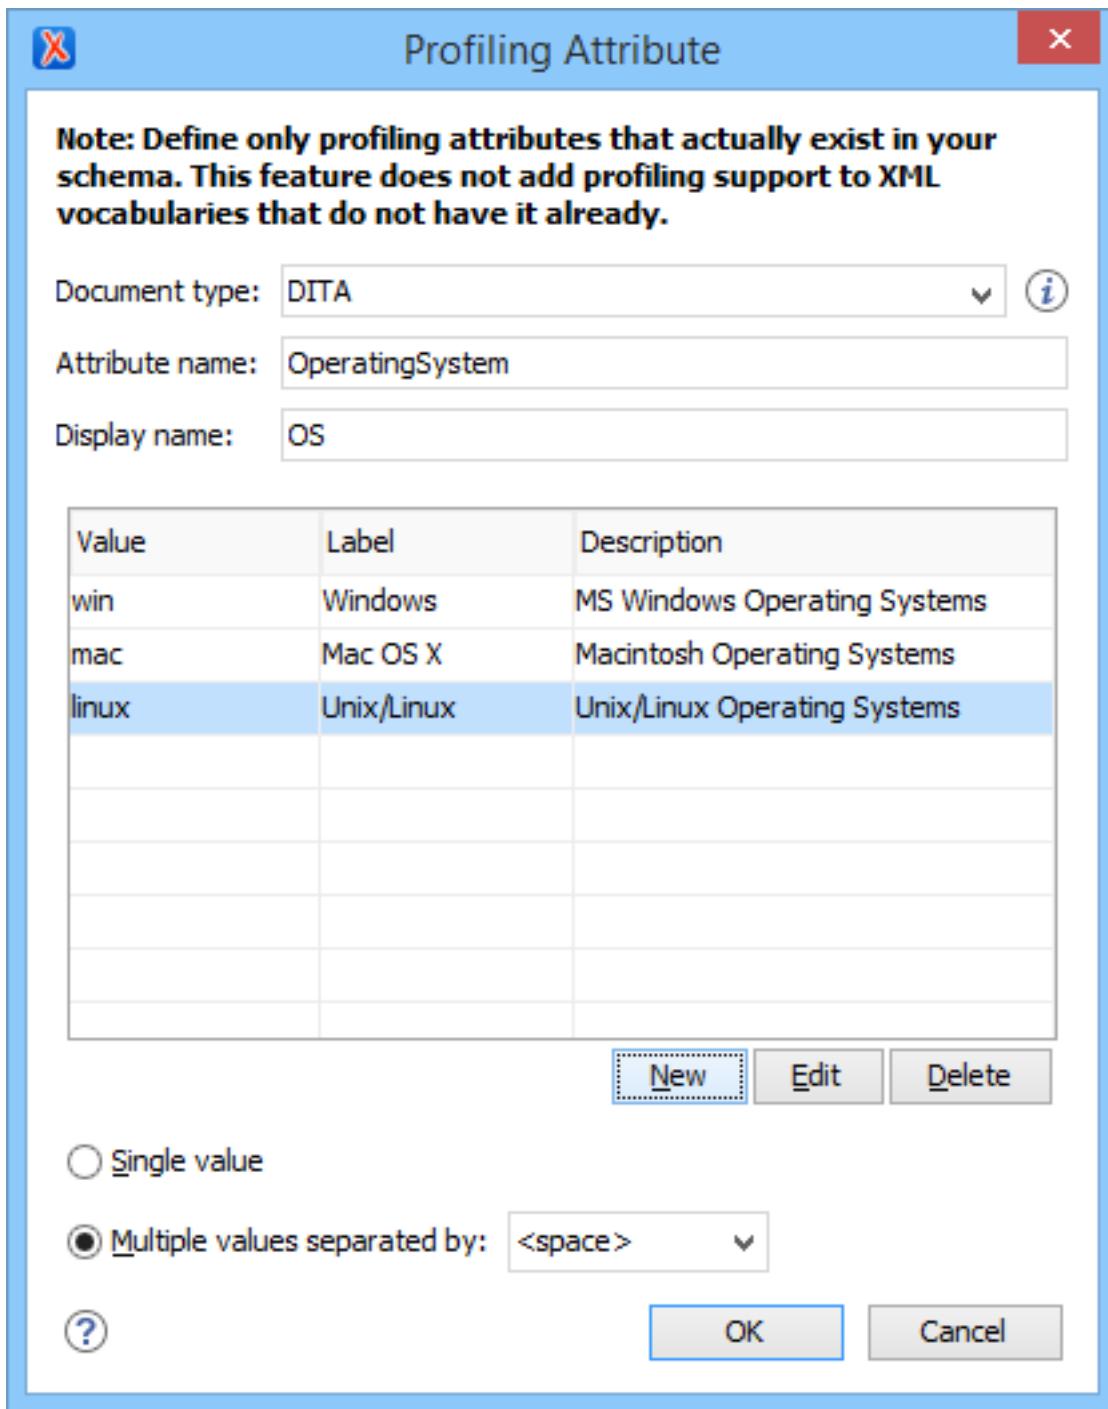

Figure 164: Profiling Attribute Dialog Box

4. Configure your profiling attributes as desired. The following options are available in this dialog box:

Document type

Select the document type (framework) for which you have defined profiling attributes.

Attribute name

The name of the new profiling attribute.

Display name

This optional field is used for descriptive rendering in profiling dialog boxes.

Attribute Values Table

This table displays the values for the profiling attribute and allows you to configure them by using the following buttons at the bottom of the table:

New	Opens a dialog box that allows you to insert a new value. The fields that can be configured in this dialog box correspond to the columns in the table and are as follows: <ul style="list-style-type: none"> • Value - The attribute value. • Label - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box, Condition Set dialog box, Profiling tab in the Edit Properties dialog box, DITA Maps Manager). If the Label is not specified, the Value will be used as its rendered name. • Description - A description for the attribute value that will be displayed in the Attribute Values Table.
Edit	Use this button or double-click an attribute value to modify it.
Delete	Removes the selected attributed value.
Single value	Use the New button to add new attribute values. You can also specify an optional description for each attribute value.
Multiple values separated by	Select this option if you want the attribute to only accept a single value.
	Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between <i>space</i> , <i>comma</i> , and <i>semicolon</i> , or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For

example, the DITA document type only accepts spaces as delimiters for attribute values.

5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save the profiling attribute.

Editing Existing Profiling Attributes

To modify an existing profiling attribute or its values, follow these steps:

1. *Open the Preferences dialog box (**Options > Preferences**) and go to Editor > Edit modes > Author > Profiling/ Conditional Text.*
2. In the **Profiling Attributes section**, press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a profiling attribute or the **Up** and **Down** buttons to change their priority).

Step Result: If you use the **Edit** button, the **Profiling Attributes** configuration dialog box is opened:

3. Modify your profiling attribute as desired.
4. To add or modify attribute values, use the **New**, **Edit**, or **Delete** buttons under the attribute values table.
5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save your modifications.

Adding or Editing Profiling Attribute Values

There are several ways to add values to existing profiling attributes.

- Use the procedure in the *Editing Existing Profiling Attributes* section to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the *In-Place Attributes Editor* in **Author** mode, the *Attributes view*, or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the *Profiling / Conditional Text preferences page* where you can edit the profiling configuration.

Note: If the *Allow additional profiling attribute values collected from the document* option is disabled in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this second method will not be possible.

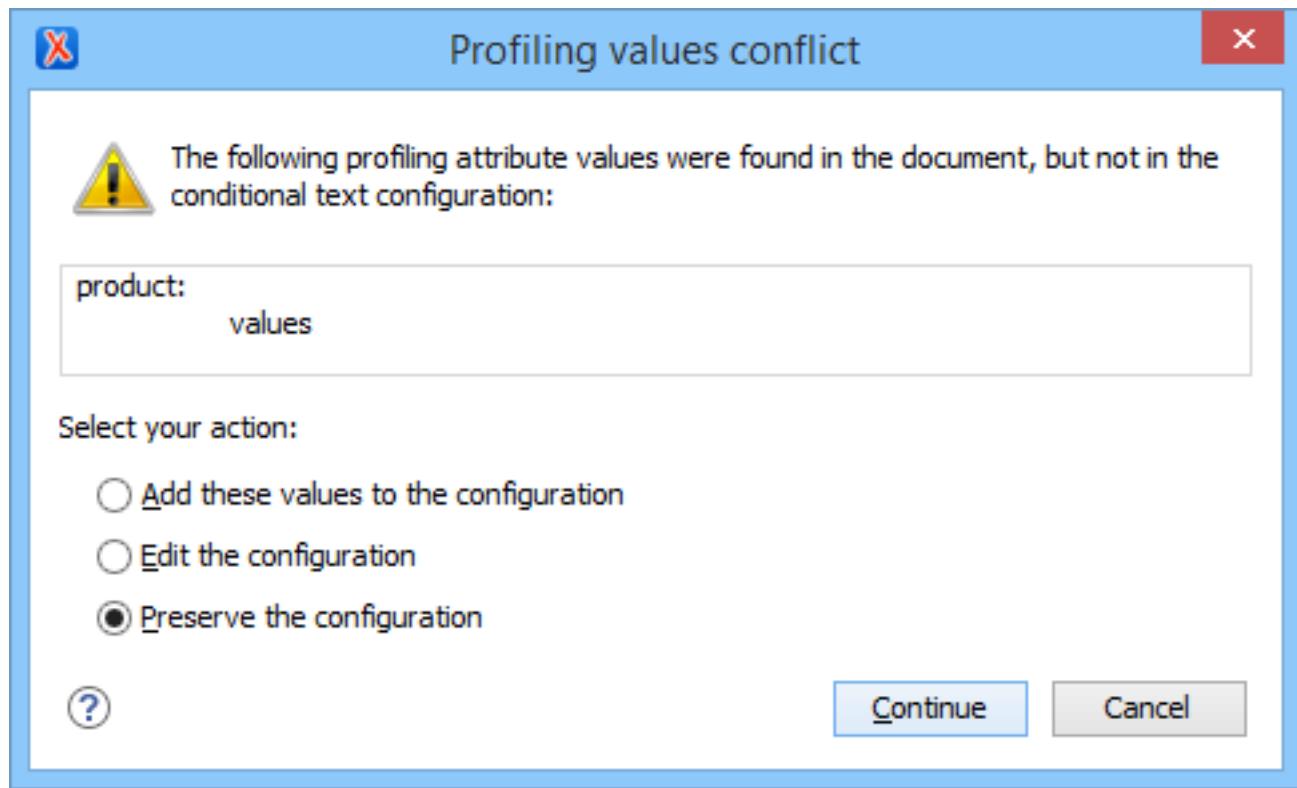

Figure 165: Profiling Values Conflict Dialog Box

Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see *Sharing a Project - Team Collaboration* on page 358.

Apply Profiling Attributes

[Edit on GitHub](#)

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment, on a single element, or on multiple elements in the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To profile a fragment from your document, select the fragment in the **Author** editing mode and follow these steps:

1. Invoke the **Edit Profiling Attributes** action from the contextual menu in **Author** mode.

Step Result: The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (framework).

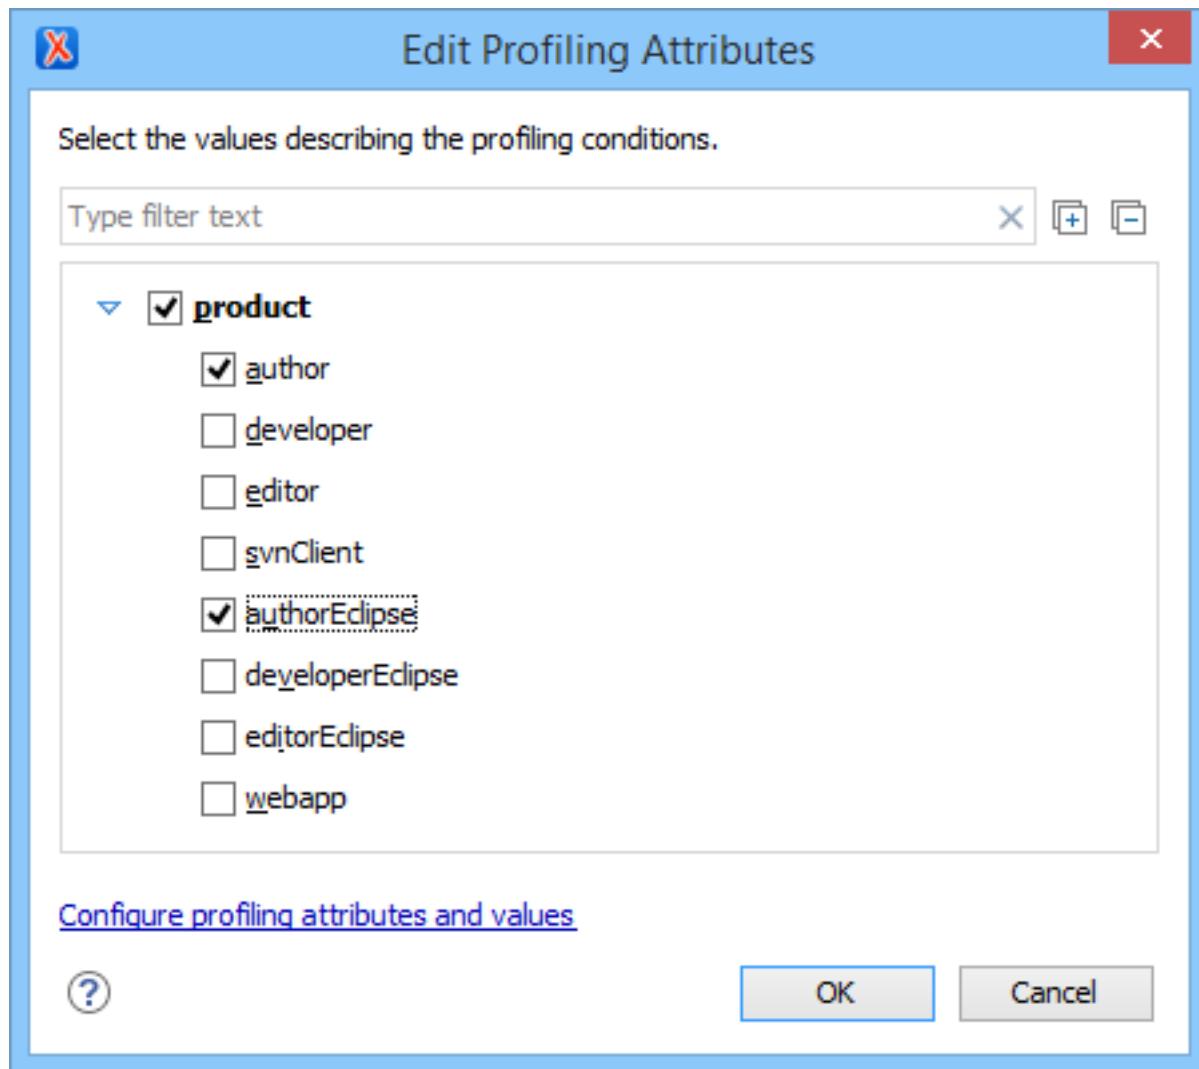

Figure 166: Edit Profiling Attributes Dialog Box

2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the document fragment.
3. Click **OK** to finish the profiling configuration.

Result: The attributes and attributes values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the **Show Profiling Attributes** option (available in the **Profiling / Conditional Text toolbar menu**) is enabled, a light green border is painted around profiled text, in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

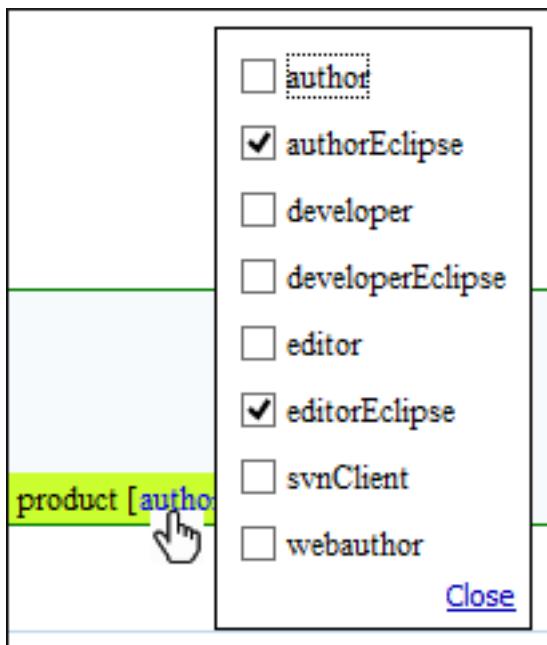

Figure 167: Profiling Attribute Value Form Control Pop Up

Related information

[Customize Profiling Conditions](#) on page 1171

Managing Profiling Condition Sets

[Edit on GitHub](#)

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
2. In the **Profiling Condition Sets** section, press the New button.

Step Result: The Condition Set configuration dialog box is opened.

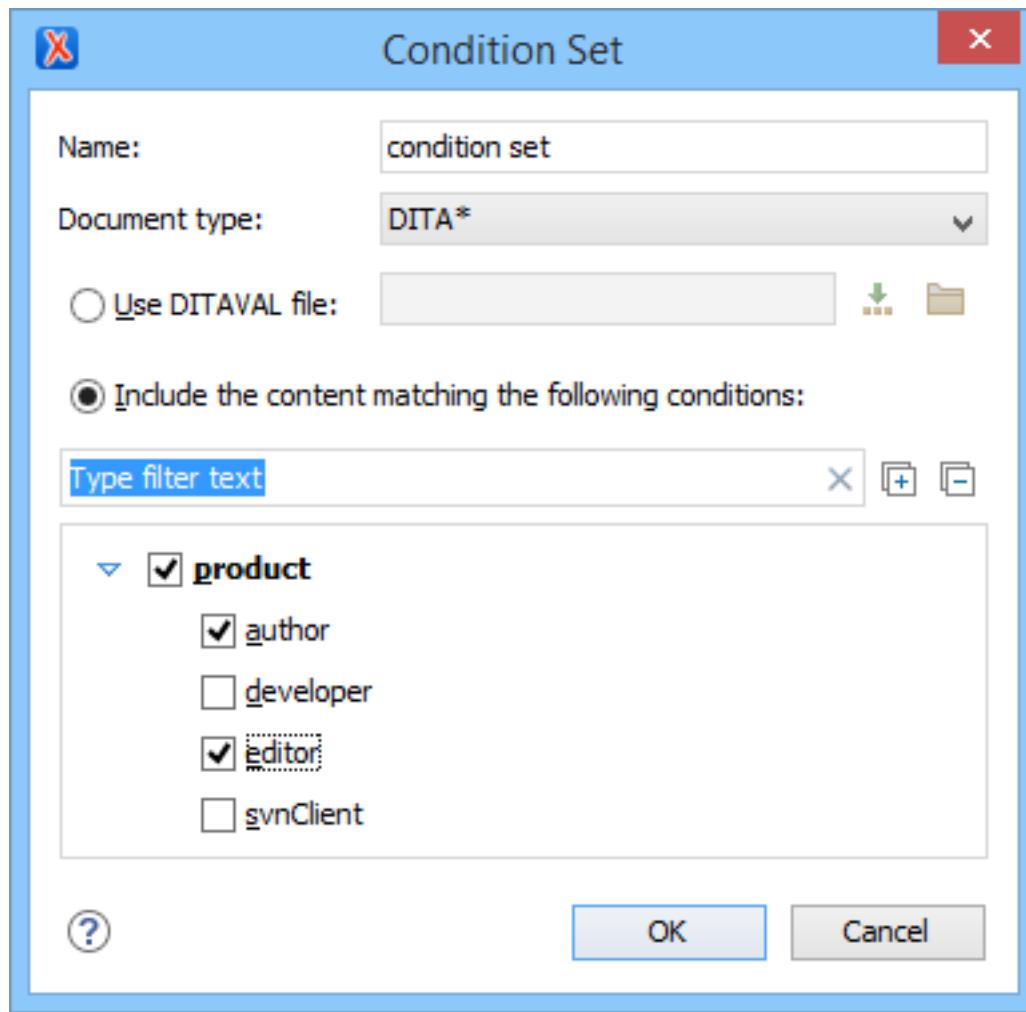

Figure 168: Condition Set Dialog Box

- Configure your condition set as desired. The following options are available in this dialog box:

Name	The name of the new condition set.
Document type	Select the document type (framework) for which you have defined profiling attributes.
Use DITAVAL file	Select this option if you want the <i>Profiling Condition Set</i> to reference a DITAVAL file. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.
Include the content matching the following conditions	You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes in this section. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

- Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
- Click **Apply** to save the condition set. All saved profiling condition sets are available in the **Profiling / Conditional Text toolbar drop-down menu**.

Editing Existing Profiling Condition Sets

To modify an existing profiling condition set, follow these steps:

1. *Open the Preferences dialog box (Options > Preferences)* and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
2. In the **Profiling Condition Sets section**, press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a condition set or the **Up** and **Down** buttons to change their priority).

Step Result: If you use the **Edit** button, the **Condition Set** configuration dialog box is opened:

3. Modify your condition set as desired.
4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save your modifications.

Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see *Sharing a Project - Team Collaboration* on page 358.

Apply Profiling Condition Sets

[Edit on GitHub](#)

All defined Profiling Condition Sets are available as shortcuts in the  **Profiling / Conditional Text toolbar menu**.

Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline** view, and **DITA Maps Manager** view. An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

EXAMPLE:

Suppose that you have the following document:

Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray pa

Context:

The garage is a good place to spray paint.

Step 1

Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2

Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3

Place the object to be painted on the covered area. Audience [expert] Other [prop2]

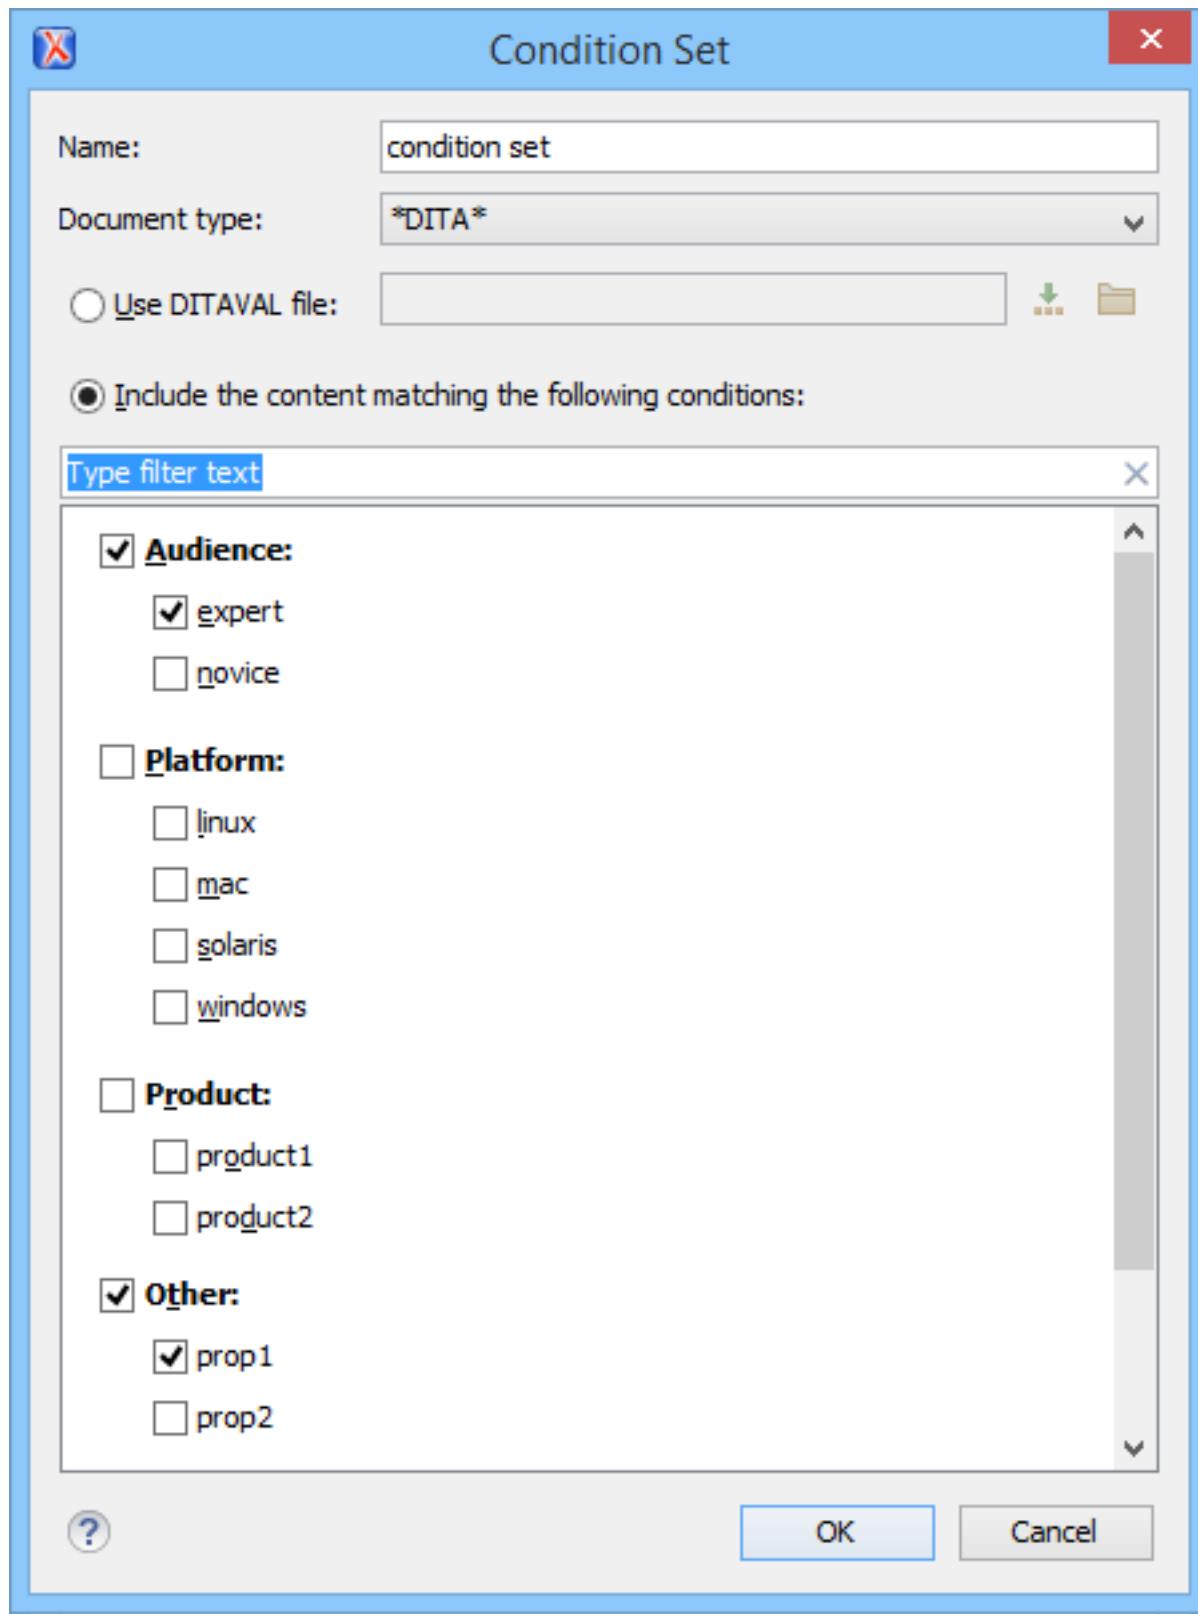

Step 4

Follow the directions on the paint can to paint the object. Audience [expert] Other

Step 5

Let the paint dry thoroughly before you move the object. Audience [novice] Other

If you apply the following condition set, it means that you want to filter out the content to only include content written for an expert audience and content that has the *Other* attribute value of *prop1*.

This is how the document looks after you apply the condition set:

Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1

Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2

Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3

Place the object to be painted on the covered area. Audience [expert] Other [property]

Step 4

Follow the directions on the paint can to paint the object. Audience [expert] Other [property]

Step 5

Let the paint dry thoroughly before you move the object. Audience [novice] Other [property]

Profiling / Conditional Text Toolbar Menu

[Edit on GitHub](#)

The **Profiling / Conditional Text** toolbar menu allows you to select some settings for how profiled content is shown in the editor. It also displays a list of the profiling conditions sets that are defined in the current framework, and it includes an option that opens a preferences page where you can define and configure profiling attributes and condition sets.

The **Profiling / Conditional Text** menu includes the following:

Show Profiling Colors and Styles

Enable this option to turn on conditional styling.

Show Profiling Attributes

Enable this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the **Outline** and **DITA Maps Manager** views. When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To

show only the content that matches the currently applied condition set, disable this option.

Note: To remind you that document content is hidden, Oxygen XML Author displays labels showing the currently applied condition set. These labels are displayed in the **Author** mode editing area, the **Outline** view and **DITA Maps Manager** view. Right-click any of the labels to quickly access the **Show Excluded Content** action.

List of all profiling condition sets that match the current document type

Click a condition set entry to activate it.

Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

All these settings are associated with the current project, being restored the next time you open it. For a new project all Profiling/Conditional Text menu actions states are reset to their default values.

Customizing Colors and Styles for Rendering Profiling in Author Mode

[Edit on GitHub](#)

By applying profiling colors and styles, you can customize the **Author** mode editing area to mark profiled content so you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
 - Remove the oil fill cap;
 - Pour new oil gradually. Regularly check the dipstick to see if the oil level reaches the mark;
- product [Gasoline]
- Sharpen the blades:
 - Clamp the blade to a vice or to the edge of a solid surface;
 - Using an electric grinder or a file, grind the length of the blade sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

Figure 169: Example: Profiling Colors and Styles

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Enable the **Show Profiling Colors and Styles option** from the  Profiling / Conditional Text toolbar drop-down menu.
2. Go to  Profiling Settings from the  Profiling / Conditional Text toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text options page**. Select the **Colors and Styles options page**.
3. Configure the styling for your profiling attribute values.

Result: The styling is now applied in the **Author** editing mode, the **Outline** view, and **DITA Maps Manager** view. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied

in the **Edit Profiling Attributes** dialog box and in the inline form control pop up that allows you to quickly set the profiling attributes.

Figure 170: Profiling Attribute Value Form Control Pop Up

Adding Tables in Author Mode

[Edit on GitHub](#)

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in various document types (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Author includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used frameworks.

Editing Tables in Author Mode

[Edit on GitHub](#)

Oxygen XML Author provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **cols** section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The predefined DITA, DocBook, and XHTML frameworks support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

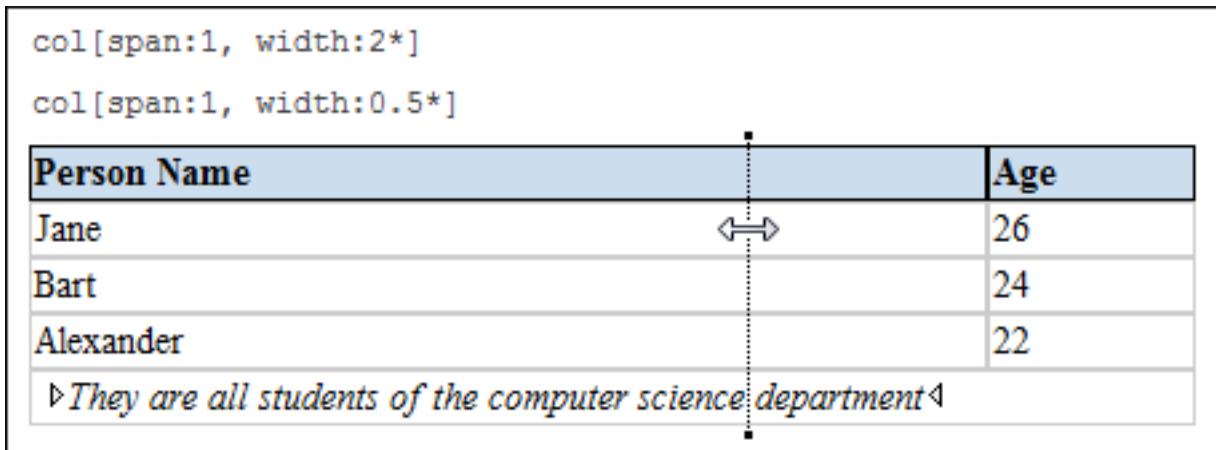

Figure 171: Resizing a Table Column in Author Mode

Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to for row selection and to for column selection and that specific row or column is highlighted.

You can use the **Ctrl** and **Shift** keys to select multiple rows.

Selecting Cells

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a *RTL document*) to select it. The cursor changes to when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Author decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

Copy/Cut and Paste

In Oxygen XML Author, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Author introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a *CALS* table, Oxygen XML Author preserves column width information. This information is then used when you paste the column into another *CALS* table.

Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the  **Delete**

 **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the *Quick navigation in tables option* is disabled in the **Cursor Navigation** preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Adding Tables in DocBook

[Edit on GitHub](#)

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- *CALS* table model - This is used for more advanced functionality.
- *HTML* table model - This is used for inserting a formal (captioned) HTML table.

Inserting a CALS Table Model in DocBook

To insert a *CALS* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the *HTML* model.

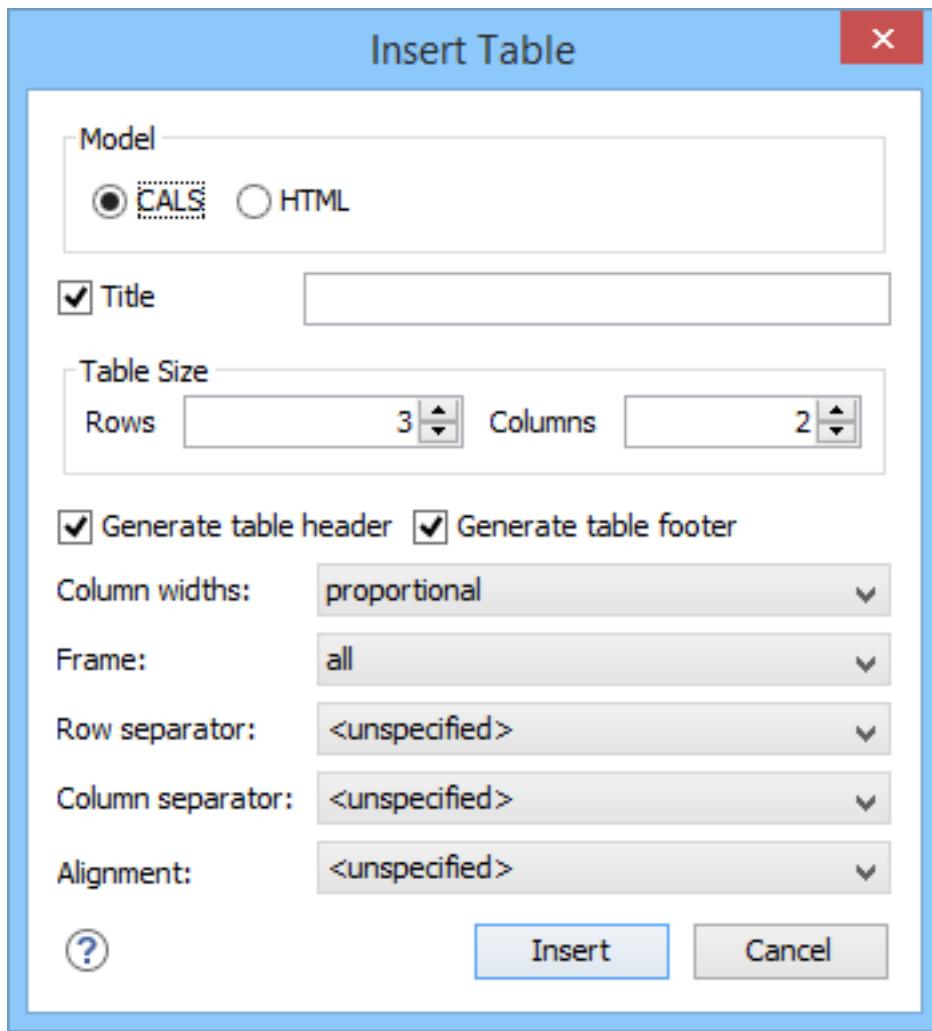

Figure 172: Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example,

`colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspeсs` (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspeсs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

▼ **Sample DocBook CALS Table**

▼ **colspeсs...**

column name	number	width	align	cols
c1	1	221.25pt	center	<input type="checkbox"/>
c2	2	232.5pt	center	<input type="checkbox"/>

Figure 173: CALS Table in DocBook

Inserting an HTML Table Model

To insert an *HTML* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table **Model**.

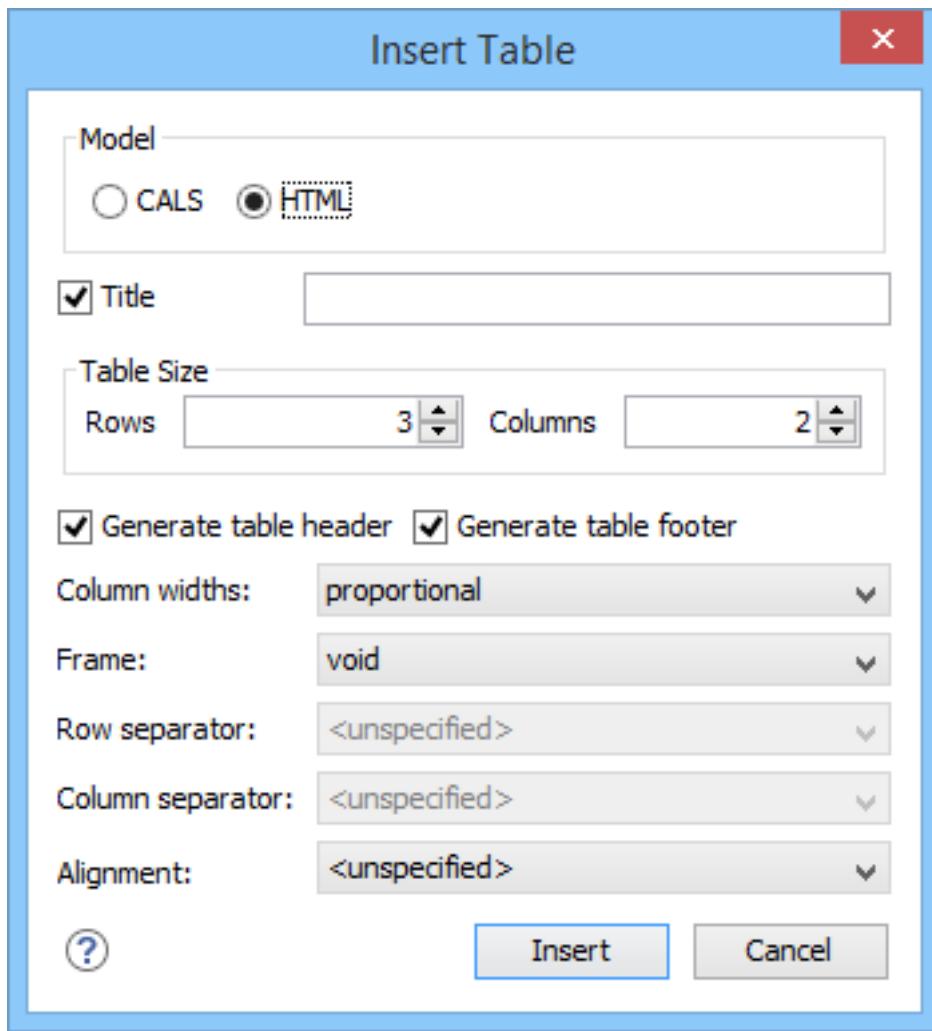

Figure 174: Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **HTML** table model:

Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `width` attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For

example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form “`0*`” (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode**, it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**).

You can also use the  [**Table Properties**](#) (**Ctrl + T (Command + T on OS X)**) action from the toolbar or contextual menu to [modify many of the properties of the table](#).

Also, remember that underneath the visual representation, both table models are really just XML, and, if necessary, you can edit the XML directly by switching to *Text mode*.

DocBook Table Layouts

[Edit on GitHub](#)

The DocBook framework supports the following two table model layouts:

- *CALS table model*
- *HTML table model*

CALS Table Model Layout

The *CALS* table model allows for more flexibility and table customization than other models. When choosing a *CALS* table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a *CALS* table includes a **colspeсs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the *Author mode*, the **colspeсs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The screenshot shows the 'Insert Table' dialog in the Oxygen XML Author interface. At the top, a title bar reads 'Sample CALS Table with no specified width and proportional column widths'. Below this, a 'colspeсs...' section lists five columns (c1-c5) with their names, numbers, widths (0.32*, 1.49*, 1.15*, 0.4*, 1.67*), and align settings. A 'colsep' checkbox is shown next to each column entry. Below this, a sample CALS table is displayed with the following structure:

Horizontal Span		a3	a4	a5	
f1	f2	f3	f4	f5	
b1	b2	b3	b4	► Vertical ⁴ Span	
c1	Spans ► Both ⁴ directions				c4
d1					d4

Figure 175: CALS Table in DocBook

HTML Table Model Layout

Choosing an *HTML* table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`width` attribute) or the text alignment (`align` attribute). Although these properties appear as

part of the **Author mode**, they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The screenshot shows the 'Sample HTML Table' configuration in the toolbar. It includes fields for 'column title' (with dropdowns for 'span', 'width', and 'align'), and two rows of table structure with 'Column 1' and 'Column 2' headers. The first row contains 'Data A' in Column 1 and 'Data B' in Column 2. The second row contains 'Data C' in both Column 1 and Column 2.

Column 1	Column 2
Data A	Data B
Data C	Data C

Figure 176: HTML Table in DocBook

Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the *CALS* model. If you want to overwrite this behavior and instruct Oxygen XML Author to convert them to *HTML* tables, set the `docbook.html.table` parameter to 1. You can find this parameter in the following stylesheet:

- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl` for DocBook 5
- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db4Driver.xsl` for DocBook 4

Table Validation in DocBook

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namestart`, `nameend`, or `colname` attributes point to an incorrect column name.

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

[Edit on GitHub](#)

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**).

You can use the  **Table Properties (Ctrl + T (Command + T on OS X))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:

- <not set> - Use this value if you want to remove a property.
- <preserve> - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a *CALS* table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

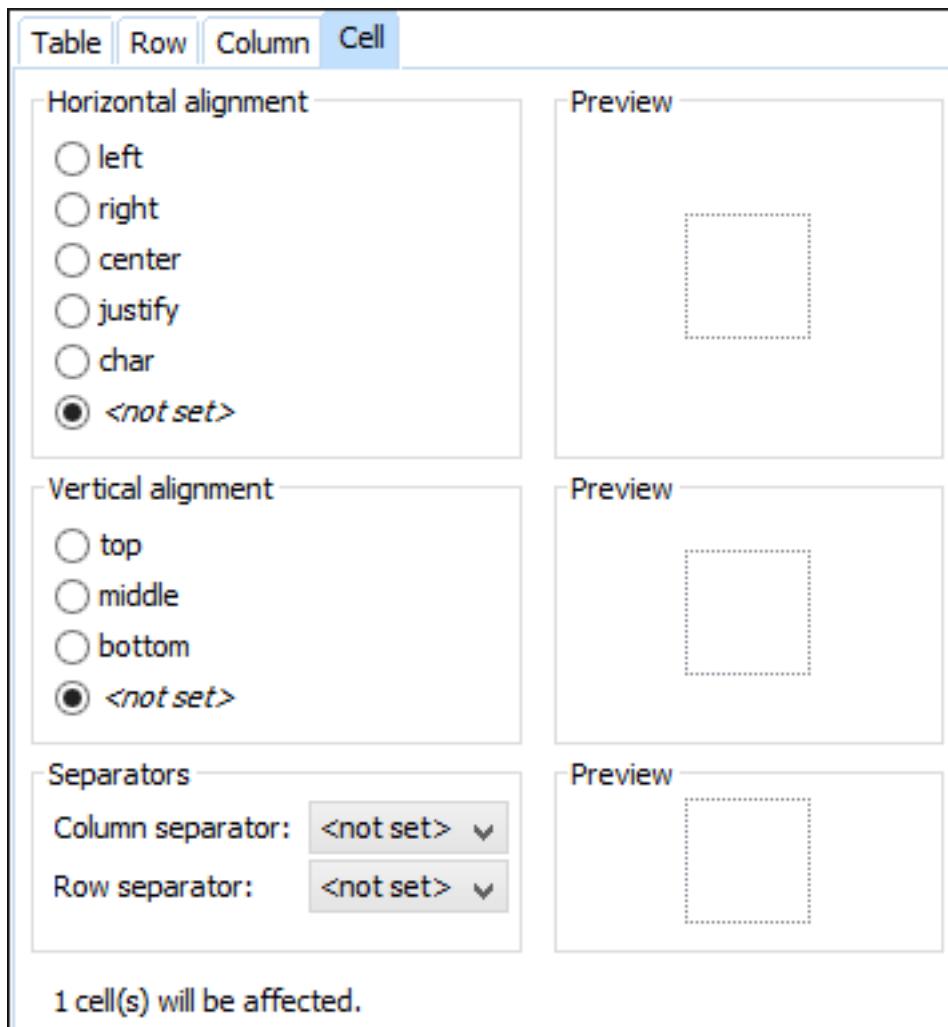

Figure 177: Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.

Column separator (Available in the Table, Column, and Cell tabs)	<ul style="list-style-type: none"> • middle - Aligns the text in a vertically centered position. • bottom - Aligns the text at the bottom of the cell. <p>Specifies whether or not to include column separators (<code>colsep</code> attribute). The allowed values are: 0 (no separator) and 1 (include separators).</p>
Row separator (Available in all four tabs)	<p>Specifies whether or not to include row separators (<code>rowsep</code> attribute). The allowed values are: 0 (no separator) and 1 (include separators).</p>
Frame	<p>Allows you to specify a value for the <code>frame</code> attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.</p>
Row type (Available in the Row tab only)	<p>Allows you change the row to a header, body, or footer type of row (within a <code>thead</code>, <code>tbody</code>, or <code>tfoot</code> attribute).</p>

Edit Table Properties for an HTML Table Model

For an *HTML* table model, the **Table properties** dialog box includes four tabs of options (**Table**, **Row**, **Column**, and **Cell**) and the options include a **Preview** pane that shows a representation of the modification.

The options in the four tabs include the following:

Frame (Available only in the Table tab)	<p>Allows you to specify a value for the <code>frame</code> attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.</p>
Row type (Available in the Row tab only)	<p>Allows you change the row to a header, body, or footer type of row (within a <code>thead</code>, <code>tbody</code>, or <code>tfoot</code> attribute).</p>
Horizontal alignment (Available in the Row, Column, and Cell tabs)	<p>Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (<code>align</code> attribute). The allowed values are:</p> <ul style="list-style-type: none"> • left - Aligns the text to a left position. • right - Aligns the text to a right position. • center - Aligns the text to a centered position. • justify - Stretches the line of text so that it has equal width. <p>Note: The <code>justify</code> value cannot be rendered in Author mode, so you will only see it in the output.</p> <ul style="list-style-type: none"> • char - Aligns text to the leftmost occurrence of the value specified on the <code>char</code> attribute for alignment.
Vertical alignment (Available in the Row, Column, and Cell tabs)	<p>Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (<code>valign</code> attribute). The allowed values are:</p> <ul style="list-style-type: none"> • top - Aligns the text at the top of the cell. • middle - Aligns the text in a vertically centered position. • bottom - Aligns the text at the bottom of the cell.

- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the bottom value. However, if the fonts are different sizes, the baseline value often makes the table look better.

Related information

[Editing Tables in Author Mode](#) on page 491

Adding Tables in DITA Topics

[Edit on GitHub](#)

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports three types of tables:

- [*DITA Simple table model*](#) - This is the most commonly used model for basic tables.
- [*OASIS Exchange Table Model \(a subset of the CALS table model\)*](#) - This is used for more advanced functionality.
- [*DITA Choice table model*](#) - This is used within a step in a DITA task document to describe a series of optional choices that a user must make before proceeding.

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

To insert a *Simple* DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the **Model**.

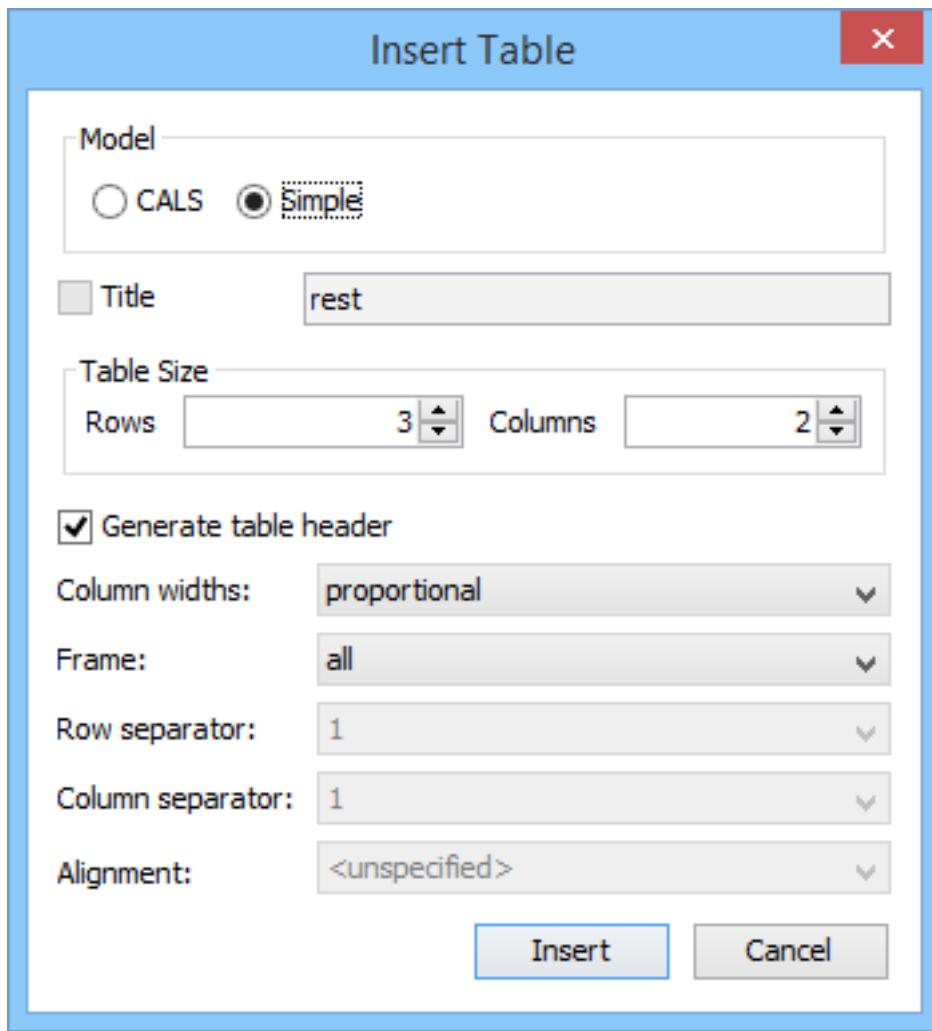

Figure 178: Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **Simple** table model:

Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode,

the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html>.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (*CALS*), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

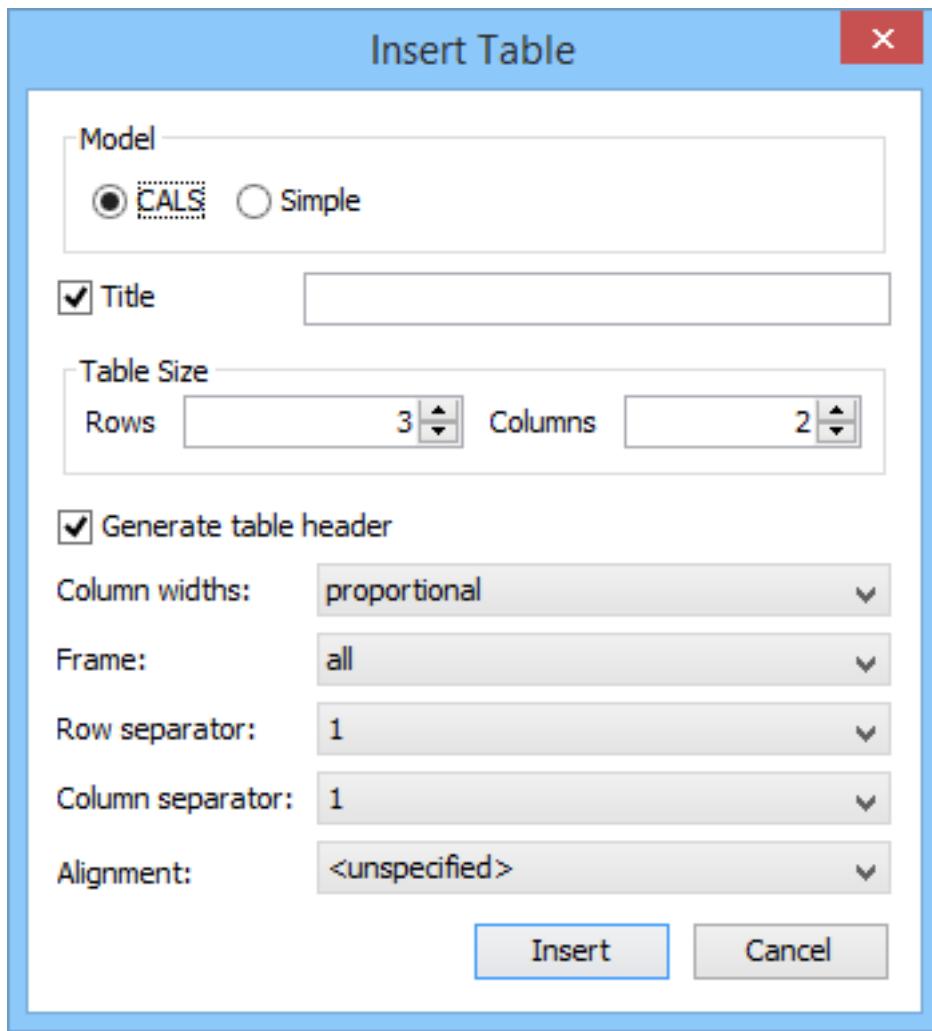

Figure 179: Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the

other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec-common/ditauseconreftarget.html>.

Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec-common/ditauseconreftarget.html>.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspeсs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The screenshot shows the Oxygen XML Author interface with the following details:

- Title:** Sample CALS Table with Fixed Width
- Section:** colspeсs...
- Column 1 (c1):**
 - name: c1
 - number: 1
 - width: 198pt
 - align: dropdown menu
 - colsep: checkbox (unchecked)
- Column 2 (c2):**
 - name: c2
 - number: 2
 - width: 219pt
 - align: dropdown menu
 - colsep: checkbox (unchecked)
- Table Preview:** A 4x4 grid of cells, where the first two columns are wider than the last two.

Figure 180: CALS Table in DITA

Inserting a Choice Table Model

To insert a *Choice* table within a `step` element in a DITA task, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select `choicetable` from the **Content Completion Assistant**. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

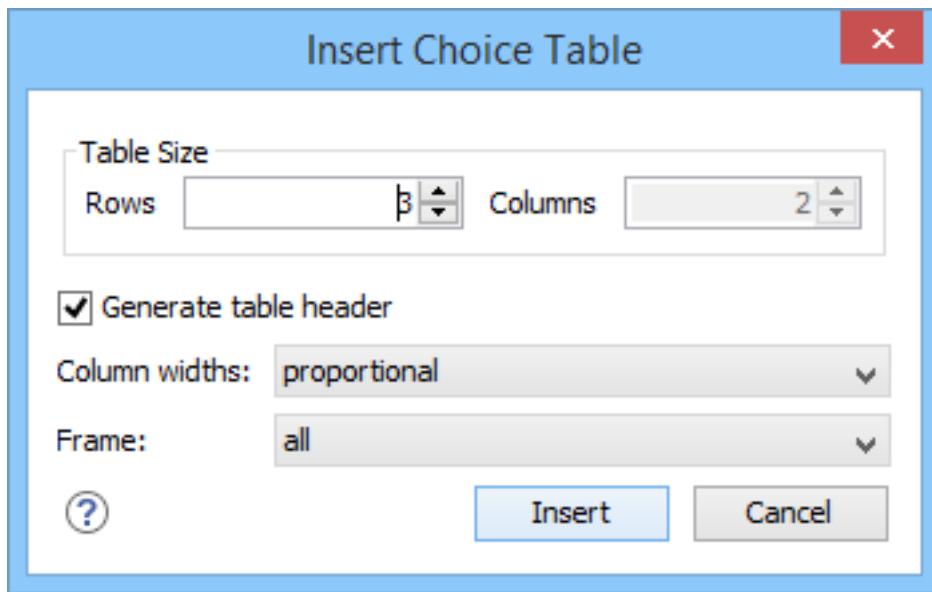

Figure 181: Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA task:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your task document at the current cursor position (within a `step` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). See the [DITA documentation](#) for a full explanation of these attributes.

You can also use the  [Table Properties \(Ctrl + T \(Command + T on OS X\)\)](#) action from the toolbar or contextual menu (or **DITA** menu) to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML, and, if necessary, you can edit the XML directly by switching to **Text mode**.

Related information

[Editing Tables in Author Mode](#) on page 491

DITA Table Layouts

[Edit on GitHub](#)

Depending on the context, DITA accepts the following table layouts:

- [CALS table model](#)
- [Simple table model](#)
- [Choice table model](#)

CALS Table Model Layout

The *CALS* table model allows for more flexibility and table customization than other models. When choosing a *CALS* table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a *CALS* table includes a `colspeсs` section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the **Author mode**, the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Sample CALS Table with no specified width and proportional column widths

colspe...

column name c1	number 1	width 0.32*	align	colsep
column name c2	number 2	width 1.49*	align	colsep
column name c3	number 3	width 1.15*	align	colsep
column name c4	number 4	width 0.4*	align	colsep
column name c5	number 5	width 1.67*	align	colsep
Horizontal Span		a3	a4	a5
f1	f2	f3	f4	f5
b1	b2	b3	b4	► Vertical ⁴ Span
c1				c4
d1	Spans ► Both ⁴ directions			d4
				d5

Figure 182: CALS Table in DITA

Simple Table Model Layout

When choosing a *Simple* table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 183: DITA Simple Table

Choice Table Model Layout

A *Choice* table model is used within a step in a DITA task document to describe a series of optional choices that a user must make before proceeding. The **choicetable** element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA tasks either by selecting **choicetable** from the **Content Completion Assistant** (within a **step** element) or by using the **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

Figure 184: DITA Choice Table

Table Validation in DITA

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map with the  **Validate and Check for Completeness** action, if the *Report table layout problems option is enabled in the DITA Map Completeness Check dialog box*, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

Simple or Choice Tables

- A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

[Edit on GitHub](#)

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties** (**Ctrl + T (Command + T on OS X)**) action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.

- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

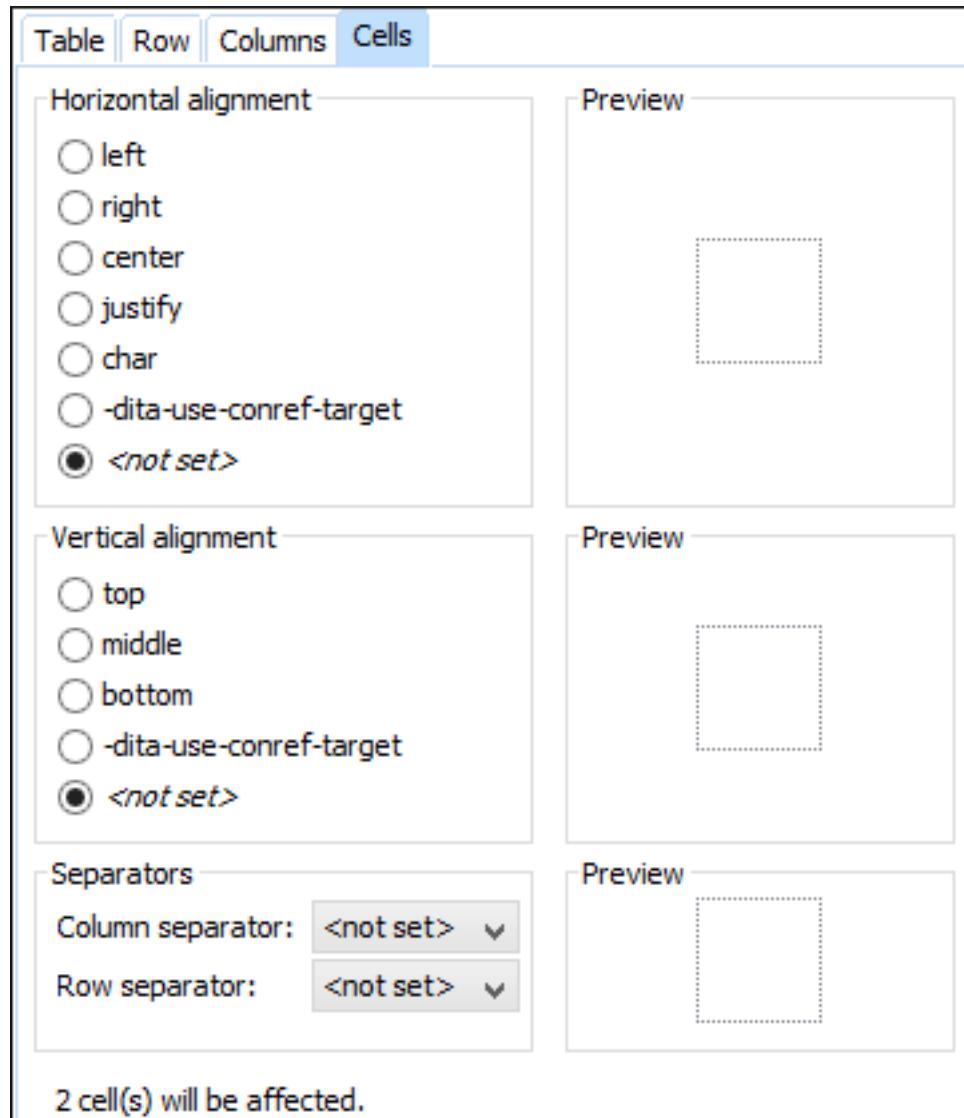

Figure 185: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.

	<ul style="list-style-type: none"> • justify - Stretches the line of text so that it has equal width. <p>Note: The <code>justify</code> value cannot be rendered in Author mode, so you will only see it in the output.</p> <ul style="list-style-type: none"> • char - Aligns text to the leftmost occurrence of the value specified on the <code>char</code> attribute for alignment. • -dita-use-conref-target - Normally, when using a <code>conref</code>, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the <code>conref</code> target. For more information, see http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html.
Vertical alignment (Available in the Row and Cell tabs)	Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (<code>valign</code> attribute). The allowed values are as follows: <ul style="list-style-type: none"> • top - Aligns the text at the top of the cell. • middle - Aligns the text in a vertically centered position. • bottom - Aligns the text at the bottom of the cell. • -dita-use-conref-target - Normally, when using a <code>conref</code>, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the <code>conref</code> target. For more information, see http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html.
Column separator (Available in the Table, Column, and Cell tabs)	Specifies whether or not to include column separators (<code>colsep</code> attribute). The allowed values are: 0 (no separator) and 1 (include separators).
Row separator (Available in all four tabs)	Specifies whether or not to include row separators (<code>rowsep</code> attribute). The allowed values are: 0 (no separator) and 1 (include separators).
Frame (Available only in the Table tab)	Allows you to specify a value for the <code>frame</code> attribute. It is used to specify where a border should appear in the table. The allowed values are as follows: <ul style="list-style-type: none"> • none - No border will be added. • all - A border will be added to all frames. • top - A border will be added to the top frame. • topbot - A border will be added to the top and bottom frames. • bottom - A border will be added to the bottom frame. • sides - A border will be added to the side frames. • -dita-use-conref-target - Normally, when using a <code>conref</code>, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the <code>conref</code> target. For more information, see http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html.

Edit Table Properties for a *Simple* or *Choice* Table Model

For a *Simple* or *Choice* table model, the **Table properties** dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html>.

Row tab

Row type

Allows you change the row to a body or header type of row.

[Adding Tables in DITA Topics](#) on page 504
[Editing Tables in Author Mode](#) on page 491

Adding Tables in XHTML Documents

[Edit on GitHub](#)

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

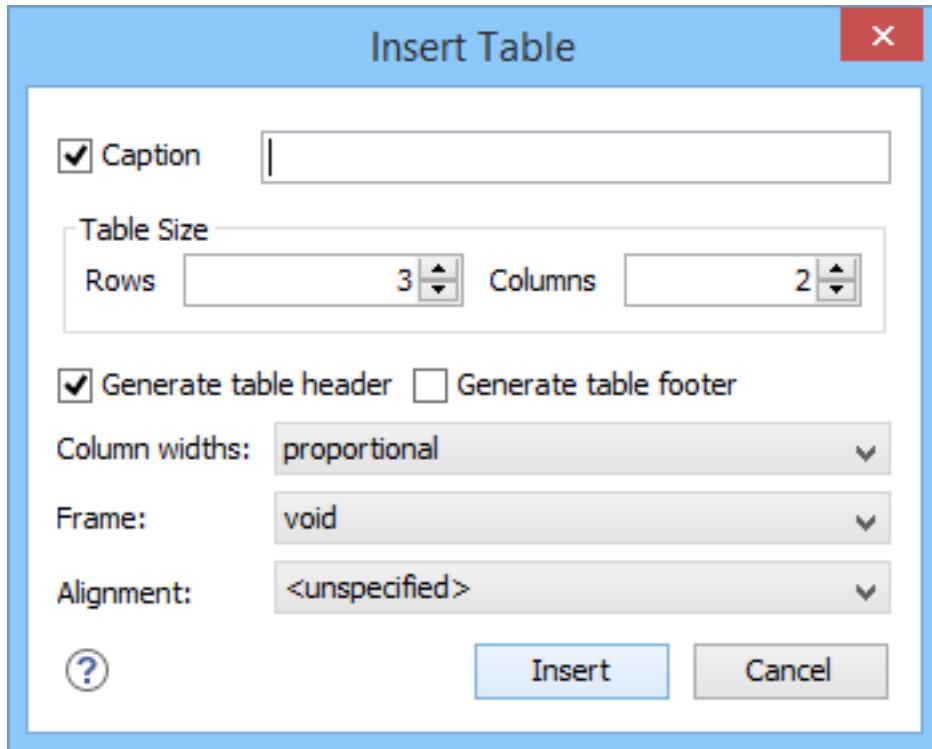

Figure 186: Insert Table Dialog Box in XHTML

The dialog box allows you to configure the following options:

Caption

If this checkbox is enabled, you can specify a title (caption) for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `width` attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of

the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "`0*`" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `colspeсs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view](#) (**Window > Show View > Attributes**).

Also, remember that underneath the visual representation, both table models are really just XML, and, if necessary, you can edit the XML directly by switching to **Text mode**.

XHTML Table Layout[Edit on GitHub](#)

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an *XHTML* table includes a **colspeccs** section that allows you to easily configure some properties. For example, you can change the value of column widths (*width* attribute) or the text alignment (*align* attribute). Although they appear as part of the *Author mode*, the **colspeccs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The diagram illustrates a table structure with various cells labeled with letters. A callout points to the first row with the text "A table with merged cells, fixed column widths, and fixed total width." The first row contains two cells: 'x' and 'y'. The cell 'y' spans horizontally across both columns of the second row. The second row is labeled "Spans ▷ Vertically" and contains three cells: 'b', 'd', and 'f'. The third row is labeled "Spans ▷ Both" and contains three cells: 'e', 'g', and 'h'. The fourth row contains three cells: 'i', 'k', and 'l'. The fifth row contains three cells: 'j', 'm', and 'n'. The sixth row contains three cells: 'o', 'p', and 'q'. The seventh row contains three cells: 'r', 's', and 't'. The eighth row contains three cells: 'u', 'v', and 'w'. The ninth row contains three cells: 'x', 'y', and 'z'.

Figure 187: Table Layout in XHTML Documents

Sorting Content in Tables and List Items[Edit on GitHub](#)

Oxygen XML Author offers support for sorting the content of tables and list items of ordered and unordered lists.

What do you want to do?

- *Sort an entire table.*
- *Sort a selection of rows in a table.*
- *Sort a table that contains cells merged over multiple rows.*
- *Sort list items.*

Sorting a Table[Edit on GitHub](#)

To sort rows in a table, select the entire table (or specific rows) and use the **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

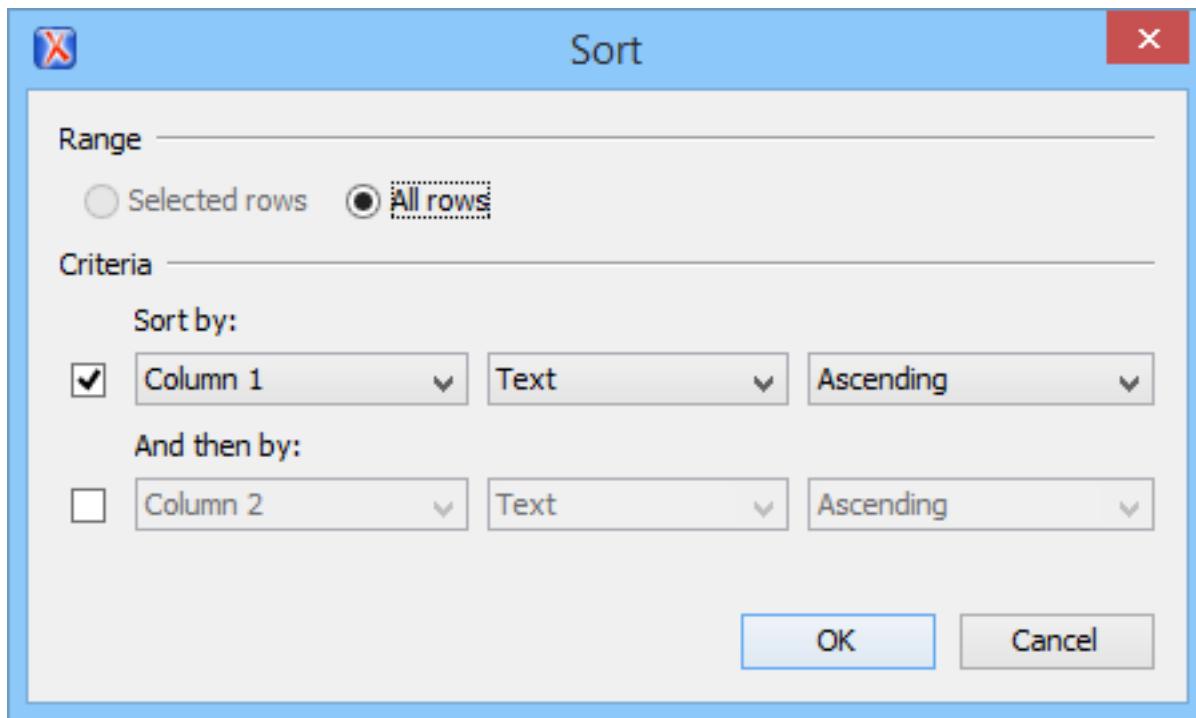

Figure 188: Sort Dialog Box

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

Note: When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
 - **Text** - Alphanumeric characters.
 - **Numeric** - Regular integer or floating point numbers are accepted.
 - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
 - The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

Note: The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

Sorting a Selection of Rows

[Edit on GitHub](#)

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.

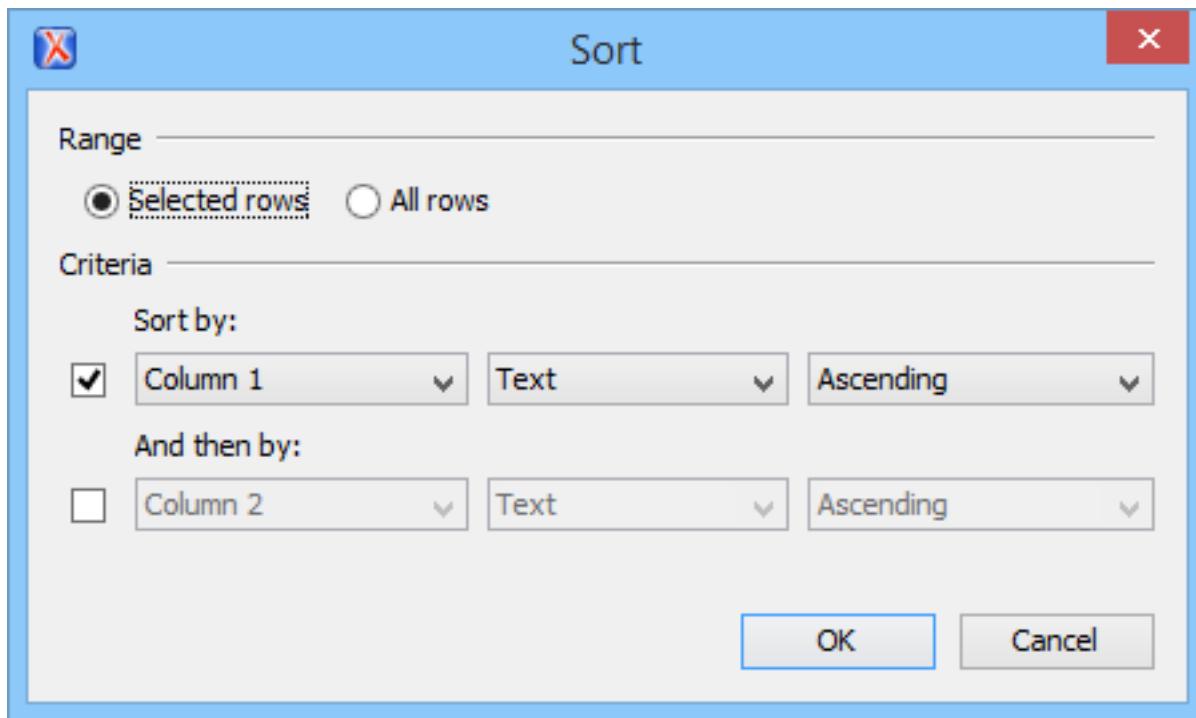

Figure 189: Sort Selected Rows

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
 - **Text** - Alphanumeric characters.
 - **Numeric** - Regular integer or floating point numbers are accepted.
 - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
 - The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

Note: The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, enable the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

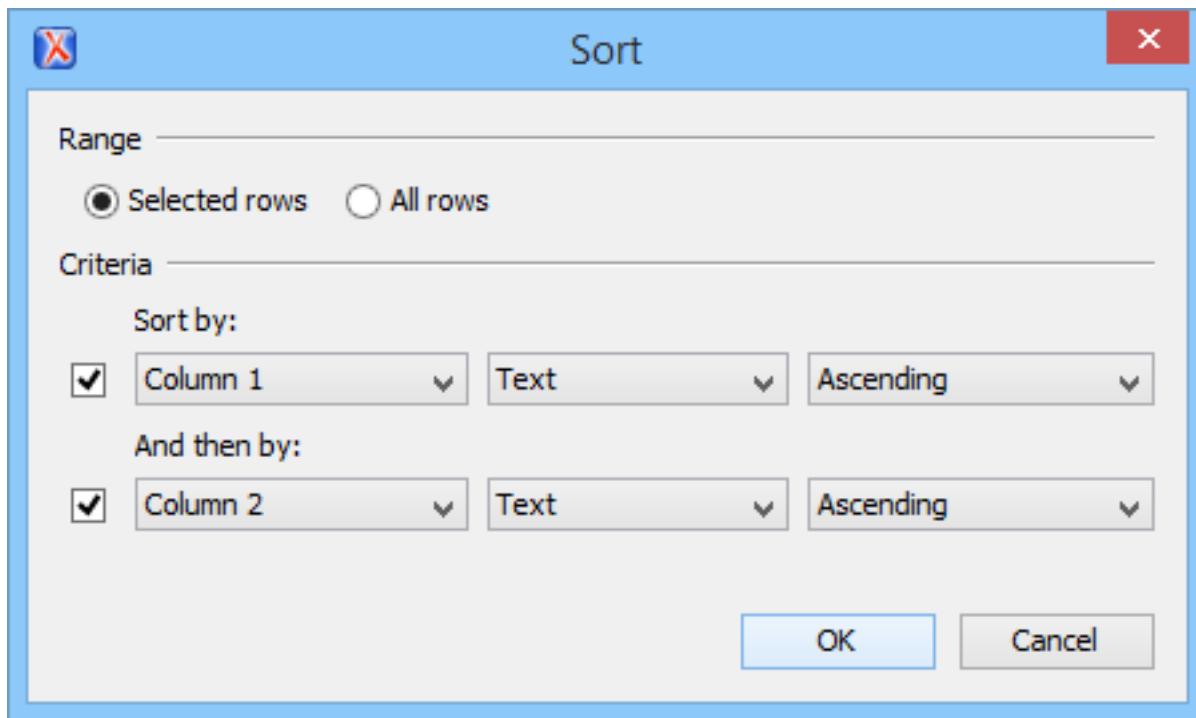

Figure 190: Sorting Based on Multiple Criteria

Sorting a Table that Contains Merged Cells

[Edit on GitHub](#)

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain *rowspans*.

Note: For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

[Edit on GitHub](#)

A sorting operation can be performed on various types of lists and list items. Oxygen XML Author provides support for sorting the following types of lists:

- Ordered list (ol)
- Unordered list (ul)
- Parameter list (parml)
- Simple list (sl)
- Required conditions (reqconds)
- Supplies list (supplyli)
- Spare parts list (sparesli)
- Safety conditions (safety)
- Definitions list (d1)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

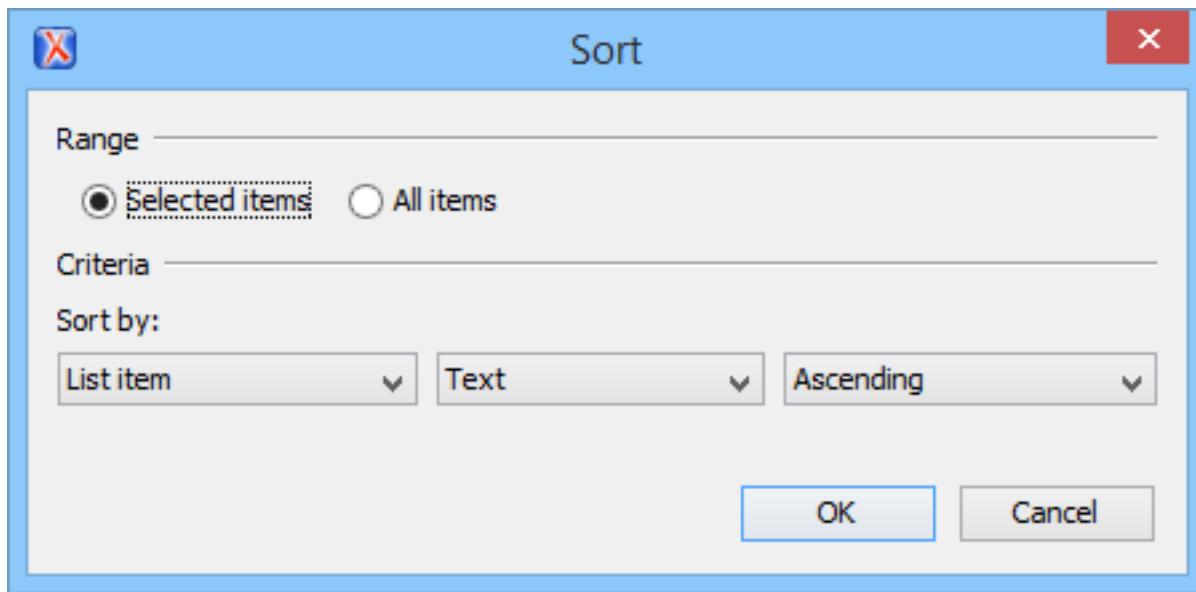

Figure 191: Sorting List Items

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

Note: When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
 - **Text** - Alphanumeric characters.
 - **Numeric** - Regular integer or floating point numbers are accepted.
 - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
 - The sorting direction (either *ascending* or *descending*).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

Note: The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

Inserting Images

[Edit on GitHub](#)

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the  **Insert Image** action from the toolbar and choose the image file you want to insert. Oxygen XML Author tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the `file:/C:/project/xml/dir/img1.jpg` image into the `file:/C:/project/xml/doc1.xml` document, Oxygen XML Author inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

Note: The  **Insert Image** action is available for the following document types: DocBook 4, DocBook 5, DITA, TEI P4, TEI P5, XHTML.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the href attribute in an image element:

```
<image href=".../images/image_file.png"/>
```

Note: To replace an image, just drag and drop a new image over the existing one. Oxygen XML Author will automatically update the reference to the new image.

- Copy the image from another application (such as an image editor) and paste it into your document. Oxygen XML Author prompts you to first save it. After saving the image, a reference to that file path is inserted at the paste position.

Related information

[Image Map Editor](#) on page 524

[Image Rendering in Author Mode](#) on page 543

Image Map Editor

[Edit on](#)[GitHub](#)

Oxygen XML Author includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an *image map* is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Author is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

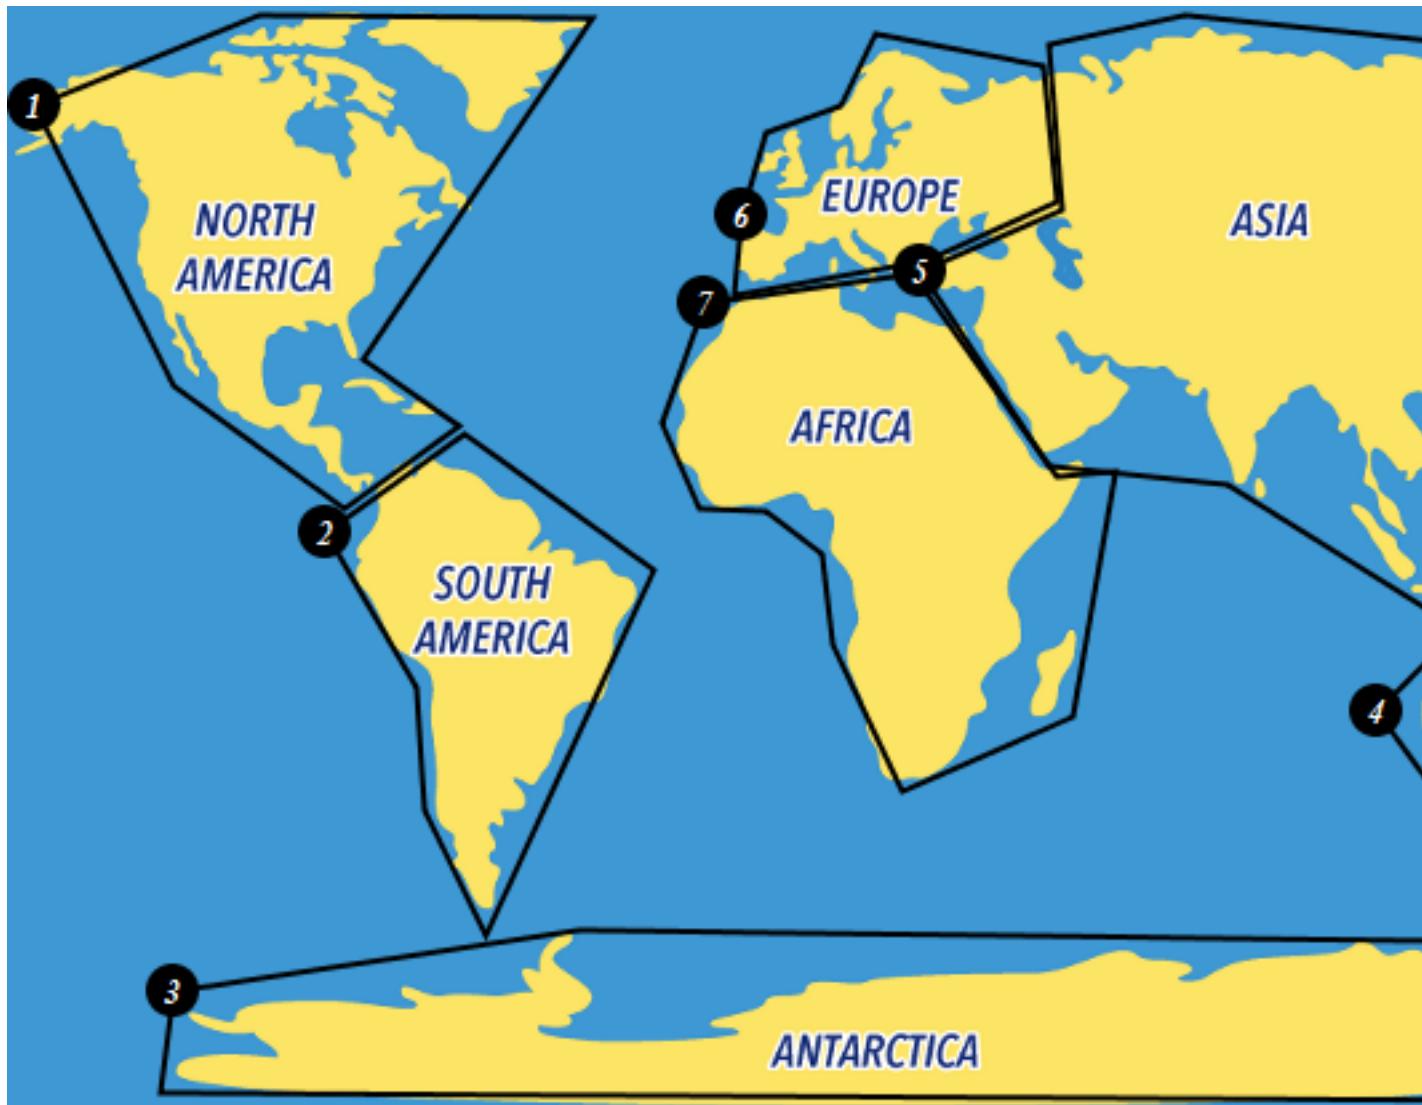

Figure 192: Image Map Rendered in Author Mode

Image Maps in DITA

[Edit on GitHub](#)

Oxygen XML Author includes support for *image maps* in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

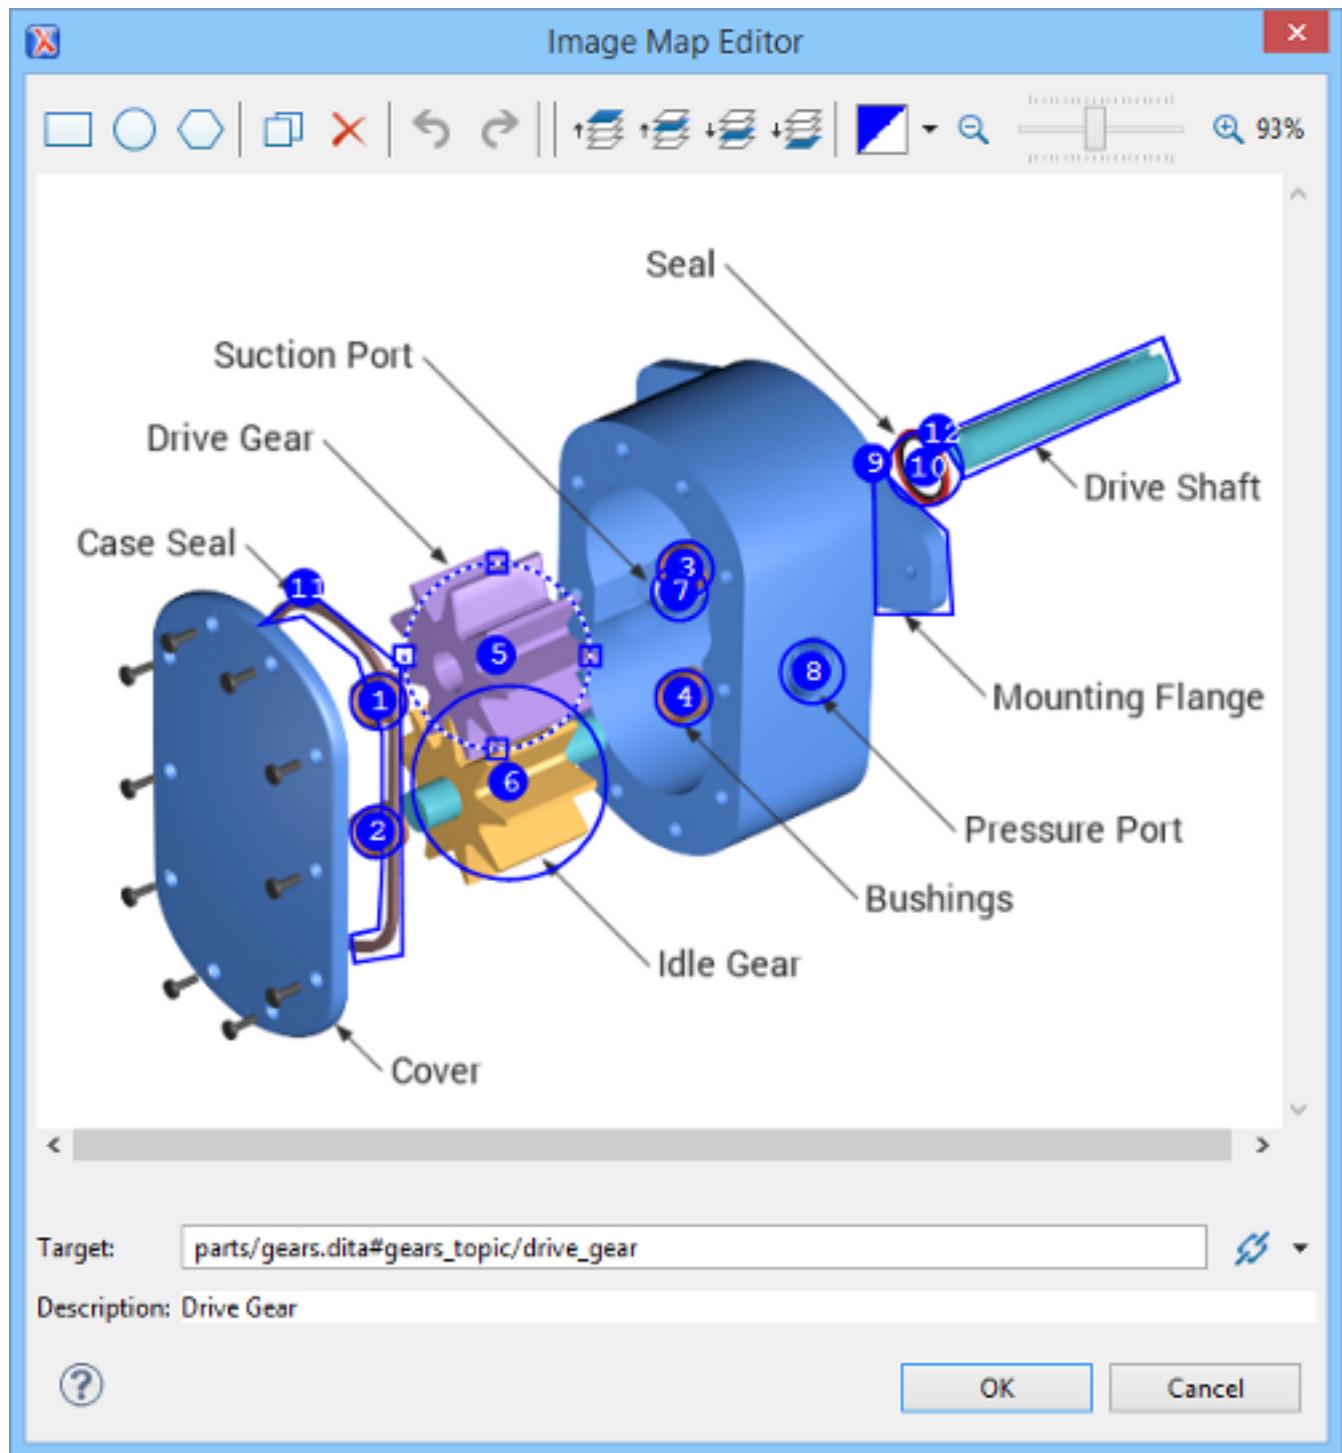

Figure 193: Image Map Editor in DITA

Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points

to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

Area Properties

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to

use the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of *inserting links in DITA* by using the identical

 **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see *Inserting*

[a Link in Oxygen XML Author](#) on page 1667.

Description	You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.
-------------	--

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, use one of the *linking options* in the Link drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

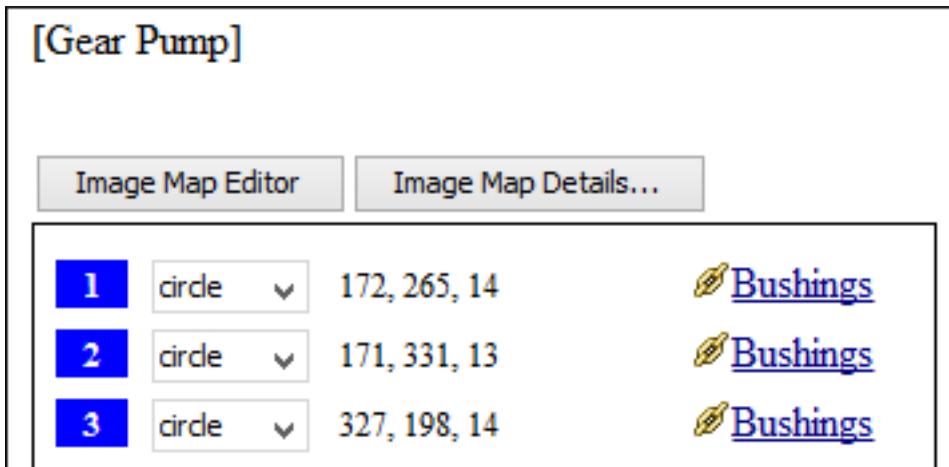

Figure 194: Image Map Details

How to Edit an Existing Image Map in DITA

To edit an existing image map, right-click the image and select **Image Map Editor** (or click the **Image Map Editor** button below the image). This opens the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Image Maps in DocBook

[Edit on GitHub](#)

Oxygen XML Author includes support for *image maps* in DocBook documents through the use of the `areaspec` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

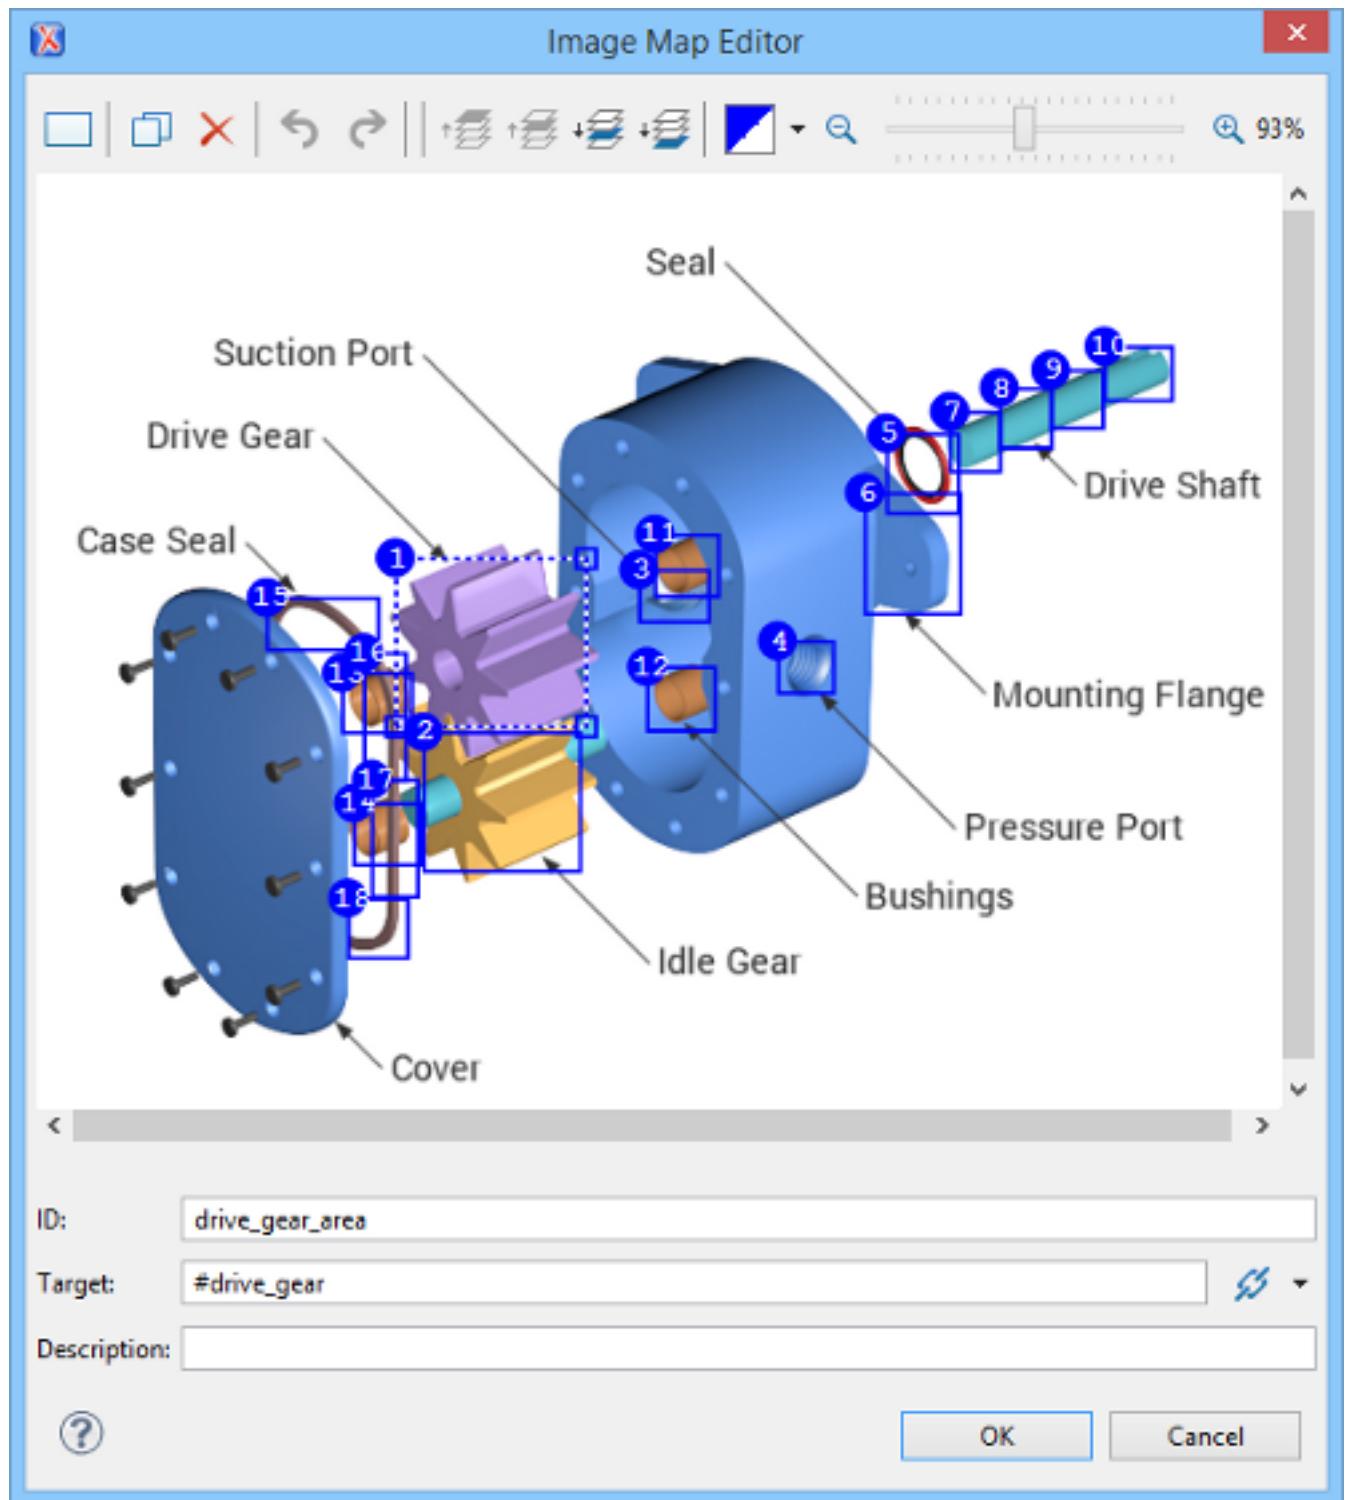

Figure 195: Image Map Editor in DocBook

Image Map Editor Interface in DocBook

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an

	area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.
 Duplicate	Use this button to create a duplicate of the currently selected shape.
 Delete	Use this button to delete the currently selected shape.
 Undo	Use this button to undo the last action.
 Redo	Use this button to redo the last action that was undone.
 Show/Hide Numbers	Use this button to toggle between showing or hiding the numbers for the shapes.
 Bring Shape to Front	Use this button to bring the currently selected shape forward to the top layer.
 Bring Shape Forward	Use this button to bring the currently selected shape forward one layer.
 Send Shape Backward	Use this button to send the currently selected shape back one layer.
 Send Shape to Back	Use this button to send the currently selected shape back to the bottom layer.
 Color Chooser	Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.
 Zoom Slider	Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

Area Properties

ID

The identifier for the selected area. This will become the value of the

<p>Target</p>	<p>Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the  Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference or Web Link. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an <code>xlink:href</code> attribute.</p>
<p>Description</p>	<p>You can enter an optional description for the selected area that will be displayed in the Image Map Details section in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.</p>

How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the  **New Rectangle** button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, enter an **ID** and use one of the *linking options* in the  **Link** drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select  **New Rectangle** button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, right-click the image and select **Image Map Editor** (or click the **Image Map Editor** button above the image). This opens the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

Note: If you want to link a set of related `area` elements, you can use `areaset` elements. However, the layer buttons on the **Image Map Editor toolbar** (, , ,) will be disabled for areas inside an `areaset` element. Therefore, to change the layer of an `areaset`, you need to move it in **Text** mode where the layer order is sequential (the `area` or `areaset` that appears first is the top layer, and so on).

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (, , ,)

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Image Maps in TEI

[Edit on GitHub](#)

Oxygen XML Author includes support for *image maps* in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using `zone` elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

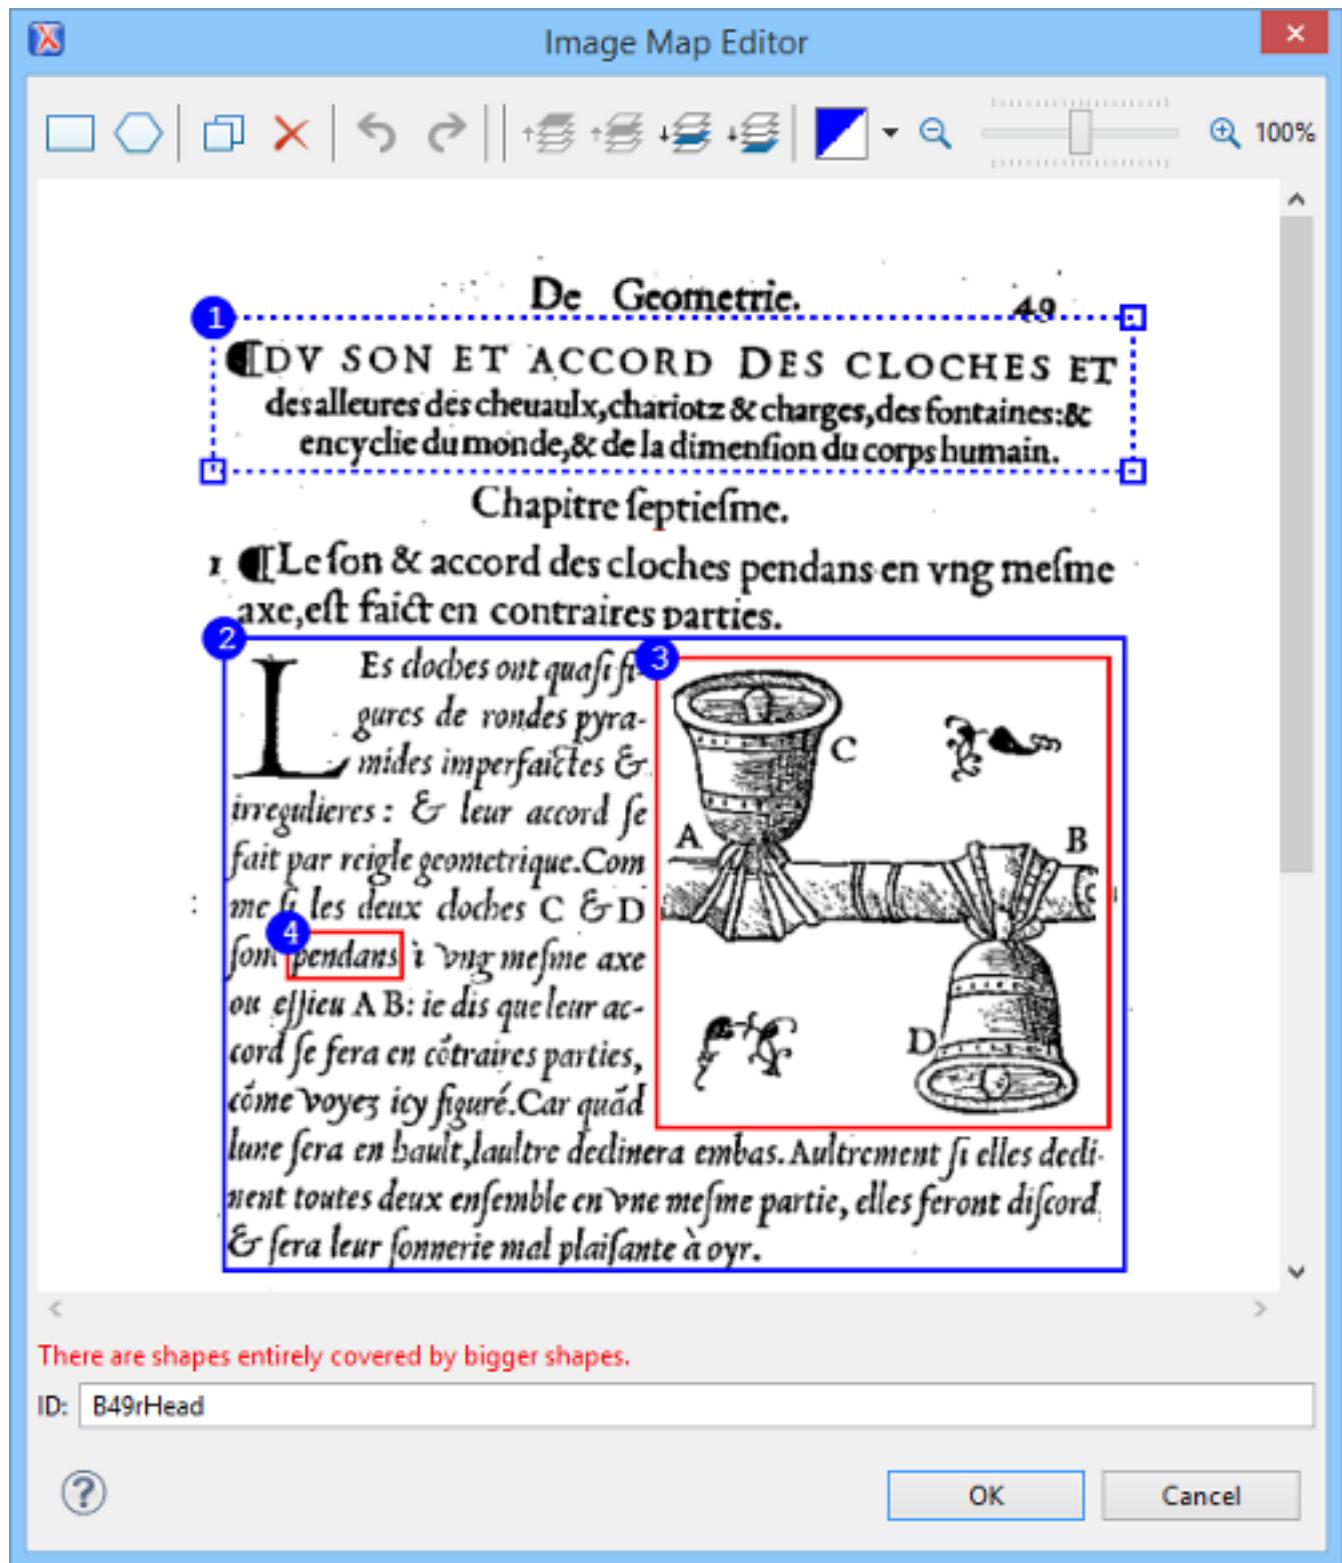

Figure 196: Image Map Editor in TEI

Image Map Editor Interface in TEI

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar**New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

**New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

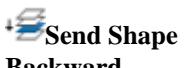

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.

**Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main image pane is where you work with shapes to add areas (zones) within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

Area Properties

ID

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (`graphic`) must be inside a `facsimile` element to support the **Image Map Editor** feature.
2. Right-click the image and select **Image Map Editor**.

Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons (New Rectangle or New Polygon).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
5. With the shape selected, enter an **ID**.
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in TEI

To edit an existing image map, right-click the image and select **Image Map Editor** (or click the **Image Map Editor** button below the image). This opens the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

Restriction: Currently, if zone elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the zone elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Image Maps in XHTML

[Edit on GitHub](#)

Oxygen XML Author includes support for *image maps* in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `img` element) may be associated with an image map (in the form of a `map` element) by specifying a `usemap` attribute on the `img` element. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

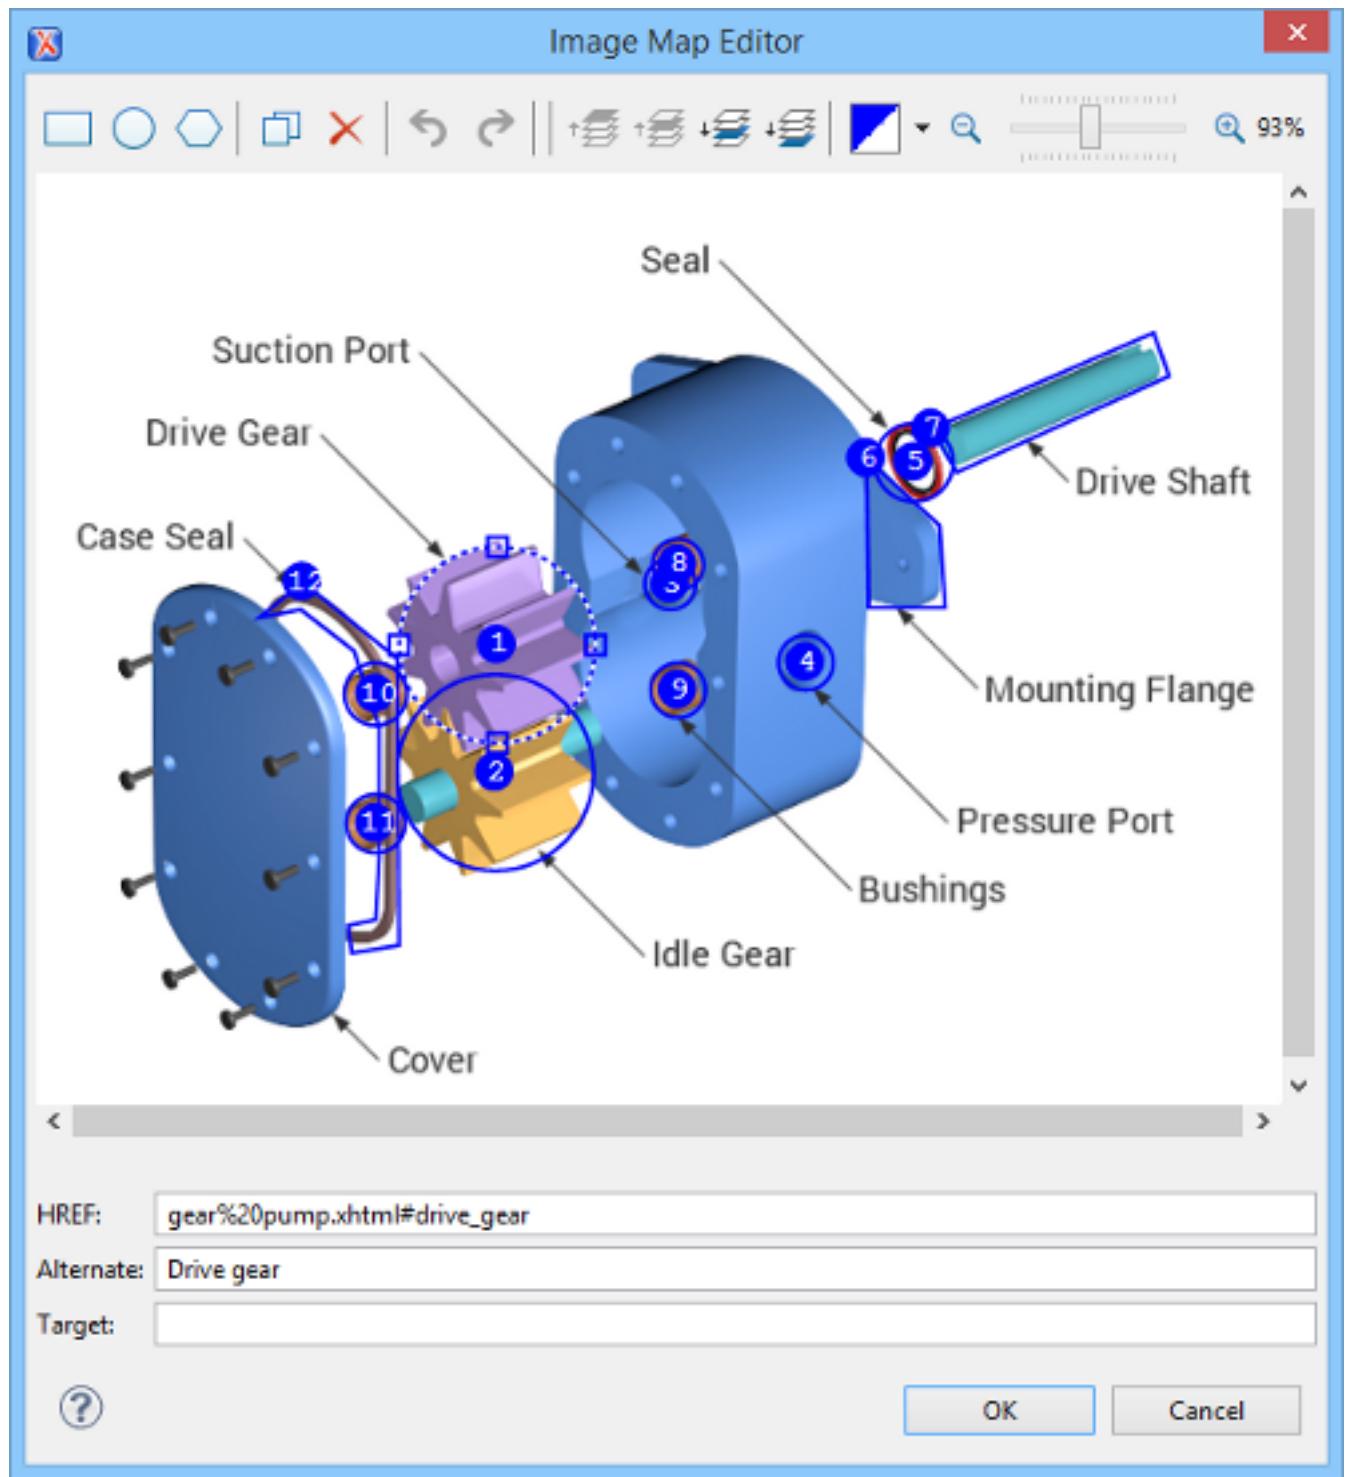

Figure 197: Image Map Editor in XHTML

Image Map Editor Interface in XHTML

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can

drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

Area Properties

Href

Specifies the hyperlink target for the selected area. This will become the value of the `href` attribute for the particular `area` element. The possible values are:

- **An Absolute URL** - A URL of another web site (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your web site (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).
- **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto:`, `file:`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

Alternate

The description for the selected area. The value is inserted in an `alt` attribute in the particular `area` element. This is a required attribute to present a text alternative for browsers that do not display images.

Target	Specifies where to open the linked resource. The allowed values are:
	<ul style="list-style-type: none"> • _blank - Opens the linked resource in a new window or tab. • _self - Opens the linked resource in the same frame as it was clicked. • _parent - Opens the linked resource in the full body of the window. • framename - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, specify the hyperlink target in the **Href field** and enter a description for the selected area in the **Alternate field**.
5. (Optional) Specify where the hyperlink resource will be opened in the **Target field**.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

How to Edit an Existing Image Map in XHTML

To edit an existing image map, right-click the image and select **Image Map Editor**. This opens the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the *Image Map Editor toolbar*). To change the layer order for a shape, use the layer buttons on the *Image Map Editor toolbar* (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Related information

[HTML Image Map Specifications](#)

Image Rendering

[Edit on GitHub](#)

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

Table 7: Supported Image Formats

Image Type	Support	Additional Information
GIF	built-in	Animations not yet supported
JPG, JPEG	built-in	<i>JPEG images with CMYK color profiles</i> are properly rendered only if color profile is inside the image.
PNG	built-in	
SVG, SVGZ, WMF	built-in	Rendered using the open-source Apache Batik library that supports SVG 1.1.
BMP	built-in	
TIFF	built-in	Rendered using a part of the Java JAI Image library.
EPS	built-in	Renders the preview TIFF image inside the EPS.
AI	built-in	Renders the preview image inside the Adobe Illustrator file.
JPEG 2000, WBMP	plugin	Renders by installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in .
CGM	plugin	Renders by installing an additional library .
PDF	plugin	Renders by installing the Apache PDF Box library .

When an image cannot be rendered, Oxygen XML Author **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Enable the [Show very large images option](#).
- The image format is not supported by default. It is recommended to [install the Java Advanced Imaging\(JAI\) Image I/O Tools plug-in](#).

Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.
- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the *scale* attribute.

Note: As a Java application, Oxygen XML Author uses the *Java Advanced Imaging* API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the `[OXYGEN_INSTALL_DIR]/lib` directory.

[Customize Oxygen XML Author to Render EPS and AI Images](#) on page 545

[JPEG CMYK Color Space Issues](#) on page 1569

Customize Oxygen XML Author to Render CGM Images (Experimental Support)

[Edit on GitHub](#)

Oxygen XML Author provides experimental support for CGM 1.0 images.

Attention: Image hotspots are not supported.

Since this is an experimental support, some graphical elements might be missing from the rendered image.

The CGM rendering support is based on a third party library. In its free of charge variant it renders the images watermarked with the string Demo, painted across the panel. You can find more information about ordering the fully functioning version here: <http://www.bdaum.de/cgmpanel.htm>.

Follow this procedure to enable the rendering of CGM images in **Author** mode:

1. Download the `CGMPANEL.ZIP` from <http://www.bdaum.de/CGMPANEL.ZIP>.
2. Unpack the ZIP archive and copy the `cgmpanel.jar` into the `[OXYGEN_INSTALL_DIR]\lib` directory.
3. Restart the application.

Customize Oxygen XML Author to Render PDF Images (Experimental Support)

[Edit on GitHub](#)

Oxygen XML Author provides experimental support for PDF images using the Apache PDFBox library.

To enable the rendering of PDF images in **Author** mode, follow this procedure:

1. Go to <http://pdfbox.apache.org/downloads.html> and download the pre-built PDFBox standalone binary JAR files `pdfbox-1.8.9.jar`, `fontbox-1.8.9.jar`, and `jempbox-1.8.9.jar`.
2. Copy the downloaded JAR libraries to the `[OXYGEN_INSTALL_DIR]\lib` directory.
3. Restart the application.

Customize Oxygen XML Author to Render PSD Images

[Edit on GitHub](#)

Oxygen XML Author provides support for rendering PSD (Adobe Photoshop) images.

To enable the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following JAR files:

- <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-lang/3.1.0/common-lang-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-io/3.1.0/common-io-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-core/3.1.0/imageio-core-3.1.0.jar>

- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar>
 - <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/imageio/imageio-psd/3.1.0/imageio-psd-3.1.0.jar>
2. Copy the downloaded JAR libraries to the `[OXYGEN_INSTALL_DIR]\lib` directory.
 3. Restart the application.

Customize Oxygen XML Author to Render EPS and AI Images

[Edit on GitHub](#)

Most EPS and AI image files include a preview picture of the content. Oxygen XML Author tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Author cannot render the image.
 - The EPS image includes a TIFF preview picture.
- Note:** Some newer versions of the TIFF picture preview are rendered in gray-scale.
- The AI image contains a JPEG preview picture. Oxygen XML Author renders the image correctly.

Installing Java Advanced Imaging (JAI) Image I/O Tools Plugin

[Edit on GitHub](#)

Certain special image types can be rendered in Oxygen XML Author by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Author and open the **Help > About** dialog box. Go to the **System properties** tab and look for the `java.runtime.name` and `java.home` properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-javac-client-419417.html>.

Note: The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the **Choose Destination Location** page, fill-in the **Destination Folder** field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

1. Download a Linux (`.tar.gz`) distribution of the JAI Image I/O Tools plugin. A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-javac-client-419417.html>.
2. In the `[OXYGEN_INSTALL_DIR]/lib` directory, create a directory named `endorsed` (`[OXYGEN_INSTALL_DIR]/lib/endorsed`).
3. Unpack the `.tar.gz`. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its `lib` directory and paste them in the `[OXYGEN_INSTALL_DIR]/lib/endorsed` directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Editing MathML Notations

[Edit on
GitHub](#)

The **Author** editor includes a built-in editor for *MathML* notations. To start the *MathML* editor, either double-click a *MathML* notation, or select the **Edit Equation** action from its contextual menu. In the *MathML* editor you can edit the mathematical symbols of a *MathML* notation. You can open a *MathML* file of your current project directly in the *MathML* editor. To do this, select **Open with > MathML editor** from the contextual menu in the **Project** view.

26         <mml:mn>5</mml:mn>
```

OK

Text Grid Author

The font size and font family that is used for the equations is based upon the context in which the MathML equation appears. To configure the minimum font size of the equation, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > MathML**.

Configure the **MathFlow** Editor

[Edit on GitHub](#)

The *MathFlow Components* product (*MathFlow SDK*) can replace the default *MathML* editor with a specialized *MathML* editor. You have to [purchase a MathFlow Component from Design Science](#) and configure it in Oxygen XML Author with the following procedure:

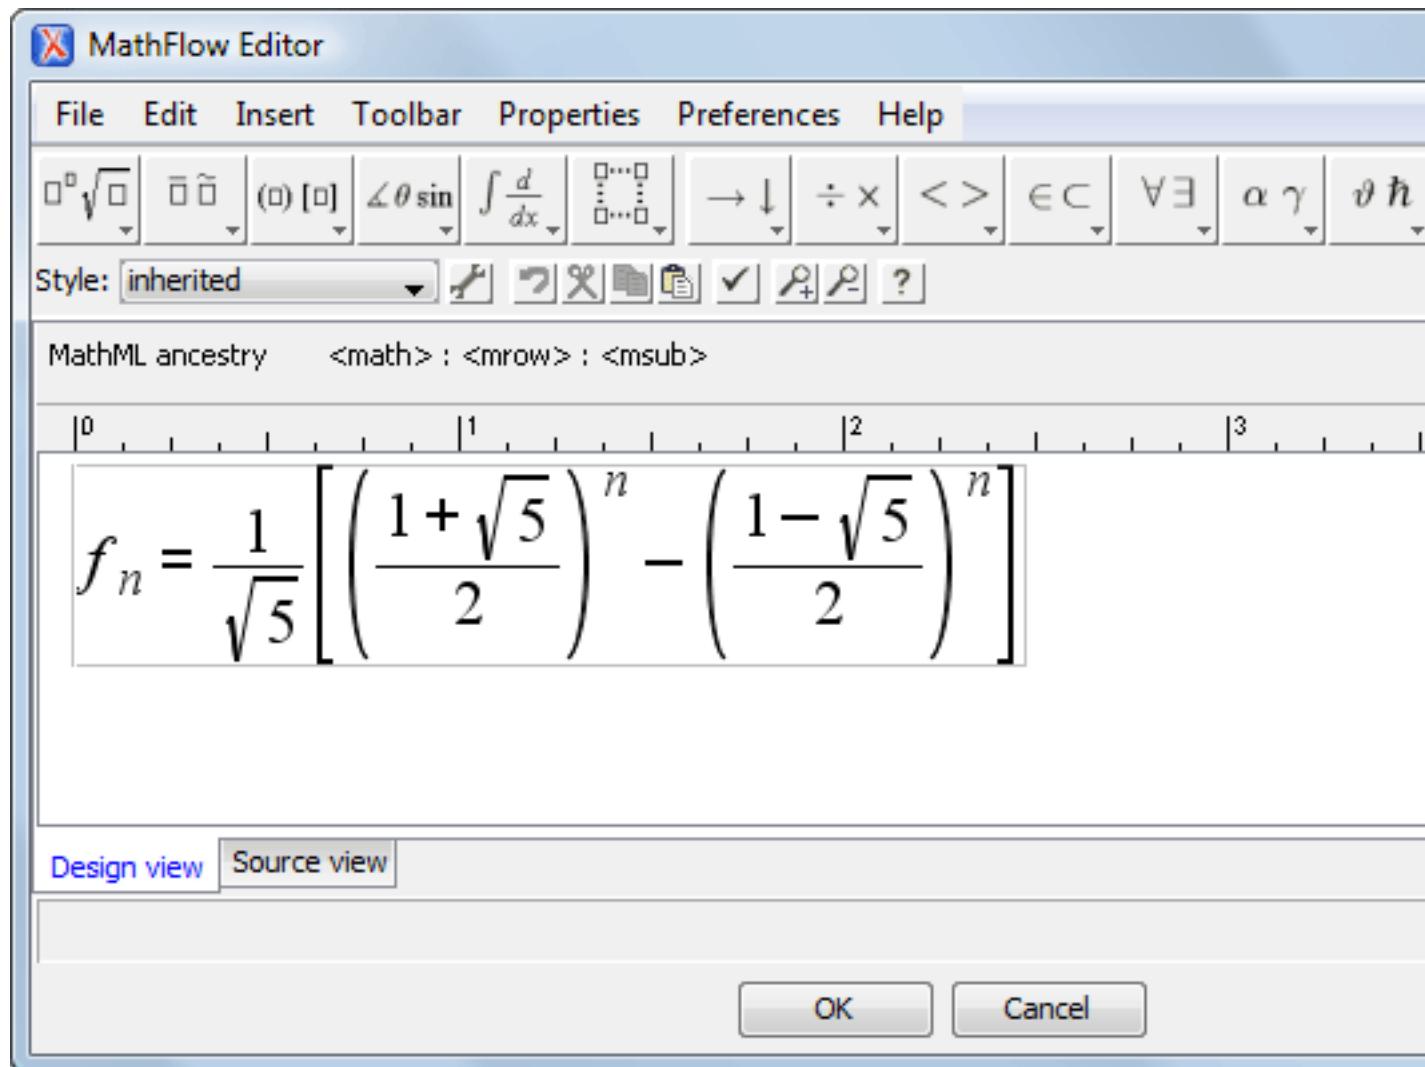

Figure 199: Default MathFlow Editor

1. Install *MathFlow Components* (*MathFlow SDK*).
2. On Windows make sure there is a copy of the *FLEXlm* DLL, which is the file [MathFlow-install-folder]/resources/windows/lmgr10.dll, in a folder that is added to the *PATH* environment variable.
3. Set the path to the *MathFlow* install folder [in the MathML preferences page](#).
4. Set the path to the *MathFlow* license file [in the MathML preferences page](#).

MathML Equations in HTML Output

[Edit on
GitHub](#)

Currently, only **Firefox** can render **MathML** equations embedded in the **HTML** code. **MathJax** is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript" src="http://cdn.mathjax.org/mathjax/latest/MathJax.js?config=TeX-AMS-MML_HTMLorMML"> </script>
```

For DITA documents, you can also edit the **DITA Map WebHelp** transformation scenario and set the `args.hdf` parameter to point to the `footer.html` resource. Then transform to WebHelp and the equation should be properly rendered in the browsers such as IE, Chrome, and Firefox.

Refreshing the Content

[Edit on
GitHub](#)

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the  **Reload** action.

To refresh the content of the referenced resources you can use the  **Refresh references** action. However, this action will not refresh the expanded external entities, for which you will need to use the  **Reload** action.

Generating IDs for Elements in Author Mode

[Edit on
GitHub](#)

Oxygen XML Author allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** or an *in-place attribute editor*. Oxygen XML Author also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu or the framework-specific menu (**DITA**, **DocBook**, or **TEI**). This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options dialog box** that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Automatically Generate IDs

Oxygen XML Author includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options dialog box** that is displayed when you select the **ID Options** action from the framework-specific menu (**DITA**, **DocBook**, or **TEI**). If enabled, Oxygen XML Author automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

ID Options Dialog Box

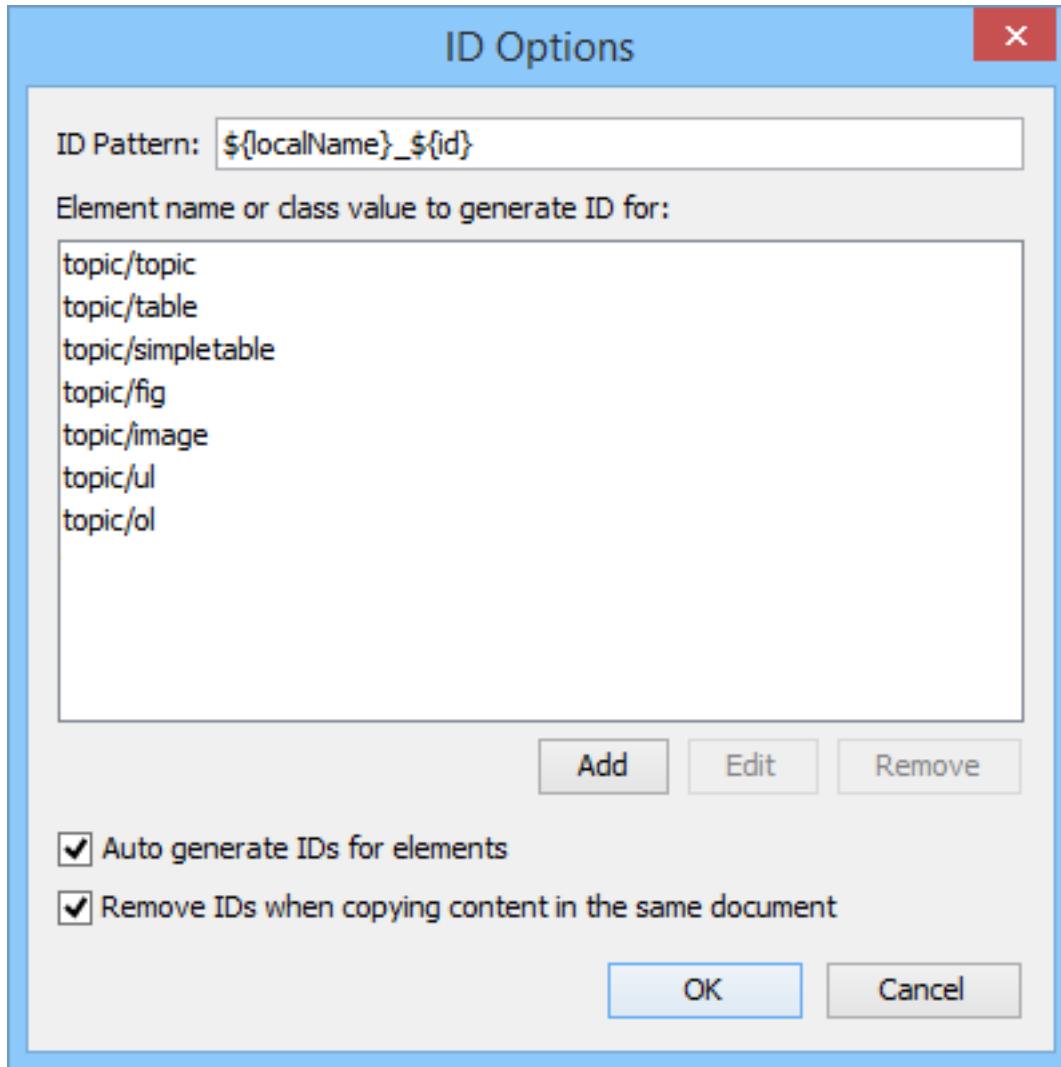

Figure 200: ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options in regards to generating ID values:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author *Editor Variables*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

Note: Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.

- If the **Auto generate IDs for elements option** is enabled and you duplicate elements with existing IDs, Oxygen XML Author assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements option** is disabled and you duplicate elements with existing IDs, the ID values are removed from the duplicates. However, when elements are duplicated in the same document, this option has no effect and IDs are preserved if the **Remove IDs when copying content in the same document option** is disabled.
- If the **Remove IDs when copying content in the same document option** is enabled, the ID values are removed from elements that are duplicated in the same document. However, enabling this option has no effect if the **Auto generate IDs for elements** option is enabled.
- If the **Remove IDs when copying content in the same document option** is disabled, the ID values are preserved when elements are duplicated in the same document. This option has no affect on elements that are duplicated in other documents.

Using Form Controls in Author Mode

[Edit on GitHub](#)

You can use form controls in **Author** mode in a variety of ways to make it easier to capture, organize, and edit content. Oxygen XML Author includes **built-in form controls** that can be used by content authors in **Author** mode. The types of built-in form controls that you can use include the following:

- **Text Field** - A graphical user interface box that allows you to enter a single line of text.
- **Combo Box** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Checkbox** - A graphical user interface box that you can click to select or deselect a value.
- **Pop-up** - A contextual menu that provides quick access to various actions.
- **Button** - A graphical user interface object that performs a specific action.
- **Button Group** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Text Area** - A box that allows you to enter multiple lines of text.
- **URL Chooser** - A dialog box that allows you to select the location of local or remote resources.
- **Date Picker** - A form control object that allows you to select a date in a specified format.
- **HTML Content** - A graphical user interface box that is used for rendering HTML content.

You can also **implement custom form controls** for more specific needs.

The following image is an example of how form controls can be used by content authors in **Author** mode. It includes several button form controls, a combo box, and a text field. The icon is a button form control that is assigned a specific action that changes the layout to an editing mode. The [+] and [-] icons are also button form controls that are assigned specific actions to add or delete records from the document. The *Direct manager* row includes a combo box form control that is both a drop-down menu and an editable text field, while the *Homepage* row includes a simple editable text field form control.

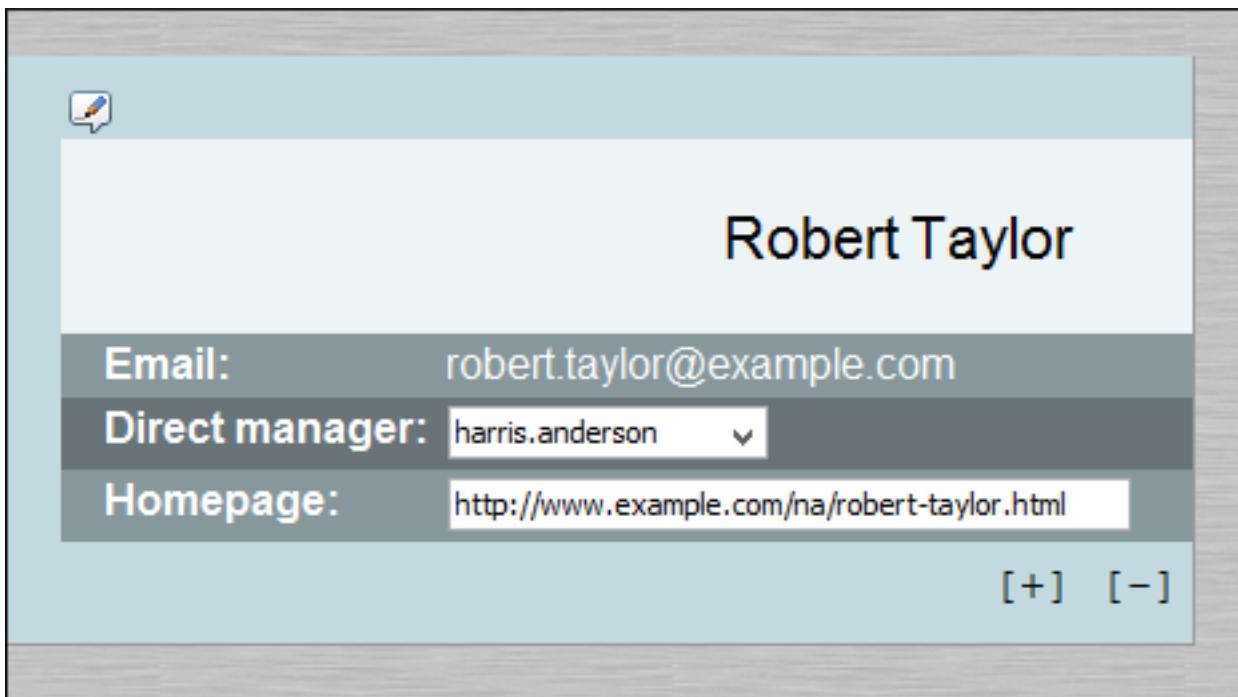

Figure 201: Example of Form Controls in Author Mode

You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled *samples* project (located in the `samples` folder inside the Oxygen XML Author installation directory) contains a file called `personal.xml` that contains form controls. You can use this file, along with its corresponding `personal.css` file (form controls are defined in the CSS) to experiment with an example of how form controls can be implemented in **Author** mode.

Contextual Menu Actions in Author Mode

[Edit on GitHub](#)

Oxygen XML Author includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in **Author** mode, the contextual menu includes *general* actions that are available for all of the recognized document types and *document type-specific* actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The *general* actions that are available in the contextual menu (some of them are also available in the submenus of the **Document** menu) for all document types include the following:

Quick Fix (**Alt + 1 (Command + Alt 1 on OS X)**)

Available when the contextual menu is invoked on an error where *Oxygen XML Author can provide a quick fix*.

Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Author *Image Viewer* or in a default system application associated with the current image type.

Track Changes Actions

Available when the **Track Changes** feature is enabled and the contextual menu is invoked on a change. The following options are available:

 **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

 **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

 **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Author Callout Actions

Available when the contextual menu is invoked on a callout. If enabled in the [Callouts preferences page](#), the callouts are displayed in **Author** mode for comments, tracked insertion changes, or tracked deletion changes.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

Reply Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

Mark as Done A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are

displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

 **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If

you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

 **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

 **Comment Change**

Opens a dialog box that allows you

to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

 **Callouts Options** Select this option to open the *Callouts preference page* where you can configure various callout options.

Comment Callout Actions

The following actions are available in the contextual menu when invoked on a *comment* callout box:

Reply	Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view.
Mark as Done	A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are

displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Edit Comment Opens the **Edit Comment** dialog box that allows you to edit the selected comment. You cannot edit a comment if you are not the author who inserted the original comment. Note that

you cannot edit a comment that was added by another user, so in that case, the action

Show Comment and the dialog box just displays the comment without the possibility of editing it.

Remove Comment Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options Select this option to open the *Callouts preference page* where you can configure various callout options.

Edit Attributes

Displays an *in-place attributes editor* that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the *profiling attributes* defined on all selected elements.

Insert submenu

This submenu includes insert actions that are specific to each framework, along with the following general action:

	Insert Entity	Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:
		<ul style="list-style-type: none"> • #<decimal value> - e.g. #65 • &#<decimal value>; - e.g. &#65 • #x<hexadecimal value> - e.g. #x41 • &#x<hexadecimal value>; - e.g. &x41
 Cut (Ctrl + X (Command + X on OS X))		Removes the current selected content from the document and places it in the clipboard.
 Copy (Ctrl + C (Command + C on OS X))		Places a copy of the current selected content in the clipboard.
 Paste (Ctrl + V (Command + V on OS X))		Inserts the current clipboard content into the document at the cursor position.
 Paste special submenu		This submenu includes special paste actions that are specific to each framework, as well as the following general paste actions:
	Paste As XML	Pastes clipboard content that is considered to be XML, preserving its XML structure.
	Paste As Text	Pastes clipboard content, ignoring any structure or styling markup.
Select submenu		This submenu allows you to select the following:
	Element	Selects the entire element at the current cursor position.
	Content	Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Text submenu	Parent	Selects the parent of the element at the current cursor position.
	This submenu contains the following actions:	
	To Lower Case	Converts the selected content to lower case characters.
	To Upper Case	Converts the selected content to upper case characters.
	Capitalize Sentences	Converts to upper case the first character of every selected sentence.
	Capitalize Words	Converts to upper case the first character of every selected word. 0034
	Count Words	Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
	Note: The content marked as deleted with <i>change tracking</i> is ignored when counting words.	
	Convert Hexadecimal Sequence to Character <u>(Ctrl + Shift + X</u> <u>(Command + Shift + X</u> <u>on OS X))</u>	Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.
Refactoring submenu	Contains a series of actions designed to alter the XML structure of the document:	

 **!Toggle Comment**

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

 **Move Up (Alt + UpArrow)**

Moves the current node or selected nodes in front of the previous node.

 **Move Down (Alt + DownArrow)**

Moves the current node or selected nodes after the subsequent node.

 **Split Element**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

 **Join Elements**

Joins two adjacent *block* elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

 **Surround with Tags
(Ctrl + E (Command + E on OS X))**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the ***Position cursor between tags option*** is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the ***Position cursor between tags option*** is disabled in the **Content Completion** preferences page, the

cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with [tag]** (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

 **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

 **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

 **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

 **Remove Text**

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Add/	Allows you
Change	to change
attribute	the value of
	an attribute

		or insert a new one.
Delete attribute	Allows you to remove one or more attributes.	
Rename attribute	Allows you to rename an attribute.	
Replace in attribute value	Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.	
Elements submenu		Contains predefined XML refactoring operations that pertain to elements. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
Delete element	Allows you to delete elements.	
Delete element content	Allows you to delete the content of elements.	
Insert element	Allows you to insert new elements.	
Rename element	Allows you to rename elements.	

Unwrap element	Allows you to remove the surrounding tags of elements, while keeping the content unchanged.
Wrap element	Allows you to surround elements with element tags.
Wrap element content	Allows you to surround the content of elements with element tags.
Fragments submenu	Contains predefined XML refactoring operations that pertain to XML fragments. Oxygen XML Author considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
Insert XML fragment	Allows you to insert an XML fragment.
Replace element content with XML fragment	Allows you to replace the content of elements with an XML fragment.
Replace element	Allows you to replace elements

with XML fragment with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the track changes support for the current document.

Accept Change(s)

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change(s)

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you

		to mark text in your document.
Colors	Allows you to select the color for highlighting text.	
Stop highlighting	Use this action to disable the highlighting tool.	
Remove highlight(s)	Use this action to remove highlighting from the document.	
 Add Comment	Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).	
 Remove Comment	Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.	
 Manage Reviews	Opens the <i>Review view</i> .	

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

 Rename in	Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.
 Search References	Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the <i>Select the scope for the Search and Refactor operations</i> dialog box, this scope will be used instead.
Search References in	Searches for the references of the ID. Selecting this action opens the <i>Select the scope for the Search and Refactor operations</i> .
 Search Occurrences in file	Searches for the occurrences of the ID in the current document.

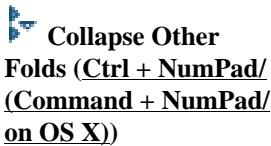

Folding submenu

This submenu includes the following actions:

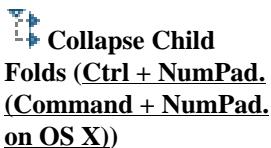

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

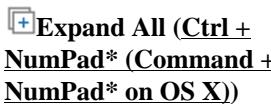

Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

Inspect Styles

Opens the *CSS Inspector view* that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the *Author mode options page*.

Document Type-Specific Contextual Menu Actions in Author Mode

Other *document type-specific* actions are available in the contextual menu of **Author** mode for the following document types (click the links to see the default actions that are available for each specific document types):

- [DocBook4 Author Actions](#)
- [DocBook5 Author Actions](#)
- [DITA Author Actions](#)
- [DITA Map Author Actions](#)
- [XHTML Author Actions](#)
- [TEI ODD Author Actions](#)
- [TEI P4 Author Actions](#)
- [TEI P5 Author Actions](#)
- [JATS Author Actions](#)

Validating XML Documents

[Edit on GitHub](#)

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects

can be time consuming and frustrating. Fortunately, Oxygen XML Author provides validation functions that enable you to easily identify errors and their location.

Checking XML Well-formedness

[Edit on GitHub](#)

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

Well-Formedness Rules

The XML Syntax rules for *Well-formed XML* are as follows:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules are as follows:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules are as follows:

- The *xml* prefix is by definition bound to the namespace name: <http://www.w3.org/XML/1998/namespace>. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: <http://www.w3.org/2000/xmlns/>. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

Check for Well-Formedness

To check if a document is *Namespace Well-Formed XML*, select the  **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on OS X))** action from the **Document > Validate** menu or from the  **Validation** drop-down menu on the toolbar.

The selected files in the current project can also be checked for well-formedness with a single action by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the [Project view](#).

If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

A non *Well-formed XML Document*

```
<root><tag></root>
```

When **Check Well-Formedness** is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert `</tag>`.

A non *Namespace-wellformed Document*

```
<x::y></x::y>
```

When **Check document form** is performed the following error is raised:

```
Element or attribute do not match QName production:  
QName ::= (NCName ':' )?NCName .
```

A non *Namespace-valid Document*

```
<x:y></x:y>
```

When **Check document form** is performed the following error is raised:

```
The prefix "x" for element "x:y" is not bound.
```

Validating XML Documents Against a Schema

[Edit on GitHub](#)

A *Valid* XML document is a *Well-Formed* XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

The  **Validate** function ensures that your document is compliant with the rules defined by an associated DTD, XML Schema, Relax NG, or Schematron schema. XML Schema or Relax NG schema also allows you to embed Schematron rules. For Schematron validations you can also select the *validation phase*.

Related information

[Validate an XML Document Against Schematron](#) on page 589

Automatic Validation

[Edit on GitHub](#)

Oxygen XML Author can be configured to automatically mark validation errors in the document as you are editing. The **Enable automatic validation** option in the [Document Checking preferences page](#) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a *configurable delay* from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. The arrow buttons of the dialog box enable the navigation to other errors issued by the Automatic Validation feature.

Manual Validation Actions

[Edit on GitHub](#)

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Author.

Manually Validate Current Document

To manually validate the currently edited document, use one of the following actions:

Validate (Ctrl + Shift + V (Command + Shift + V on OS X))

Available from the **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project** view .

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the XML catalogs and resets the schema used for content completion.

Available from the **Validation** drop-down menu on the toolbar or the **Document > Validate** menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note: Automatic validation also caches the associated schema.

Validate with

Available from the **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project** view .

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message

panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Note: The **Validate with** action does not work for files loaded through an *Oxygen XML Author custom protocol plugin* developed independently and added to Oxygen XML Author after installation.

Validate with Schema

Available from the **Validate** submenu when invoking contextual menu in the **Project** view .

Use this action to validate all selected files with a chosen schema.

Other Validation Options

To open the schema used for validating the current document, select the  **Open Associated Schema** action from the **Document > Schema** menu.

The  **Validation options** button, available in the **Document > Validate** menu, allows you to quickly access to the *validation options* for the built-in validator in the Oxygen XML Author preferences page.

Tip: If a large number of validation errors are detected and the validation process takes too long, you can *limit the maximum number of reported errors in the Document Checking preferences page*.

[Presenting Validation Errors in Author Mode](#) on page 309

Presenting Validation Errors in Text Mode

[Edit on GitHub](#)

Oxygen XML Author can be configured to *automatically validate documents* while editing in the **Text** mode, and actions are also available to *manually validate documents* on-request.

A line with a validation error or warning is marked in the editor panel by underlining the error region with a red line, while validation warnings are underlined in yellow. Hovering over a validation error presents a tooltip message with more details about the error and *possible quick fixes* (if available for that error or warning).

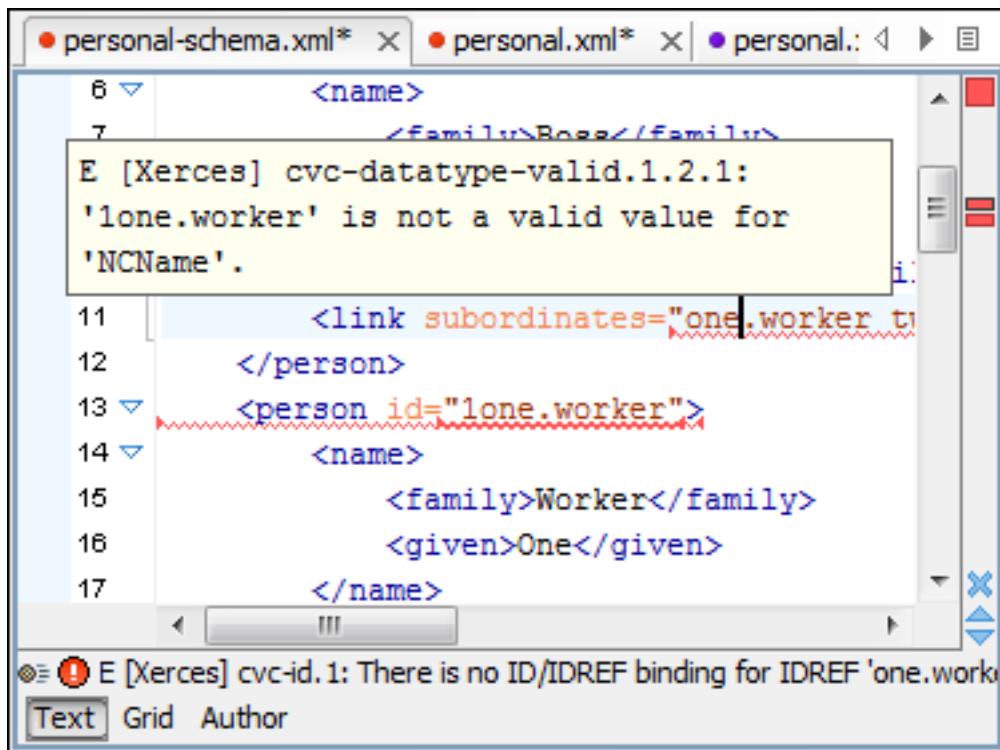

Figure 202: Presenting Validation Errors in Text Mode

Also, the ruler on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The ruler contains the following:

Upper Part of the Ruler

A success indicator square will turn green if the validation is successful, red if validation errors are found, or yellow if validation warnings are found. More details about the errors or warnings are displayed in a tool tip when you hover over indicator square. If there are numerous errors, only the first three are presented in the tool tip.

Middle Part of the Ruler

Errors are depicted with red markers, and warnings with yellow markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the [**Maximum number of validation highlights** option](#).

Clicking a marker will highlight the corresponding text area in the editor. The error or warning message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [**Document Checking preferences page**](#)).

Bottom Part of the Ruler

Two navigation arrows () allow you to skip to the next or previous error. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and

**Document > Automatic validation > Previous error
(Ctrl + Comma (Command + Comma on OS X)).**

Also, the  button can be used to clear all the error markers.

Status messages from every validation action are logged in the **Information view**.

If you want to see all the validation error messages grouped in the **Results panel**, you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

Customizing Assert Error Messages

[Edit on GitHub](#)

To customize the error messages that the Xerces or Saxon validation engines display for the `assert` and `assertion` elements, set the `message` attribute on these elements.

- For Xerces, the `message` attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the `message` attribute has to belong to the `http://saxon.sourceforge.net/` namespace.

The value of the `message` attribute is the error message displayed if the assertion fails.

Custom Validators

[Edit on GitHub](#)

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the [Custom Validation Engines preferences page](#). After a custom validation engine is *properly configured*, it can be applied on the current document by selecting it from the list of custom validation

engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the *output message format* of Oxygen XML Author for linked messages:

- **LIBXML** - Included in Oxygen XML Author (Windows edition only). It is associated to XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. XML catalogs support (the --catalogs parameter) and XInclude processing (--xinclude) are enabled by default in the preconfigured LIBXML validator. The --postvalid parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the --dtdvalid \${ds} parameter manually to the DTD validation command line. \${ds} represents the detected DTD declaration in the XML document.

CAUTION: File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Author is installed in the default location on Windows (C:\Program Files) because the built-in XML catalog files are stored in the frameworks subfolder of the installation folder and in this case, the file path contains at least one space character.

Attention: On OS X, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmleschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

- **Saxon-EE** - Included in Oxygen XML Author. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be *configured in Preferences*.
- **MSXML 4.0** - Included in Oxygen XML Author (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET** - Included in Oxygen XML Author (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **XSV** - Not included in Oxygen XML Author. Windows and Linux distributions of XSV can be downloaded from <http://www.cogsci.ed.ac.uk/~ht/xsv-status.html>. The executable path is *already configured in Oxygen XML Author* for the [OXYGEN_INSTALL_DIR]/xsv installation folder. If it is installed in a different folder, the predefined executable path must be *corrected in Preferences*. It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.
- **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Author. It can be downloaded [from here](#) (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory [OXYGEN_INSTALL_DIR]/sdc. If it is installed in a different folder, the predefined executable path and working directory must be *corrected in the Preferences page*. It is associated to XSD Editor.

A custom validator cannot be applied on files loaded through an *Oxygen XML Author custom protocol plugin* developed independently and added to Oxygen XML Author after installation.

Linked Output Messages of an External Engine

[Edit on GitHub](#)

Validation engines display messages in an output view at the bottom of the Oxygen XML Author window. If such an output message (*warning*, *error*, *fatal error*, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- *Type*:[F|E|W] (the string *Type*: followed by a letter for the type of the message: fatal error, error, warning) - this property is optional in a linked message.
- *SystemID*: a system ID of a file (the string *SystemID*: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- *Line*: a line number (the string *Line*: followed by the number of the line that will be highlighted).
- *Column*: a column number (the string *Column*: followed by the number of the column where the highlight will start on the highlighted line) - this property is optional in a linked message.
- *EndLine*: a line number (the string *EndLine*: followed by the number of the line where the highlight ends) - this property is optional in a linked message.
- *EndColumn*: a column number (the string *EndColumn*: followed by the number of the column where the highlight ends on the end line) - this property is optional in a linked message.

Note: The *Line/Column* pair works in conjunction with the *EndLine/EndColumn* pair. Thus, if both pairs are specified, then the highlight starts at *Line/Column* and ends at *EndLine/EndColumn*. If the *EndLine/EndColumn* pair is missing, the highlight starts from the beginning of the line identified by the *Line* parameter and ends at the column identified by the *Column* parameter.

- *AdditionalInfoURL*: the URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- *Description*: message content (the string *Description*: followed by the content of the message that will be displayed in the output view).

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/
errors.html#errorID
Description: custom validator message
```

Validation Scenario

[Edit on GitHub](#)

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Author validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors in regards to parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Author (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist XML Database, Documentum xDB (X-Hive/DB) 10 XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document in which the *master file* includes smaller fragment files using XML entity references.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Defining Master Files at Project Level](#) on page 360 or [Working with Modular XML Files in the Master Files Context](#) on page 606.

To watch our video demonstration about how to use a validation scenario in Oxygen XML Author, go to http://oxygenxml.com/demo/Validation_Scenario.html.

Creating a New Validation Scenario

[Edit on GitHub](#)

To create a validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the). The **Configure Validation Scenario(s)** dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework are rendered in bold.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Defining Master Files at Project Level](#) on page 360 or [Working with Modular XML Files in the Master Files Context](#) on page 606.

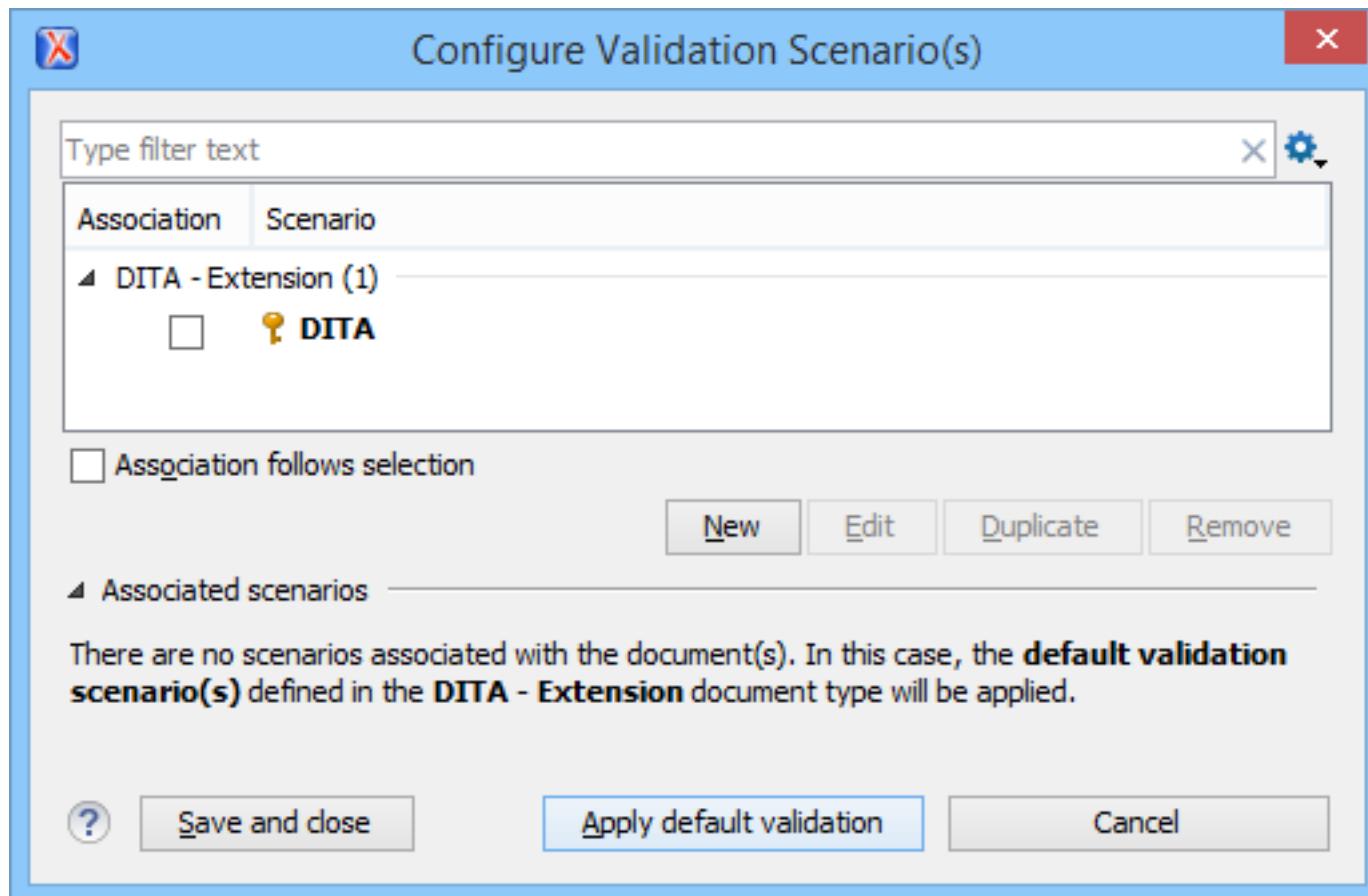

Figure 204: Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.

The **New scenarios** dialog box is displayed and it lists all the validation units for the scenario.

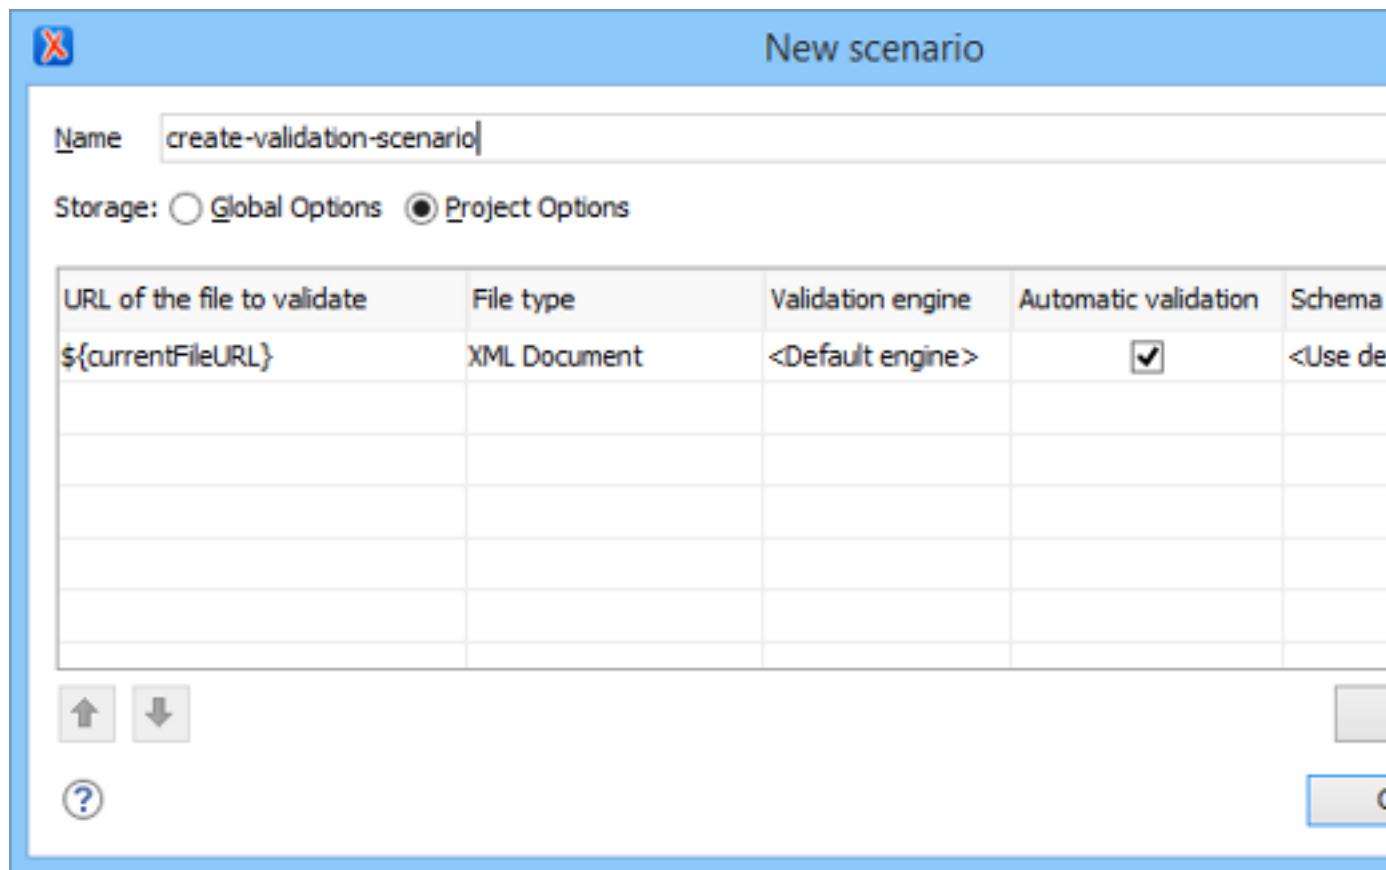

Figure 205: Create New Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Global Options** or **Project Options**.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.

- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

\${Desktop} - My Desktop
 \${start-dir} - Start directory of custom validator
 \${standard-params} - List of standard params for validation
 \${cfn} - The current file name without extension
 \${currentFileURL} - The path of the currently edited file
 \${cfdu} - The path of current file directory (URL)
 \${frameworks} - Oxygen frameworks directory (URL)
 \${pdu} - Project directory (URL)
 \${oxygenHome} - Oxygen installation directory (URL)
 \${home} - The path to user home directory (URL)
 \${pn} - Project name
 \${env(VAR_NAME)} - Value of environment variable
 \${system(var.name)} - Value of system variable

Figure 206: Insert an Editor Variable

File type

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map  [Validate](#) and [Check for Completeness action](#), but for a local file rather than an entire DITA map).

	The Table Layout Validation engine looks for table layout problems (for more information, see Report table layout problems on page 583).
Automatic validation	If this option is checked, the validation operation defined by this row is also applied by the automatic validation feature . If the Automatic validation feature is disabled in the Document Checking preferences page , then this option is ignored, as the preference setting has a higher priority.
Schema	This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.
 Settings	Opens the Specify Schema dialog box that allows you to set a schema for validating XML documents, or a list of extensions for validating XSL or XQuery documents. You can also set a default phase for validation with a Schematron schema.
 Move Up	Moves the selected scenario up one spot in the list.
 Move Down	Moves the selected scenario down one spot in the list.
Add	Adds a new validation unit to the list.
Remove	Removes an existing validation unit from the list.
3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the <i>validation phase</i> .	
4. Press OK .	The newly created validation scenario will now be included in the list of scenarios in the Configure Validation Scenario(s) dialog box. You can select the scenario in this dialog box to associate it with the current document and press the Apply associated button to run the validation scenario.

Editing a Validation Scenario

[Edit on GitHub](#)

To edit an existing validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the). The **Configure Validation Scenario(s)** dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework are rendered in bold.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Defining Master Files at Project Level](#) on page 360 or [Working with Modular XML Files in the Master Files Context](#) on page 606.

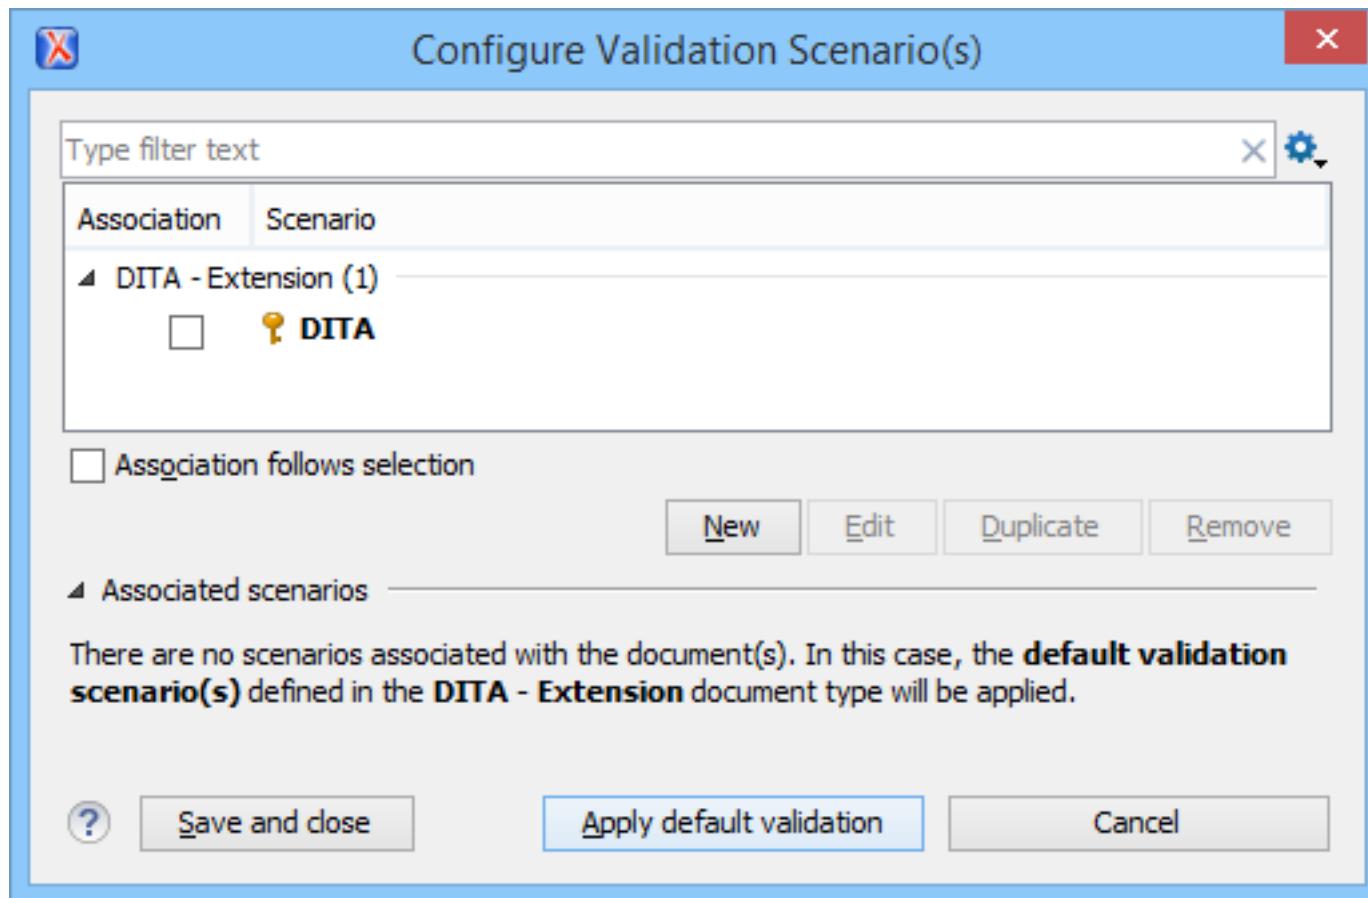

Figure 207: Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds **imported** to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author creates a **scenarios** file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and press the **Edit** button. If you try to edit one of the *read-only* predefined scenarios, you will receive a warning message that Oxygen XML Author needs to create a customizable duplicate (you can also use the **Duplicate** button).

The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

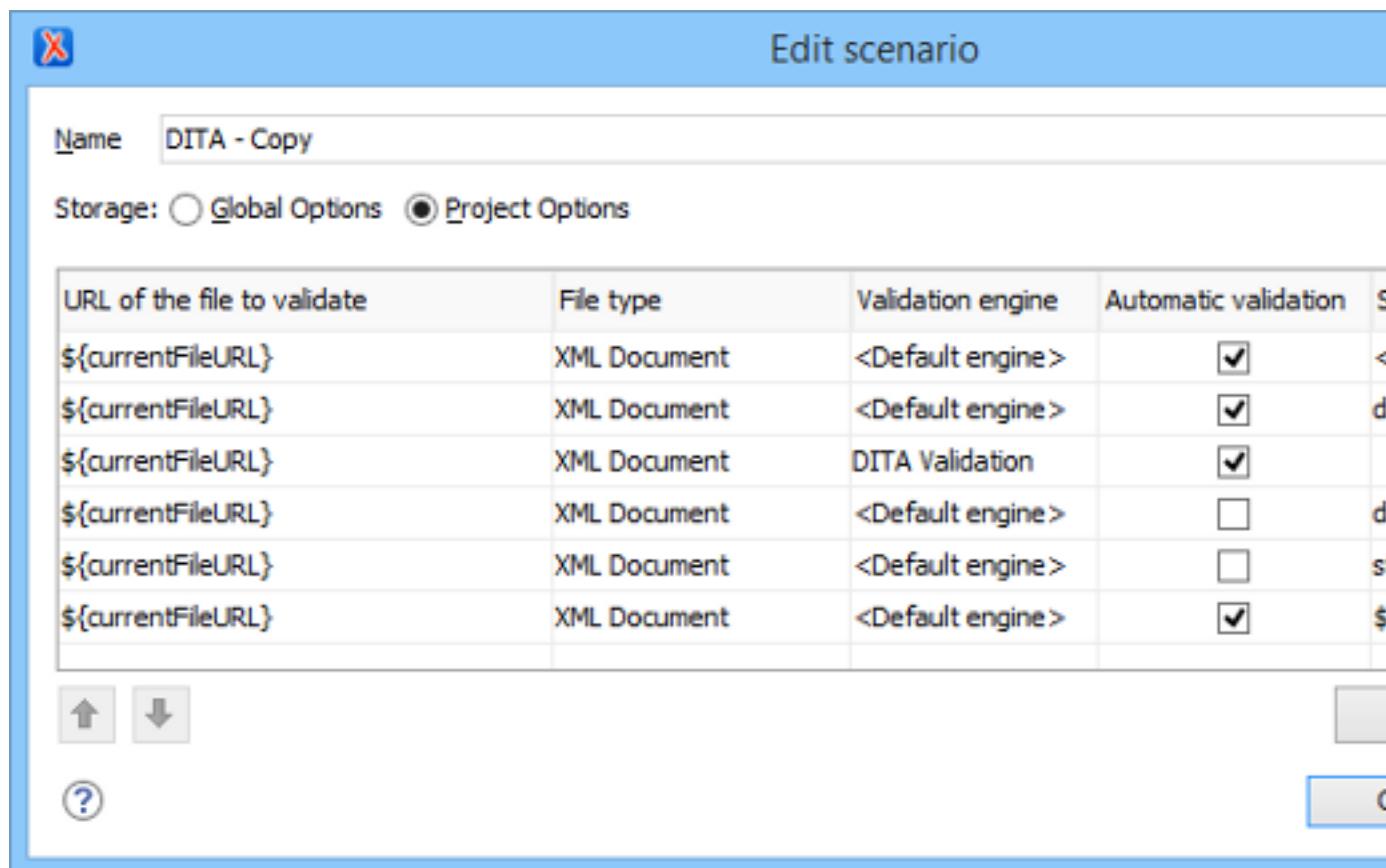

Figure 208: Edit Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Global Options** or **Project Options**.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

```

${Desktop} - My Desktop
${start-dir} - Start directory of custom validator
${standard-params} - List of standard params for validation
${cfn} - The current file name without extension
${currentFileURL} - The path of the currently edited file
${cfdu} - The path of current file directory (URL)
${frameworks} - Oxygen frameworks directory (URL)
${pdu} - Project directory (URL)
${oxygenHome} - Oxygen installation directory (URL)
${home} - The path to user home directory (URL)
${pn} - Project name
${env(VAR_NAME)} - Value of environment variable
${system(var.name)} - Value of system variable

```

Figure 209: Insert an Editor Variable

File type

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map  [Validate](#) and [Check for Completeness action](#), but for a local file rather than an entire DITA map).

Automatic validation

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#) on page ).

Schema

If this option is checked, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#), then this option is ignored, as the preference setting has a higher priority.

 **Settings**

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

 **Move Up**

Opens the **Specify Schema** dialog box that allows you to set a schema for validating XML documents, or a list of extensions for validating XSL or XQuery documents. You can also set a default phase for validation with a Schematron schema.

 **Move Down**

Moves the selected scenario up one spot in the list.

Add

Moves the selected scenario down one spot in the list.

Remove

Adds a new validation unit to the list.

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the *validation phase*.
4. When you are done configuring the scenario, press **OK**.

The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word *copy* at the end of its name.

Sharing Validation Scenarios

[Edit on GitHub](#)

The validation scenarios and their settings can be shared with other users by saving them at project level or by [exporting them to a specialized scenarios file](#) that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Global Options** or **Project Options**.

Storage: [Global Options](#) [Project Options](#)

Selecting **Global Options** stores the scenario in the global options that are stored in the user home directory.

Selecting **Project Options** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

You can also change the storage options on existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios.

Related information

[Sharing and Storing Options](#) on page 219

References to XML Schema Specification

[Edit on](#)
[GitHub](#)

If validation is done against XML Schema, Oxygen XML Author indicates a specification reference relevant for each validation error. The error messages contain an **Info** field that, when clicked, will open the browser on the *XML Schema Part 1: Structures* specification at exactly the point where the error is described. This allows you to understand the reason for that error.

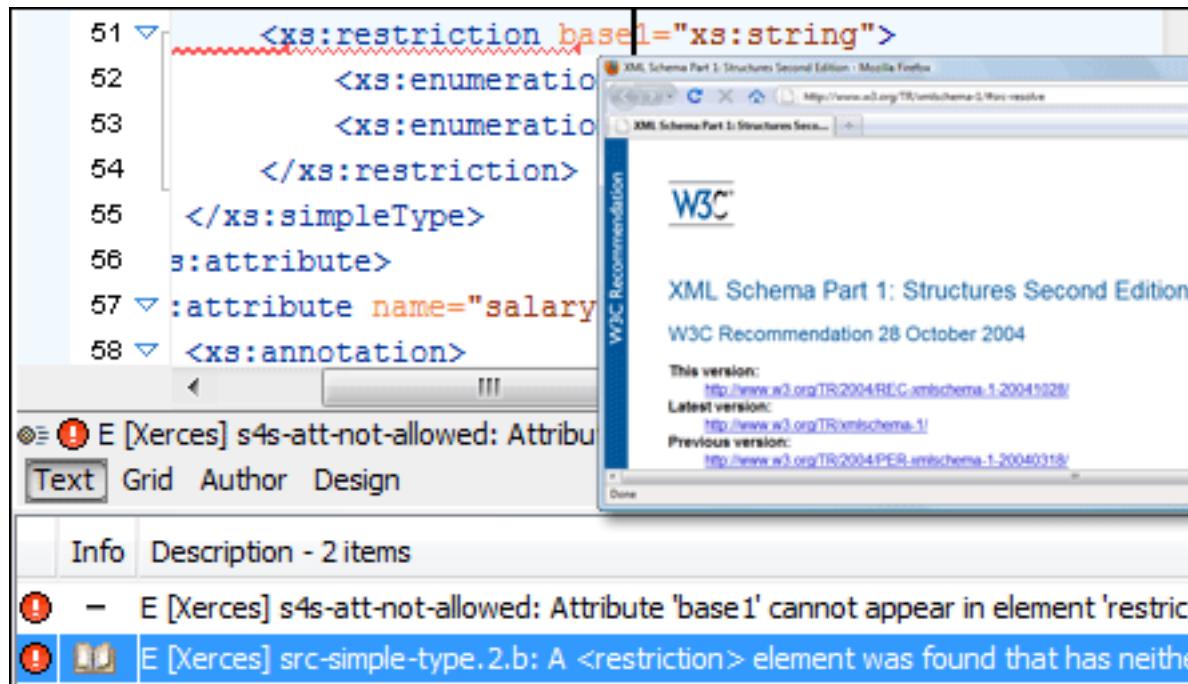

Figure 210: Link to Specification for XML Schema Errors

Resolving References to Remote Schemas with an XML Catalog

[Edit on](#)
[GitHub](#)

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an *XML catalog*.

For example, if the XML document contains a reference to a remote schema docbook.rng like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
  type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
  uri="rng/docbook.rng"/>
```

An XML catalog can also be used to map a W3C XML Schema specified with a URN in the xsi:schemaLocation attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

```
xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
      uri="topic.xsd"/>
```

Validation Example - A DocBook Validation Error

[Edit on GitHub](#)

In the following DocBook 4 document, the content of the `listitem` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
  "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
  <title>Article Title</title>
  <sect1>
    <title>Section1 Title</title>
    <itemizedlist>
      <listitem>
        <link>a link here</link>
      </listitem>
    </itemizedlist>
  </sect1>
</article>
```

The **Validate Document** action will return the following error:

Unexpected element "link". The content of the parent element type must match "(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist|variablelist|caution|important|note|tip|warning|literallayout|programlisting|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco|informalequation|informalexample|informalfigure|informaltable|equation|example|figure|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights|abstract|authorblurb|epigraph|indexterm|beginpage) +".

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `listitem` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that “The content of element type must match”.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to lookup the element and read about it. In this case, you should learn about the child elements of `listitem` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

Validate an XML Document Against Schematron

[Edit on GitHub](#)

To validate an XML document against a Schematron schema, select the **Validate** action from the

Validation toolbar drop-down menu, or the **Document > Validate** menu, or from the **Validate** menu when invoking the contextual menu in the **Project** view.

If you want to add a persistence association between your Schematron rules and the current edited XML document, use the **Associate Schema** action from the **Document > Schema** menu or the **Document** toolbar. A custom processing instruction is added into the document and the validation process will take into account the Schematron rules:

PI Added by the Associate Schema Action

```
<?xml-model href="percent.sch" type="application/xml"
schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The possible errors that might occur during the validation process are presented in the **Errors** panel at the bottom area of the Oxygen XML Author window. Each error is flagged with a severity level that can be one of *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Author looks for the following information:

- The **role** attribute, which can have one of the following values:
 - **warn** or **warning**, to set the severity level to *warning*
 - **error**, to set the severity level to *error*
 - **fatal**, to set the severity level to *fatal*
 - **info** or **information**, to set the severity level to *info*
- The start of the message, after trimming leading white-spaces. Oxygen XML Author looks to match the following exact string of characters (case sensitive):
 - **Warning:**, to set the severity level to *warning*
 - **Error:**, to set the severity level to *error*
 - **Fatal:**, to set the severity level to *fatal*
 - **Info:**, to set the severity level to *info*

Note: Displayed message does not contain the matched prefix.

- If none of the previous rules match, Oxygen XML Author sets the severity level to *error*.

Finding and Replacing Text in the Current File

[Edit on GitHub](#)

This section walks you through the find and replace features available in Oxygen XML Author.

You can use a number of advanced views depending on what you need to find in the document you are editing or in your entire project. The [Find/Replace dialog box](#) allows you to search through the current project or selected resources and offers a set of options to improve your search. The [Find All Elements/Attributes dialog box](#) allows you to search through the structure of the current document for elements and attributes.

As an alternative to the dedicated search operations, you can also use the [Quick Find toolbar](#).

Find/Replace Dialog Box

[Edit on GitHub](#)

To open the **Find/Replace** dialog box, use the  **Find/Replace** action that is available in the **Find** menu, on the toolbar, or by pressing **Ctrl + F (Command + F on OS X)**.

You can use the **Find/Replace** dialog box to perform the following operations:

- Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.
- Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the white spaces contained in the fragment you are searching for.

Note: The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in the **Results view**.

The *find* operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the **Find** and **Replace with** areas, do one of the following:

- Press **Ctrl + Enter (Command + Enter on OS X)** on your keyboard.
- Use the **Insert newline** contextual menu action.

You can use *Perl-like regular expressions syntax* to define patterns. A content completion assistance window is available in the **Find** and **Replace with** areas to help you edit regular expressions. It is activated every time you type \ (backslash key) or on-demand if you press **Ctrl + Space (Command + Space on OS X)** on your keyboard.

The *replace* operation can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

To replace the tag-name start tag and its attributes with the new-tag-name tag use as **Find** the expression <tag-name(\s+)(.*> and as **Replace with** the expression <new-tag-name\$1\$2>.

The **Find/Replace** dialog box contains the following options:

- **Find** - The target character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation (\xNNNN) and octal notation (\0NNNN) can be used. In this case you have to select the **Regular expression option**. For example, to search for a space character you can use the \u0020 code.
- **Replace with** - The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the **Regular expression option** is selected.

Note: Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.

Tip: Special characters such as *newline* and *tab* can be inserted in the **Find** and **Replace with** text boxes using dedicated actions in the contextual menu (**Insert newline** and **Insert tab**).

Unicode characters in the \uNNNN format can also be used in the **Replace with** area.

- The  **History** button - Contain lists of the last find and replace expressions. Use the  **Clear history** action from the bottom of the lists to remove these expressions.
- **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.

Note: The **Content Completion Assistant** helps you input XPath expressions, valid in the current context.

- **Direction** - Specifies if the search direction is from current position to end of file (**Forward**) or to start of file (**Backward**).
- **Scope** - In **Author** mode, the search scope is restricted to the entire document only.
- **Case sensitive** - When checked, the search operation follows the exact letter case of the text entered in the **Find** field.
- **Whole words only** - Only entire occurrences of a word are included in the search operation.
- **Incremental** - The search operation is started every time you type or delete a letter in the **Find** text box.

- **Regular expression** - When this option is enabled, you can use regular expressions in *Perl-like regular expressions syntax* to look for specific pieces of text.
 - **Dot matches all** - A dot used in a regular expression also matches end of line characters.
 - **Canonical equivalence** - If enabled, two characters will be considered a match if, and only if, their full *canonical decompositions* match. For example, the **ã** symbol can be inserted as a single character or as two characters (the **a** character, followed by the tilde character). This option is disabled by default.
- **Wrap around** - When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.
- **Enable XML search options** - This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:
 - **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
 - **Element contents** - Search in the text content of XML elements.
 - **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
 - **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
 - **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
 - **PIs (Processing Instructions)** - Only the content are searched, skipping '<?', '?>'. e. g.: <?processing instruction?>
 - **CDATA** - Searches inside content of CDATA sections.
 - **DOCTYPE** - Searches inside content of DOCTYPE sections.
 - **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

Note: Even if you enable all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, disable **Enable XML search options**.

- **Find All Elements** - Available when editing in **Author** mode, you can use this link to extend the search scope to XML-specific markup (names and values of both attributes and elements).
- **Find** - Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.
- **Replace** - Executes a replace operation for the target followed by a find operation for the next occurrence.
- **Find All** - Executes a find operation and displays all results in the **Results view**. The results are *displayed in the Results view*.
- **Replace All** - Executes a replace operation in the entire scope of the document.
- **Replace to End** - Executes a replace operation starting from current target until the end of the document, in the direction specified by the current selection of the **Direction** switch (**Forward** or **Backward**).

Find All Elements Dialog Box

[Edit on GitHub](#)

To open the **Find All Elements** dialog box, go to **Find > Find All Elements**(**Ctrl + Shift + E (Command + Shift + E on OS X)**) or from the shortcut **Find All Elements** that is available in *the Find / Replace dialog box*. It assists you in defining XML element / attribute search operations in the current document.

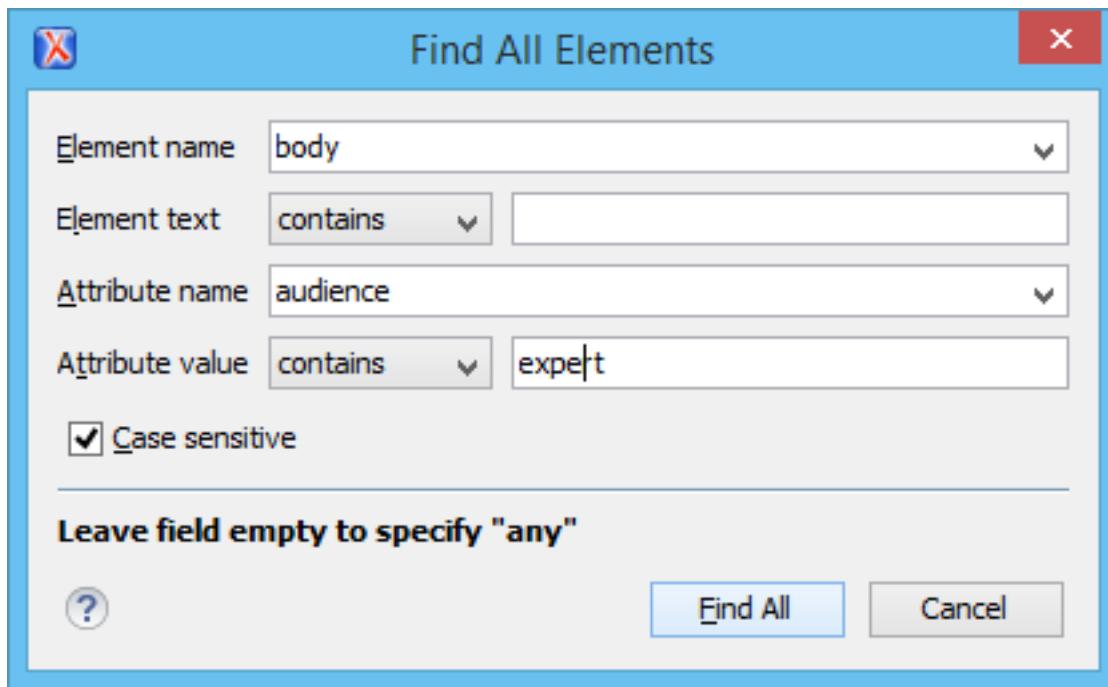

Figure 211: Find All Elements Dialog Box

The dialog box can perform the following actions:

- Find all the elements with a specified name
- Find all the elements that contain, or does not contain, a specified string in their text content
- Find all the elements that have a specified attribute
- Find all the elements that have an attribute with, or without, a specified value

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.

Note: Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.

- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For *any* element text, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.

- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.

Note: Use the qualified name of the attribute (<namespace prefix>:<attribute name>) when the document uses this attribute notation.

- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.

- **Case sensitive** - When this option is checked, operations are case-sensitive

When you press **Find All**, Oxygen XML Author tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

Quick Find Toolbar

[Edit on GitHub](#)

A reduced version of the [Find / Replace dialog box](#) is available as *a dockable toolbar*. To display it press the **Alt + Shift + F (Command + Alt + F on OS X)** key combination or invoke the **Find > Quick Find** action. By default, the toolbar is displayed at the bottom of the Oxygen XML Author window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the **Close** button or **ESC** key.

All matches are highlighted in the current editor.

The toolbar offers the following controls:

- A search input box where you insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.
- **Next** and **Previous** buttons. They allow you to advance to the next or previous match.
- **All** button. Highlights in the current document all matches of the search string.
- **Incremental** checkbox. The search operation is started every time you type or delete a character in the search input box.
- **Case sensitive** checkbox. When selected, the search operation follows the exact letter case of the search text.
- Shortcuts to the [Find/Replace](#) and [Find/Replace in Files](#) dialog boxes.

Keyboard Shortcuts for Finding the Next and Previous Match

[Edit on GitHub](#)

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3 (Command + Shift + G on OS X)** keyboard shortcuts. They are useful to quickly repeat the last find action performed in the [Find / Replace dialog box](#), taking into account the same find options.

Regular Expressions Syntax

[Edit on GitHub](#)

Oxygen XML Author uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Author does not support the following constructs:

- The conditional constructs `(?{X})` and `(?(condition)X|Y)`.
- The embedded code constructs `(?{code})` and `(??{code})`.
- The embedded comment syntax `(?#comment)`.
- The preprocessing operations `\1`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Author/Java in the text searches from the **Find/Replace** dialog boxes. The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the **Find/Replace** dialog boxes:

- `/w` - `[#\x0000-\#x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W` - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-

expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.

- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

Finding and Replacing Text in Multiple Files

[Edit on GitHub](#)

To open the **Find/Replace in Files** dialog box, use the  **Find/Replace in Files** action that is available in the following locations::

- The **Find** menu.
- The main toolbar.
- The contextual menu of the **DITA Maps Manager** view.
- The contextual menu of the **Project** view.
- The contextual menu of the **Data Source Explorer** view for most types of database connections.

The operation works on both local and remote files from an (S)FTP, WebDAV or [CMS](#) server.

It enables you to define *Search for* or *Search for and Replace* operations across a number of files. You can use [Perl-like regular expression syntax](#) to match patterns in text content. The *replace* operation can bind regular expression capturing groups (`$1`, `$2`, etc.) from the find pattern.

To replace the `tag-name` start tag and its attributes with the `new-tag-name` tag use as **Text to find** the expression `<tag-name(\s+)(.*>` and as **Replace with** the expression `<new-tag-name $1$2>`.

The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Author uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: `.xml`, `.xsl`, `.fo`, `.xsd`, `.rng`, `.nvd1`, `.sch`, `.wsdl` or [an extension associated with the XML editor type](#). For the other files it uses [the encoding configured for non-XML files](#).

You can cancel a long operation at any time by pressing the **Cancel** button of the progress dialog box displayed when the operation is executed.

Since the content of read-only files cannot be modified, the **Replace** operation is not processing those files. For every such file, a warning message is displayed in the message panel.

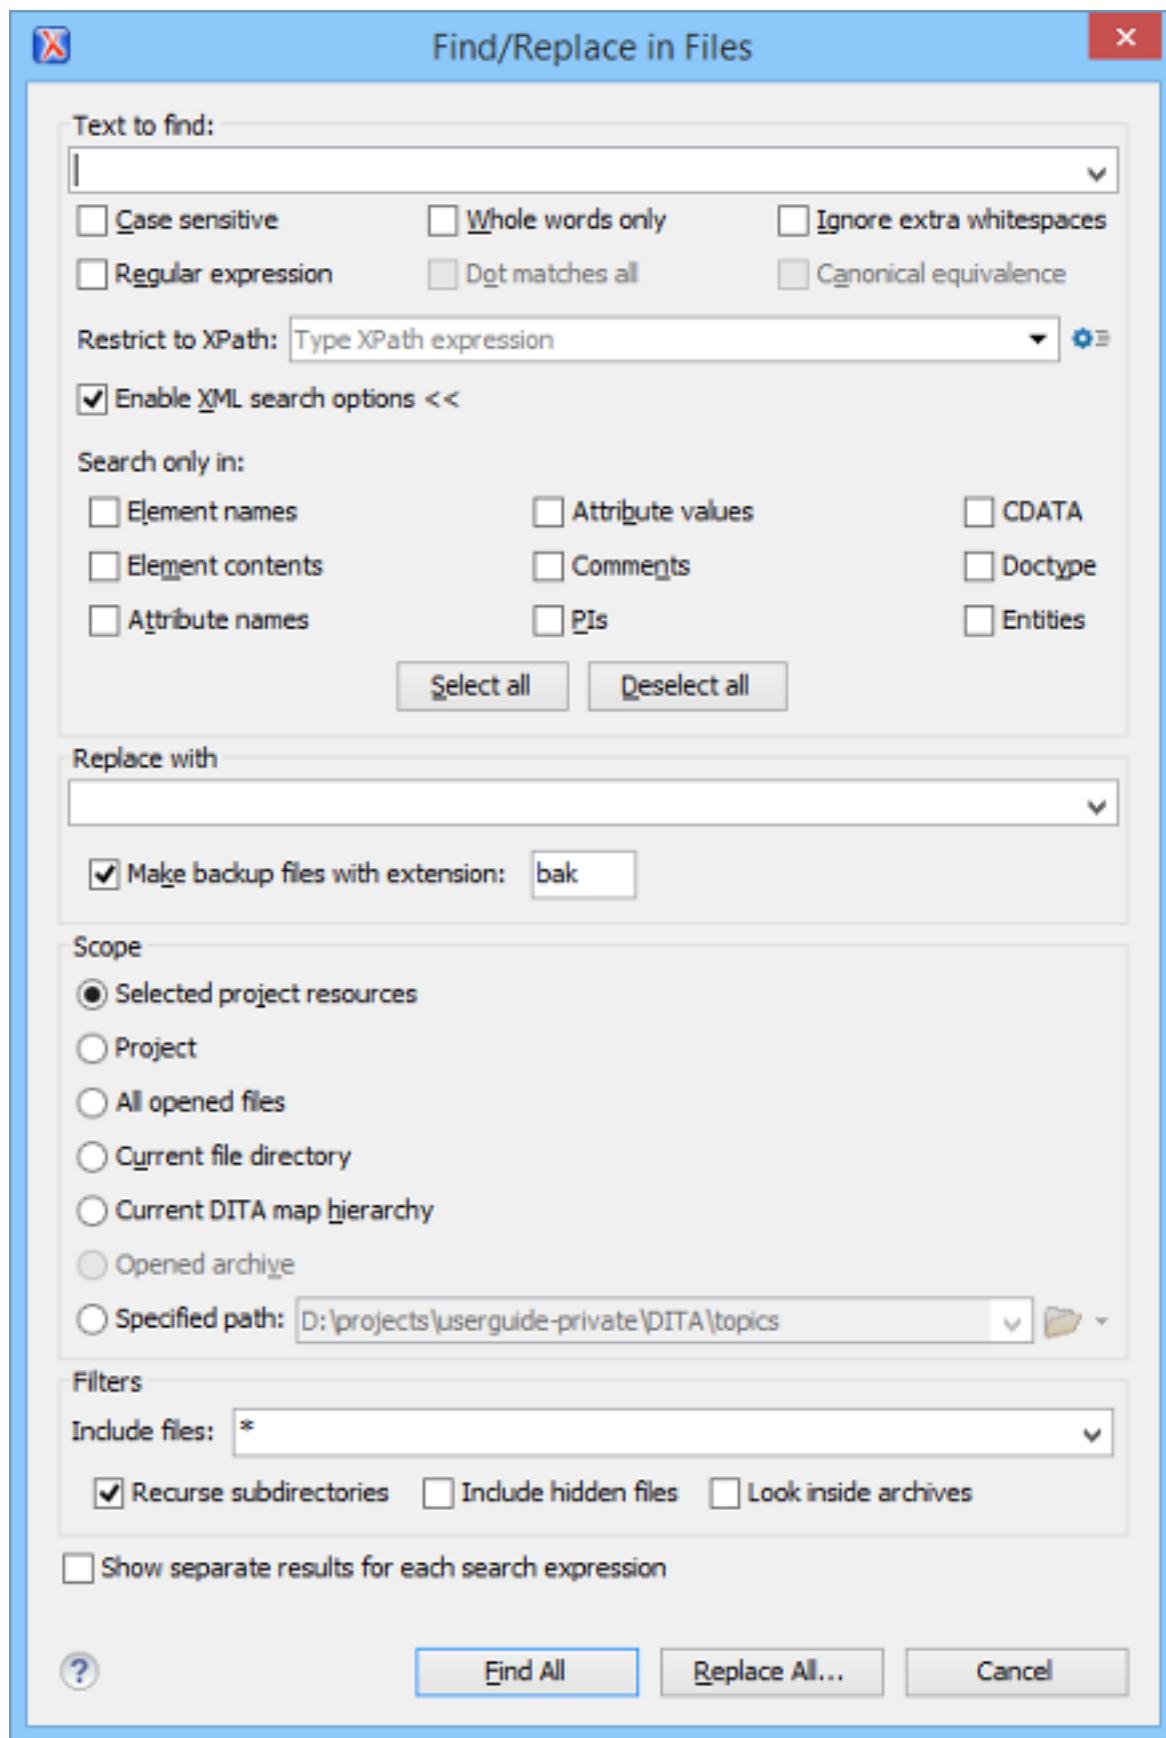

Figure 212: Find / Replace in Files Dialog Box

The dialog box contains the following options:

- **Text to find** - The target character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation (\xNNNN) and octal notation (\0NNNN) can be used. In this case you have to select the **Regular expression** option. For example, to search for a space character you can use the \u0020 code.
 - **Case sensitive** - When checked, the search operation follows the exact letter case of the value entered in the **Text to find** field.
 - **Whole words only** - Only entire occurrences of a word are included in the search operation.
 - **Ignore extra whitespaces** - If enabled, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation.
 - **Regular expression** - When this option is enabled, you can use regular expressions in *Perl-like regular expressions syntax* to look for specific pieces of text.
 - **Dot matches all** - A dot used in a regular expression also matches end of line characters.
 - **Canonical equivalence** - If enabled, two characters will be considered a match if, and only if, their full *canonical decompositions* match. For example, the à symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is disabled by default.
 - **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.
- Note:** The **Content Completion Assistant** helps you input XPath expressions, valid in the current context.
- **Enable XML search options** - This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:
 - **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
 - **Element contents** - Search in the text content of XML elements.
 - **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
 - **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
 - **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
 - **PIs (Processing Instructions)** - Only the content are searched, skipping '<?', '?>'. e. g.: <?processing instruction?>
 - **CDATA** - Searches inside content of CDATA sections.
 - **DOCTYPE** - Searches inside content of DOCTYPE sections.
 - **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

Note: Even if you enable all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, disable **Enable XML search options**.

- **Replace with** - The character string with which to replace the target. It may contain regular expression group markers if the search expression is a regular expression and the **Regular expression** checkbox is checked.
- **Make backup files with extension** - In the replace process Oxygen XML Author makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.
- **Selected project resources** - Searches only in the selected files of the currently opened project. This option is not displayed when this dialog box is opened from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.
- **Project files** - Searches in all files from the current project. This option is not displayed when this dialog box is opened from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.
- **All opened files** - Searches in all files opened in Oxygen XML Author (regular files or DITA maps). You are prompted to save all modified files before any operation is performed. This option is not displayed when this dialog box is started from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.

- **Current file directory** - The search is done in the directory of the file opened in the current editor panel. If there is no opened file, this option is disabled. This option is not displayed when this dialog box is opened from the contextual menu of the **DITA Maps Manager** view and **Archive Browser** view.
- **Current DITA Map hierarchy** - The search is done in all maps and topics referenced by the currently selected DITA map, opened in the **DITA Maps Manager** view.
- **Opened archive** - The search is done in an archive opened in the **Archive Browser** view. Displayed only when this dialog box is opened from the **Archive Browser** view.
- **Specified path** - Chooses the search path.
- **Include files** - Narrows the scope of the operation only to the files that match the given filters.
- **Recurse subdirectories** - When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the search is also performed in the hidden files.
- **Include archives** - When enabled, the search is also done in all individual file entries from all supported ZIP-type archives.
- **Show separate results for each search expression** - When enabled, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the *Find in Files* tab, replacing any previous search results.
- **Find All** - Executes a find operation and returns the result list to the message panel. The results are *displayed in a view* that allows grouping the results as a tree with two levels.
- **Replace All** - Replaces all occurrences of the target contained in the specified files.

When you replace a fragment of text, Oxygen XML Author provides a preview of the changes you make. The **Preview** dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The **Next change** and **Previous change** buttons allow you to navigate through the changes displayed in the **Preview** dialog box.

CAUTION: Use this option with caution. Global search and replace across all project files does not open the files containing the targets, nor does it prompt on a per occurrence basis, to confirm that a replace operation must be performed. As the operation simply matches the string defined in the find field, this may result in replacement of matching strings that were not originally intended to be replaced.

Regular Expressions Syntax

[Edit on](#)
[GitHub](#)

Oxygen XML Author uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Author does not support the following constructs:

- The conditional constructs `(?{X})` and `(?(condition)X|Y)`.
- The embedded code constructs `(?{code})` and `(??{code})`.
- The embedded comment syntax `(?#comment)`.
- The preprocessing operations `\1`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Author/Java in the text searches from the **Find/Replace** dialog boxes. The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the **Find/Replace** dialog boxes:

- `/w` - `[#\x0000-\#\x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W` - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-

expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.

- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

Search and Refactor Actions for IDs and IDREFS

[Edit on GitHub](#)

Oxygen XML Author allows you to search for ID declarations and references (IDREFS) and to *define the scope of the search and refactor operations*. These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the **Quick Assist** menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and *choose the scope of the rename operation*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Note: Available in the **Text** mode only.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the *Select the scope for the Search and Refactor operations*.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the *Select the scope for the Search and Refactor operations*.

Note: Available in the **Text** mode only.

Searches for the declaration and references of the ID in the current document.

Tip: A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on OS X)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Author collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

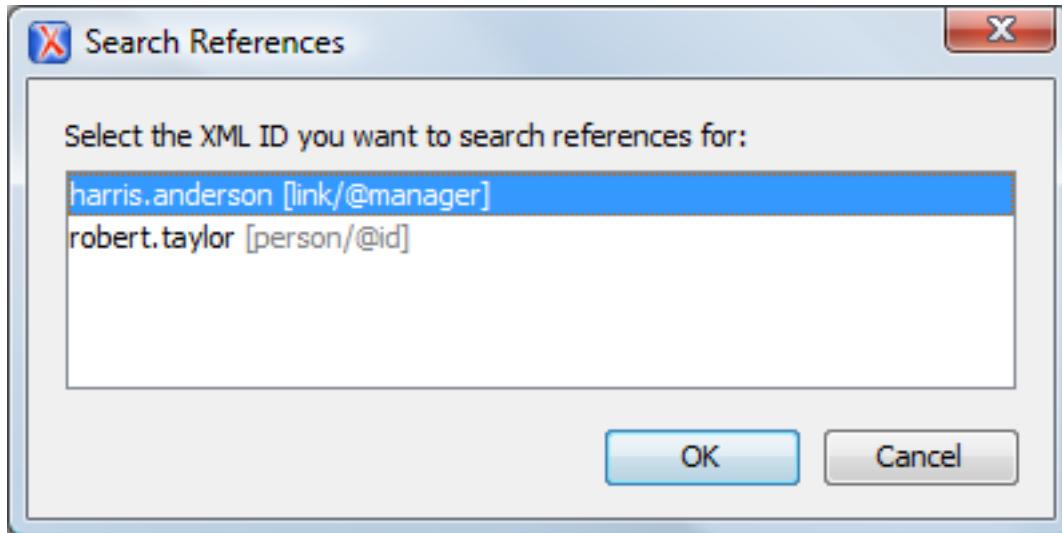

Figure 213: Selecting an ID in the Author Mode

Search and Refactor Operations Scope

[Edit on GitHub](#)

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Assist action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the **Master Files support**.

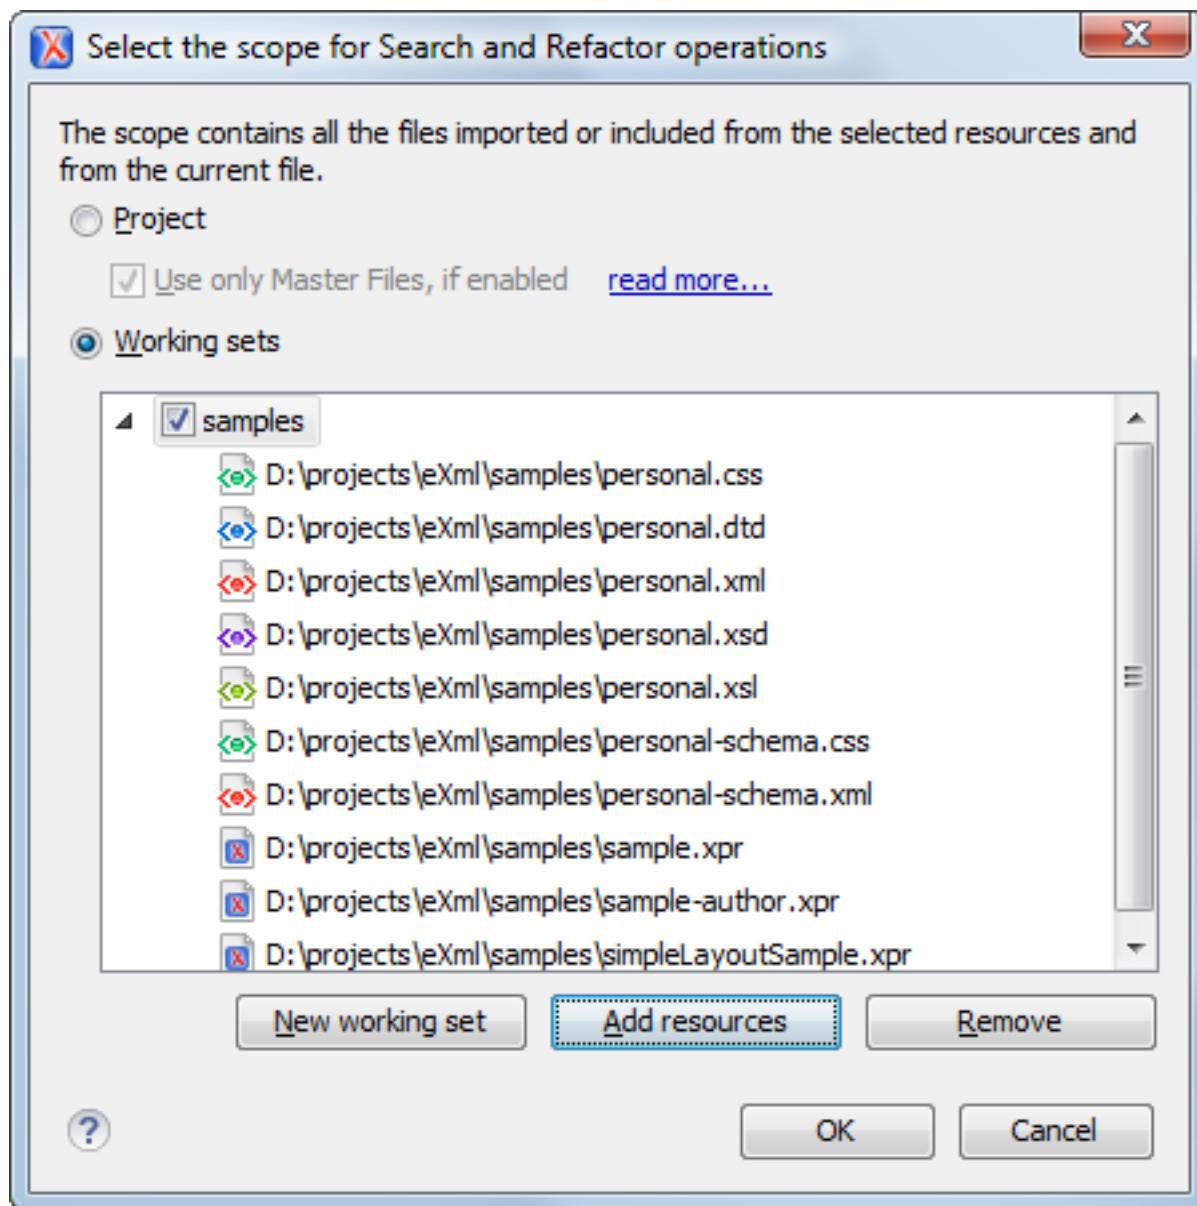

Figure 214: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

Associate a Schema to a Document

[Edit on GitHub](#)

This section explains the methods of associating a schema to a document for validation and content completion purposes.

Related information

[Working with Modular XML Files in the Master Files Context](#) on page 606

Setting a Schema for Content Completion

[Edit on GitHub](#)

This section explains the available methods of setting a schema for content completion in an XML document edited in Oxygen XML Author.

Supported Schema Types for XML Documents

[Edit on GitHub](#)

The following schema types are supported:

- W3C XML Schema 1.0 and 1.1 (with and without embedded Schematron rules)
- DTD
- Relax NG - XML syntax (with and without embedded Schematron rules)
- Relax NG - compact syntax
- NVDL
- Schematron (both ISO Schematron and Schematron 1.5)

Setting a Default Schema

[Edit on GitHub](#)

When trying to detect a schema, Oxygen XML Author searches in multiple locations, in the exact following order:

- The *validation scenario* associated with the document.
- The validation scenario associated with the document type (if defined).
- The document schema declaration.

Note: If a DTD schema is specified in the document, the content completion for **Author** mode is based on this schema (even if there is already one detected from the validation scenario).

- The document type schema definition. Each document type available in *Document Type Association preferences page* contains a set of rules for associating a schema with the current document.

Note: The locations are sorted by priority, from high to low.

The schema has one of the following types: XML Schema, XML Schema with embedded Schematron rules, Relax NG (XML syntax or compact syntax), Relax NG (XML syntax) with embedded Schematron rules, Schematron, DTD, NVDL.

The rules are applied in the order they appear in the table and take into account the local name of the root element, the default namespace and the file name of the document.

Important:

The editor is creating the content completion lists by analysing the specified schema and the current context (the position in the editor). If you change the schema, then the list of tags to be inserted is updated.

```

212 <para os="oxygen">&oxy; is the <acronym>XML</acronym> Editor of

```

A list of operations to be performed in a well-defined sequence.

A Procedure encapsulates a task composed of Steps (and possibly, SubSteps). Procedures are usually performed sequentially, unless individual Steps direct the reader explicitly. Often it is important to assure that certain conditions exist.

Figure 215: Content Completion Driven by DocBook DTD

Making the Schema Association Explicit in the XML Instance Document

[Edit on GitHub](#)

The schema used by the *Content Completion Assistant* and *document validation* engine can be associated with the document using the **Associate Schema** action. For most of the schema types, it uses *the xml-model processing instruction*, the exceptions being:

- **W3C XML Schema** - The `xsi:schemaLocation` attribute is used.
- **DTD** - The DOCTYPE declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of document type level.

Select the **Associate schema** action from the toolbar or **Document > Schema** menu to select the schema that will be associated with the XML document. The **Associate Schema** dialog box is displayed:

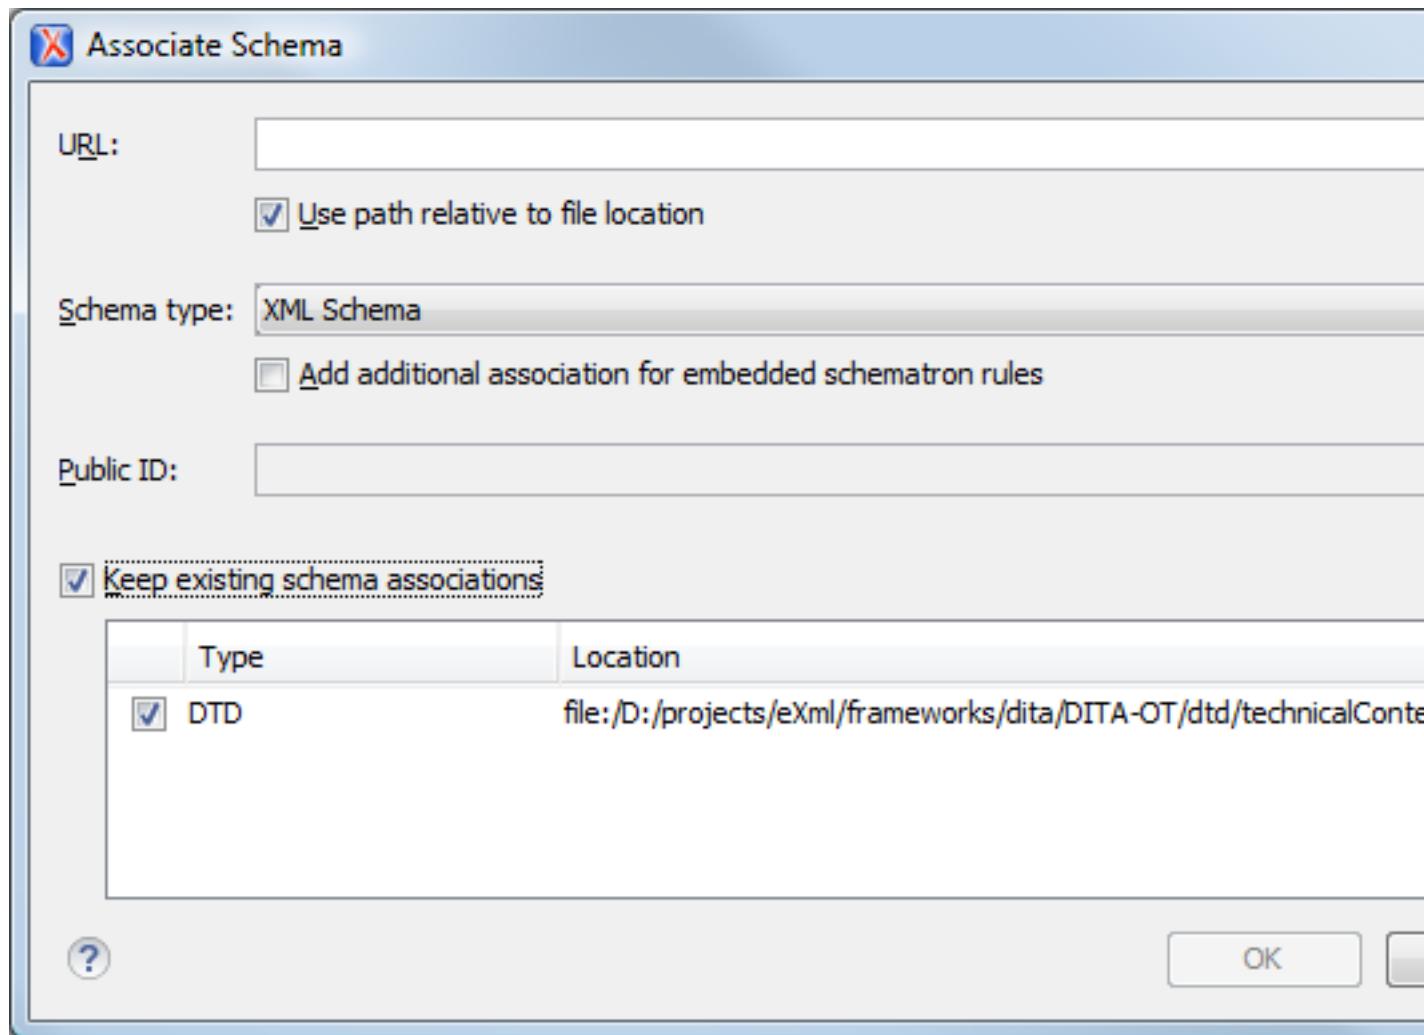

Figure 216: Associate Schema Dialog Box

The available options are:

- **URL** - Contains a predefined set of schemas that are used more often and it also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).
- **Schema type** - Selected automatically from the list of possible types in the **Schema type** combo box (XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, NVDL) based on the extension of the schema file that was entered in the **URL** field.
- **Public ID** - Specify a public ID if you have selected a DTD.
- **Add additional association for embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules, enable this option.
- **Use path relative to file location** - Enable this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users, without running into problems caused by multiple project locations on physical disk.
- **Keep existing schema associations** - Enable this option to keep the associations of the currently edited document with a Schema when you associate a new one.

The association with an XML Schema is added as an attribute of the root element. The **Associate schema** action adds one of the following:

- `xsi:schemaLocation` attribute, if the root element of the document sets a default namespace with an `xmlns` attribute.
- `xsi:noNamespaceSchemaLocation` attribute, if the root element does not set a default namespace.

The association with a DTD is added as a DOCTYPE declaration. The association with a Relax NG , Schematron or NVDL schema is added as *xml-model processing instruction*.

Associating a Schema With the Namespace of the Root Element

[Edit on GitHub](#)

The namespace of the root element of an XML document can be associated with an XML Schema using an *XML catalog*. If there is no `xsi:schemaLocation` attribute on the root element and the *XML* document is not matched with a *document type*, the namespace of the root element is searched in *the XML catalogs set in Preferences*.

If the XML catalog contains a `uri` or `rewriteUri` or `delegateUri` element, its schema will be used by the application to drive the *content completion* and document *validation*.

xml-model Processing Instruction

[Edit on GitHub](#)

The `xml-model` processing instruction associates a schema with the XML document that contains the processing instruction. It must be added at the beginning of the document, just after the XML prologue. The following code snippet contains an `xml-model` processing instruction declaration:

```
<?xml-model href="../schema.sch" type="application/xml"
schematypens="http://purl.oclc.org/dsdl/schematron" phase="ALL" title="Main
schema"?>
```

It is available in the *Content Completion Assistant*, before XML document root element, and includes the following attributes:

- `href` (required) - The schema file location.
- `type` - The content type of the schema. This is an optional attribute with the following possible values for each specified type:
 - DTD - The recommended value is `application/xml-dtd`.
 - W3C XML Schema - The recommended value is `application/xml`, or can be left unspecified.
 - RELAX NG XML Syntax - The recommended value is `application/xml`, or can be left unspecified.
 - RELAX NG Compact Syntax - The recommended value is `application/relax-ng-compact-syntax`.
 - Schematron - The recommended value is `application/xml`, or can be left unspecified.
 - NVDL - The recommended value is `application/xml`, or can be left unspecified.
- `schematypens` - The namespace for the schema language of the referenced schema with the following possible values:
 - DTD - Not specified.
 - W3C XML Schema - The recommended value is `http://www.w3.org/2001/XMLSchema`.
 - RELAX NG XML Syntax - The recommended value is `http://relaxng.org/ns/structure/1.0`.
 - RELAX NG Compact Syntax - Not specified.
 - Schematron - The recommended value is `http://purl.oclc.org/dsdl/schematron`.
 - NVDL - The recommended value is `http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0`.
- `phase` - The phase name for the validation function in Schematron schema. This is an optional attribute. To run all phases from the Schematron, use the special `#ALL` value. If the phase is not specified, the default phase that is configured in the Schematron will be applied.
- `title` - The title for the associated schema. This is an optional attribute.

Older versions of Oxygen XML Author used the `oxygen` processing instruction with the following attributes:

- RNGSchema - Specifies the path to the Relax NG schema that is associated with the current document.
- type - Specifies the type of Relax NG schema. It is used along with the RNGSchema attribute and can have the value `xml` or `compact`.
- NVDLSchema - Specifies the path to the NVDL schema that is associated with the current document.
- SCHSchema - Specifies the path to the SCH schema that is associated with the current document.

Note: Documents that use the `<oxygen>` processing instruction are compatible with newer versions of Oxygen XML Author.

Learning Document Structure

[Edit on GitHub](#)

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Author is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file to provide a DTD as an initialization source for *content completion* and *document validation*. This feature is also useful for producing DTD's for documents containing personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Author automatically learns the document structure and uses it for *content completion*. To disable this feature you have to uncheck the checkbox *Learn on open document in the user preferences*.

Create a DTD from Learned Document Structure

[Edit on GitHub](#)

When there is no schema associated with an XML document, Oxygen XML Author can learn the document structure by parsing the document internally. This feature is enabled with the option *Learn on open document* that is available in the user preferences.

To create a DTD from the learned structure:

1. Open the XML document for which a DTD will be created.
2. Go to **Document > XML Document > Learn Structure (`Ctrl + Shift + L` (`Command + Shift + L` on OS X))**. The **Learn Structure** action reads the mark-up structure of the current document. The **Learn completed** message is displayed in the application's status bar when the action is finished.
3. Go to **Document > XML Document > Save Structure (`Ctrl + Shift + S` (`Command + Shift + S` on OS X))** and enter the DTD file path.
4. Press the *Save* button.

Working with Modular XML Files in the Master Files Context

[Edit on GitHub](#)

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Author provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the master XML files.

You can set a main XML document either using the *master files support from the Project view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Author warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a master file include:

- Correct validation of a module in the context of a larger XML structure.
- **Content Completion Assistant** displays all collected entities and IDs starting from the master files.

- Oxygen XML Author uses the schema defined in the master file when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The master files defined for the current module determines the *scope of the search and refactoring actions* for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Author performs the search and refactoring actions in the context that the master files determine, improving the speed of execution.

To watch our video demonstration about editing modular XML files in the master files context, go to http://oxygenxml.com/demo/Working_With_XML_Modules.html.

[Defining Master Files at Project Level](#) on page 360

[XML Resource Hierarchy/Dependencies View](#) on page 607

XML Resource Hierarchy/Dependencies View

[Edit on GitHub](#)

The **Resource Hierarchy/Dependencies** view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the *XInclude* and *External Entity* mechanisms.

To define the scope for calculating the dependencies of a resource, click  [Configure dependencies search scope](#) on the **Resource Hierarchy/Dependencies** toolbar.

To open this view, go to **Window > Show View > Resource Hierarchy/Dependencies**. As an alternative, right-click the current document and either select **Resource Hierarchy** or **Resource Dependencies**.

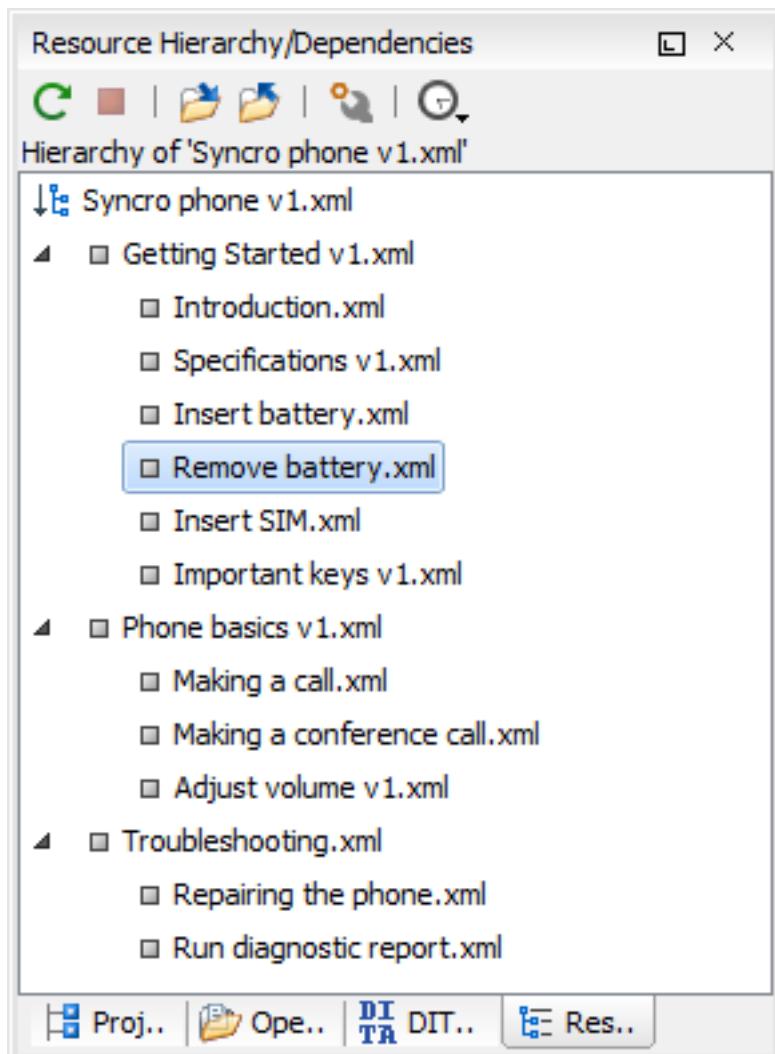

Figure 217: Resource Hierarchy/Dependencies View - Hierarchy for Syncro phone v1.xml

The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

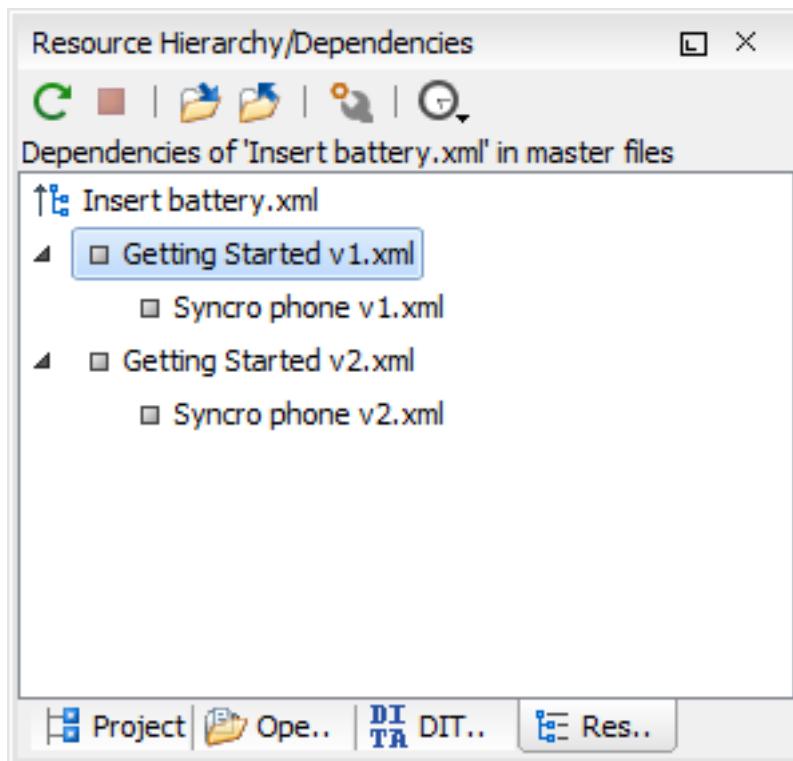

Figure 218: Resource Hierarchy/Dependencies View - Dependencies for Insert battery.xml

The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refreshes the Hierarchy/Dependencies structure.

Stops the hierarchy/dependencies computing.

Allows you to choose a resource to compute the hierarchy structure.

Allows you to choose a resource to compute the dependencies structure.

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

**Expand All**

Adds the currently selected resource in *the Master Files directory*.

Collapse All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to *update the references to the resource*. Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

Search and Refactor Operations Scope on page 600

Moving/Renaming XML Resources

[Edit on GitHub](#)

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Working with XML Catalogs

[Edit on GitHub](#)

An *XML Catalog* maps a system ID or a URI reference pointing to a resource (stored either remotely or locally) to a local copy of the same resource. If XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the Internet connection is slow.

Oxygen XML Author supports any XML Catalog file that conforms to one of the following:

1. *OASIS XML Catalogs Committee Specification v1.1*.
2. *OASIS Technical Resolution 9401:1997*, including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS XML Catalog specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements *systemSuffix* and *uriSuffix*.

Depending on the resource type, Oxygen XML Author uses different catalog mappings.

Table 8: Catalog Mappings

Document	Referenced Resource	Mappings
XML	DTD	<p><i>system</i> or <i>public</i></p> <p>The <i>Prefer option</i> controls which one of the mappings should be used.</p>
	XML Schema	<p>The following strategy is used (if one step fails to provide a resource, the next is applied):</p> <ol style="list-style-type: none"> 1. resolve the schema using <i>URI</i> catalog mappings. 2. resolve the schema using <i>system</i> catalog mappings.
	Relax NG	
	Schematron	
	NVDL	<p>This happens only if the <i>Resolve schema locations also through system mappings option</i> is enabled (it is by default).</p> <ol style="list-style-type: none"> 3. resolve the root <i>namespace</i> using <i>URI</i> catalog mappings.
XSL	XSL/ANY	<i>URI</i>
CSS	CSS	<i>URI</i>
XML Schema	XML Schema	<p>The following strategy is used (if one step fails to provide a resource, the next is applied):</p> <ol style="list-style-type: none"> 1. resolve schema reference using <i>URI</i> catalog mappings. 2. resolve schema reference using <i>system</i> catalog mappings.
Relax NG	Relax NG	<p>This happens only if the <i>Resolve schema locations also through system mappings option</i> is enabled (it is by default).</p> <ol style="list-style-type: none"> 3. resolve schema <i>namespace</i> using <i>uri</i> catalog mappings. <p>This happens only if the <i>Process namespaces through URI mappings for XML Schema option</i> is enabled (it is not by default).</p>

Creating an XML Catalog with a Template

An XML Catalog file can be created quickly in Oxygen XML Author starting from the two XML Catalog document templates called *OASIS XML Catalog 1.0* and *OASIS XML Catalog 1.1* and available when *creating new document templates*.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog
    PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
    "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">

<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">

    <!-- Use "system" and "public" mappings when resolving DTDs -->
    <system
        systemId="http://www.docbook.org/xml/4.4/docbookx.dtd"
        uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>
    <!-- The "systemSuffix" matches any system ID ending in a specified
        string -->
    <systemSuffix
        systemIdSuffix="docbookx.dtd"
        uri="frameworks/docbook/dtd/docbookx.dtd"/>

    <!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
    <uri

```

```

    name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    uri="frameworks/docbook/5.0/rng/docbookxi.rng"/>

    <!-- The "uriSuffix" matches any URI ending in a specified string -->
    <uriSuffix
        uriSuffix="docbook.xsl"
        uri="frameworks/docbook/xsl/fo/docbook.xsl"/>

</catalog>

```

How Oxygen XML Author Determines which Catalog to Use

An XML catalog is used to resolve references for document validation and transformations and it maps such references to the built-in local copies of the schemas of the Oxygen XML Author frameworks (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Author includes a built-in catalog set as default, but you can also create your own and Oxygen XML Author looks for catalogs in the following order:

- Global user-defined catalogs that are set in the [XML Catalog preferences page](#).
- User-defined catalogs that are set at document type level, in the [Catalog tab](#) from the [Document Type configuration dialog box](#).
- Default built-in catalogs.

An XML catalog can be used to map a W3C XML Schema specified with an URN in the `xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```

<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with a catalog entry like this:

```

<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
      uri="topic.xsd"/>
```

Related information

[XML Catalog Preferences](#) on page 154

Resolve Schemas Through XML Catalogs

[Edit on GitHub](#)

Oxygen XML Author resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteURI` mappings from the XML catalog). If this succeeds, the process end here.
- If the [Resolve schema locations also through system mappings option](#) is selected, it attempts to resolve the schema location as a systemID (`system`, `systemSuffix`, `rewriteSuffix`, `rewriteSystem` from the XML catalog). If this succeeds, the process ends here.
- If the [Process namespace through URI mappings for XML Schema option](#) is selected, it attempts to resolve the location by processing the schema namespace as a URI (`uri`, `uriSuffix`, `rewriteURI` from the XML catalog). The namespace is taken into account only when the schema specified in the `schemaLocation` attribute was not resolved successfully. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location is used.

Editing Large XML Documents with DTD Entities or XInclude

[Edit on GitHub](#)

Consider the case of documenting a large project. It is likely that there will be several people involved. The resulting document can be few megabytes in size. The question becomes how to deal with this amount of data in such a way that work parallelism will not be affected.

Fortunately, XML provides two solutions for this: *DTD Entities* and *XInclude*. A master document can be created, with references to the other document parts, containing the document sections. The users can edit the documents individually, then apply an XSLT stylesheet over the master and obtain the output files in various formats (for example, PDF or HTML).

Including Document Parts with DTD Entities

[Edit on GitHub](#)

There are two conditions for including a part using DTD entities:

- The master document should declare the DTD to be used, while the external entities should declare the XML sections to be referenced.
- The document containing the section must not define again the DTD.

A master document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
<!ENTITY testing SYSTEM "testing.xml" > ]
>
<book>
<chapter> ...
```

The referenced document looks like this:

```
<section> ... here comes the section content ... </section>
```

Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

At a certain point in the master document there can be inserted the section *testing.xml* entity:

```
... &testing; ...
```

When splitting a large document and including the separate parts in the master file using external entities, only the master file will contain the Document Type Definition (the DTD) or other type of schema. The included sections can not define the schema again because the main document will not be valid. If you want to validate the parts separately you have to *use XInclude* for assembling the parts together with the master file.

Including Document Parts with XInclude

[Edit on GitHub](#)

XInclude is a standard for assembling XML instances into another XML document through inclusion. It enables larger documents to be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files in the main file. XInclude is targeted as the replacement for External Entities. The advantage of using XInclude is that, unlike the entities method, each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated

without having to remove or comment out the DOCTYPE, as is the case with External Entities. This makes XInclude a more convenient and effective method for managing XML instances that need to be stand-alone documents and part of a much larger project.

The main application for XInclude is in the document-oriented content frameworks such as manuals and Web pages. Employing XInclude enables authors and content managers to manage content in a modular fashion that is akin to Object Oriented methods used in languages such as Java, C++ or C#.

The advantages of modular documentation include: reusable content units, smaller file units that are easier to be edited, better version control and distributed authoring.

Include a chapter in an article using XInclude

Create a chapter file and an article file in the samples folder of the Oxygen XML Author install folder.

Chapter file (`introduction.xml`) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
    <title>Getting started</title>
    <section>
        <title>Section title</title>
        <para>Para text</para>
    </section>
</chapter>
```

Main article file looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/
xinclude.mod">
%xinclude;
]>
<article>
    <title>Install guide</title>
    <para>This is the install guide.</para>
    <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
                href="introduction.xml">
        <xi:fallback>
            <para>
                <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
            </para>
        </xi:fallback>
    </xi:include>
</article>
```

In this example the following is of note:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the `xi` namespace to certain elements defined by the DocBook DTD.
- The `href` attribute of the `xi:include` element specifies that the `introduction.xml` file will replace the `xi:include` element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the `xi:fallback` element - a `FIXME` message.

If you want to include only a fragment of a file in the master file, the fragment must be contained in a tag having an `xml:id` attribute and you must use an XPointer expression pointing to the `xml:id` value. For example, if the master file is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml" schematypens="http://
relaxng.org/ns/structure/1.0"?>
<test>
  <xi:include href="a.xml" xpointer="a1"
  xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the `a.xml` file is:

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference the document is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml" schematypens="http://
relaxng.org/ns/structure/1.0"?>
<test>
  <a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

The XInclude support in Oxygen XML Author is enabled by default. To [configure it, open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Enable XInclude processing**. When enabled, Oxygen XML Author will be able to validate and transform documents comprised of parts added using XInclude.

Viewing Status Information

[Edit on GitHub](#)

Status information generated by operations such as *schema detection*, *manual validation*, *automatic validation*, and *transformations* are fed into the **Information** view, allowing you to monitor how the operation is being executed.

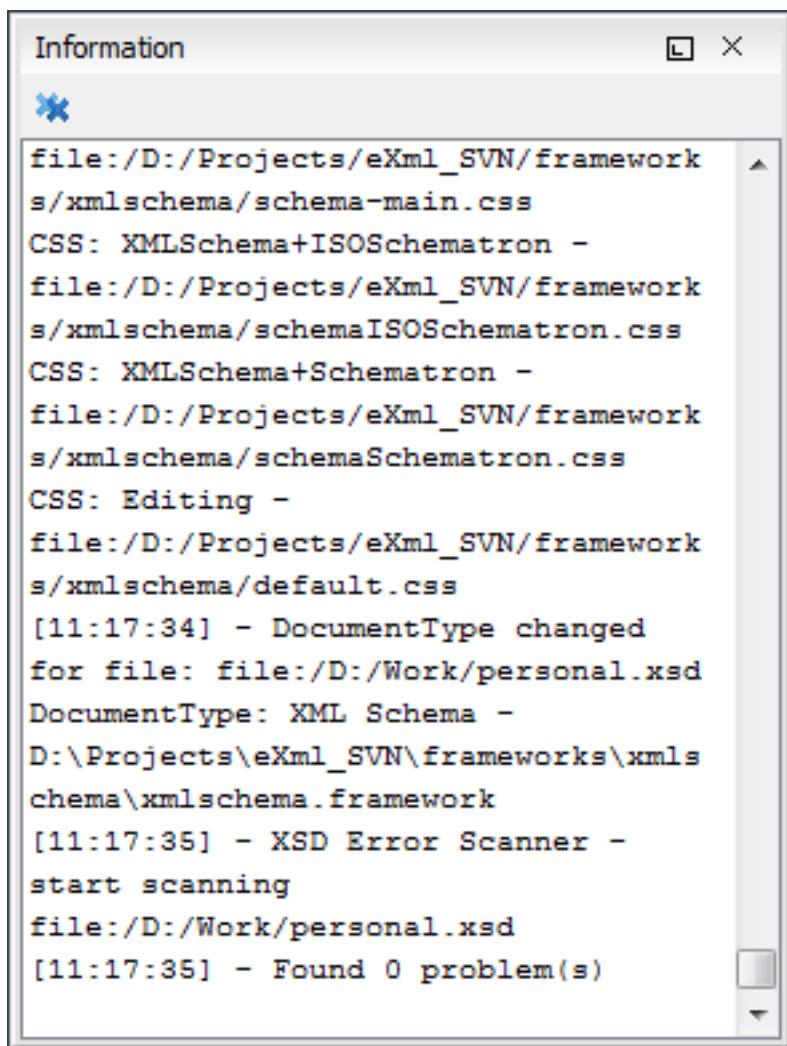

Figure 219: Information view messages

Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages can be controlled with the **Maximum number of lines option** in the **Views** preference page.

To make the view visible, select **Window > Show View > Information**.

Making a Persistent Copy of Results

[Edit on GitHub](#)

The **Results** panel displays the results from the following operations:

- *document validation*
- *checking the form of documents*
- *XSLT or FO transformation*
- *find all occurrences of a string in a file*
- *find all occurrences of a string in multiple files*
- *applying an XPath expression to the current document*

To make a persistent copy of the **Results** panel, use one of these actions:

File > Save Results

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

File > Print Results

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results panel**. The action is also available on the right-click menu of the **Results** panel.

Save Results as XML from the contextual menu

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
  <Incident>
    <engine>The engine who
provide the error.<engine>
    <severity>The severity
level<severity>
    <Description>Description of
output message.</Description>
    <SystemID>The location of

Editor Highlights
[Edit on GitHub](#)

An *editor highlight* is a text fragment emphasized by a colored background.

Highlights are generated in both **Text** and **Author** mode when the following actions generate results:

- Find/Replace in Files
- Open/Find Resource
- Find All
- Find All Elements
- XPath in Files

By default, Oxygen XML Author uses a different color for each type of highlight (*XPath in Files*, *Find/Replace*, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the [Editor preferences page](#). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the document.

- Clicking the **Next** and **Previous** buttons (from the bottom of the range ruler.

Note: When there are multiple types of highlights in the document, the **Next** and **Previous** buttons () navigate through highlights of the same type.

- Clicking the messages displayed in the **Results view** at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the **Remove all** button from bottom of the range ruler.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the **Remove all** button from the results panel at the bottom of the editor.

Note: Use the **Highlight all results in editor** button to either display all the highlights or hide them.

Printing a File

[Edit on GitHub](#)

Printing is supported in **Text**, **Author**, and **Grid** modes. The **Print(Ctrl + P (Command + P on OS X))** action that is available from **File** menu displays the **Page Setup** dialog box, used for defining the page size and orientation properties for printing.

A **Print Preview** action is also available in the **File** menu. It allows you to manage the format of the printed document.

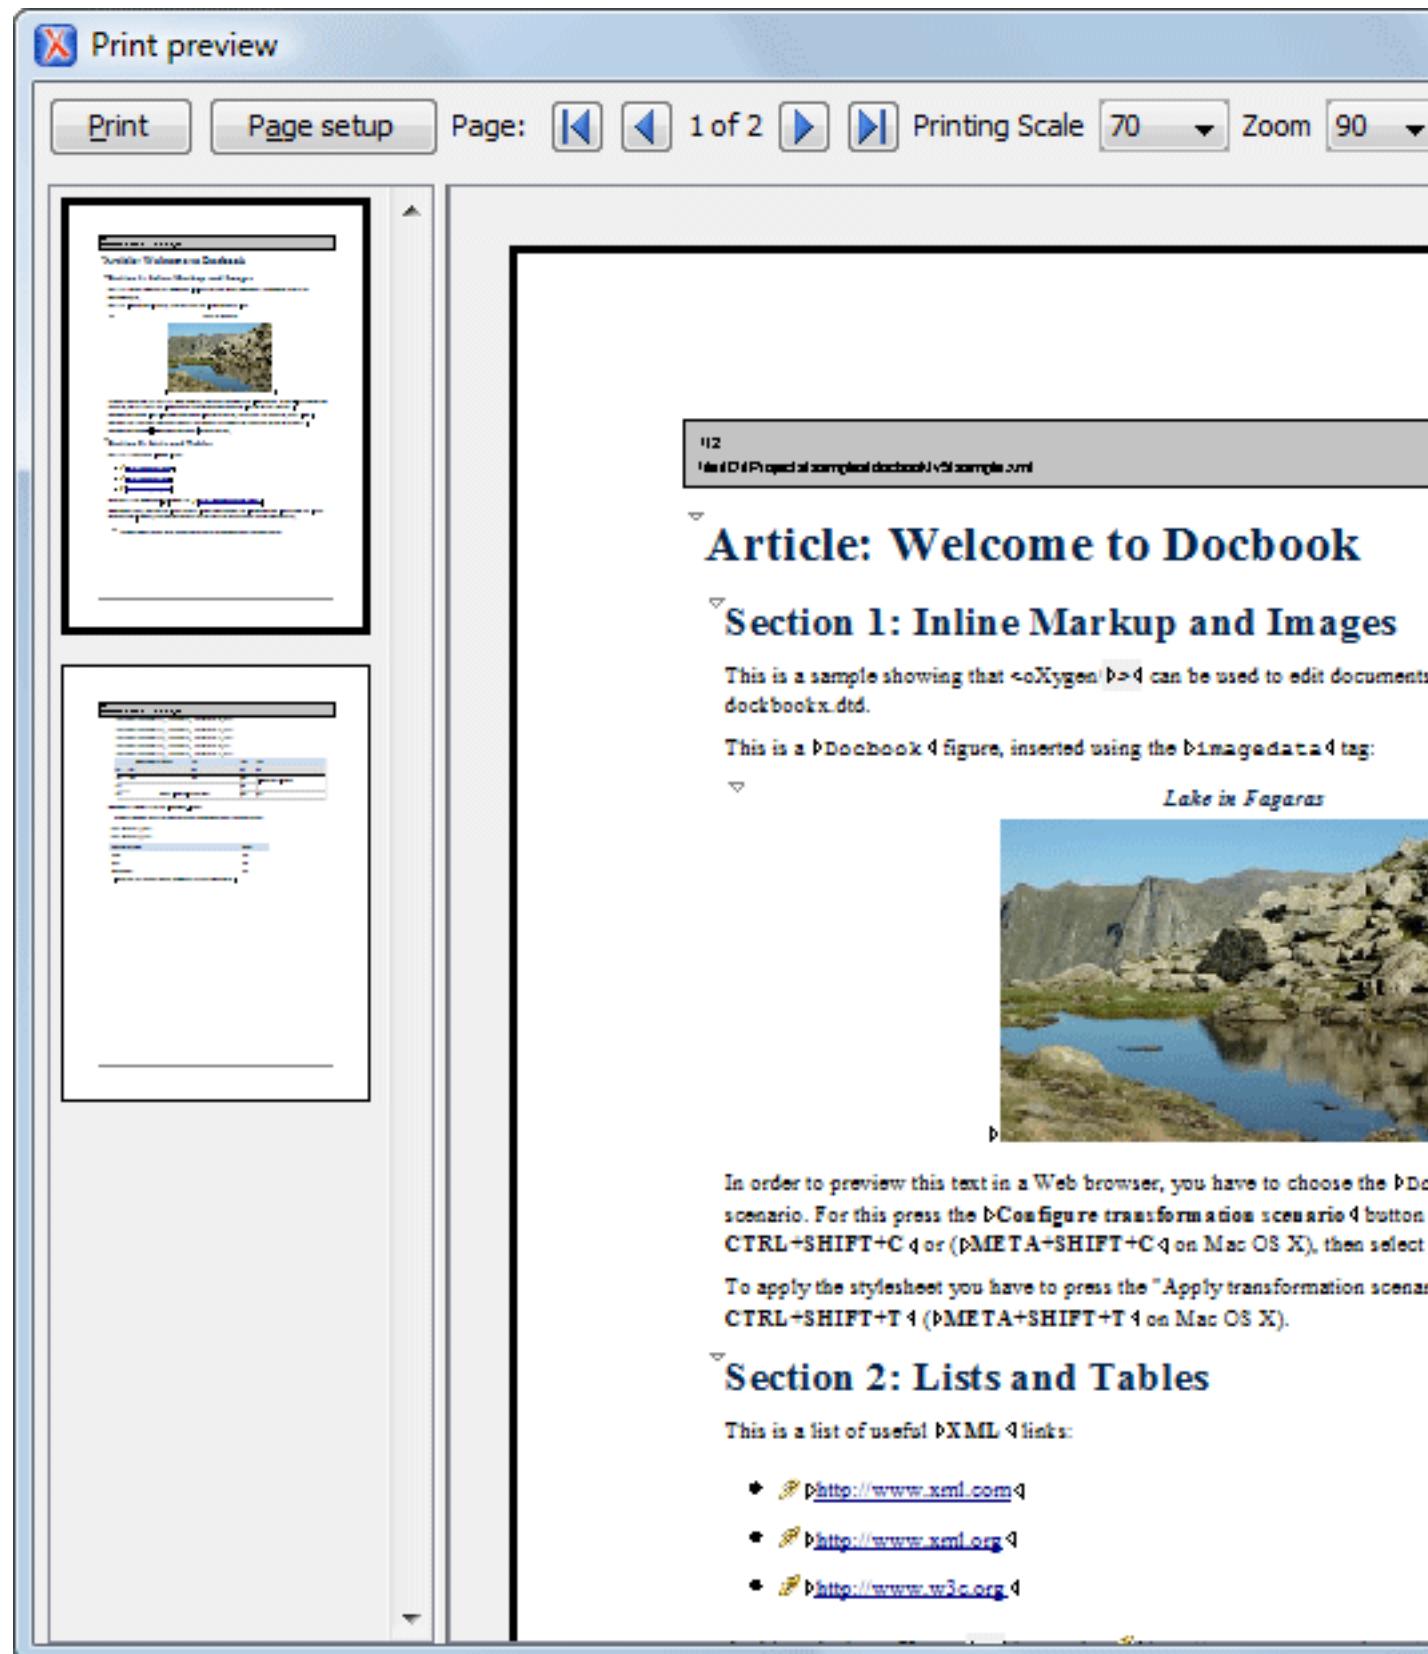

Figure 220: Print Preview Dialog Box

The main window is split in three sections:

- **Preview area** - Displays the formatted document page as it will appear on printed paper.
- **Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- **Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

Other Printing Features

- If you are printing a document that is opened in the **Author** visual editing mode, you can use the *CSS print media type* to change the styling in the printed output.
- If you are printing a document that is opened in **Author** mode and it contains *Tracked Changes*, you can print (or print preview) a copy of the document as if all changes have been accepted by switching the *Track Changes Visualization Mode* to **View Final**.
- If you are printing a document that is opened in **Text** mode and line numbers are displayed (the *Show line numbers option* is enabled), the printed output will include the line numbers.
- If you are printing an XML document that is opened in **Text** mode and the *folding support* is activated (the *Enable folding option* is enabled), the printed output will include the current folded state. Note that this applies to printing an entire document and not selections within the document.
- If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.

XML Quick Fixes

[Edit on GitHub](#)

The Oxygen XML Author Quick Fix support helps you resolve errors that appear in an XML document by offering quick fixes to problems such as missing required attributes or invalid elements. Quick fixes are available in **Text** mode and **Author** mode

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window and the available quick fixes include a link that can be used to perform the fix.

Figure 221: Quick Fix Presented in a Tooltip in Text Mode

Figure 222: Quick Fix Presented in a Tooltip in Author Mode

- When hovering over the error or warning in **Author** mode, a small quick fix drop-down menu is presented. You can use the drop-down menu to display a list of available quick fixes to select from for the particular error or warning.

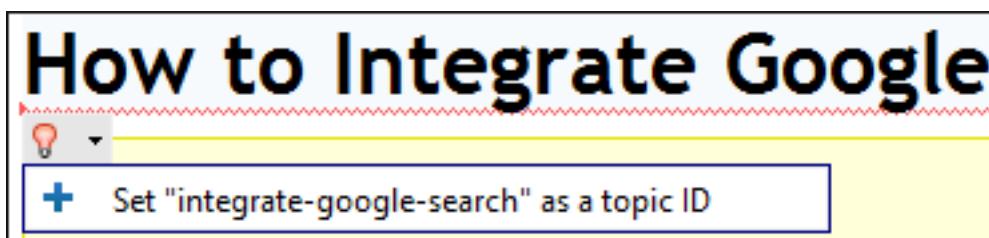

Figure 223: Quick Fix Drop-Down Menu in Author Mode

- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Author displays the list of available fixes.

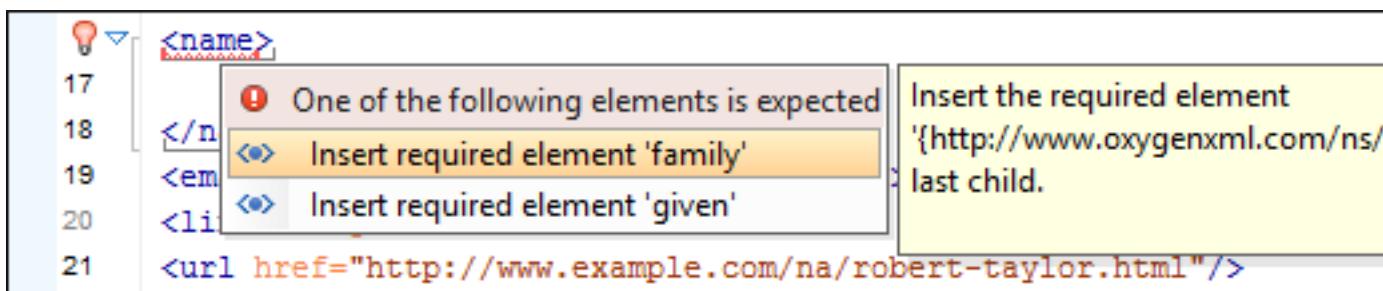

Figure 224: Quick Fix Menu Invoked by Clicking on the Icon

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing **Alt + 1 (Command + Alt 1 on OS X)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of quick fixes is recomputed to ensure that you always have valid proposals.

Note: A quick fix that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the *Content Completion Assistant options* are configured.

Quick Fixes for XSD and Relax NG Errors

[Edit on GitHub](#)

Oxygen XML Author offers quick fixes for common errors that appear in XML documents that are validated against XSD or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in **Text** mode and **Author** mode.

Oxygen XML Author provides quick fixes for numerous types of problems, including the following:

Problem type	Available quick fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

[Schematron Quick Fixes \(SQF\)](#) on page 622

Schematron Quick Fixes (SQF)

[Edit on GitHub](#)

Oxygen XML Author provides support for Schematron Quick Fixes (SQF). They help you resolve errors that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog: <http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html>.

Displaying the Schematron Quick Fix Proposals

The defined Schematron Quick Fixes are displayed on validation errors in **Text** mode and **Author** mode.

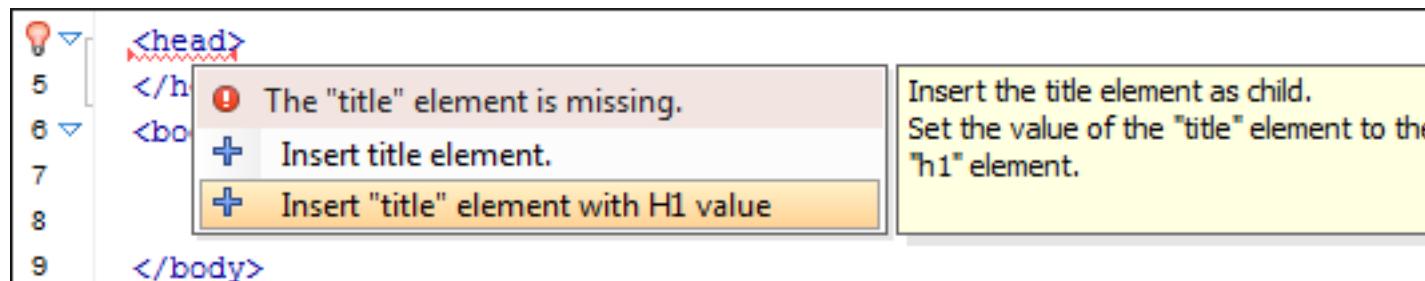

Figure 225: Example of a Schematron Quick Fix

[Schematron Quick Fix Specifications](#)

Refactoring XML Documents

[Edit on GitHub](#)

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project** view.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view.

Note: The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that are used also appear in the **Refactoring** submenu of the contextual menu in the **Project** view and the **DITA Maps Manager**.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

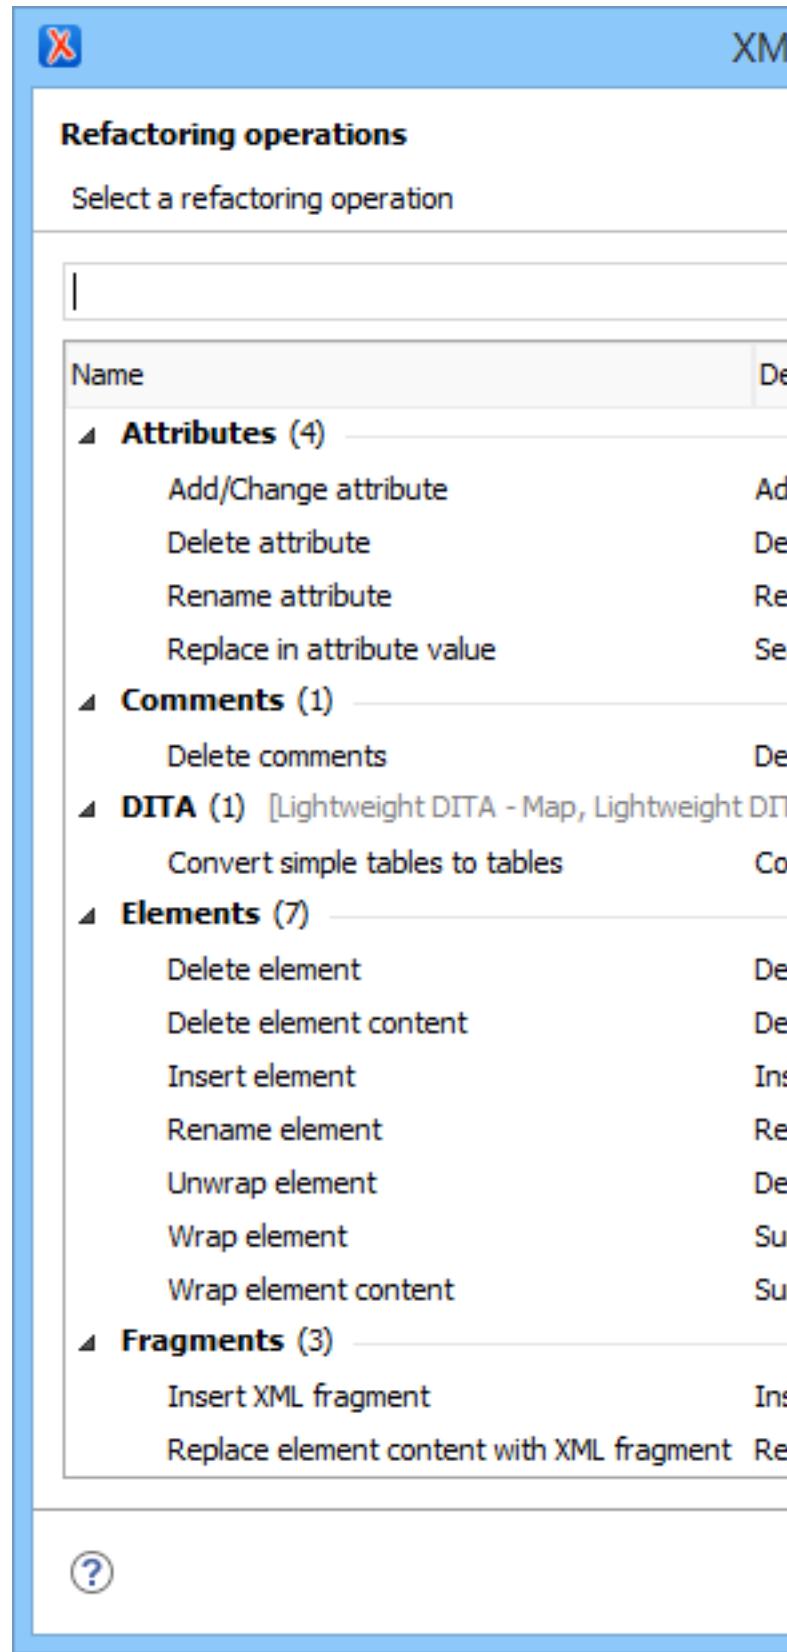

Figure 226: XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

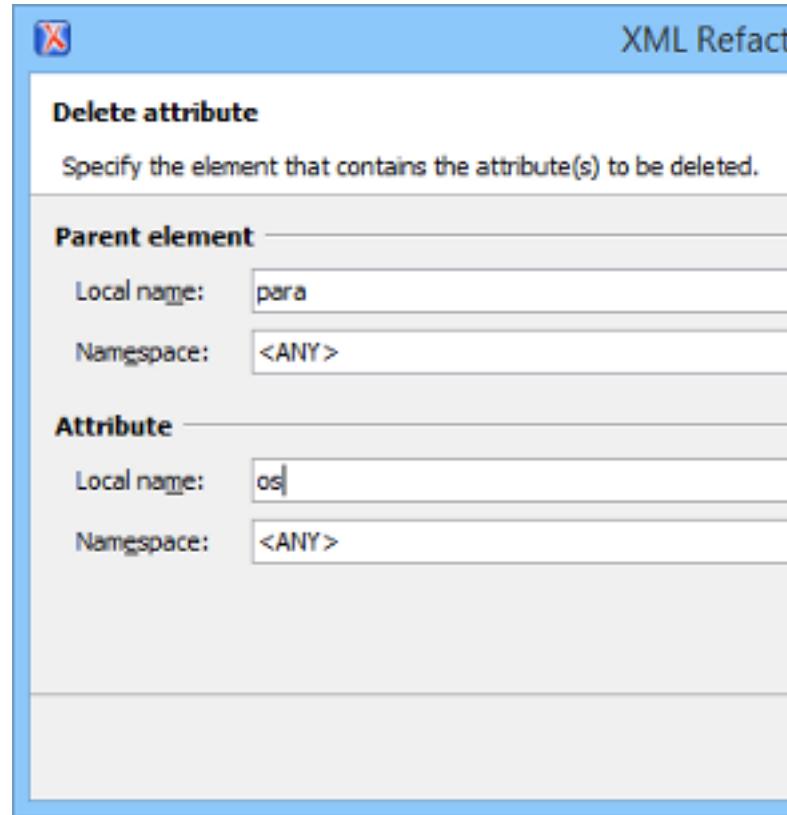

Figure 227: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map hierarchy, etc.) or you can define your own set of resources by creating a working set.

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When enabled, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When enabled, the resources inside archives will also be affected.

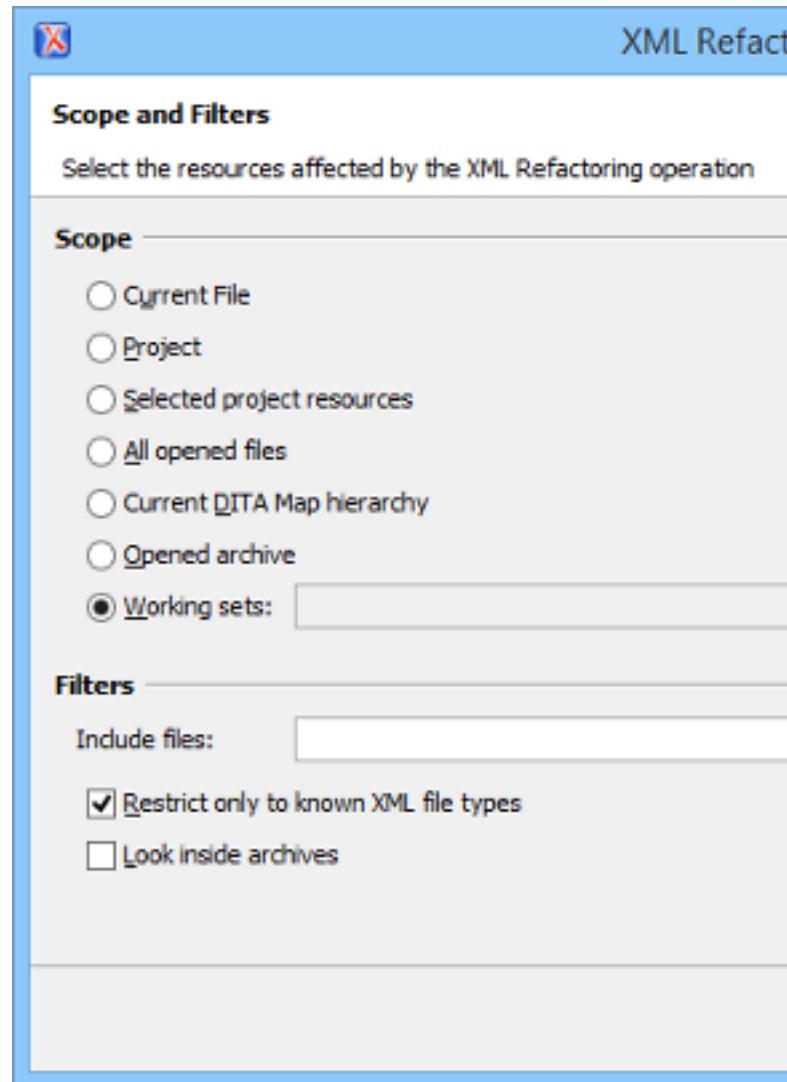

Figure 228: XML Refactoring - Scope and Filters Wizard Page

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

Note: It is recommended that you use the **Preview** button to review all the changes that will be made by the refactoring operation before applying the changes.

Warning: After clicking the **Finish** button, the operation will be processed and Oxygen XML Author provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Predefined Refactoring Operations

[Edit on GitHub](#)

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip: Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
 - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
 - **Local name** - The local name of the affected attribute.
 - **Namespace** - The namespace of the affected attribute.
 - **Value** - The value for the affected attribute.
- **Options** section
 - You can choose between one of the following options for the **Operation mode**:
 - **Add the attribute in the parent elements where it is missing**
 - **Change the value in the parent elements where the attribute already exists**
 - **Both**

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
 - **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
 - **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
 - **Find** - The text fragments to find. You can use Perl-like regular expressions.
 - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note: Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
 - **Local name** - The local name of the element to be inserted.

- **Namespace** - The namespace of the element to be inserted.
- **Location** section
 - **XPath**- An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
 - **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
 - **Local name** - The local name of the *Wrapper element*.
 - **Namespace** - The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

- **Wrapper element** section
 - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
 - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
- **Location** section
 - **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
 - **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

Additional Notes

Note: There are some operations that allow <ANY> for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-FO-](#)

[XQUERY > XPath](#) page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

Storing and Sharing Refactoring Operations

[Edit on GitHub](#)

Oxygen XML Author scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a *framework* you are customizing.
- Any folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Refactoring**, and specify the same folder in the **Load additional refactoring operations from text box**.

Note: If you share a project with your team, you can also share the custom operation by doing the following:
Then by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to project level:
 - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**.
 - b. Select **Project Options** at the bottom of the dialog box.
3. In the **Load additional refactoring operations from text box**, use the \${pd} editor variable so that the folder path is declared relative to the project.
- A folder specified by the [XML Refactoring Operations Plugin Extension](#).
- The refactoring folder from the Oxygen XML Author installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

Sharing Refactoring Operations

The purpose of Oxygen XML Author scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the refactoring operations to other resources, such as frameworks or projects.

After storing operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

[Edit on GitHub](#)

Oxygen XML Author includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

Editing CSS Stylesheets

[Edit on GitHub](#)

Oxygen XML Author includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to [create new CSS documents or templates](#).
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.

- **Syntax highlighting** - The syntax highlighting in Oxygen XML Author makes CSS files more readable.
- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

Validating CSS Stylesheets

[Edit on GitHub](#)

Oxygen XML Author includes a built-in *CSS Validator*, integrated with general validation support. This makes the *usual validation features* for presenting errors also available for CSS stylesheets.

When you edit a CSS document, you can access the *CSS validator options* by selecting  **Validation options** from the **Document > Validate** menu.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in *the CSS validation preferences*. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the *CSS extensions specific for Oxygen* that can be used in *Author mode*. That means all Oxygen specific extensions are accepted in a CSS stylesheet by *the built-in CSS validator* when this profile is selected.

Specify Custom CSS Properties

[Edit on GitHub](#)

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.oxygenxml.com/ns/css http://
www.oxygenxml.com/ns/css/CssProperties.xsd"
    xmlns="http://www.oxygenxml.com/ns/css">
    <property name="custom">
        <summary>Description for custom property.</summary>
        <value name="customValue"/>
        <value name="anotherCustomValue"/>
    </property>
</css_keywords>
```

2. Go to your desktop and create the `builtin/css-validator/` folder structure.
3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command.
The `custom_props.jar` file is created.
5. Go to `[OXYGEN_INSTALL_DIR]/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to `[OXYGEN_INSTALL_DIR]/lib/endorsed`.

Content Completion in CSS Stylesheets

[Edit on GitHub](#)

A **Content Completion Assistant**, similar to *the one available for XML documents* offers the CSS properties and the values available for each property. It is activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property. The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author mode** operations.

The properties and values available are dependent on the CSS Profile selected in the [CSS preferences](#). The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile **CSS 3 with Oxygen extensions** includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen XML Author](#) that can be used in *Author mode*.

Proposals for CSS Selectors - After inserting a *CSS selector*, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for @media and @import Rules - After inserting @media or @import <url> rules, the content completion assistance will propose a list of supported media types.

Related tasks

[Specify Custom CSS Properties](#) on page 632

CSS Outline View

[Edit on GitHub](#)

The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Author highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

[Edit on GitHub](#)

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same [folding features available for XML documents](#) are also available in CSS stylesheets.

Note: To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

[Edit on GitHub](#)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the [format and indent operation available for XML documents](#) is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

[Edit on GitHub](#)

Minification (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Author opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Author performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note: The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

Note: To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **Document > Source** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

Editing LESS CSS Stylesheets

[Edit on GitHub](#)

Oxygen XML Author provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables*, *nesting*, *mixins*, *operators*, and *functions*. Oxygen XML Author offers additional LESS features that include:

- **Create new LESS files and templates** - You can use the built-in new file wizards to [create new LESS documents or templates](#).
- **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in LESS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Compile to CSS** - Options are available to compile LESS files to CSS.
- **Syntax highlighting** - Oxygen XML Author supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.
- **Shortcut to open resources** - While editing LESS files, you can use [**Ctrl + Single-Click \(Command + Single-Click on OS X\)**](#) to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to <http://lesscss.org/>.

Validating LESS Stylesheets

[Edit on GitHub](#)

Oxygen XML Author includes a built-in *LESS CSS Validator*, integrated with general validation support. The [usual validation features](#) for presenting errors also available for LESS stylesheets.

Oxygen XML Author provides three validation methods:

- Automatic validation as you type - marks validation errors in the document as you are editing.
- Validation upon request, by pressing the **Validate** button from the **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.
- Validation scenarios, by selecting **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor. This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

Content Completion in LESS Stylesheets

[Edit on GitHub](#)

A **Content Completion Assistant** offers the LESS properties and the values available for each property. It is activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into LESS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

The properties and values available are dependent on the CSS Profile selected in the *CSS preferences*.

Compiling LESS Stylesheets to CSS

[Edit on GitHub](#)

When editing LESS files, you can compile the files into CSS. Oxygen XML Author provides both manual and automatic options to compile LESS stylesheets into CSS.

Important: The LESS processor works well only with files having the *UTF-8* encoding. Thus, it is highly recommended that you always use the *utf-8* encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select **Compile to CSS (Ctrl + Shift + C (Command + Shift + C on OS X))**.
2. Enable the *Automatically compile LESS to CSS when saving option* in the settings (*open the Preferences dialog box (Options > Preferences)* and go to **Editor > Open/Save > Save Hooks**). If enabled, when you save a LESS file it will automatically be compiled to CSS (this option is disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Editing StratML Documents

[Edit on GitHub](#)

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Author supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline** view. Oxygen XML Author implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

Editing XLIFF Documents

[Edit on GitHub](#)

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Author provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New file templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/css/`.
- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/1.2`, and for version 2.0 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0`.

XLIFF Version 2.0 Enhanced Support:

- Support for validating XLIFF 2.0 documents using modules. The default modules are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0/modules`.

Editing JavaScript Documents

[Edit on GitHub](#)

This section explains the features of the Oxygen XML Author JavaScript Editor and how you can use them.

JavaScript Editor Text Mode

[Edit on GitHub](#)

Oxygen XML Author allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

```

12  ▼function newPage(filename, overlay) {
13      divs = document.getElementsByTagName("div");
14
15  ▼    if (divs) {
16      var xdiv = divs[0];
17
18  ▼    if (xdiv) {
19        var xid = xdiv.getAttribute("id");
20
21        var mytoc = window.top.frames[0];
22  ▼        if (mytoc.lastUnderlined) {
23            mytoc.lastUnderlined.style.textDecoration = "none";
24        }
25
26        var tdiv = xbGetElementById(xid, mytoc);
27
28  ▼        if (tdiv) {
29            var ta = tdiv.getElementsByTagName("a").item(0);
30            ta.style.textDecoration = "underline";
31            mytoc.lastUnderlined = ta;
32        }
33    }
34  }
35
36  ▼    if (overlay != 0) {
37    overlaySetup('lc');
38  }

```

Figure 229: JavaScript Editor Text Mode

The contextual menu of the **JavaScript** editor offers the following actions:

Allows you to cut fragments of text from the editing area.

Allows you to copy fragments of text from the editing area.

Allows you to paste fragments of text in the editing area.

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts

Go to Matching Bracket

a comment for each line of the fragment you want to comment.

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Author moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

Note: A rectangle decorates the opening or closing bracket that matches the current one, at all times.

Source

Allows you to select one of the following actions:

To Lower Case	Converts the selection content to lower case characters.
To Upper Case	Converts the selection content to upper case characters.
Capitalize Lines	Converts to upper case the first character of every selected line.
Join and Normalize Lines	Joins all the rows you select to one row and normalizes the content.
Insert new line after	Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

Folding

When you invoke the contextual menu from the folding stripe on the left side of the editor, the following actions are available:

 Collapse Other <u>Folds (Ctrl + NumPad/</u>	Folds all the elements except the current element.
---	--

**(Command + NumPad/
on OS X)**

 **Collapse Child**
**Folds (Ctrl + NumPad.
(Command + NumPad.
on OS X))**

Folds the elements indented with one level inside the current element.

 **Expand Child Folds**

Unfolds all child elements of the currently selected element.

 **Expand All (Ctrl +
NumPad* (Command +
NumPad* on OS X))**

Unfolds all elements in the current document.

Validating JavaScript Files

[Edit on GitHub](#)

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Author uses the Mozilla Rhino library for validation. For more information about this library, go to <http://www.mozilla.org/rhino/doc.html>. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Author can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Files

[Edit on GitHub](#)

When you edit a JavaScript document, the **Content Completion Assistant** presents you a list of the elements you can insert at the cursor position. For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

Note: These icons decorate both the elements from the content completion list of proposals and from the **Outline** view.

```

12 ▾ function newPage(filename, overlay) {
13     divs = document.getElementsByTagName("div");
14
15 ▾     if (divs) {
16         var xdiv = divs[0];
17
18 ▾     if (xdiv) {
19         var xid =
20             TypeInfo - TypeInfo
21             UIEvent - UIEvent
22             UserDataHandler - UserDataHandler
23             mytoc.lastU
24             f_0 alert(msg)
25             f_0 blur()
26             f_0 clearInterval(id_setinterval)
27             f_0 clearTimeout(id_settimeout)
28             var tdiv
29             f_0 addEventListener('click', myfunc, false);
30             f_0 addEventListener('dblclick', myfunc, false);
31             f_0 addEventListener('mousedown', myfunc, false);
32             f_0 addEventListener('mouseup', myfunc, false);
33             f_0 addEventListener('mouseover', myfunc, false);
34             f_0 addEventListener('mouseout', myfunc, false);
35
36 ▾     if (overlay != 0) {
37         overlaySetup('lc');
38     }

```

Figure 230: JavaScript Content Completion Assistant

The **Content Completion Assistant** collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

JavaScript Outline View

[Edit on GitHub](#)

Oxygen XML Author present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

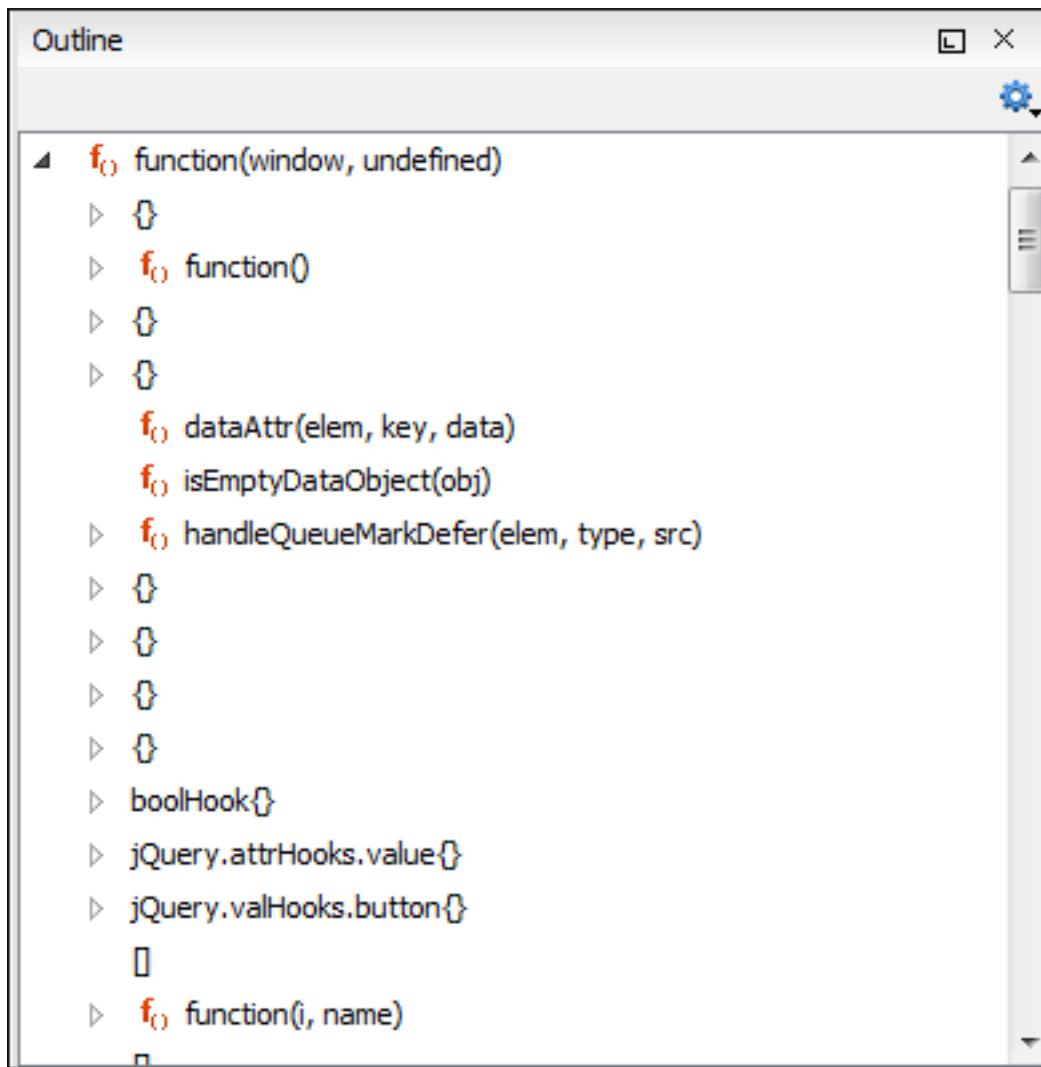

Figure 231: JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

- **f₀** - function
- **v** - variable
- **o** - object
- **p** - property
- **f₀** - method

The contextual menu of the JavaScript **Outline** view contains the usual **Cut**, **Copy**, **Paste**, and **Delete** actions. From the **Settings** menu, you can enable the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

Editing SVG Files

[Edit on GitHub](#)

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text,

and embedded raster graphics with many painting styles, scripting through languages such as *ECMAScript*, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation frameworks (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Author adds SVG support by using the *Batik distribution* package (an open source project developed by the Apache Software Foundation) and the *default XML catalog* resolves the SVG DTD.

Note: Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the *Batik Implementation Status* page.

How to Render SVG Images that Use Java Scripting

1. Copy the `js.jar` library from the *Batik distribution* into the Oxygen XML Author `lib` folder.
2. Restart the application.

Standalone SVG Viewer

[Edit on GitHub](#)

Oxygen XML Author includes a simple *SVG Viewer* that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

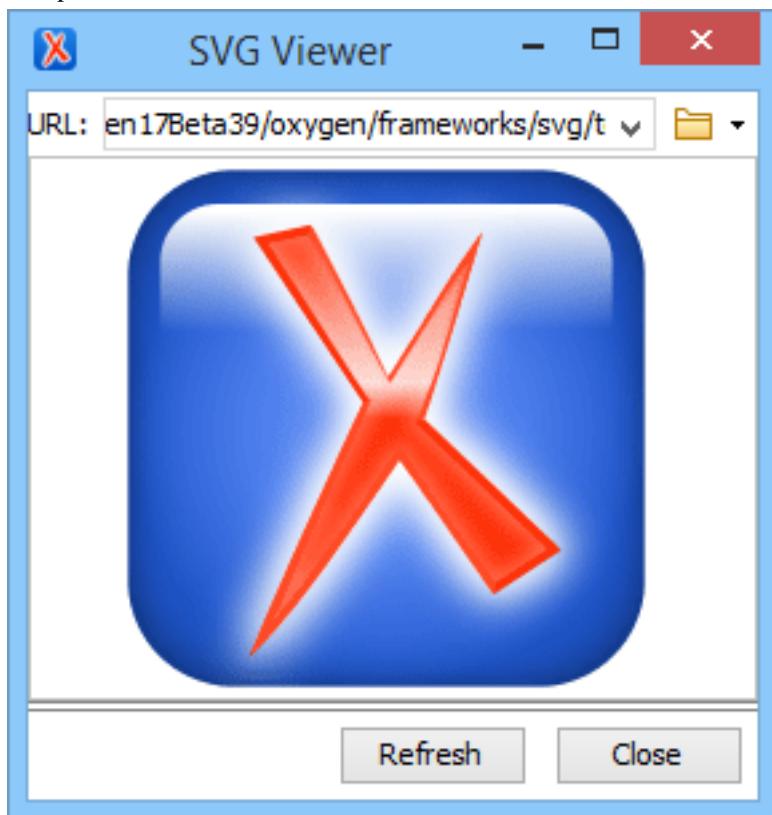

Figure 232: SVG Viewer

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project** view and selecting **Open with > SVG Viewer**.

Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

Pan

To pan an image, **click and drag** the image with your mouse.

[SVG 1.2 Rendering Issues](#) on page 1573

[Edit on GitHub](#)

Integrated SVG Viewer in the Results Panel

Oxygen XML Author includes an integrated *SVG Viewer* that can render the results of an XSLT transformation scenario that generates SVG images in the results panel at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select **Show in results view as > SVG** in the [*Output tab of the XSLT transformation scenario configuration dialog box*](#). When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the results panel.

Example of a Use-Case

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Author or exported from a external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.
3. Create an *XML transformation with XSLT scenario*.
4. While configuring the transformation scenario, select *Show in results view as > SVG in the Output tab* of the configuration dialog box.
5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the results panel at the bottom of the editor.

Figure 233: Integrated SVG Viewer

Editing XHTML Documents

[Edit on GitHub](#)

Oxygen XML Author provides support for editing XHTML files. Oxygen XML Author includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the `[OXYGEN_INSTALL_DIR]/samples/xhtml` folder.

The XHTML editing features include:

- **Source Editing** - You can edit XHTML files in the **Text** editing mode (XML source editor) using all of its *useful features*.
- **Visual Editing** - You can edit XHTML files in the visual **Author** editing mode using all of its *authoring features*.
- **Validation** - Easily identify errors and their location with the Oxygen XML Author *XML validation features*.
- **Content Completion** - The **Content Completion Assistant** displays a list of context-sensitive proposals that are valid at the current cursor position.
- **Import HTML as XHTML** - Oxygen XML Author includes support for *importing HTML files as an XML document*.
- **Remote Editing** - Oxygen XML Author has built-in support for *editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols*, allowing you to edit XHTML pages from your web server.

- **Syntax Highlighting** - XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

[XHTML Document Type](#) on page 1076

Spell Checking

[Edit on GitHub](#)

Oxygen XML Author includes an [automatic \(as-you-type\) spell checking feature](#), as well as a manual spell checking action to open a **Spelling** dialog box that offers a variety of options. To open this dialog box, use the **Check Spelling** action on the toolbar or from the **Edit** menu.

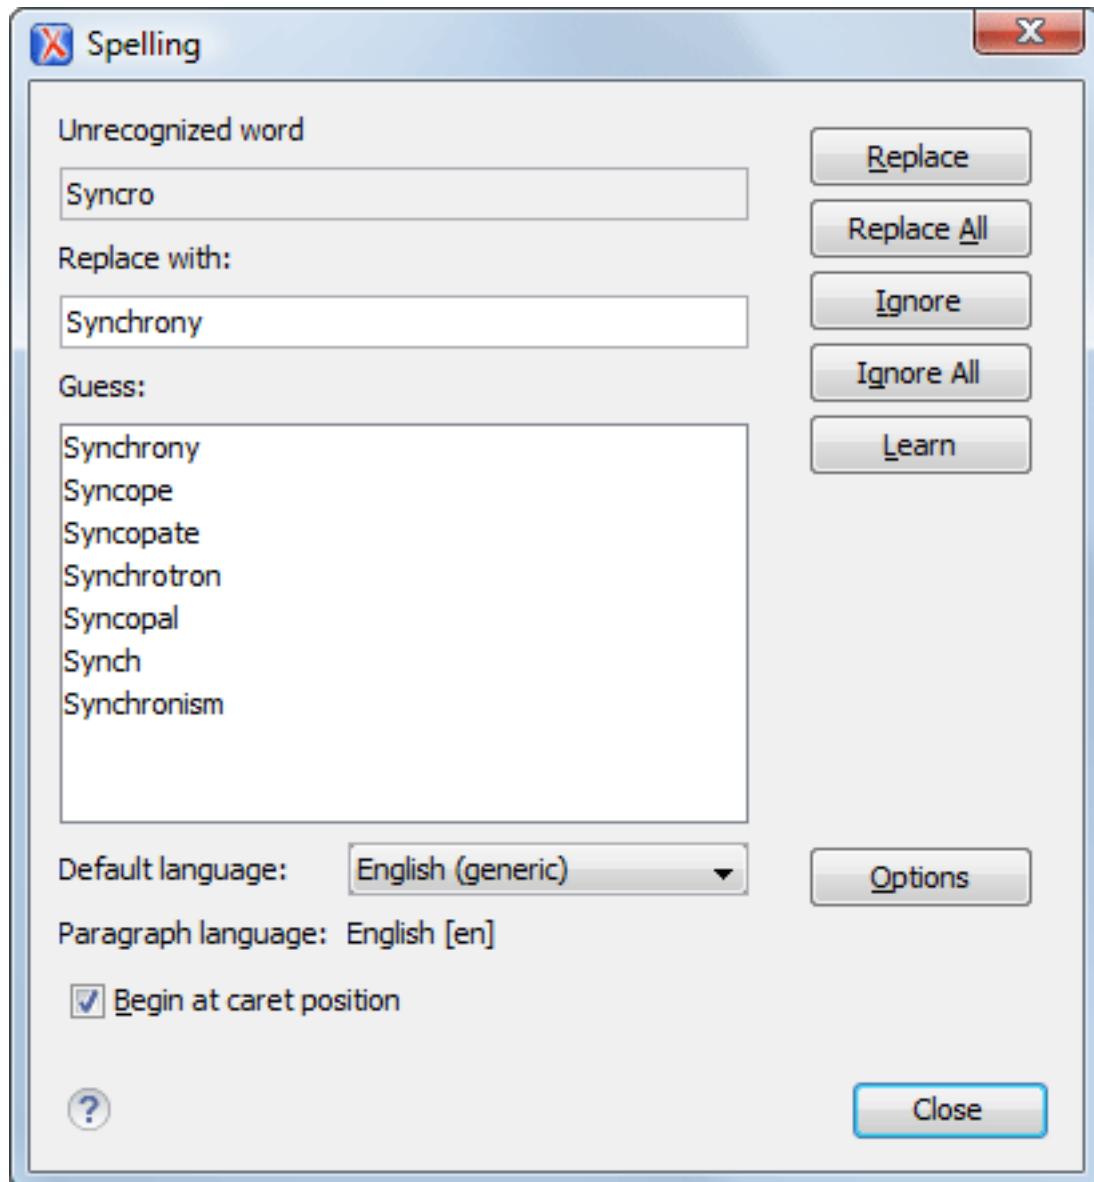

Figure 234: Check Spelling Dialog Box

The **Spelling** dialog box contains the following fields:

- **Unrecognized word** - Contains the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.
- **Replace with** - The character string that is suggested to replace the unrecognized word.
- **Guess** - Displays a list of words suggested to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.
- **Default language** - Allows you to select the default dictionary used by the spelling engine.
- **Paragraph language** - In an XML document, you can mix content written in multiple languages. To tell the spell checker engine what language was used to write a specific section, you need to set the language code in the `lang` or `xml : lang` attribute to that section. Oxygen XML Author automatically detects such sections and instructs the spell checker engine to apply the appropriate dictionary.
- **Replace** - Replaces the currently highlighted word in the XML document, with the selected word in the **Replace with** field.
- **Replace All** - Replaces all occurrences of the currently highlighted word in the XML document, with the selected word in the **Replace with** field.
- **Ignore** - Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Author skips the content of the XML elements *marked as ignorable*.
- **Ignore All** - Ignores all instances of the unknown word in the current document.
- **Learn** - Includes the unrecognized word in the list of valid words.
- **Options** - Sets the configuration options of the spell checker.
- **Begin at cursor position** - Instructs the spell checker to begin checking the document starting from the current cursor position.
- **Close** - Closes the dialog box.

Spell Checking Dictionaries

[Edit on GitHub](#)

There are two spell checking engines available in Oxygen XML Author: **Hunspell** checker (default setting) and **Java** checker. You can set the spell check engine in the **Spell checking engine** preferences page. The dictionaries used by the two engines differ in format, so you need to follow specific procedures to add another dictionary to your installation of Oxygen XML Author.

Dictionaries for the Hunspell Checker

[Edit on GitHub](#)

The Hunspell spell checker is open source and has LGPL license. The format of the Hunspell spell dictionary is supported by Mozilla, OpenOffice and the Chrome browser. Oxygen XML Author includes the following built-in dictionaries for the Hunspell checker:

- English (US)
- English (UK)
- French
- German
- Spanish.

Each language-country variant combination has its specific dictionary. If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a dictionary from this list follow [these instructions](#).

Add Dictionaries for the Hunspell Checker

[Edit on GitHub](#)

To add new spelling dictionaries to Oxygen XML Author, or to replace an existing one, follow these steps:

1. [Download the files](#) you need for your language dictionary.

2. The downloaded .oxt file is a zip archive. If you are creating a new dictionary, copy the .aff and .dic files from this archive in the spell subfolder of the Oxygen XML Author preferences folder.

The Oxygen XML Author preferences folder is [APPLICATION-DATA-FOLDER] / com.oxygenxml.author>, where [APPLICATION-DATA-FOLDER] is:

- C:\Users\[USER-NAME]\AppData\Roaming on Windows 7/8/10
- [USER-HOME-FOLDER]/Library/Preferences on OS X
- [USER-HOME-FOLDER] on Linux

3. If you are updating an existing dictionary, copy the .aff and .dic files into the following folder: [OXYGEN_INSTALL_DIR]/dicts/spell.
4. Restart the application after copying the dictionary files.

Note: You can specify that Oxygen XML Author includes dictionaries and term lists from a custom location by selecting the **Include dictionaries and term list from option** and specifying its path in the **Dictionaries** preferences page.

Related information

[Adding Term Lists](#) on page 647

Dictionaries for the Java Checker

[Edit on GitHub](#)

A Java spell checker dictionary has the form of a .dar file located in the directory [OXYGEN_INSTALL_DIR] / dict. Oxygen XML Author includes the following built-in dictionaries for the Java checker:

- English (US)
- English (UK)
- English (Canada)
- French (France)
- French (Belgium)
- French (Canada)
- French (Switzerland)
- German (old orthography)
- German (new orthography)
- Spanish

A pre-built dictionary can be added by copying the corresponding .dar file to the folder [OXYGEN_INSTALL_DIR]/dicts and restarting Oxygen XML Author. There is one dictionary for each language-country variant combination.

Learned Words

[Edit on GitHub](#)

Spell checker engines rely on dictionaries to decide that a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Press the **Learn** button from the [Spelling dialog box](#).

Note: To delete items from the list of learned words, select **Delete learned words** in the [Editor > Spell Check > Dictionaries preferences page](#).

Adding Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors,

Oxygen XML Author provides a way of adding industry-specific terms to the spell checker engine. This involves creating a file (*term list*) similar in structure to the file used by Oxygen XML Author for storing *learned words*.

The term list files are specific for each language and can also be specific to each domain or area of expertise (for example, *legal*, *medical*, *automotive*, etc.).

To create a custom term file, follow this procedure:

1. Create a text file using one of the following naming conventions:

- <languageCode>-<name>.tdi

For example, a term file for a list of French medical terms could be named `fr-medical.tdi`.

- <languageCode_countryCode>-<name>.tdi

For example, a term file for a list of English legal terms can be named `en_US-legal.tdi` for American English, or `en_GB-legal.tdi` for their British counterparts.

2. Edit the term file you just created and add the terms. Make sure that you only add one term per line.

3. Save the term file in the Oxygen XML Author default dictionary location:

- [HOME_DIR]/AppData/Roaming/com.oxygenxml.author/spell folder on Windows Vista/7/8/10.
- [HOME_DIR]\Application Data\com.oxygenxml.author\spell folder on Windows XP.
- [HOME_DIR]/Library/Preferences/com.oxygenxml.author/spell folder on OS X.
- [HOME_DIR]/com.oxygenxml.author/spell folder on Linux.

Note: To change the default dictionary location folder go to the [Editor > Spell Check > Dictionaries preferences page](#).

Ignored Words (Elements)

[Edit on GitHub](#)

The content of some XML elements such as `programlisting`, `codeblock`, or `screen` should always be skipped by the spell checking process. The skipping can be done manually, word by word by the user using the **Ignore** button of [the Spelling dialog box](#), or automatically by maintaining a set of known element names that should never be checked. You maintain this set of element names [in the user preferences](#) as a list of XPath expressions that match the elements.

Only a small subset of XPath expressions is supported, that is only the '/' and '//' separators and the '*' wildcard. Two examples of supported expressions are `/a/*/b` and `//c/d/*`.

Automatic Spell Check

[Edit on GitHub](#)

Oxygen XML Author includes an option to automatically check the spelling as you type. This feature is disabled by default, but it can be enabled and configured in the [Spell Check preferences page](#). When the **Automatic Spell Check option** is enabled, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

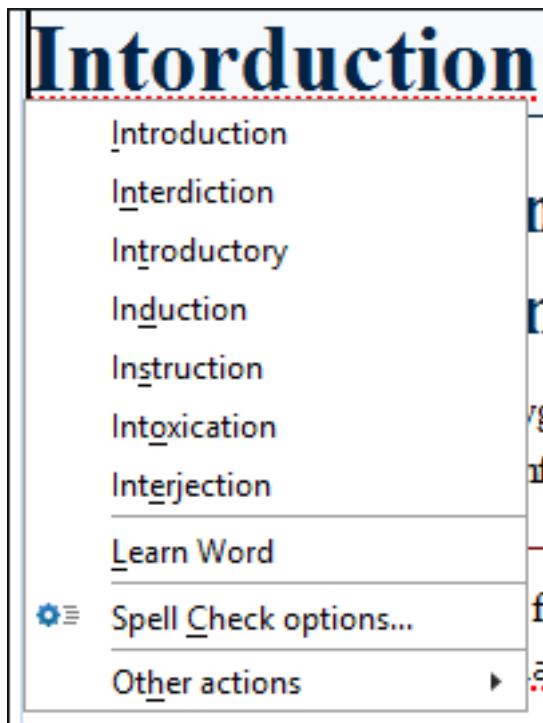

Figure 235: Automatic Spell Checking in Author Mode

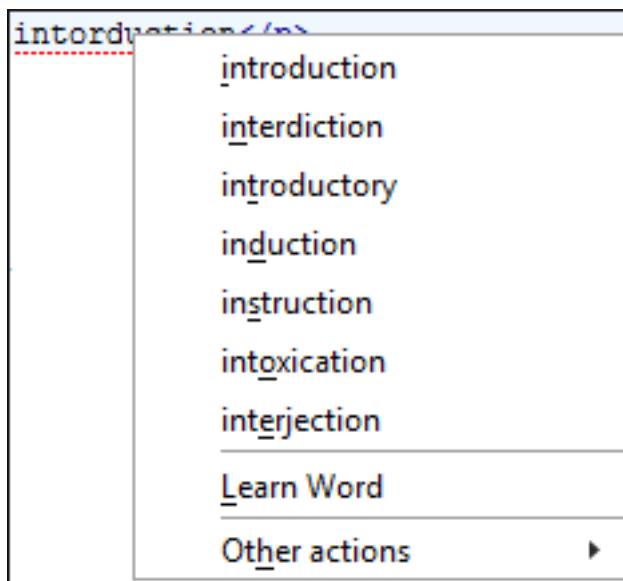

Figure 236: Automatic Spell Checking in Text Mode

The contextual menu includes the following actions:

- | | |
|--|---|
| Delete Repeated Word | Allows you to delete repeated words. |
| List of Suggestions | A list of words suggested by the spell checking engine as possible replacements for the unknown word. |
| Learn Word | Allows you to add the current unknown word to the persistent dictionary. |
| Spell check options (Available in Author mode only) | Opens the <i>Spell Check preferences page</i> . |

Other actions

This submenu give you access to all the usual contextual menu actions.

Related information

[Learned Words](#) on page 647

Spell Checking in Multiple Files

[Edit on GitHub](#)

The **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The **Edit** menu.
- The contextual menu of the **Project** view.
- The contextual menu of the **DITA Maps Manager** view.

The spelling corrections are displayed in [the Results view](#), that allows you to group the reported errors as a tree with two levels.

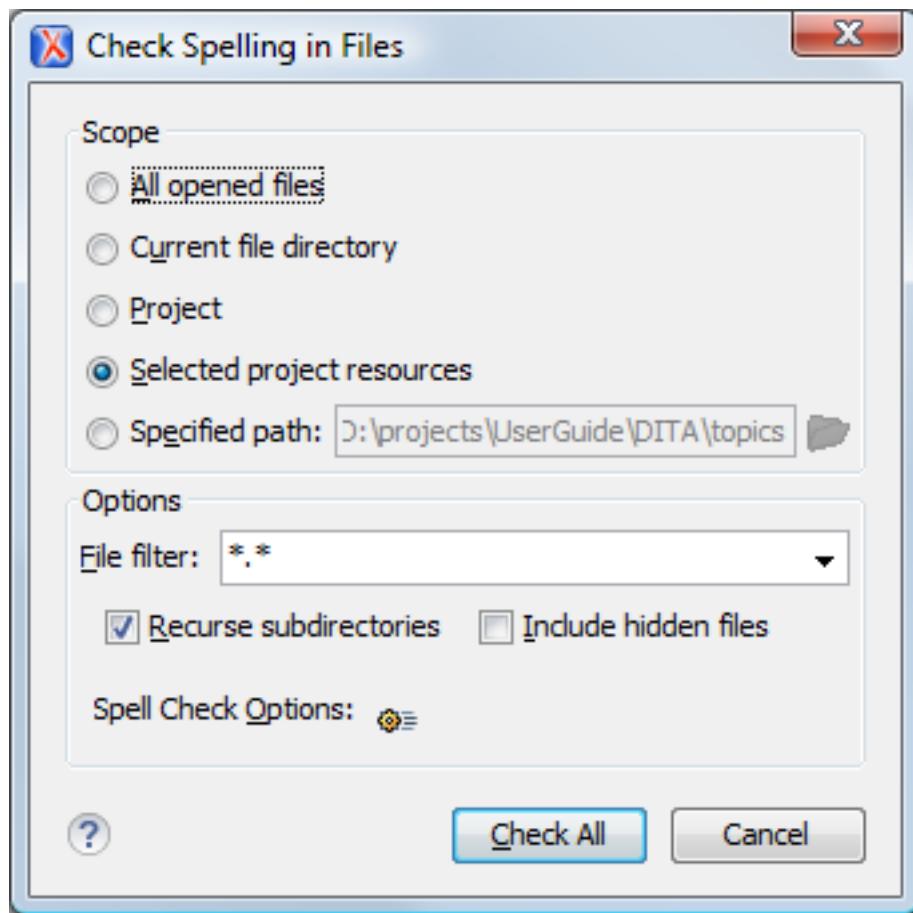

Figure 237: Check Spelling in Files Dialog Box

The following scopes are available:

- **All opened files** - The spell check is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.

- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the [Spell Check preferences panel](#)

When you invoke the **Check Spelling in Files** action in the **DITA Maps Manager** view, a different dialog box is displayed:

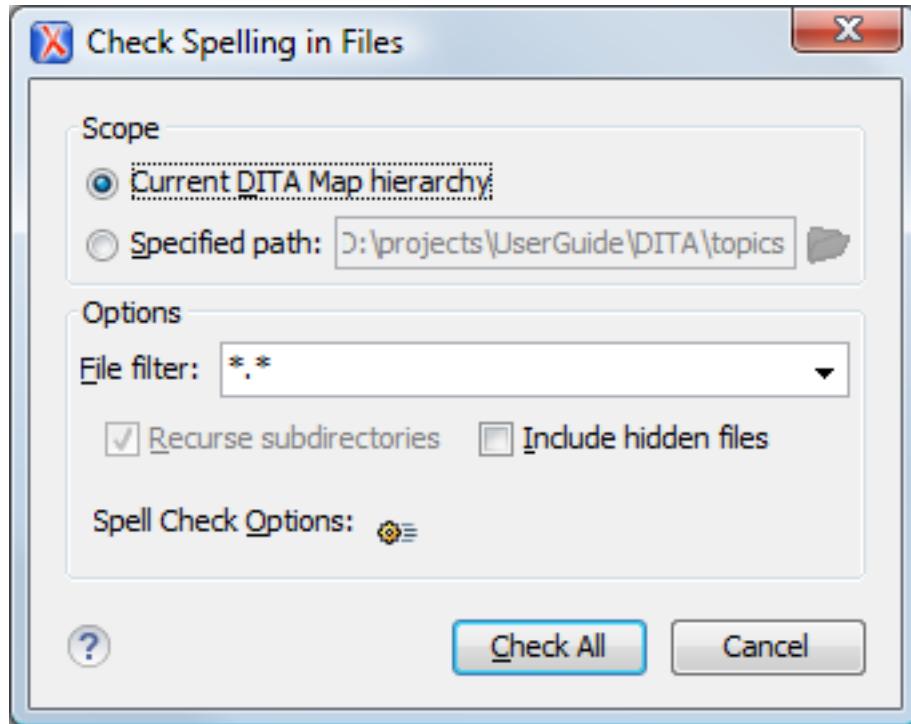

Figure 238: Check Spelling in Files Dialog Box (Invoked from the DITA Maps Manager View)

The following scopes are available:

- **Current DITA Map hierarchy** - All the files referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view
- **Specified path** - checks the spelling in the files located at a path that you specify

AutoCorrect Misspelled Words

[Edit on GitHub](#)

Oxygen XML Author includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in **Author** mode. Oxygen XML Author includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the *AutoCorrect* feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the Replacements table.

When enabled, the *AutoCorrect* feature can be used to do the following:

- Automatically correct misspelled words while you edit in **Author** mode.
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R).

- Quickly insert text fragments.

AutoCorrect is enabled by default. To configure this feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; : ? ! ' ")] }). After a correction, the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following options:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the [AutoCorrect Replacements Table](#) and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the [Use additional suggestions from the spell checker option](#) is enabled in the [AutoCorrect preferences page](#) and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of *learned words*.
- **AutoCorrect options** - Opens the [AutoCorrect preferences page](#) that allows you to configure the feature.

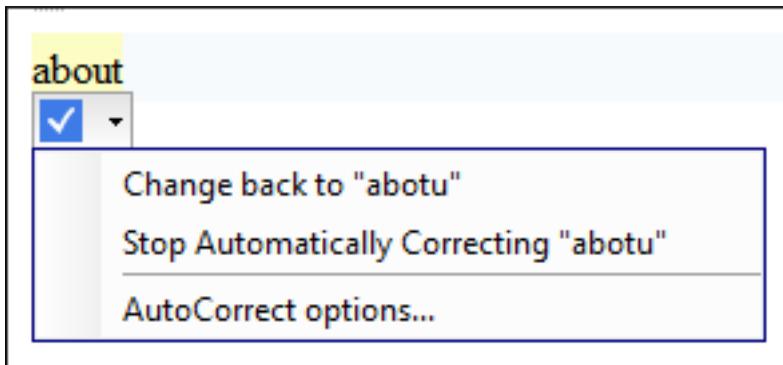

Figure 239: AutoCorrect Widget

The *AutoCorrect* feature results in the following types of substitutions in regards to case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

The *AutoCorrect* feature also uses the list of [ignored elements from the Spell Check preferences page](#). All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.

Add Dictionaries for the AutoCorrect Feature

[Edit on GitHub](#)

To add new dictionaries for the *AutoCorrect* feature, or to replace an existing one, follow these steps:

1. [Download the files](#) you need for your language dictionary.
2. If you are creating a new dictionary, copy the downloaded .dat files to the `autocorrect` subfolder of the Oxygen XML Author preferences folder.

The Oxygen XML Author preferences folder is `[APPLICATION-DATA-FOLDER] / com.oxygenxml.author>`, where `[APPLICATION-DATA-FOLDER]` is:

- C:\Users\[USER-NAME]\AppData\Roaming on Windows Vista/7/8/10
 - [USER-HOME-FOLDER]/Library/Preferences on OS X
 - [USER-HOME-FOLDER] on Linux
3. If you are updating an existing dictionary, copy the .dat file to the following folder:
[OXYGEN_INSTALL_DIR]/dicts/autocorrect.
 4. Restart the application after copying the dictionary files.

Note: You can setup Oxygen XML Author to use dictionaries from a custom location configured in [the Dictionaries preferences page](#).

Loading Large Documents

[Edit on GitHub](#)

When you open a document with a file size larger than the limit configured in [Open/Save preferences](#), Oxygen XML Author prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

If your file has a size smaller than 300 MB, the recommended approach is [Optimize loading for large files](#). For documents that exceed 300 MB the recommended approach is [Optimize loading for huge files](#).

File Sizes Smaller than 300 MB

[Edit on GitHub](#)

For editing large documents (file size up to 300 Megabytes), a special memory optimization is implemented on loading such a file so that the total memory allocated for the application is not exceeded.

A temporary buffer file is created on disk so you have to make sure that the available free disk space is at least double the size of the large file that you want to edit. For example, Oxygen XML Author can load a 200-Megabytes file using a minimum memory setting of 512 Megabytes and at least 400-Megabytes free disk space.

The increase of the maximum size of editable files includes the following restrictions:

- A file larger than the value of the above option is edited only in **Text** mode.
- The [automatic validation](#) is not available when editing a very large file.
- The XPath filter is disabled in [the Find/Replace dialog box](#).
- The bidirectional Unicode support (right-to-left writing) is disabled.
- [The option Format and indent the document on open](#) is disabled for non-XML documents. For XML documents, it is done optimizing the memory usage but without respecting the options set in [the Format preferences page](#).
- Less precise localizations for the results of an [XPath expression](#).

File Sizes Greater than 300 MB

[Edit on GitHub](#)

Files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between different database formats. Traditional text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all the file content must be loaded in memory before the user can actually view it.

The file is split in multiple pages (each having about 1MB in size). Each page is individually loaded (and edited) in the **Text** mode by using the special horizontal slider located at the top of the editing area. The loading operation is very fast and has no upper limit for the size of the loaded file.

The increase of the maximum size of editable files includes the following restrictions:

- For XML files, only the UTF-8, UTF-16, and ASCII encodings are handled; for all non-XML files, the content is considered to be UTF-8.

- Files can be edited in **Text** editing mode only.
- The *automatic validation* is disabled.
- The XPath filter is disabled in *the Find/Replace dialog box*.
- The bidirectional Unicode support (right-to-left writing) is disabled.
- *The Format and indent the document on open option* is disabled for non-XML documents. For XML documents, the format and indent operation it is done optimizing the memory usage, but it ignores the options set in *the Format preferences page*.
- The **Outline** view is not supported.
- The file content is soft wrapped by default.
- The **Find/Replace** dialog box only supports the **Find** action.
- Saving changes is possible if **Safe save** is activated.
- The **undo** operation is not available if you go to other pages and come back to the modified page. the Undo operation loses its previous states if the back and forth between

Scratch Buffer

[Edit on GitHub](#)

A handy addition to the document editing is the **Scratch Buffer** view used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the scratch buffer to the editor panel. The **Scratch Buffer** is basically a text area offering XML syntax highlight. The view contextual menu contains basic edit actions such as **Cut**, **Copy**, and **Paste**.

Handling Read-Only Files

[Edit on GitHub](#)

If a file marked as read-only is opened in Oxygen XML Author you can by default perform modifications to it. This behavior is controlled by the *Can edit read only files option*. When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the **Properties view**. If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.

Editing Documents with Long Lines

[Edit on GitHub](#)

Documents that contain long lines can affect performance when opened in **Text** mode. If you choose to present the document with the *Line wrap option* enabled, the following features may be affected:

- The editor uses the Monospaced font.
- You cannot set font styles.
- Automatic validation is disabled.
- Automatic spell checking is disabled.
- When editing XML documents, the **XPath** field is disabled in the **Find/Replace** dialog box.
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. We recommend using XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.

XML Digital Signatures

[Edit on GitHub](#)

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

[Edit on GitHub](#)

Digital signatures are widely used as security tokens, not just in XML. A digital signature provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A digital signature must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The signature must provide a way to establish the identity of the data's signer for authentication.
- The signature must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A public key system is used to create the digital signature and it's also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, [XML-Signature Syntax and Processing](#)). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The XML Signature is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of canonicalization and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

To canonicalize something means to put it in a standard format that everyone generally uses. Since the signature is dependent on the content it is signing, a signature produced from a non-canonicalized document could possibly be different from one produced from a canonicalized document. The canonical form of an XML document is physical representation of the document produced by the method described in this specification. The term canonical XML refers to XML that is in canonical form. The XML canonicalization method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. The term XML canonicalization refers to the process of applying the XML canonicalization method to an XML document or document subset. XML canonicalization is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the canonical form of the original document before application processing with the canonical form of the document result of the application processing.

A digital signature over the canonical form of an XML document or document subset would allow the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the canonical form of the document. The document is then transferred to

the relying party, which validates the signature by reading the document and computing a digest of the canonical form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the canonical forms for which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following canonicalization algorithms are used in Oxygen XML Author: Canonical XML (or Inclusive XML Canonicalization)([XMLC14N](#)) and Exclusive XML Canonicalization([EXC14N](#)). The first is used for XML where the context doesn't change while the second was designed for canonicalization where the context might change.

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The canonicalization method can specify whether or not comments should be included in the canonical form output by the XML canonicalization method. If a canonical form contains comments corresponding to the comment nodes in the input node-set, the result is called canonical XML with comments. In an uncommented canonical form comments are removed, including delimiter for comments outside document element.

The three operations. [Canonicalize](#), [Sign](#), and [Verify Signature](#), are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

[Edit on GitHub](#)

Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores*.

A *keystore* is an encrypted file that contains private keys and certificates. All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

In Oxygen XML Author there are provided two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

To configure the options for a certificate or to validate it, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Signing Certificates**. This opens [the certificates preferences page](#).

[Digital Signatures Overview](#) on page 655

Canonicalizing Files

[Edit on GitHub](#)

You can select the canonicalization algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

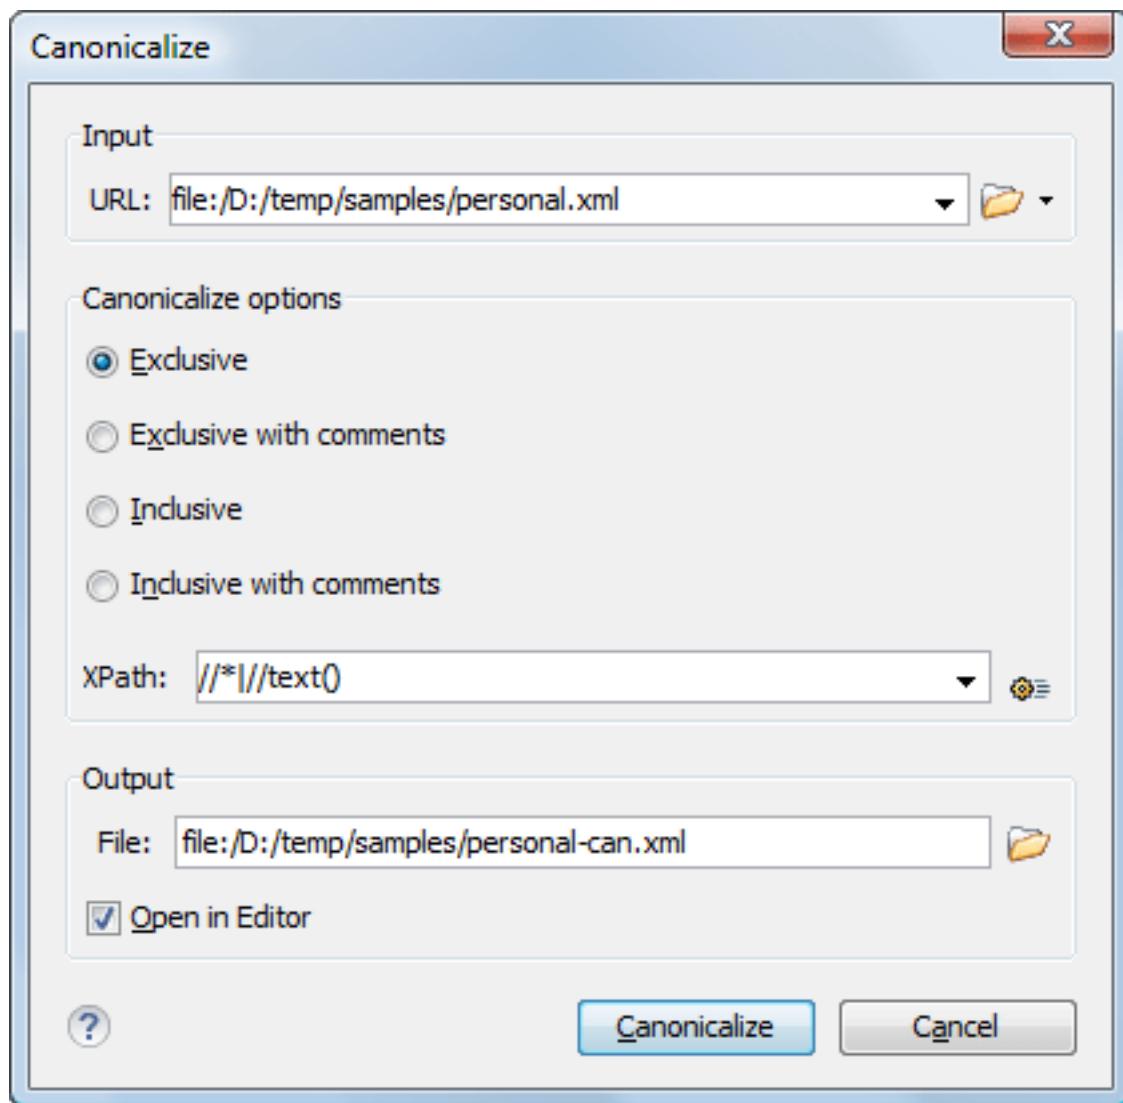

Figure 240: Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into

other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in the editor.

Signing Files

[Edit on GitHub](#)

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

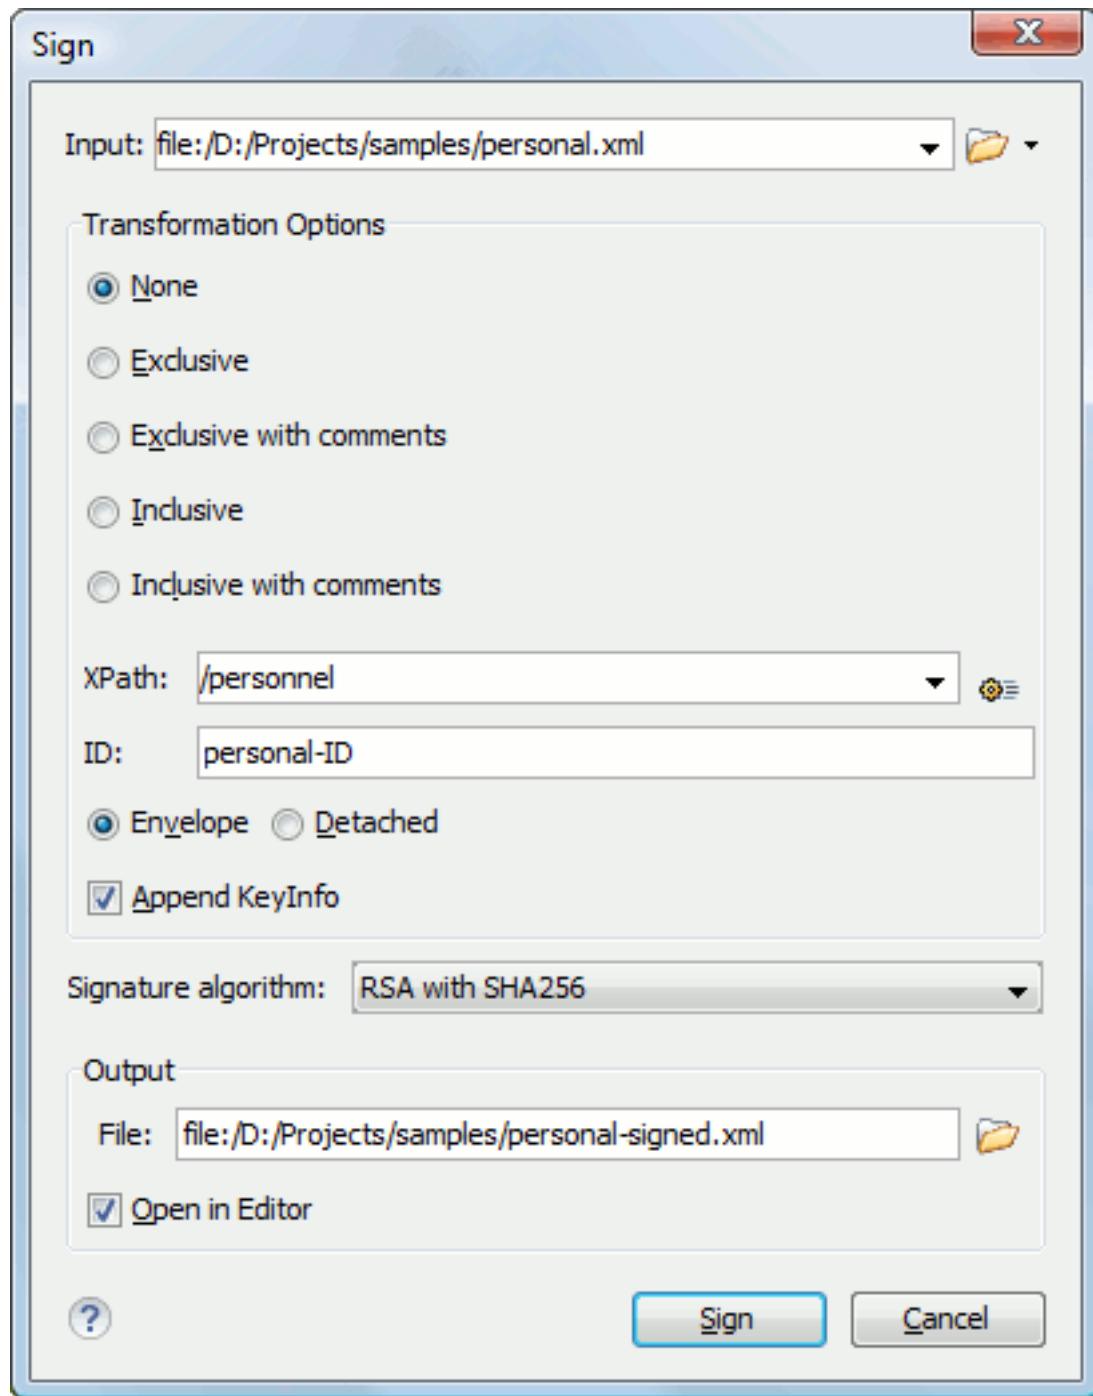

Figure 241: Signature Settings Dialog Box

The following options are available:

Note: If Oxygen XML Author could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page](#) where you can configure a valid certificate.

! Could not obtain a valid certificate. You must configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.

- **Transformation Options** - See the [Digital Signature Overview](#) section for more information about these options.

- **None** - If selected, no canonicalization algorithm is used.

- **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.

- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) for more information.
- **Append KeyInfo** - If this option is checked, the `ds:KeyInfo` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in Oxygen XML Author.

[Edit on GitHub](#)

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Example of How to Digitally Sign XML Files or Content

[Edit on GitHub](#)

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Author includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Author installation directory includes a `samples` folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `person` elements inside the `personnel` element. Suppose you want to digitally sign the specific `person` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `personal.xml` file in Oxygen XML Author in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu.
The **Sign** dialog box is displayed.

Tip: If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Author cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the [XML Signing Certificates preferences page](#) that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
 - a) Select one of [the Transformation Options](#). For the purposes of this example, select the **Inclusive with comments** option.
 - b) Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
 - c) Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
 - d) Select [the Envelope option](#) and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

[Verifying Signature](#) on page 660

Compare Files or Directories

[Edit on GitHub](#)

Oxygen XML Author provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: **Compare Directories** or **Compare Files**. These utilities are available from the **Tools** menu or can be opened as stand-alone applications from the Oxygen XML Author installation folder (`diffDirs.exe` and `diffFiles.exe`).

Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (`diffFiles.bat` and `diffDirs.bat` on Windows, `diffFiles.sh` and `diffDirs.sh` on Unix/Linux, `diffFilesMac.sh` and `diffDirsMac.sh` on OS X). To specify files or directories to compare,

you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: *zip*, *docx*, and *xlsx*).

For example, to start the comparison between the two Windows directories `c:\Program Files` and `c:\ant`, use the following command:

```
diffDirs.bat "c:\Program Files" "c:\ant"
```

If there are spaces in the path names, surround the paths with quotes. If you pass only one argument, you are prompted to manually choose the second directory or archive. This is also true for the files comparison utility.

Compare Files

[Edit on GitHub](#)

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffFiles.exe`).

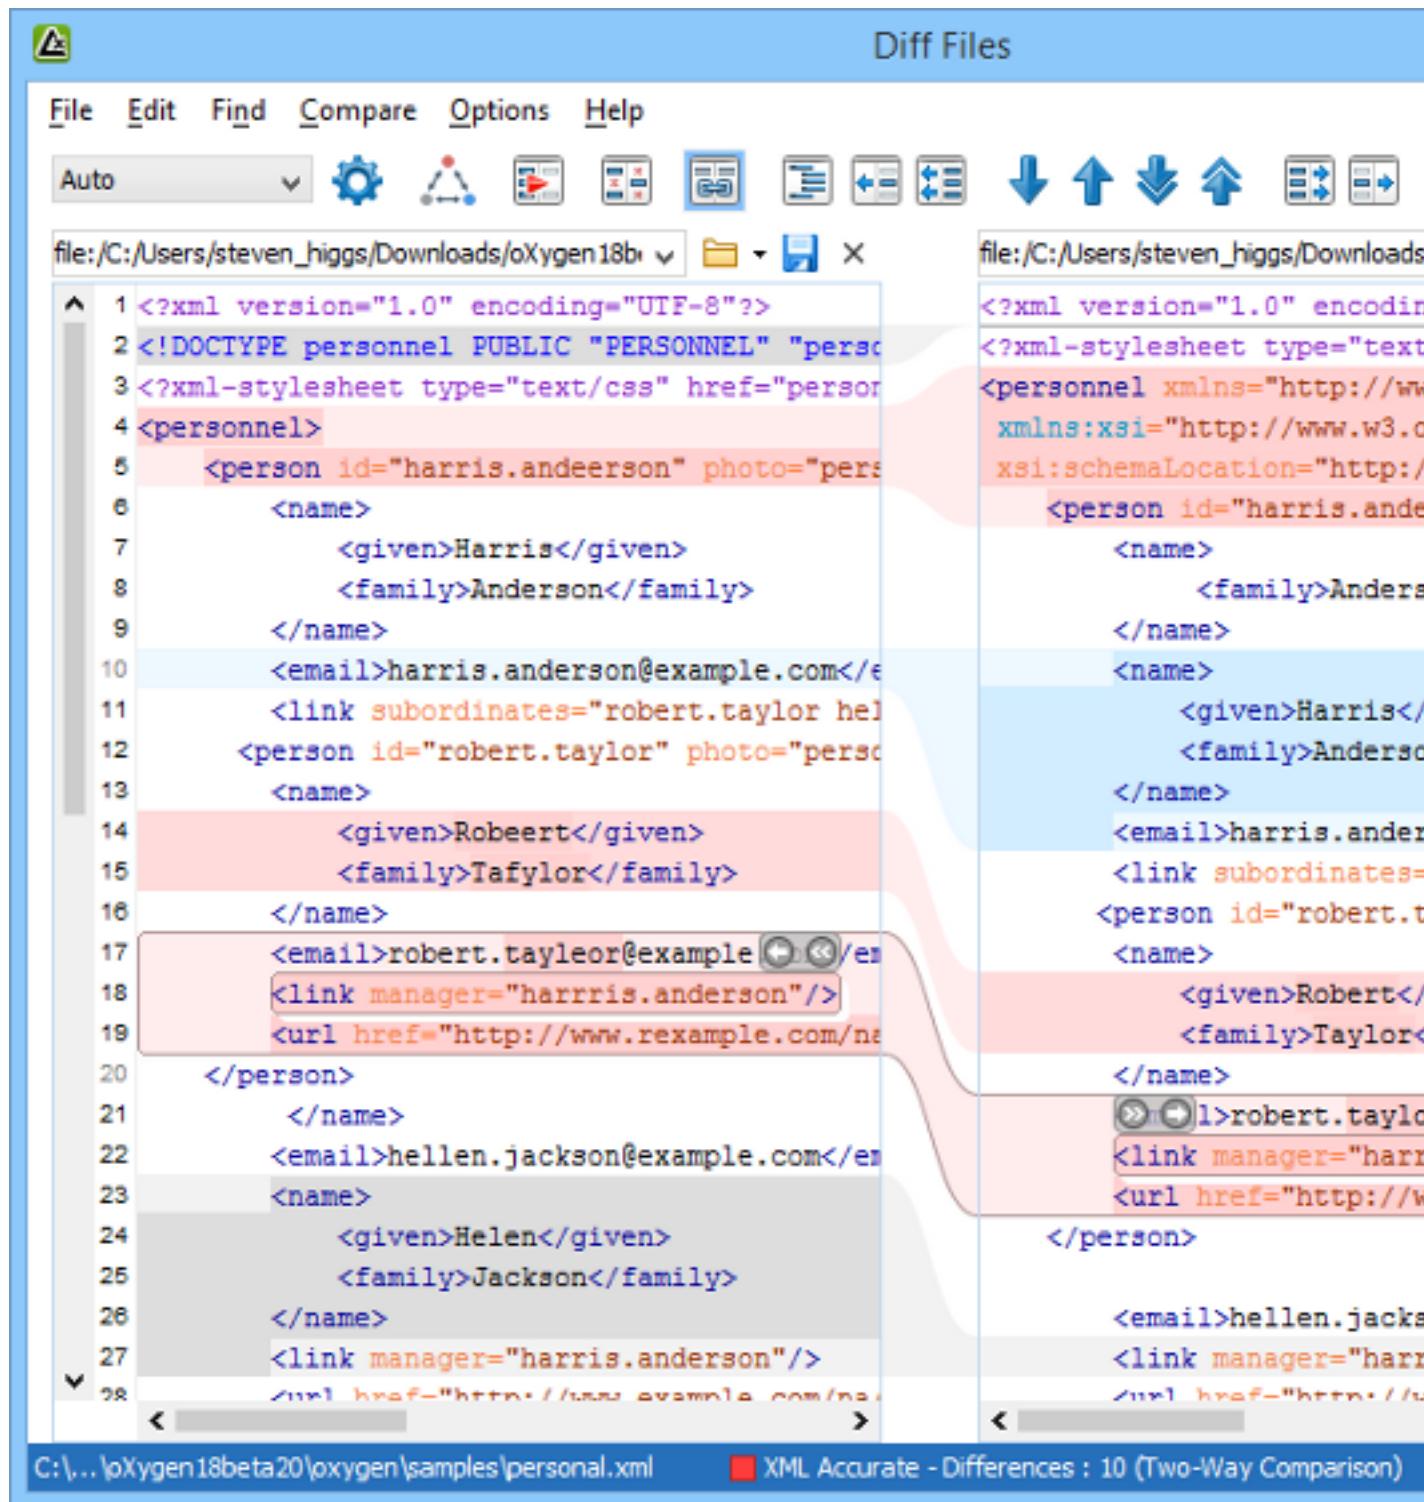

Figure 242: Compare Files Tool

Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

Compare Files

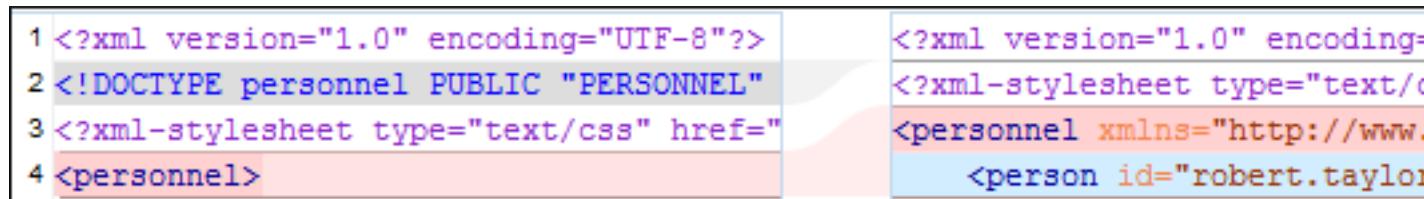

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the  **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the  **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
4. You can also use the  **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <!DOCTYPE personnel PUBLIC "PERSONNEL"
3 <?xmlstylesheet type="text/css" href="
4 <personnel>
```

Figure 243: Two-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Compare Fragments

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the  **Close (Ctrl + W (Command + W on OS X))** button, before pasting the fragments. If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

 **Append left change to right and Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

 **Copy change from left to right and Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

 **Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Author offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the [New](#) dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
 - The name of an XML tag
 - The < character
 - The /> sequence of characters
 - The name of an attribute inside an XML tag
 - The = sign
 - The " character
 - An attribute value
 - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Three-Way Comparisons

Oxygen XML Author also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, a remote change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

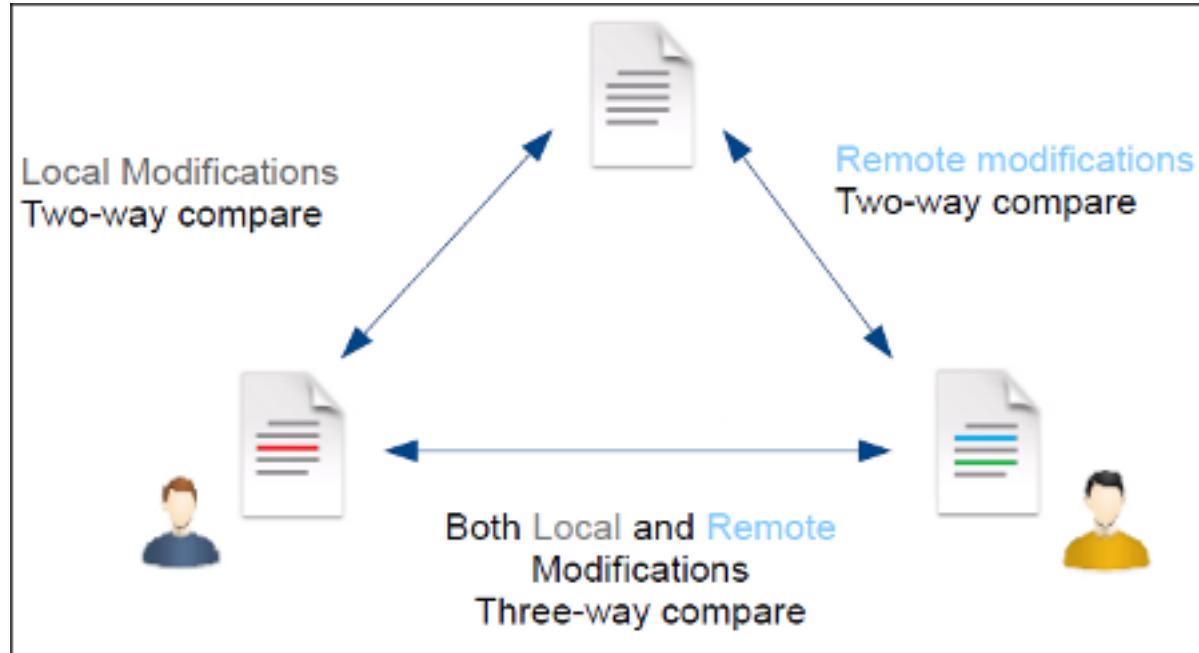

Figure 244: Three-Way Comparison

Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
Step Result: The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.
2. Click the **Three-Way Comparison** button on the toolbar and select the base file in the **Ancestor** field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the **algorithm** for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

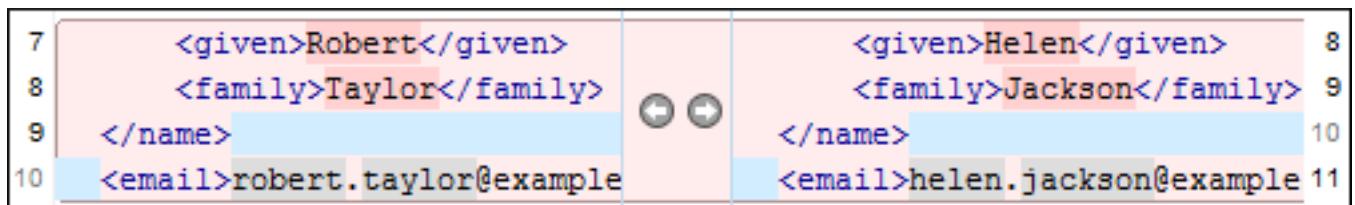

Figure 245: Three-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and **Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and **Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms

Oxygen XML Author offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second Level Comparisons

Oxygen XML Author automatically performs a second level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons are processed on text nodes using a word level comparison, meaning that it looks for identical words. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

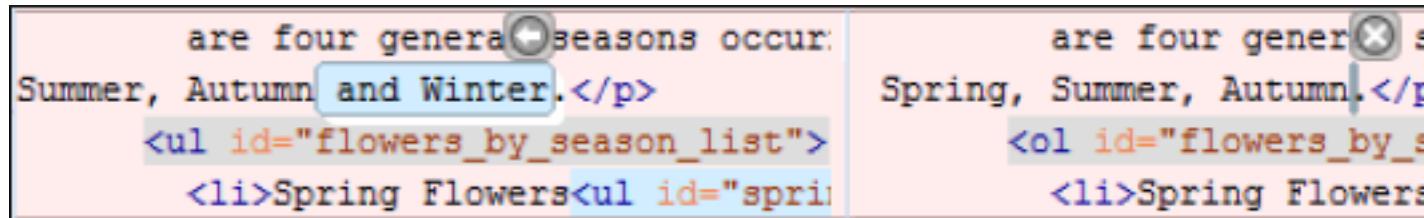

Figure 246: Second Level Diff Comparison

Note: If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second level comparison will not automatically be performed. In this case you can manually select a second level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

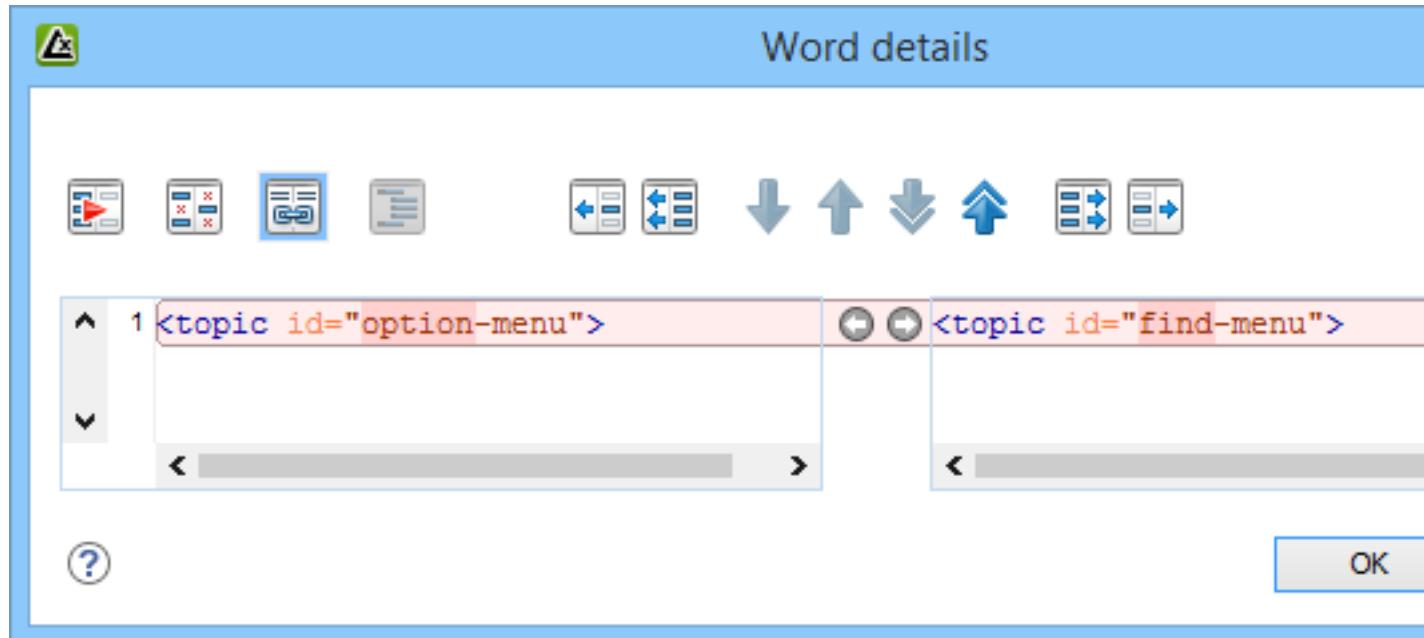

Figure 247: Word Level Comparison

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

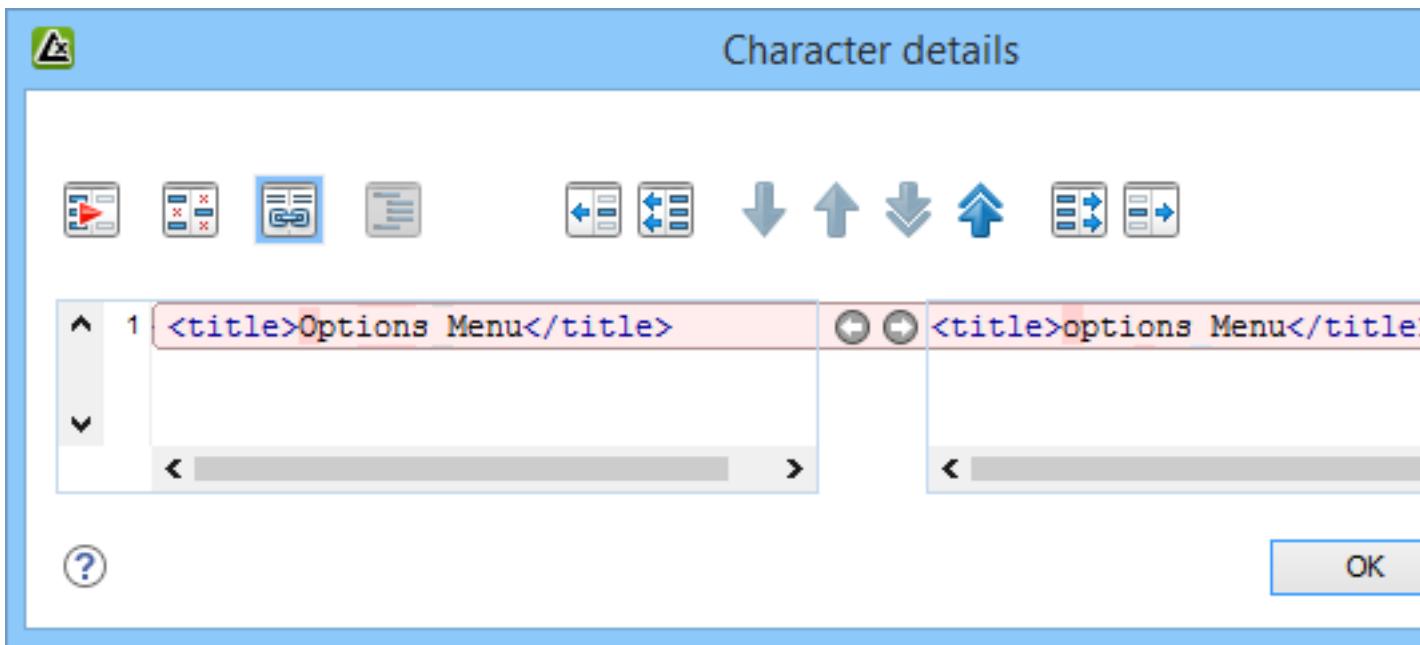

Figure 248: Character Level Comparison

Compare Files Tool Menus

[Edit on GitHub](#)

This section describes the actions that are available in the menus of the **Files Comparison** interface.

File Menu

[Edit on GitHub](#)

The **File** menu of the files comparison tool contain the following actions:

Source

The file that is displayed in the left side of the application window.

- **Source > Open** - Browses for a source file.
- **Source > Open URL** - Opens the URL to be used as a source file. See [Open URL](#) for details.
- **Source > Open File from Archive** - Browses an archive content for a source file.
- **Source > Save** - Saves the changes made in the source file.
- **Source > Save As** - Displays the **Save As** dialog box that allows you to save the source file with a new name.
- **Source > Close** - Closes the source file.

Target

The file that is displayed in the right side of the application window.

- **Target > Open** - Browses for a target file.
- **Target > Open URL** - Opens the URL to be used as a target file. See [Open URL](#) for details.
- **Target > Open File from Archive** - Browses an archive content for a target file.
- **Target > Save** - Saves the changes made in the target file.
- **Target > Save As** - Displays the **Save As** dialog box that allows you to save the target file with a new name.
- **Target > Close** - Closes the target file.

Ancestor

The base file that will be compared with both files in a [three-way comparison](#).

- **Ancestor > Open** - Browses for a target file.
- **Ancestor > Open URL** - Opens the URL to be used as a target file. See [Open URL](#) for details.
- **Ancestor > Open File from Archive** - Browses an archive content for a target file.

Exit

Quits the application.

Edit Menu
[Edit on GitHub](#)

The following actions are available in the **Edit** menu:

Cut

Cut the selection from the currently focused editor panel to the clipboard.

Copy

Copy the selection from the currently focused editor panel to the clipboard.

Paste

Paste content from the clipboard into the currently focused editor panel.

Select all

Selects all content in the currently focused editor panel.

Undo

Undo changes in the currently focused editor panel.

Redo

Redo changes in the currently focused editor panel.

Find Menu
[Edit on GitHub](#)

The **Find** menu includes the following actions:

Find/Replace

Perform *find/replace* operations in the currently focused **Editor**.

Find Next

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

Find Previous

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

Compare Menu
[Edit on GitHub](#)

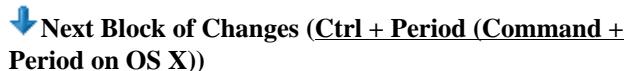

The following actions are available in the **Compare** menu:

**Three-Way Comparison**

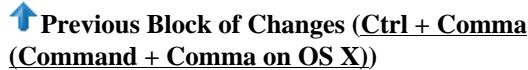

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**

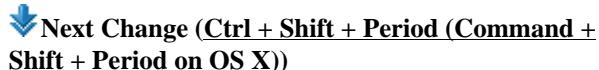

Looks for differences between the two files displayed in the left and right side of the application window.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

**Copy All Changes from Right to Left**

Copies all changes from the target file in the right side to the source file in the left side.

**Copy All Changes from Left to Right**

Copies all changes from the source file in the left side to the target file in the right side.

**Copy Change from Right to Left**

Copies the selected difference from the target file in the right side to the source file in the left side.

**Copy Change from Left to Right**

Copies the selected difference from the source file in the left side to the target file in the right side.

**Show Word Level Details**

Provides a word-level comparison of the selected change.

**Show Character Level Details**

Provides a character-level comparison of the selected change.

 **Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

Options Menu

[Edit on GitHub](#)

The **Options** menu contains the following actions:

Preferences

Opens the preferences.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

[Edit on GitHub](#)

The **Help** menu contains the following actions:

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Author Support Center web page in a browser.

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into

Oxygen XML Author. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Author support team.

Compare Toolbar of the Compare Files Tool

[Edit on GitHub](#)

The toolbar of the **Compare Files** tool contains the operations that can be performed on the source and target files or XML fragments.

Figure 249: Compare Toolbar

The following actions are available:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Author, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side of the application window.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the

**Synchronized scrolling**

comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Enables or disables synchronized scrolling so that a selected difference can be seen on both sides of the application window. This option is enabled by default.

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))****Copy Change from Right to Left**

Copies the selected difference from the target file in the right side to the source file in the left side.

**Copy All Changes from Right to Left**

Copies all changes from the target file in the right side to the source file in the left side.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

**Copy All Changes from Left to Right**

Copies all changes from the source file in the left side to the target file in the right side.

**Copy Change from Left to Right**

Copies the selected difference from the source file in the left side to the target file in the right side.

Ignore Nodes by XPath

You can use this text field to enter an XPath 2.0 expression to ignore certain nodes from the comparison. This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms. If an XPath 2.0 expression is specified in the **Ignore nodes by XPath option** in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be

used instead of the default. If you delete the expression from this field, neither will be used.

First Change (**Ctrl + B (Command + B on OS X)**)

Jumps to the first change.

Compare Directories

[Edit on GitHub](#)

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffDirs.exe`).

The directories comparison results are presented as a tree of files and directories. The directories and folders that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Author starts a *file comparison* between the two files, using the **Compare Files** tool.

Compared using 'Auto'. 11 differences from which: 10 modified files, 0 only in left side, 1 only in right side.

Figure 250: Compare Directories Tool

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

Step Result: The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the  **Perform Directories Differencing** button from the toolbar.
3. You can also use the  **Diff Options** button to access the *Directories Comparison preferences page* where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the  **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Author treat supported archives as directories, enable the *Look in archives option* in the **Directories Comparison** preferences page.
3. To highlight the differences, click the  **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date.

A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An X symbol, when a file or a folder exists in only one of the compared directories.
- A #symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the *Directories Comparison / Appearance preferences page*. You can double-click lines marked with the # symbol to open a **Compare Files** window, which shows the differences between the two files.

The **Options** menu contains the following actions:

Preferences

Opens the preferences.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu
[Edit on](#)
[GitHub](#)

The **Help** menu contains the following actions:

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Author Support Center web page in a browser.

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Author. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Author support team.

Compare Toolbar of the Compare Directories Tool
[Edit on](#)
[GitHub](#)

The toolbar contains the following actions:

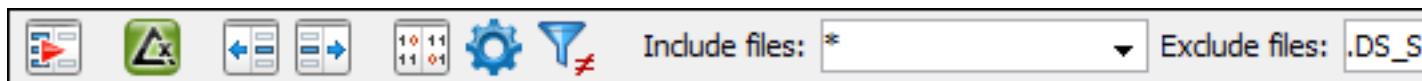

Figure 251: Compare toolbar

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Binary Compare

Performs a byte-level comparison on the selected files.

Diff Options

Opens the [Directory Comparison preferences page](#) where you can configure various options.

Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

File and folder filters

Differences can be filtered using three combo boxes:

Include files, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all jpeg and gif image files, edit the **Exclude files** filter box to read *.jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.

Compare Images

[Edit on GitHub](#)

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF, JPG, JPEG, PNG, and BMP*.

Chapter

8

Transforming Documents

Topics:

- *Transformation Scenarios*
- *WebHelp System Output*

This chapter presents the various transformation scenarios and outputs available in Oxygen XML Author.

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by other users. This process is known as a *transformation*.

Oxygen XML Author allows you to use transformation scenarios to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Author, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for transformation to any format is that your source document is well-formed.

Note: You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Transformation Scenarios

[Edit on GitHub](#)

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Author, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Types of transformation scenarios include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters.
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters.
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario.
- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters.
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario.
- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters.

Note:

Status messages generated during the transformation process are displayed in the [Information view](#).

Built-in Transformation Scenarios

[Edit on GitHub](#)

Oxygen XML Author included preconfigured built-in transformation scenarios that are used for common transformations. To obtain the desired output, use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu and choose one of the built-in scenarios for the current document.

You can use the  **Apply Transformation Scenario(s)** action even if the current document is not associated with a transformation scenario.

If the document contains an `xmlstylesheet` processing instruction that refers to an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Author prompts you to associate the document with a built-in transformation scenario.

The default transformation scenario is suggested based on the processing instruction from the edited document. The **XSL URL** field of the default transformation scenario contains the URL from the `href` attribute of the processing

instruction. By default, the **Use xmlstylesheet declaration** checkbox is enabled, Saxon is used as the transformation engine, and no FO processing is performed. The result of the transformation is stored in a file with the same URL as the edited document, but the extension is changed to `html`. The name and path are preserved because the output file name is specified with the help of two *editor variables*: `${cf}` and `${cn}`.

DocBook 4 Transformation Scenarios

[Edit on GitHub](#)

Default transformation scenarios allow you to convert DocBook 4 to DocBook 5 documents and transform DocBook documents to WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, EPUB and EPUB 3.

Related information

[Editing a Transformation Scenario](#) on page 763

DocBook 4 to WebHelp Output

[Edit on GitHub](#)

DocBook 4 documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output

To publish a DocBook 4 document as a *WebHelp Classic* system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook 4 document as a *WebHelp Classic with Feedback* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see [Deploying the WebHelp Classic with Feedback System](#) on page 835.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Classic Mobile Output

To publish a DocBook 4 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

110n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
        d.getElementsByTagName(s)[0]; if
        (d.getElementById(id)) return;
        js = d.createElement(s);
        js.id = id; js.src = "//
        connect.facebook.net/en_US/
        sdk.js#xfbml=1&version=v2.0" ;
      fjs.parentNode.insertBefore(js,
      fjs); })(document, 'script',
      'facebook-jssdk')); -->
</script>
```

```
<div data-share="true" data-
show-faces="true" data-
action="like" data-
layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0> and add it in the *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib* directory.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins` directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

[WebHelp System Output](#) on page 780

DocBook to PDF Output Customization

[Edit on GitHub](#)

Main steps for customization of PDF output generated from DocBook XML documents.

When the default layout and output look of the DocBook to PDF transformation need to be customized, the following main steps should be followed. In this example a company logo image is added to the front matter of a book. Other types of customizations should follow some similar steps.

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
  <mediaobject/>
  <title
    t:template="book.verso.title"
    font-size="&hsiz2;"
    font-weight="bold"
    font-family="${title.font.family}"/>
  <corpaauthor/>
  ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a *DocBook customization layer*.

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Author and set the customization layer in *the XSL URL property of the scenario*.

[The book DocBook XSL: The Complete Guide](#) by Bob Stayton contains more details about customizing the PDF output.

[Video demonstration for creating a DocBook customization layer in Oxygen XML Author.](#)

DocBook to EPUB Transformation

[Edit on
GitHub](#)

The EPUB specification recommends the use of *OpenType* fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
    font-family: "MyFont";
    font-weight: bold;
    font-style: normal;
    src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the `font-family` rule, as in the following example:

```
h1 {
    font-size: 20pt;
    margin-bottom: 20px;
    font-weight: bold;
    font-family: "MyFont";
    text-align: center;
}
```

3. In your DocBook to EPUB transformation, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

Note: The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

DocBook to DITA Transformation

[Edit on
GitHub](#)

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
 - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu.
 - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.
 2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4 or DocBook 5** section.
 3. Click the **Apply associated** button to run the transformation.
- Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

DocBook 5 Transformation Scenarios

[Edit on GitHub](#)

Default transformation scenarios allow you to transform DocBook 5 documents to WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, EPUB, and EPUB 3.

Related information

[Editing a Transformation Scenario](#) on page 763

DocBook 5 to WebHelp Output

[Edit on GitHub](#)

DocBook 5 documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output

To publish a DocBook 5 document as a *WebHelp Classic* system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook 5 document as a *WebHelp Classic with Feedback* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see [Deploying the WebHelp Classic with Feedback System](#) on page 835.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Classic Mobile Output

To publish a DocBook 5 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

clean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

l10n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0";

      fjs.parentNode.insertBefore(js,
      fjs); })(document, 'script',
      'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-
  show-faces="true" data-
  action="like" data-
  layout="standard" class="fb-like"/>
```

</div>

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0> and add it in the *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib* directory.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the OXYGEN_INSTALL_DIR\frameworks

\docbook\xsl\com.oxygenxml.webhelp\\predefined-skins directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

DocBook to PDF Output Customization

[Edit on GitHub](#)

Main steps for customization of PDF output generated from DocBook XML documents.

When the default layout and output look of the DocBook to PDF transformation need to be customized, the following main steps should be followed. In this example a company logo image is added to the front matter of a book. Other types of customizations should follow some similar steps.

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
    <mediaobject/>
    <title
        t:named-template="book.verso.title"
        font-size="&hsize2;"
        font-weight="bold"
        font-family="${title.font.family}" />
    <corpauthor/>
    ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a *DocBook customization layer*.

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Author and set the customization layer in [the XSL URL property of the scenario](#).

Related information

The book DocBook XSL: The Complete Guide by Bob Stayton contains more details about customizing the PDF output.

Video demonstration for creating a DocBook customization layer in Oxygen XML Author.

DocBook to EPUB Transformation

[Edit on GitHub](#)

The EPUB specification recommends the use of *OpenType* fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the `font-family` rule, as in the following example:

```
h1 {
  font-size: 20pt;
  margin-bottom: 20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

3. In your DocBook to EPUB transformation, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

Note: The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

DocBook to DITA Transformation

[Edit on GitHub](#)

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
 - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T** (**Command + Shift + T** on OS X)) action from the toolbar or the **Document > Transformation** menu.
 - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C** on OS X)) action from the toolbar or the **Document > Transformation** menu.
 2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
 3. Click the **Apply associated** button to run the transformation.
- Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

DITA Topic Transformation Scenarios

[Edit on GitHub](#)

The following default transformation scenarios are available for DITA Topics:

- **DITA XHTML** - Transforms a DITA topic to XHTML using DITA Open Toolkit.
- **DITA PDF** - Transforms a DITA topic to PDF using the DITA Open Toolkit and the Apache FOP engine.

Related information

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

[Editing a Transformation Scenario](#) on page 763

DITA Map Transformation Scenarios

[Edit on GitHub](#)

The following default transformations scenarios are available:

- Predefined transformation scenarios allow you to transform a DITA map to a variety of outputs, such as PDF, ODF, XHTML, WebHelp, EPUB, and CHM files.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to [integrate a DITA-OT plugin](#). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this transformation scenario if you want to generate a DITA map statistics report containing information such as:
 - The number of processed maps and topics.
 - Content reuse percentage.
 - Number of elements, attributes, words, and characters used in the entire DITA map structure.
 - DITA conditional processing attributes used in the DITA maps.
 - Words count.
 - Information types such as number of containing maps, bookmaps, or topics.

Related information

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

DITA Map to WebHelp Output

[Edit on GitHub](#)

DITA maps can be transformed into a variety of WebHelp systems designed to suit your specific needs. This section contains the procedures for obtaining the output for the variants of the WebHelp system.

Related information

[WebHelp System Output](#) on page 780

WebHelp Responsive Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Responsive* system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.

- *Advanced Tab* - This tab allows you to specify some advanced options for the transformation scenario.
 - *Output Tab* - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0> and add it in the `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib` directory.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments	When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.
webhelp.sitemap.base.url	Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.
webhelp.sitemap.change.frequency	The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.
webhelp.sitemap.priority	The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

Parameters Specific to WebHelp Responsive Output

webhelp.fragment.after.body	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the body in the output.
webhelp.fragment.after.logo_and_title	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the logo and title in the output.
webhelp.fragment.after.main.page.search	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the search field in the output.
webhelp.fragment.after.toc_or_tiles	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the table of contents or tiles in the main page of the output.
webhelp.fragment.after.top_menu	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the top menu in the output.
webhelp.fragment.before.body	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the body in the output.
webhelp.fragment.before.logo_and_title	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the logo and title in the output.

<code>webhelp.fragment.before.main.page.search</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the search field in the output.
<code>webhelp.fragment.before.toc_or_tiles</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the table of contents or tiles in the main page of the output.
<code>webhelp.fragment.before.top_menu</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the top menu in the output.
<code>webhelp.fragment.footer</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the footer in the output.
<code>webhelp.fragment.head</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the header in the output.
<code>webhelp.fragment.welcome</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as a welcome message (or title) in the output.
<code>webhelp.show.breadcrumb</code>	Specifies if the breadcrumb component will be presented in the output. The default value is yes.
<code>webhelp.show.indexterms.link</code>	Specifies if an icon that links to the index will be presented in the output. The default value is yes.
<code>webhelp.show.main.page.tiles</code>	Specifies if the tiles component will be presented in the main page of the output. For a <i>tree</i> style layout, this parameter should be set to no.
<code>webhelp.show.main.page.toc</code>	Specifies if the table of contents will be presented in the main page of the output. The default value is yes.
<code>webhelp.show.navigation.links</code>	Specifies if navigation links will be presented in the output. The default value is yes.
<code>webhelp.show.print.link</code>	Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.
<code>webhelp.show.side.toc</code>	Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.
<code>webhelp.show.top.menu</code>	Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.
<code>webhelp.top.menu.depth</code>	Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

WebHelp Responsive with Feedback Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Responsive with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- *Templates Tab* - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- *Parameters Tab* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the *Parameters section* below for details about the most commonly used parameters for WebHelp Responsive transformations.
- *Filters Tab* - This tab allows you to filter certain content elements from the generated output.
- *Advanced Tab* - This tab allows you to specify some advanced options for the transformation scenario.
- *Output Tab* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the *instructions to complete the system deployment*.

Parameters for Customizing WebHelp Responsive with Feedback Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen

	<p>XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.</p>
webhelp.search.ranking	If this parameter is set to <code>false</code> then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is <code>true</code>).
webhelp.show.changes.and.comments	When set to <code>yes</code> , user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is <code>no</code> .
webhelp.sitemap.base.url	Base URL for all the <code>loc</code> elements in the generated <code>sitemap.xml</code> file. The value of a <code>loc</code> element is computed as the relative file path from the <code>href</code> attribute of a <code>topicref</code> element from the DITA map, appended to this base URL value. The <code>loc</code> element is mandatory in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>sitemap.xml</code> file is not generated.
webhelp.sitemap.change.frequency	The value of the <code>changefreq</code> element in the generated <code>sitemap.xml</code> file. The <code>changefreq</code> element is optional in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>changefreq</code> element is not added in <code>sitemap.xml</code> . Allowed values: <empty string> (default), <code>always</code> , <code>hourly</code> , <code>daily</code> , <code>weekly</code> , <code>monthly</code> , <code>yearly</code> , <code>never</code> .
webhelp.sitemap.priority	The value of the <code>priority</code> element in the generated <code>sitemap.xml</code> file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The <code>priority</code> element is optional in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>priority</code> element is not added in <code>sitemap.xml</code> .
Parameters Specific to WebHelp Responsive with Feedback Output	
webhelp.fragment.after.body	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the body in the output.
webhelp.fragment.after.logo_and_title	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the logo and title in the output.
webhelp.fragment.after.main.page.search	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the search field in the output.
webhelp.fragment.after.toc_or_tiles	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be

webhelp.fragment.after.top_menu	Displayed after the table of contents or tiles in the main page of the output.
webhelp.fragment.before.body	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the top menu in the output.
webhelp.fragment.before.logo_and_title	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the body in the output.
webhelp.fragment.before.main.page.search	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the search field in the output.
webhelp.fragment.before.toc_or_tiles	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the table of contents or tiles in the main page of the output.
webhelp.fragment.before.top_menu	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the top menu in the output.
webhelp.fragment.footer	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the footer in the output.
webhelp.fragment.head	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the header in the output.
webhelp.fragment.welcome	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as a welcome message (or title) in the output.
webhelp.show.breadcrumb	Specifies if the breadcrumb component will be presented in the output. The default value is yes.
webhelp.show.indexterms.link	Specifies if an icon that links to the index will be presented in the output. The default value is yes.
webhelp.show.main.page.tiles	Specifies if the tiles component will be presented in the main page of the output. For a <i>tree</i> style layout, this parameter should be set to no.
webhelp.show.main.page.toc	Specifies if the table of contents will be presented in the main page of the output. The default value is yes.
webhelp.show.navigation.links	Specifies if navigation links will be presented in the output. The default value is yes.
webhelp.show.print.link	Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.
webhelp.show.side.toc	Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `2`.

WebHelp Classic Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Classic* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0" ;

      fjs.parentNode.insertBefore(js,
      fjs); })(document, 'script',
      'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-
  show-faces="true" data-
  action="like" data-
  layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to

webhelp.google.search.script	frm for frameless (<i>iframe</i>) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
webhelp.head.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
webhelp.logo.image.target.url	URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.
webhelp.logo.image	Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.
webhelp.reload.stylesheet	Specifies a path to an image displayed as a logo in the left side of the output header.
webhelp.search.japanese.dictionary	Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.
webhelp.search.ranking	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.show.changes.and.comments	If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).
webhelp.sitemap.base.url	When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.
webhelp.sitemap.change.frequency	Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.
	The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter

webhelp.sitemap.priority

set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

WebHelp Classic Mobile Output[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Classic Mobile* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic Mobile** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** below for details about the most commonly used parameters for WebHelp Responsive transformations.
 - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
 - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

Parameters for Customizing WebHelp Classic Mobile Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0" ;
      fjs.parentNode.insertBefore(js,
      fjs); }(document, 'script',
      'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-
  show-faces="true" data-
  action="like" data-
  layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `linkTarget` attribute to

	frm for frameless (<i>iframe</i>) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
webhelp.google.search.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
webhelp.head.script	URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.
webhelp.reload.stylesheet	Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.
webhelp.search.japanese.dictionary	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.sitemap.base.url	Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.
webhelp.sitemap.change.frequency	The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.
webhelp.sitemap.priority	The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

WebHelp Classic With Feedback Output

[Edit on GitHub](#)

To publish a DITA map as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
 - **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** below for details about the most commonly used parameters for WebHelp Responsive transformations.
 - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
 - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
 5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the [instructions to complete the system deployment](#).

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

Parameters for Customizing WebHelp Classic with Feedback Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

webhelp.copyright	Adds a small copyright text that appears at the end of the <i>Table of Contents</i> pane.
webhelp.custom.resources	The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.
webhelp.favicon	The file path that points to an image to be used as a <i>favicon</i> in the WebHelp output.
webhelp.footer.file	Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate <code>div</code> or <code>span</code> element, and the code for each <code>script</code> element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:
	<pre><div id="facebook"> <div id="fb-root"/> <script> <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0]; if (d.getElementById(id)) return; js = d.createElement(s); js.id = id; js.src = "// connect.facebook.net/en_US/ sdk.js#xfbml=1&version=v2.0" ; fjs.parentNode.insertBefore(js, fjs); })(document, 'script', 'facebook-jssdk')); --> </script> <div data-share="true" data- show-faces="true" data- action="like" data- layout="standard" class="fb-like"/> </div></pre>
webhelp.footer.include	Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the <code>webhelp.footer.file</code> parameter has a value, then the content of that file is used as footer. If the <code>webhelp.footer.file</code> has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.
webhelp.google.search.results	URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element <code>gcse:searchresults-only</code> . You can use all supported attributes for this element. It is recommended to set the <code>linkTarget</code> attribute to <code>frm</code> for frameless (<code>iframe</code>) version of WebHelp or to <code>contentWin</code> for the frameset version of WebHelp. The default value for this attribute is <code>_blank</code> and

webhelp.google.search.script	the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
webhelp.head.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
webhelp.logo.image.target.url	URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.
webhelp.logo.image	Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.
webhelp.reload.stylesheet	Specifies a path to an image displayed as a logo in the left side of the output header.
webhelp.search.japanese.dictionary	Set this parameter to <code>true</code> if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is <code>false</code> .
webhelp.search.ranking	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.show.changes.and.comments	If this parameter is set to <code>false</code> then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is <code>true</code>).
webhelp.sitemap.base.url	When set to <code>yes</code> , user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is <code>no</code> .
webhelp.sitemap.change.frequency	Base URL for all the <code>loc</code> elements in the generated <code>sitemap.xml</code> file. The value of a <code>loc</code> element is computed as the relative file path from the <code>href</code> attribute of a <code>topicref</code> element from the DITA map, appended to this base URL value. The <code>loc</code> element is mandatory in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>sitemap.xml</code> file is not generated.
	The value of the <code>changefreq</code> element in the generated <code>sitemap.xml</code> file. The <code>changefreq</code> element is optional in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>changefreq</code> element is not added in <code>sitemap.xml</code> . Allowed

webhelp.sitemap.priority

values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF WYSIWYG Transformation
[Edit on GitHub](#)

Oxygen XML Author comes bundled with a DITA OT plugin that converts DITA maps to PDF using a CSS layout processor. Oxygen XML Author supports the following processors (not included in the Oxygen XML Author installation kit):

- **Prince Print with CSS** - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

The DITA-OT plugin is located in the following directory: `DITA_OT_DIR/plugins/com.oxygenxml.pdf.css`.

Although it includes a set of CSS files in its `css` subfolder, when this plugin is used in Oxygen XML Author, the CSS files located in the `${frameworks}` directory take precedence.

Creating the Transformation Scenario

To create an experimental DITA map to PDF WYSIWYG transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG - Experimental**.
3. When applied, this new transformation scenario uses the currently selected CSS files for the opened topic files. These CSS files can be selected from the **Styles** drop-down menu from the toolbar.
- Important:** The author could open the map in the editor and change its style, but this is ignored in the publishing stage. Since authors usually edit topics instead of the map, Oxygen XML Author uses the styles selected in the opened topics.
4. In the **Parameters** tab, configure the following parameters:
 - `css.processor.path.prince` (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
 - `css.processor.path.antenna-house` (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
 - `webhelp.show.changes.and.comments` - When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

Customizing the Styles (for Output and Editing)

If you need to change the styles in the associated CSS, make sure you install Oxygen XML Author in a folder in which you have full read and write privileges (for instance, your user home directory). This is due to the fact that all the installed files are usually read-only (for instance, in Windows, Oxygen XML Author is installed in the `Program Files` folder where the users do not have change rights).

If you want to change the style of an element, open a document in the editor and select **Inspect Styles** from the contextual menu. *The CSS Inspector view* that shows all the CSS rules that apply to the selected element will be displayed. Click the link for the CSS selector that you need to change and Oxygen XML Author will open the CSS file and position the cursor at that selector. Simply add the properties you need and to see the changes in the editor, press **F5** to reload the document. Once you are satisfied with how it looks, use the transformation scenario and check for the changes in the PDF output.

Note: This experimental transformation scenario also allows you to present colored highlights in the PDF output.

Compiled HTML Help (CHM) Output Format

[Edit on GitHub](#)

To perform a **Compiled HTML Help (CHM)** transformation Oxygen XML Author needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Author automatically detects HTML Help Workshop and uses it.

Note: HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

Changing the Output Encoding

Oxygen XML Author uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. The **Compiled HTML Help (CHM)** default scenario that comes bundled with Oxygen XML Author has the `htmlhelp.locale` parameter set to `en-US`.

The default value of the `htmlhelp.locale` is `en-US`. To customize this parameter, go to  **Configure Transformation Scenarios** and click the  **Edit** button. In the parameter tab search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`US`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

Kindle Output Format

[Edit on GitHub](#)

Oxygen XML Author requires KindleGento generate Kindle output from DITA maps. To install KindleGen for use by Oxygen XML Author, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author and open a DITA map in the **DITA Maps Manager** view.
4. In the **DITA Maps Manager** view, open the  **Configure Transformation Scenario(s)** dialog box.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the `kindlegen.executable` parameter as the path to the *KindleGen* directory.
7. Accept the changes.

XHTML Transformation Scenarios

[Edit on GitHub](#)

The following default transformation scenarios are available for XHTML:

- **XHTML to DITA concept** - Converts an XHTML document to a DITA concept document.

- **XHTML to DITA reference** - Converts an XHTML document to a DITA reference document.
- **XHTML to DITA task** - Converts an XHTML document to a DITA task document.
- **XHTML to DITA topic** - Converts an XHTML document to a DITA topic document.

TEI ODD Transformation Scenarios

[Edit on GitHub](#)

The following default transformations are available:

- **TEI ODD XHTML** - Transforms a TEI ODD document into an XHTML document
- **TEI ODD PDF** - Transforms a TEI ODD document into a PDF document using the Apache FOP engine
- **TEI ODD EPUB** - Transforms a TEI ODD document into an EPUB document
- **TEI ODD DOCX** - Transforms a TEI ODD document into a DOCX document
- **TEI ODD ODT** - Transforms a TEI ODD document into an ODT document
- **TEI ODD RelaxNG XML** - Transforms a TEI ODD document into a RelaxNG XML document
- **TEI ODD to DTD** - Transforms a TEI ODD document into a DTD document
- **TEI ODD to XML Schema** - Transforms a TEI ODD document into an XML Schema document
- **TEI ODD to RelaxNG Compact** - Transforms a TEI ODD document into an RelaxNG Compact document

Creating New Transformation Scenarios

[Edit on GitHub](#)

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of scenarios that are available in Oxygen XML Author and how to create each type of transformation.

XML Transformation with XSLT

[Edit on GitHub](#)

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.
- Use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.

Note: If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XML transformation with XSLT**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template](#) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors](#). Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xmlstylesheet" declaration

If enabled, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is disabled and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation

Parameters

scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Extensions

Opens a [Configure parameters dialog box](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets](#). If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Additional XSLT stylesheets

Opens a [dialog box for configuring the XSLT extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

Opens a [dialog box for adding XSLT stylesheets](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

[Edit on GitHub](#)

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@attr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc('\${cfdu}/test.xml')//*
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable](#) can

be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is

	enabled, the parameter will be evaluated as an XPath expression.
Edit	Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An <i>editor variable</i> can be inserted in the text box using the  Insert Editor Variables button. If the Evaluate as XPath option is enabled, the parameter will be evaluated as an XPath expression.
Unset	Resets the selected parameter to its default value. Available only for edited parameters with set values.
Delete	Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related information

[Editor Variables](#) on page 226

XSLT Extensions

[Edit on GitHub](#)

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the  **Move up** or  **Move down** buttons.

Additional XSLT Stylesheets

[Edit on GitHub](#)

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add	Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an <i>editor variable</i> in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.
Remove	Deletes the selected stylesheet from the Additional XSLT stylesheets list.
Open	Opens the selected stylesheet in a separate view.
Up	Moves the selected stylesheet up in the list.
Down	Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

[Edit on GitHub](#)

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("im")

A Saxon-specific option that sets the initial mode for the transformation.

Template ("it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed.

Use a configuration file ("config")

Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.

Version warnings ("versmsg")

Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

Line numbering ("l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("strip")

Allows you to choose how the *strip whitespace* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.

- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Optimization level (" -opt ")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

Allow calls on extension functions (" -ext ")

If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http:// [URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version option**.

Validation of the source file ("'-val'"')

Requests schema-based validation of the source file and of any files read using document() or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("'-outval'"')

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("--generateByteCode:(on|off)"')

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

FO Processor Tab (XSLT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an *external processor*.

Output Tab (XSLT Transformations)
[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  *Insert Editor Variables* button, or the  *Browse* button.

Open in Browser/System Application

If enabled, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box (Options > Preferences)*, go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the  text field, the  *Insert Editor Variables* button, or the  *Browse* button.

Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*.

- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an *integrated SVG viewer in the results panel* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important: When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

XML Transformation with XQuery

[Edit on GitHub](#)

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XQuery**.
- Use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XQuery**.

Note: If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XML transformation with XQuery**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the *advanced Saxon preferences page*, the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and *the external engines defined in the Custom Engines preferences page*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the *advanced options of the Saxon HE/PE/EE engine* for the current transformation scenario. To configure the same options globally, go

to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the [Configure parameters dialog box](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

[Edit on GitHub](#)

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc('\${cfdu}/test.xml')//*
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is

Unset	enabled, the parameter will be evaluated as an XPath expression.
Delete	Resets the selected parameter to its default value. Available only for edited parameters with set values.
	Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related information

[Editor Variables](#) on page 226

XQuery Extensions

[Edit on GitHub](#)

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be

moved and press the  **Move up** or  **Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

[Edit on GitHub](#)

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Recoverable errors ("'-warnings'"')

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("'-strip'"')

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.

Optimization level (" -opt ")	Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
Use linked tree model (" -tree:linked ")	• None ("none") - Strips <i>no</i> whitespace before further processing.
Enable XQuery 3.0 support (" -qversion:(1.0 3.0) ")	Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.
Initializer class	This option activates the linked tree model.
	If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.
	Equivalent to the <i>-init</i> Saxon command-line argument. The value is the name of a user-supplied class that implements the <code>net.sf.saxon.lib.Initializer</code> interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Use a configuration file (" -config ")	Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.
Allow calls on extension functions (" -ext ")	If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file (" -val ")	Requests schema-based validation of the source file and of any files read using <code>document()</code> or similar functions. It can have the following values:
	<ul style="list-style-type: none"> • Schema validation ("strict") - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled. • Lax schema validation ("lax") - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but

Validation errors in the result tree treated as warnings ("`-outval`")

the validation will not fail if, for example, element declarations are not found.

- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("`--generateByteCode:(on|off)`")

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

Enable XQuery update ("`-update:(on|off)`")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("`-backup:(on|off)`) If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

FO Processor Tab (XQuery Transformations)

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an *external processor*.

Output Tab (XQuery Transformations)
[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Enabling this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Open in Browser/System Application

If enabled, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box (Options > Preferences)*, go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*.
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an *integrated SVG viewer in the results panel* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important: When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

DITA OT Transformation

[Edit on GitHub](#)

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.
- Use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.

Note: If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **DITA OT Transformation**.

All three methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

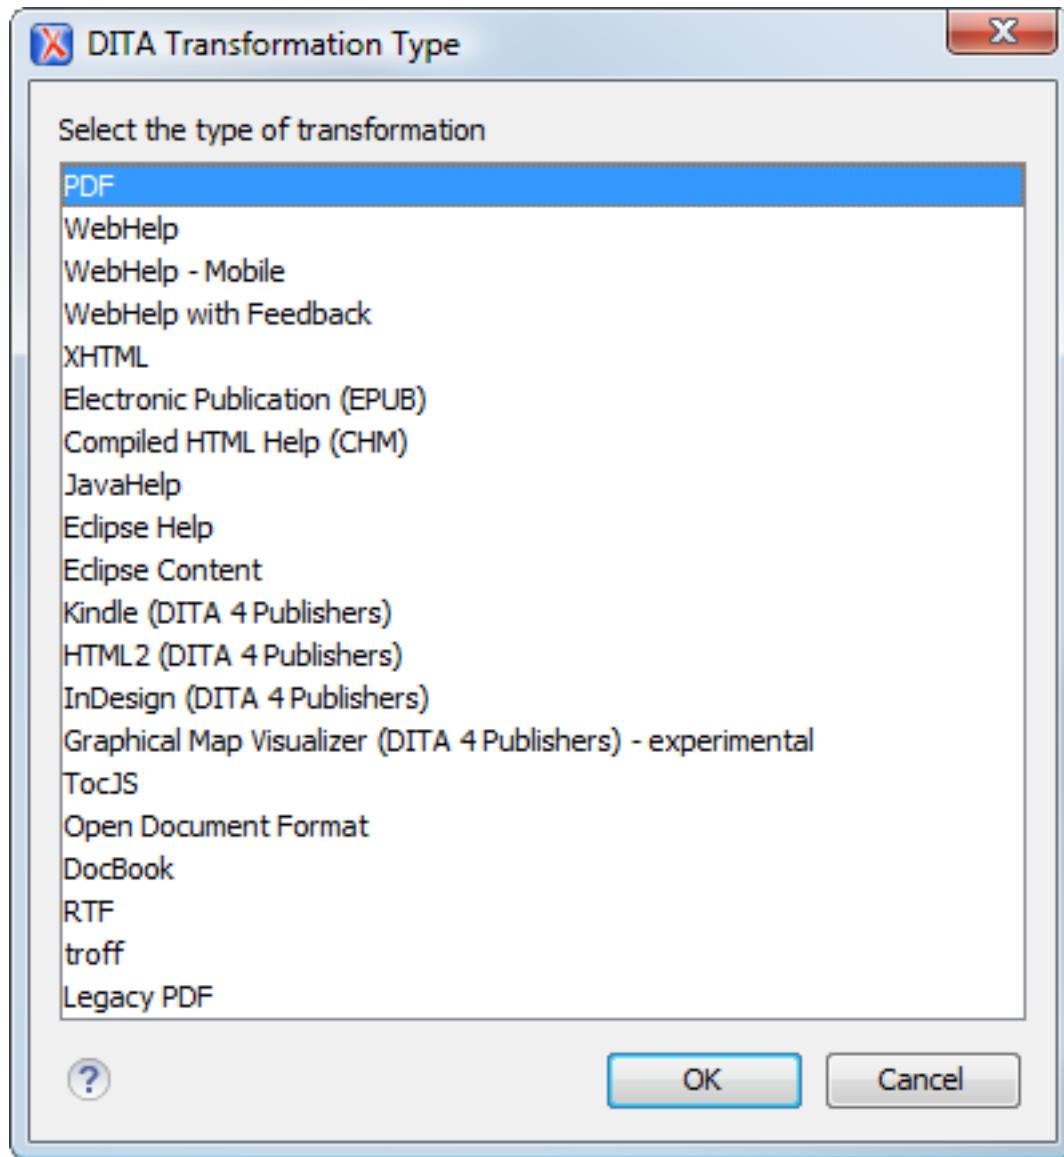

Figure 252: DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for **PDF** output).

Skins Tab (DITA OT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of predefined skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Predefined

[Create custom skin](#)

Figure 253: Skins Tab

The **Skins** tab includes the following sections:

Predefined Skins

This section presents the predefined skins that are included in Oxygen XML Author. The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation

Custom Skins

project that is stored on the Oxygen XML Author website, press the **Online preview** link.

You can use this section to customize the look of the output.

CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

Create custom skin

Use this link to open the [WebHelp Skin Builder](#) tool.

Templates Tab (DITA OT Transformations)

[Edit on](#)

[GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive** or **WebHelp Responsive with Feedback** output types and it provides a set of predefined *skins* that you can use as a base for the layout of your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output. You can choose predefined skins in a *tile* style of layout or a *tree* style of layout, and you can also [add your own customized skins](#).

Templates **Parameters** **Filters** **Advanced** **Output**

tiles

flowers green light

orange oxygen Choose custom skin...

tree

flowers green light

orange oxygen Choose custom skin...

Figure 254: Templates Tab

The **Templates** tab comes by default with the following predefined collections of skins:

Tiles

This section presents the predefined skins that are arranged in a *tiles* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

Tree

This section presents the predefined skins that are arranged in a *tree* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

When you add a new collection of skins, this tab will list them.

FO Processor Tab (DITA OT Transformations)
[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

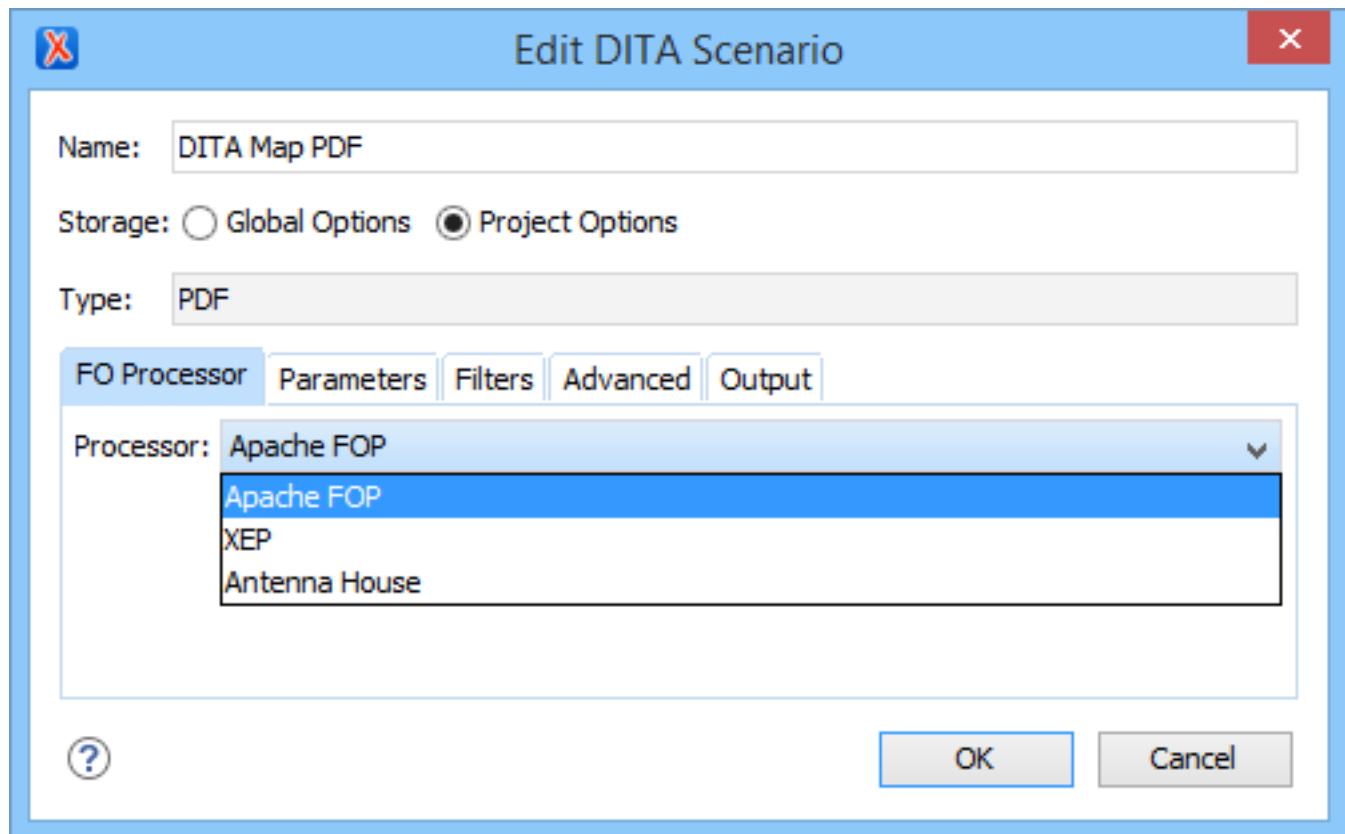

Figure 255: FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Author.

XEP

The *RenderX* XEP processor. If XEP is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the [FO Processors option page](#).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA_OT_DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Author installation directory.

Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Author preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the [Parameters tab](#).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related information

[FO Processors Preferences](#) on page 170

[XSL-FO Processors](#) on page 776

Parameters Tab (DITA OT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA OT Documentation](#). You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the [ask editor variable](#) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New	Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the  Insert Editor Variables button or the  Browse button.
Unset	Resets the selected parameter to its default value. Available only for edited parameters with set values.
Edit	Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.
Delete	Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

Related information[DITA Open Toolkit Documentation](#)**Filters Tab (DITA Transformations)**[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

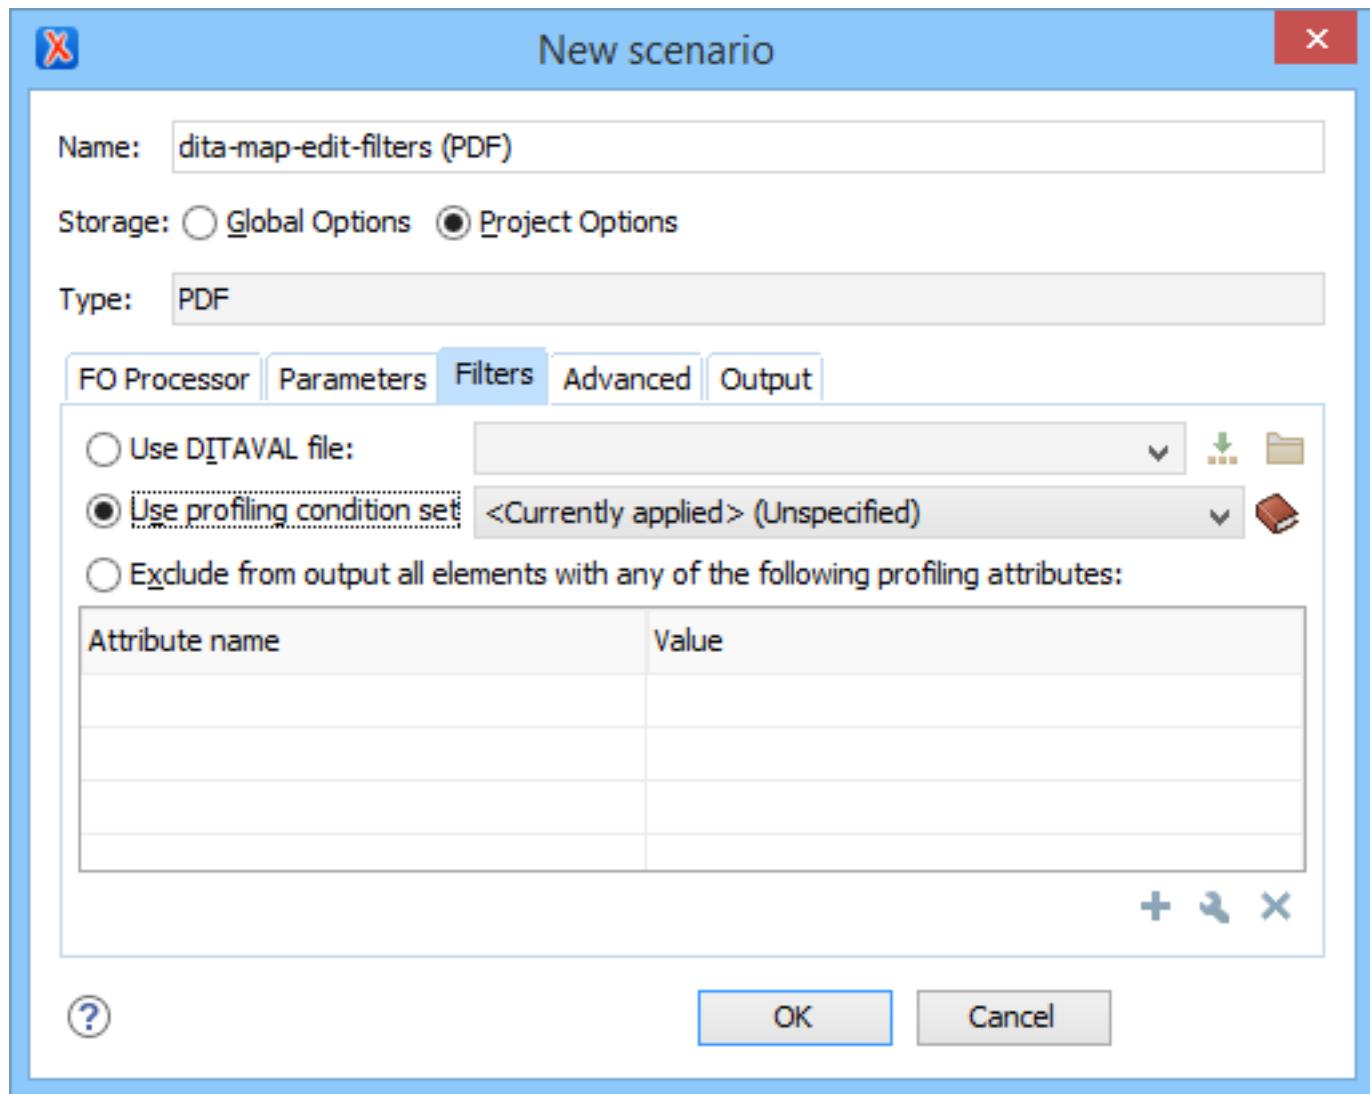

Figure 256: Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA* map, you can specify the file to be used when filtering content. You can specify the path by using the

text field, the history drop-down menu, the **Insert** **Editor Variables** button, or the **Browse** button. You can find out more about constructing a *DITAVAL* file in the [DITA OT Documentation](#).

Attention: If a filter file is specified in the `args.filter` parameter (in [the Parameters tab](#)), that file takes precedence over a *DITAVAL* file specified here.

Use profiling condition set

Sets the *profiling condition set* that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the **New**, **Edit**, or **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

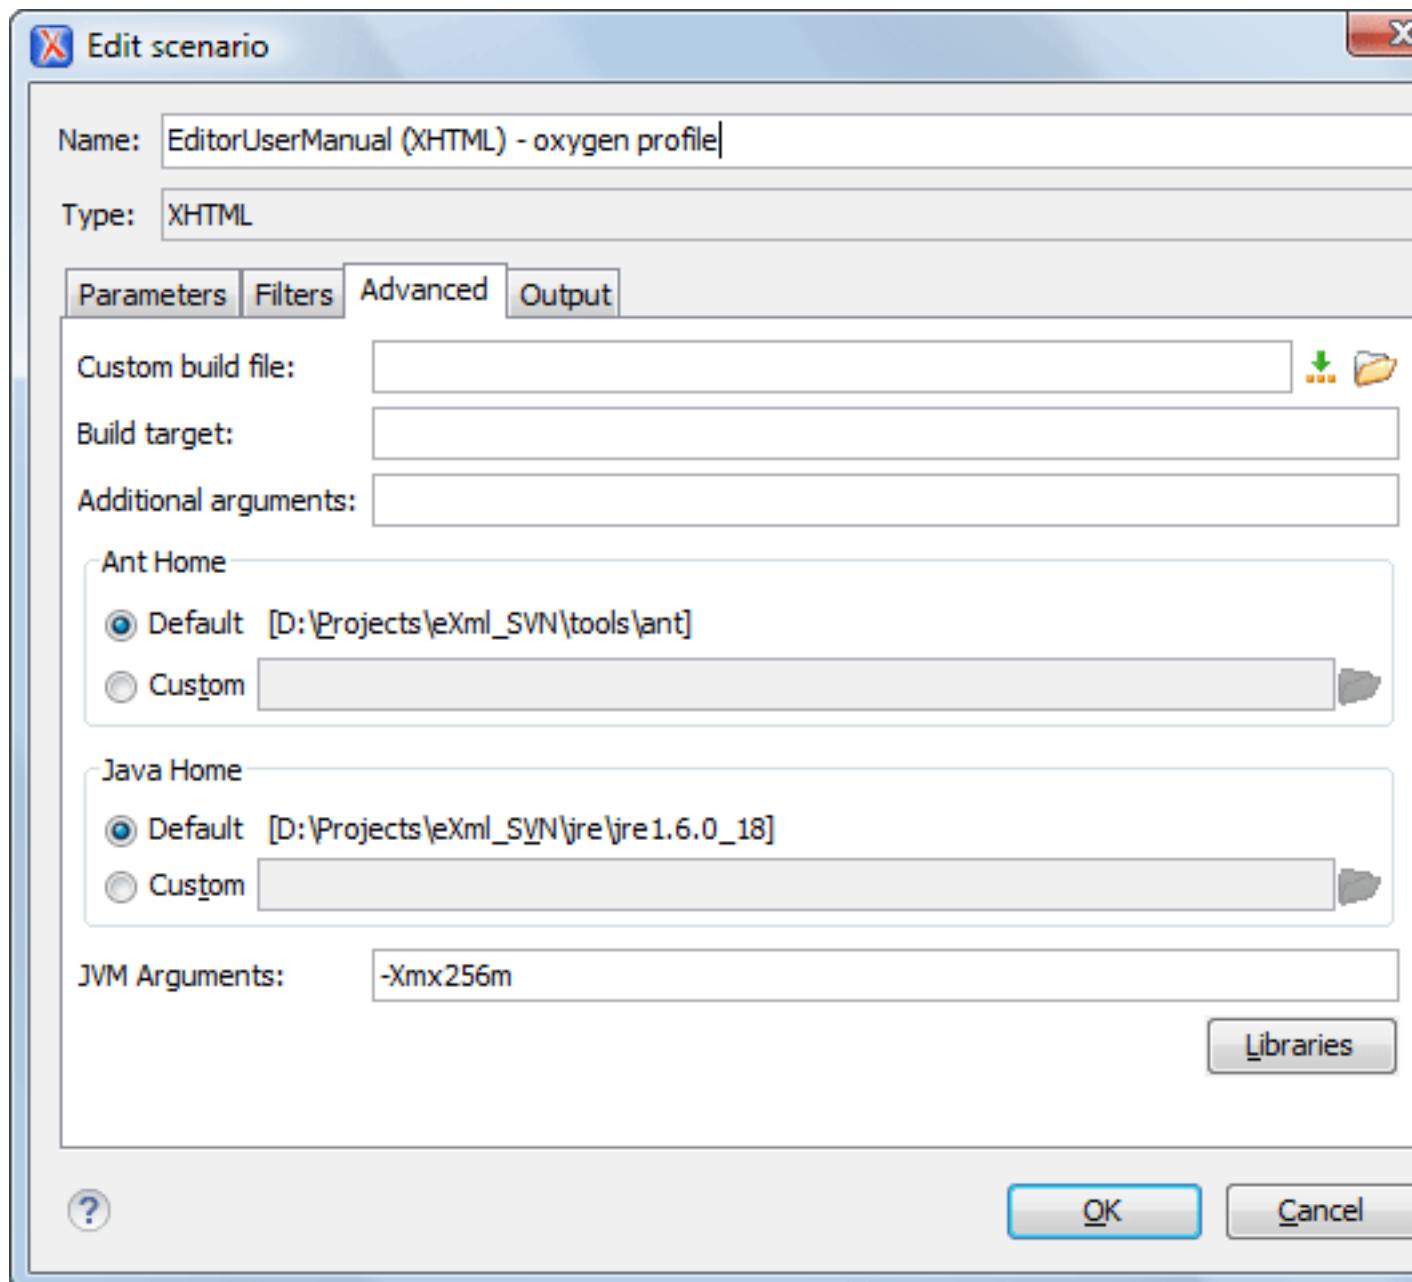

Figure 257: Advanced Settings Tab

You can specify the following parameters:

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the [Parameters tab](#) is used. You can specify the path by using the text field, the  [Insert](#) button, or the  [Browse](#) button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#).

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA OT 1.8.5 and older requires Java 1.6 or later, while DITA OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

Output Tab (DITA OT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

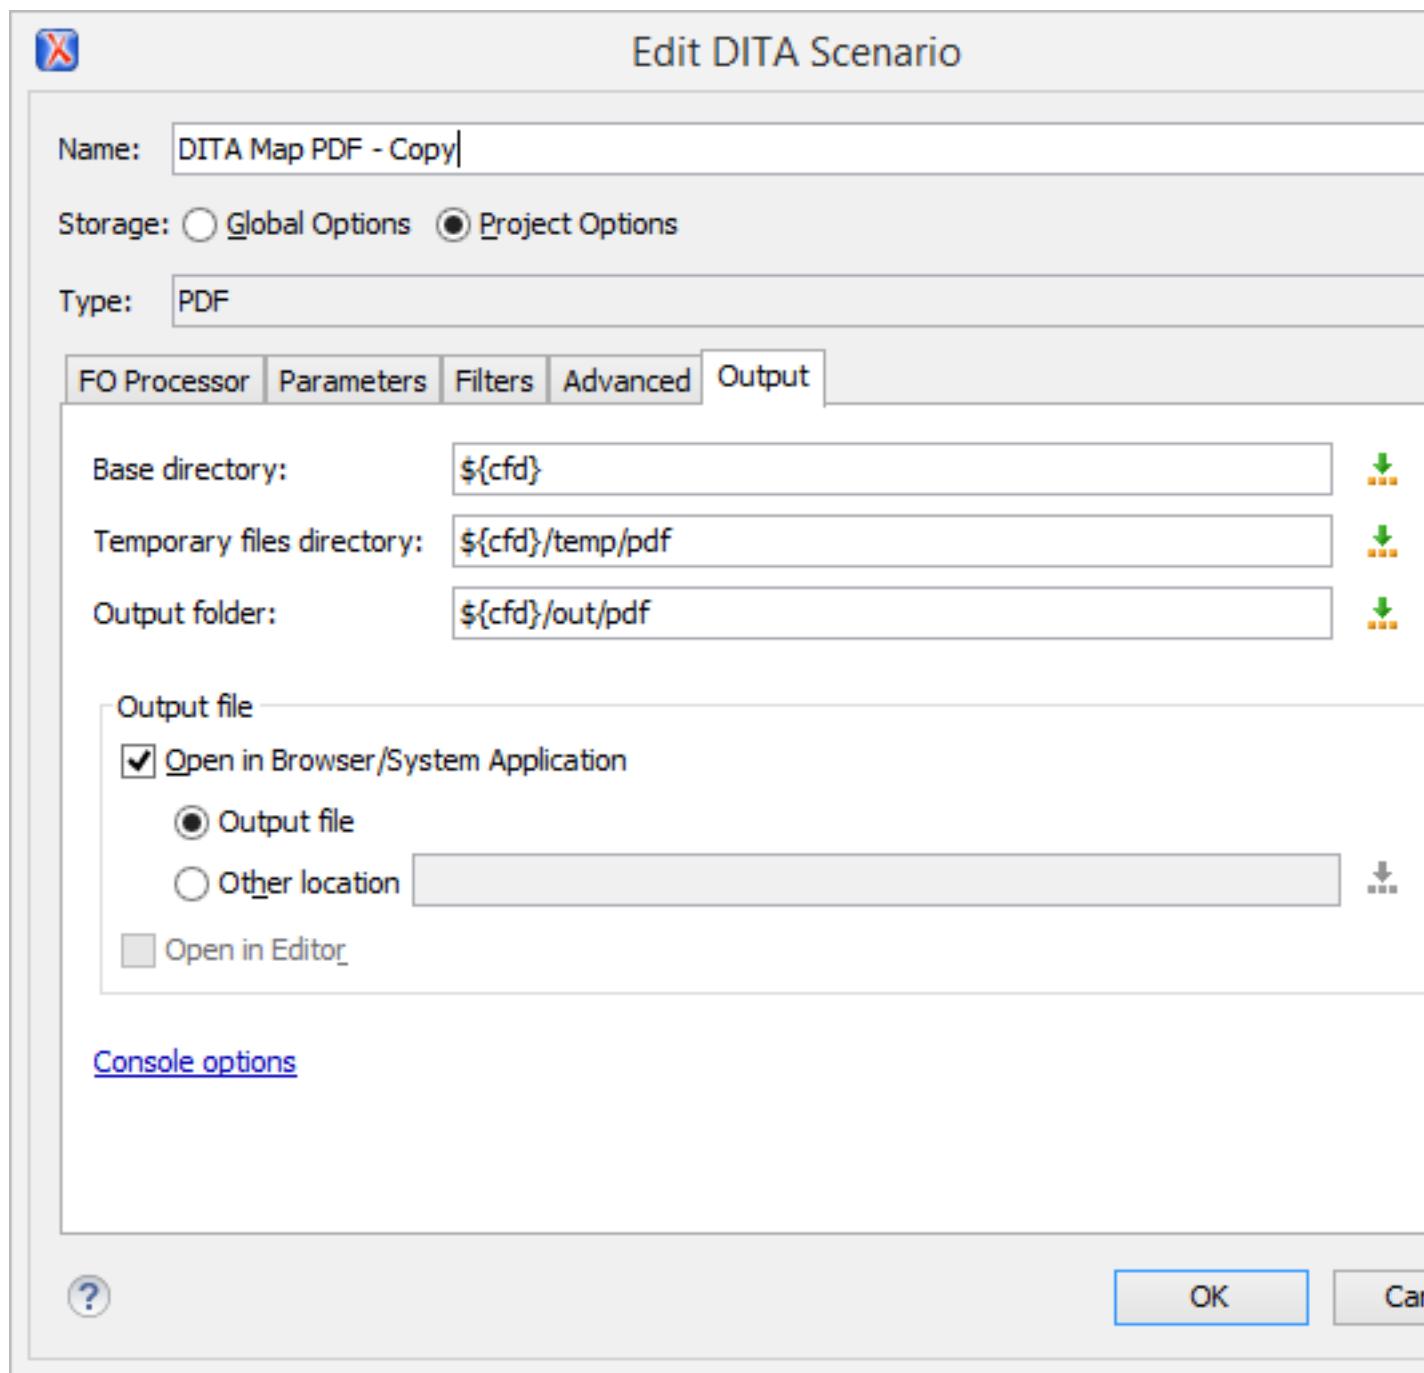

Figure 258: Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field,

the **Insert Editor Variables** button, or the **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

Note: If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If enabled, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the [Console options](#) preferences page that contains options to control the display of the console output received from the publishing engine.

Troubleshooting DITA Transformation Errors

[Edit on GitHub](#)

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. *Validate the DITA map* by using the **Validate and Check for Completeness** action that is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. *Run the DITA transformation scenario.*
4. If the transformation results in errors or warnings, they are displayed in the **Transformation problems** message panel at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
 - **Severity** - The first column displays the following icons that indicate the severity of the problem:
 - **Informational** - The transformation encountered a condition of which you should be aware.
 - **Warning** - The transformation encountered a problem that should be corrected.
 - **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
 - **Info** - You can click the **See More** icon to open a web page that contains details about DITA-OT error messages.
 - **Description** - A description of the problem.
 - **Resource** - The name of the transformation resource.
 - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.

Ant Transformation

[Edit on GitHub](#)

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Author runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant version 1.8.2) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

To create an Ant transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **ANT transformation**.
- Use the **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **ANT transformation**.

Note: If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **ANT transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Options Tab (Ant Transformations)

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

Working directory

The path of the current directory of the Ant external process. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Build file

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as -verbose).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#).

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to -Xmx384m, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

Parameters Tab (Ant Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the [ask editor variable](#) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the  **Value** of the parameter by using the  [Insert Editor Variables](#) button or the  [Browse](#) button.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

Output Tab (Ant Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path  [Insert Editor Variables](#) button, or the  [Browse](#) button.

- **In System Application** - The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).
- **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate

Show console output	built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).
	Allows you to specify when to display the console output log. The following options are available:

- **When build fails** - displays the console output log if the build fails.
- **Always** - displays the console output log, regardless of whether or not the build fails.

XSLT Transformation

[Edit on GitHub](#)

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation**.
- Use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation**.

Note: If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XSLT transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template](#) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors](#). Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xmlstylesheet" declaration

If enabled, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is disabled and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

 **Advanced options**

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a [Configure parameters dialog box](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets](#). If the XSLT transformation engine is custom-defined, you can not use this dialog box to

Extensions

configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Additional XSLT stylesheets

Opens a *dialog box for configuring the XSLT extension jars or classes* that define extension Java functions or extension XSLT elements used in the transformation.

Opens a *dialog box for adding XSLT stylesheets* that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters[Edit on GitHub](#)

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all *additional stylesheets*, along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@attr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc('\${cfdu}/test.xml')//*
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can

be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* can

be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value.
Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related information

[Editor Variables](#) on page 226

XSLT Extensions

[Edit on GitHub](#)

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the  **Move up** or  **Move down** buttons.

Additional XSLT Stylesheets

[Edit on GitHub](#)

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an *editor variable* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

[Edit on GitHub](#)

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode (" -im ")

A Saxon-specific option that sets the initial mode for the transformation.

Template (" -it ")	A Saxon-specific option that sets the name of the initial XSLT template to be executed.
Use a configuration file (" -config ")	Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.
Version warnings (" -versmsg ")	Warns you when the transformation is applied to an XSLT 1.0 stylesheet.
Line numbering (" -l ")	Line numbers where errors occur are included in the output messages.
Expand attributes defaults (" -expand ")	Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.
DTD validation of the source (" -dtd ")	Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:
	<ul style="list-style-type: none"> • On - Requests DTD validation of the source file and of any files read using the <code>document()</code> function. • Off - (default setting) Suppresses DTD validation. • Recover - Performs DTD validation but treats the errors as non-fatal. <p>Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.</p>
Recoverable errors (" -warnings ")	Allows you to choose how dynamic errors are handled. The following options can be selected:
	<ul style="list-style-type: none"> • Recover silently ("silent") - Continues processing without reporting the error. • Recover with warnings ("recover") - Issues a warning but continues processing. • Signal the error and do not attempt recovery ("fatal") - Issues an error and stops processing.
Strip whitespaces (" -strip ")	Allows you to choose how the <i>strip whitespaces</i> operation is handled. You can choose one of the following values:
	<ul style="list-style-type: none"> • All ("all") - Strips <i>all</i> whitespace text nodes from source documents before any further processing, regardless of any <code>xml:space</code> attributes in the source document. • Ignore ("ignorable") - Strips all <i>ignorable</i> whitespace text nodes from source documents before any further processing, regardless of any <code>xml:space</code> attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content. • None ("none") - Strips <i>no</i> whitespace before further processing.
Optimization level (" -opt ")	Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10

(full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

Allow calls on extension functions ("`-ext`")

If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http:// [URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version option**.

Validation of the source file ("`-val`")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

Validation errors in the result tree treated as warnings ("'-outval'")

- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document	The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.
--	--

Generate bytecode ("--generateByteCode:(on|off)")

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

FO Processor Tab (XSLT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor](#).

Output Tab (XSLT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field,

 [Insert Editor Variables](#) button, or the  [Browse](#) button.

Open in Browser/System Application

If enabled, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*.
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an *integrated SVG viewer in the results panel* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important: When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

XProc Transformation

[Edit on GitHub](#)

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XProc transformation**.
- Use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XProc transformation**.

Note: If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XProc transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XProc Tab
[Edit on](#)
[GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XProc** tab contains the following options:

XProc URL

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the built-in *Calabash* engine or a custom engine that is *configured in the Preferences dialog box*.

Inputs Tab (XProc Transformations)
[Edit on](#)
[GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the **URL** column.

The following actions are available for managing the input ports:

New

Opens an **Edit** dialog box that allows you to add a new port and its URL. The *built-in editor variables* and *custom editor variables* can be used to specify the URL.

Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The *built-in editor variables* and *custom editor variables* can be used to specify the URL.

Delete

Removes the selected port from the list. It is enabled only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)
[Edit on](#)
[GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the **New** and **Delete** buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The *built-in editor variables* and *custom editor variables* can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An *editor variable* can be inserted for the URL by using the  **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output results view.

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An *editor variable* can be inserted for the URL by using the  **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output results view.

Delete

Removes the selected output port from the list. It is enabled only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

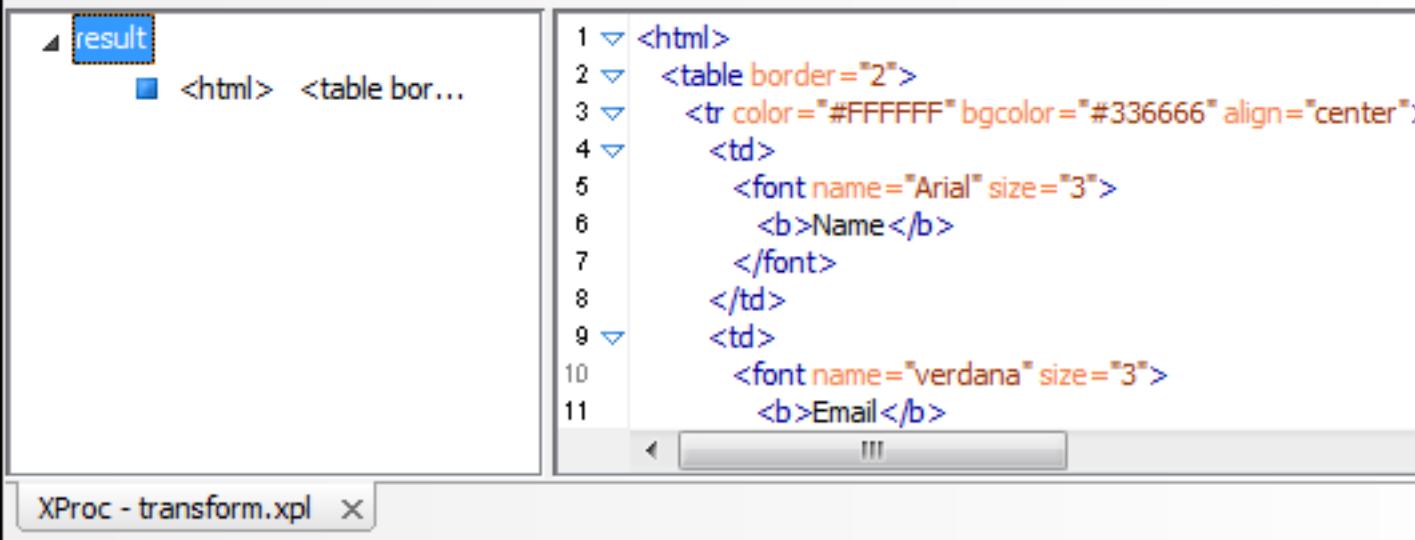

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field,

the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

The screenshot shows the Oxygen XML Author interface with the 'XProc - transform.xpl' tab active. On the left, there is a tree view pane showing a single node named 'result'. Underneath it, another node is partially visible with the text '<html> <table bor...>'. On the right, the main content area displays the XML code for the transformation result. The code is as follows:

```

1 <html>
2   <table border="2">
3     <tr color="#FFFFFF" bgcolor="#336666" align="center">
4       <td>
5         <font name="Arial" size="3">
6           <b>Name</b>
7         </font>
8       </td>
9       <td>
10      <font name="verdana" size="3">
11        <b>Email</b>

```

Figure 259: XProc Transformation Results View

Options Tab (XProc Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The [built-in editor variables](#) and [custom editor variables](#) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

XQuery Transformation

[Edit on GitHub](#)

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

Note: When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation**.
 - Use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation**.
- Note:** If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **XQuery transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, the **Insert Editor Variables** button, or the browsing tools in the **Browse** dropdown. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the [Configure parameters dialog box](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

[Edit on GitHub](#)

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@attr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc('\${cfdu}/test.xml')//*
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New	Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An <i>editor variable</i> can be inserted in the text box using the  Insert Editor Variables button. If the Evaluate as XPath option is enabled, the parameter will be evaluated as an XPath expression.
Edit	Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An <i>editor variable</i> can be inserted in the text box using the  Insert Editor Variables button. If the Evaluate as XPath option is enabled, the parameter will be evaluated as an XPath expression.
Unset	Resets the selected parameter to its default value. Available only for edited parameters with set values.
Delete	Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related information

[Editor Variables](#) on page 226

XQuery Extensions

[Edit on GitHub](#)

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the  **Move up** or  **Move down** buttons.

[Advanced Saxon HE/PE/EE XQuery Transformation Options](#)[Edit on GitHub](#)

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Recoverable errors ("warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml : space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml : space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Optimization level ("-opt")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Enable XQuery 3.0 support ("-qversion:(1.0|3.0)")

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when

running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Use a configuration file ("'-config'"')

Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

Allow calls on extension functions ("'-ext'"')

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file ("'-val'"')

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("'-outval'"')

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("--generateByteCode:(on|off)"')

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#/javadoc>.

Enable XQuery update ("'-update:(on|off)"')

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("'-backup:(on|off)"')

If checked, backup versions for any XML files updated with an XQuery Update are generated.

This option is available when the **Enable XQuery update** option is enabled.

FO Processor Tab (XQuery Transformations)

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an *external processor*.

Output Tab (XQuery Transformations)

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Enabling this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Open in Browser/System Application

If enabled, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the  text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*.
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an *integrated SVG viewer in the results panel* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important: When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the

path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

SQL Transformation

[Edit on GitHub](#)

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.
- Use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.

Note: If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **SQL transformation**.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

Name

The unique name of the SQL transformation scenario.

Storage

Allows you to select one of the following storage options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

SQL URL

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the browsing tools in the

 **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel.

Connection

Allows you to select a connection from a drop-down list.

To configure a connection, use the  **Advanced options** button to open the **Data Source preferences page**.

Parameters	Allows you to add or configure parameters for the transformation.
-------------------	---

Editing a Transformation Scenario

[Edit on GitHub](#)

Editing a transformation scenario is useful if you need to configure some of its parameters.

Note: You can edit transformation scenarios that are defined at project level only. To edit a transformation scenario that is associated with a predefined document type, *duplicate it and edit the duplicated scenario*.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.

Step Result: The *Configure Transformation Scenario(s) dialog box* is opened.

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

Tip: You could also select the scenario and the  **Edit** button in the **Transformation Scenarios** view to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Transformation Types

The *Configure Transformation Scenario(s) dialog box* contains a **Type** column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains includes some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA OT** - This type of transformation includes configurable options in the following tabs:
 - *Skins Tab* (Available for **WebHelp Classic** and **WebHelp Classic with Feedback**)
 - *Templates Tab* (Available for **WebHelp Responsive** and **WebHelp Responsive with Feedback**)
 - *FO Processor Tab* (Available for PDF output)
 - *Parameters Tab*
 - *Filters Tab*
 - *Advanced Tab*
 - *Output Tab*
- **ANT** - This type of transformation includes configurable options in the following tabs:
 - *Options Tab*
 - *Parameters Tab*
 - *Output Tab*
- **XSLT** - This type of transformation includes configurable options in the following tabs:
 - *XSLT Tab*
 - *FO Processor Tab*
 - *Output Tab*
- **XProc** - This type of transformation includes configurable options in the following tabs:
 - *XProc Tab*
 - *Inputs Tab*
 - *Parameters Tab*

- *Outputs Tab*
- *Options Tab*
- **XQuery** - This type of transformation includes configurable options in the following tabs:
 - *XQuery Tab*
 - *FO Processor Tab*
 - *Output Tab*

[Creating New Transformation Scenarios](#) on page 712

[Duplicating a Transformation Scenario](#) on page 764

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

Duplicating a Transformation Scenario

[Edit on GitHub](#)

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a predefined transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.
2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.

Step Result: The [Configure Transformation Scenario\(s\) dialog box](#) is opened.

Tip: You could also select the scenario and the  **Duplicate** button in the **Transformation Scenarios** view to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types section](#).

[Editing a Transformation Scenario](#) on page 763

Configure Transformation Scenario(s) Dialog Box

[Edit on GitHub](#)

You can use the **Configure Transformation Scenarios(s)** dialog box for *editing exiting transformation scenarios* or *creating new ones*.

To open this dialog box, use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

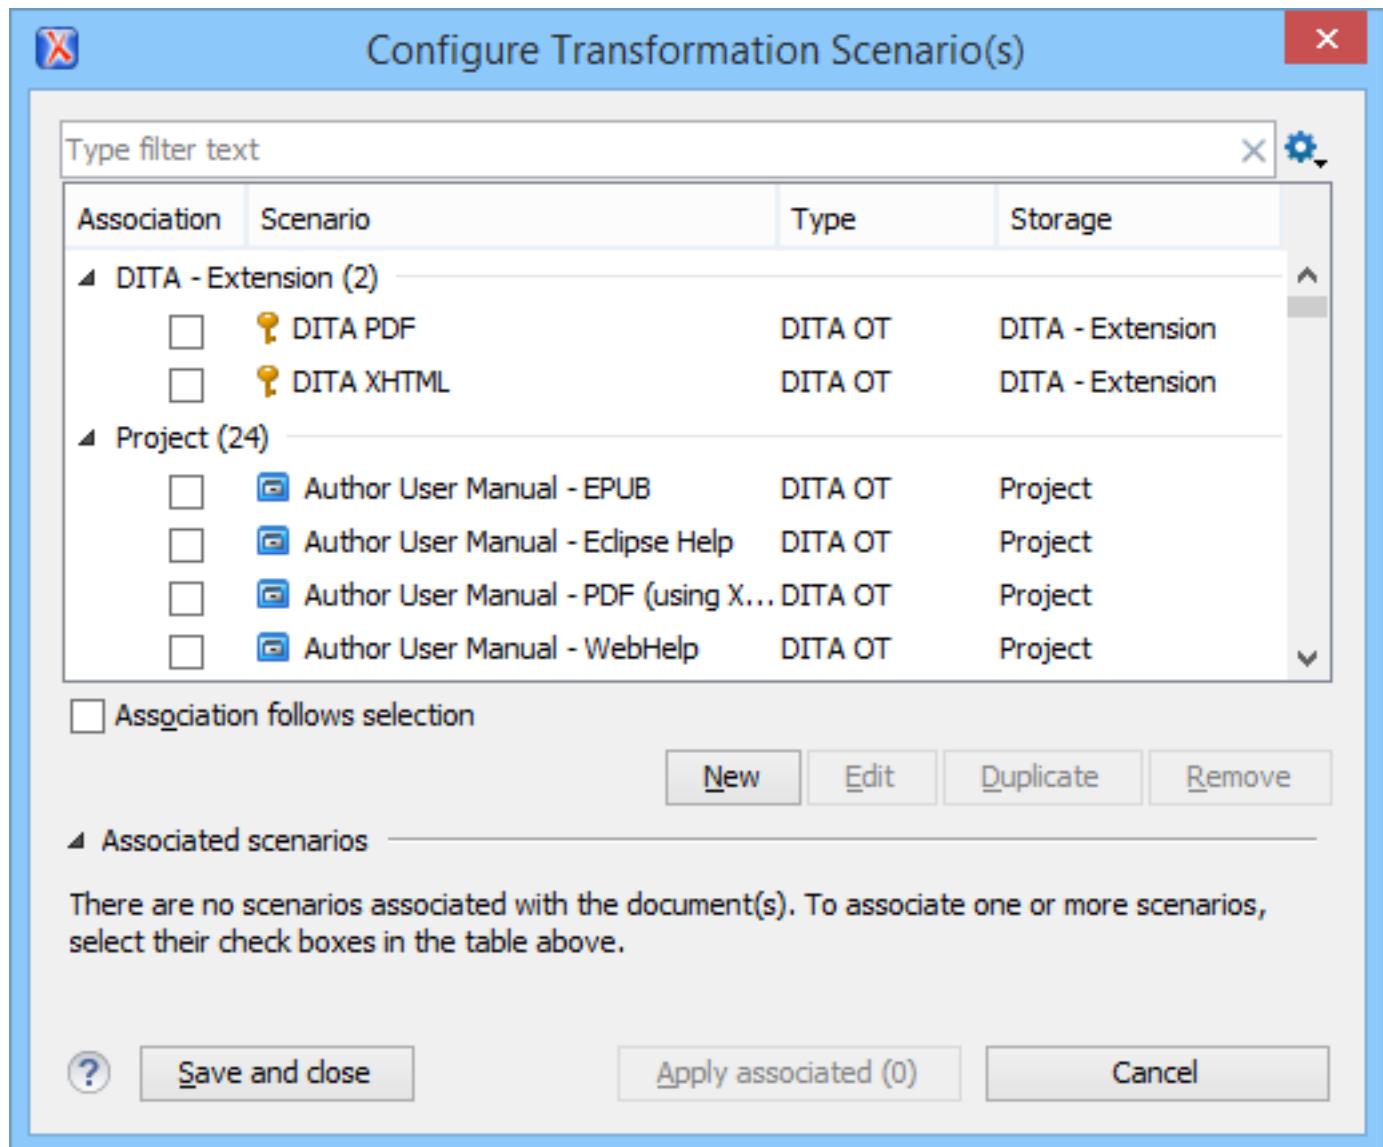

Figure 260: Configure Transformation Scenario(s) Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an

imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

The middle section of the dialog box displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at project level. The following columns are used to display the transformation scenarios:

- **Association** - The check-boxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - Displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Author, see the [Transformation Types section](#).
- **Storage** - Displays where a transformation scenario is stored (the [Show Storage option](#) must be enabled.)

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

The bottom section of the dialog box contains the following actions:

Association follows selection

Enable this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

Note: When this option is enabled, the **Association** column is hidden.

New

This button allows you to [create a new transformation scenario](#).

Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the [Transformation Types section](#).

Note: If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Author displays a warning message to inform you that this is not possible and gives you the option to create a [duplicate transformation scenario](#) to edit instead.

Duplicate

Use this button to create a [duplicate transformation scenario](#).

Remove

Use this button to remove transformation scenarios.

Note: Removing scenarios associated with a defined document type is not allowed.

The **Edit**, **Duplicate**, and **Remove** actions are also available in the contextual menu of the transformation scenarios listed in the middle section of the dialog box (along with  **Import scenarios** and  **Export selected scenarios**).

This contextual menu also contains a **Change storage** action that allows you to change the storage location of a transformation scenario to **Global Options** or **Project Options**. You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

Related information

[Editing a Transformation Scenario](#) on page 763

[Duplicating a Transformation Scenario](#) on page 764

Apply Batch Transformations

[Edit on GitHub](#)

A transformation action can be applied on a batch of selected files [from the contextual menu of the Project view](#) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. (Optional, but recommended) Organize the files you want to transform in logical folders.
 - a) Create a logical folder in the **Project** view by using the **New > Logical Folder** action from the contextual menu of the root file.
 - b) Add files you want to transform to the logical folder by using the  **Add Files** or  **Add Edited File** actions from the contextual menu of the logical folder.

Note: You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the **Project** view each time you want to transform them, but this can be tedious.
2. Right-click the newly created logical folder and select **Transform > Configure Transformation Scenario(s)** to select one or more transformation scenarios to be applied on all the files in the logical folder.

Note: These types of transformation scenarios must be configured with the current file (`$(cf)`) or current file URL (`$(currentFileURL)`) editor variables for the input file. This ensures that each file becomes the current file when its turn arrives in the batch transformation process. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the input file. For example, for a DocBook PDF transformation make sure the **XML URL** input box is set to the `$(currentFileURL)` editor variable. For a DITA PDF transformation make sure the `args.input` parameter is set to the `$(cf)` editor variable.

3. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select **Transform > ➔ Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.
4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform > ➔ Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

Sharing the Transformation Scenarios

[Edit on GitHub](#)

The transformation scenarios and their settings can be shared with other users by saving them at project level or by *exporting them to a specialized scenarios file* that can then be imported. When you create a new transformation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Global Options** or **Project Options**.

Storage: [Global Options](#) [Project Options](#)

Selecting **Global Options** stores the scenario in the global options that are stored in the user home directory.

Selecting **Project Options** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

You can also change the storage options on existing transformation scenarios by using the *Change storage action* from the contextual menu of the list of scenarios.

Related information

[Sharing and Storing Options](#) on page 219

Transformation Scenarios View

[Edit on GitHub](#)

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, select **Window > Show View > Transformation Scenarios**.

Transformation Scenarios [scenarios-view.dita]

Association	Scenario	Type

Figure 261: Transformation Scenarios view

Oxygen XML Author supports multiple scenarios association. To associate multiple scenarios with a document, enable the check-boxes in front of each scenario. You can also associate multiple scenarios with a document from the [Configure Transformation Scenario\(s\) dialog box](#).

The **Transformation Scenarios** view presents both global and project-level scenarios. By default, Oxygen XML Author presents the items in the following order:

1. Scenarios that match the current framework.
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

Toolbar/Contextual Menu Actions and Options

The following actions and options are available on the toolbar or in the contextual menu:

Select this option to run the current transformation scenario.

Select this option to switch to the **Debugger** perspective and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

This drop-down menu contains a list of the *scenarios that you can create*. Oxygen XML Author determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the *Transformation Types section*.

Removes the current scenario from the list. This action is also available by using the **Delete** key.

Use this option to change the storage location of the selected scenario. You are also able to keep the original storage location and make a copy of the selected scenario in the target storage location.

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

Use this option to export transformation and validation scenarios individually. Oxygen XML Author creates a `scenarios` file that contains the scenarios that you export.

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available

	scenarios, regardless of the document they are associated with.
Show only the scenarios available for the editor	Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.
Show associated scenarios	Select this option to only display the scenarios associated with the document you are editing.

Change storage	Use this option to change the storage location of the selected scenario to Global Options or Project Options . You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.
-----------------------	--

 **Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds `imported` to the name of the imported scenario.

 **Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a `scenarios` file that

contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Show Type	Use this option to display the transformation type of each scenario.
Show Storage	Use this option to display the storage location of the scenarios.
Group by Association	Select this option to group the scenarios depending on whether or not they are associated with the current document.
Group by Type	Select this option to group the scenarios by their type.
Group by Storage	Select this option to group the scenarios by their storage location.
 Ungroup all	Select this option to ungroup all the scenarios.
Reset Layout	Select this option to restore the default settings of the layout.

[Edit on GitHub](#)

Debugging PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Catalog**, click **Add**, and select the file located at *DITA_OT_DIR\plugins\org.dita.pdf2\cfg\catalog.xml*.
2. Open the map in the **DITA Maps Manager** and create a **DITA Map PDF** transformation scenario.
3. Edit the scenario, go to the **Parameters** tab and change the value of the **clean.temp** parameter to **no**.
4. Run the transformation scenario.
5. Open the **stage1.xml** file located in the temporary directory and [format and indent](#) it.
6. Create a transformation scenario for this XML file by associating the **topic2fo_shell_fop.xsl** stylesheet located at *DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl*. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets **topic2fo_shell_xep.xsl** or **topic2fo_shell_axf.xsl** located in the same folder.
7. In the transformation scenario edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).

8. In the transformation scenario edit the **Parameters** list and set the parameter *locale* with the value *en_GB* and the parameter *customizationDir.url* to point either to your customization directory or to the default DITA OT customization directory. Its value should have a URL syntax like this: `file:///c:/path/to/DITA_OT_DIR/plugins/org.dita.pdf2/cfg`.
9. Debug the transformation scenario.

Configuring Calabash with XEP

[Edit on GitHub](#)

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the `[OXYGEN_INSTALL_DIR]/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../../../tools/xep/xep.xml"/>` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Author.

Integration of an External XProc Engine

[Edit on GitHub](#)

The Javadoc documentation of the XProc API is available for download from the application website as a zip file [xprocAPI.zip](#).

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a Java archive (jar) from the classes you created.
4. Create a `engine.xml` file according with the `engine.dtd` file. The attributes of the `engine` element are as follows:
 1. `name` - The name of the XProc engine.
 2. `description` - A short description of the XProc engine.
 3. `class` - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
 4. `version` - The version of the integration.
 5. `engineVersion` - The version of the integrated engine.
 6. `vendor` - The name of the vendor / implementer.
 7. `supportsValidation` - `true` if the engine supports validation (otherwise, `false`).

The `engine` element has only one child, `runtime`. The `runtime` element contains several `library` elements with the `name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a folder with the name of the integration in the `[OXYGEN_INSTALL_DIR]/lib/xproc`.
6. Place the `engine.xml` and all the libraries necessary to run the new integration in that folder.

XSLT Processors

[Edit on GitHub](#)

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author.

Supported XSLT Processors

[Edit on
GitHub](#)

Oxygen XML Author includes the following XSLT processors:

- **Xalan 2.7.1** - [Xalan-Java](#) is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - [Saxon 6.5.5](#) is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE)** - [Saxon-HE/PE](#) implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 9.6.0.7 Enterprise Edition (EE)** - [Saxon EE](#) is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the W3C XML Schema 1.0 or 1.1. This can be [configured in Preferences](#).

Note: Oxygen XML Author implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

Note: Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Author installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability follow these steps:

1. Download Saxon 9.6.0.7 Professional Edition (PE) or Enterprise Edition (EE) from <http://www.saxonica.com>.
2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author.

- **Xsltproc (libxslt)** - [Libxslt](#) is the XSLT C library developed for the Gnome project. Libxslt is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions. The *libxml2* version included in Oxygen XML Author is 2.7.6 and the Libxslt version is 1.1.26.

Oxygen XML Author uses Libxslt through its command line tool (`Xsltproc`). The XSLT processor is included in the distribution kit of the stand-alone version for Windows and Mac OS X. Since there are differences between various Linux distributions, on Linux you must install Libxslt on your machine as a separate application and set the PATH variable to contain the `Xsltproc` executable.

Note: The Xsltproc processor can be configured from the [XSLTPROC options page](#).

CAUTION: There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are

stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 - MSXML 4.0** is available only on Windows platforms. It can be used for *transformation*.

Oxygen XML Author uses the Microsoft XML parser through its command line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from [Microsoft web-site](#).

- **MSXML .NET - MSXML .NET** is available only on Windows platforms. It can be used for *transformation*.

Oxygen XML Author performs XSLT transformations and validations using .NET Framework's XSLT implementation (`System.Xml.Xsl.XslTransform` class) through the `nxslt` command line utility. The `nxslt` version included in Oxygen XML Author is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed.` Exit code: 128.

You can get the .NET Framework version 1.0 from the [Microsoft website](#).

- **.NET 1.0** - A transformer based on the `System.Xml` 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (<http://msdn.microsoft.com/xml/>). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed.` Exit code: 128.

You can get the .NET Framework version 1.0 from the [Microsoft website](#).

- **.NET 2.0** - A transformer based on the `System.Xml` 2.0 library available in the .NET 2.0 framework from [Microsoft](#). It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed.` Exit code: 128.

You can get the .NET Framework version 2.0 from the [Microsoft website](#).

For information about configuring the XSLT preferences, see the [XSLT options](#) section.

Configuring Custom XSLT Processors

[Edit on GitHub](#)

You can configure and run XSLT and XQuery transformations with processors other than [the ones which come with the Oxygen XML Author distribution](#).

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows [the format of an Oxygen XML Author linked message](#), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related information

[Custom Engines Preferences](#) on page 175

Configuring the XSLT Processor Extensions Paths

[Edit on GitHub](#)

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

The DocBook extensions for Xalan and Saxon are included in the `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\extensions` folder.

For more information about how to use extensions, see the following links:

- **Xalan** - <http://xml.apache.org/xalan-j/extensions.html>
- **Saxon 6.5.5** - <http://saxon.sourceforge.net/saxon6.5.5/extensions.html>
- **Saxon 9.6.0.7** - <http://www.saxonica.com/documentation9.5/index.html#!extensibility>

To set an XSLT processor extension (a directory or a `.jar` file), use *the Extensions button* in the **Edit scenario** dialog box.

Note: The old way of setting an extension (using the parameter `-Dcom.oxygenxml.additional.classpath`) was deprecated, and instead you should use the extension mechanism of the XSLT transformation scenario.

XSL-FO Processors

[Edit on GitHub](#)

This section explains how to apply XSL-FO processors when transforming XML documents to various output formats in Oxygen XML Author.

Built-in XSL-FO Processor

[Edit on GitHub](#)

The Oxygen XML Author installation package is distributed with the *Apache FOP* that is a Formatting Objects processor for rendering your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

Other FO processors can be configured in *the Preferences dialog box*.

Add a Font to the Built-in FO Processor - Simple Version

[Edit on GitHub](#)

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of *the procedure for setting a custom font in Apache FOP*.

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
 - a) Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">
  <renderers>
    <renderer mime="application/pdf">
      <fonts>
        <auto-detect/>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

- b) *Open the Preferences dialog box (Options > Preferences)*, go to **XML > XSLT/FO/XQuery > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

2. Set the font on the document content.

This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

- For DocBook documents you can start with the predefined scenario called **DocBook PDF**, [edit the XSLT parameters](#) and set the font name (in our example the font family name is **Arial Unicode MS**) to the parameters body.font.family and title.font.family.
- For TEI documents you can start with the predefined scenario called **TEI PDF**, [edit the XSLT parameters](#) and set the font name (in our example **Arial Unicode MS**) to the parameters bodyFont and sansFont.
- For DITA transformations to PDF using DITA-OT you should modify the following two files:
 - DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml* - The font-face element included in each element physical-font having the attribute `char-set="default"` must contain the name of the font (**Arial Unicode MS** in our example)
 - DITA_OT_DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf* - An element auto-detect must be inserted in the element fonts, which is inside the element renderer that has the attribute `mime="application/pdf"`:

```
<renderer mime="application/pdf">
  .
  .
  <font>
    <auto-detect/>
  </font>
  .
</renderer>
```

Add a Font to the Built-in FO Processor

[Edit on GitHub](#)

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important: If this special font is installed in the operating system, there is a simple way of telling FOP to look for it. See [the simplified procedure for adding a font to FOP](#).

- Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

On Windows the fonts are located into the C:\Windows\Fonts directory. On Mac, they are placed in / Library/Fonts. To install a new font on your system, is enough to copy it in the Fonts directory.

- Generate a font metrics file from the font file.

- Open a terminal.
- Change the working directory to the Oxygen XML Author install directory.
- Create the following script file in the Oxygen XML Author installation directory.

For OS X and Linux create a file ttfConvert.sh:

```
#!/bin/sh

export LIB=lib
export CP=$LIB/fop.jar
export CP=$CP:$LIB/avalon-framework-4.2.0.jar
export CP=$CP:$LIB/xercesImpl.jar
export CP=$CP:$LIB/commons-logging-1.1.3.jar
export CP=$CP:$LIB/commons-io-1.3.1.jar
export CP=$CP:$LIB/xmlgraphics-commons-1.5.jar
export CP=$CP:$LIB/xml-apis.jar
export CMD="java -cp $CP org.apache.fop.apps.TTFReader"
export FONT_DIR='.'
```

```
$CMD $FONT_DIR/Arialuni.ttf Arialuni.xml
```

For Windows create a file ttfConvert.bat:

```
@echo off
set LIB=lib
set CP=%LIB%\fop.jar
set CP=%CP%;%LIB%\avalon-framework-4.2.0.jar
set CP=%CP%;%LIB%\xercesImpl.jar
set CP=%CP%;%LIB%\commons-logging-1.1.3.jar
set CP=%CP%;%LIB%\commons-io-1.3.1.jar
set CP=%CP%;%LIB%\xmlgraphics-commons-1.5.jar
set CP=%CP%;%LIB%\xml-apis.jar
set CMD=java -cp "%CP%" org.apache.fop.fonts.apps.TTFReader
set FONT_DIR=C:\Windows\Fonts
%CMD% %FONT_DIR%\Arialuni.ttf Arialuni.xml
```

The paths specified in the file are relative to the Oxygen XML Author installation directory. If you decide to create it in other directory, change the file paths accordingly.

The *FONT_DIR* can be something different on your system. Check that it points to the correct font directory. If the Java executable is not in the *PATH*, specify the full path of the executable.

If the font has bold and italic variants, convert them too by adding two more lines to the script file:

- for OS X and Linux:

```
$CMD $FONT_DIR/Arialuni-Bold.ttf Arialuni-Bold.xml
$CMD $FONT_DIR/Arialuni-Italic.ttf Arialuni-Italic.xml
```

- for Windows:

```
%CMD% %FONT_DIR%\Arialuni-Bold.ttf Arialuni-Bold.xml
%CMD% %FONT_DIR%\Arialuni-Italic.ttf Arialuni-Italic.xml
```

d) Run the script.

On Linux and OS X, run the command `sh ttfConvert.sh` from the command line. On Windows, run the command `ttfConvert.bat` from the command line or double-click the file `ttfConvert.bat`.

3. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
 - Create a FOP configuration file that specifies the font metrics file for your font.

```
<fop version="1.0">
  <base>./</base>
  <font-base>file:/C:/path/to/FOP/font/metrics/files/</font-base>
  <source-resolution>72</source-resolution>
  <target-resolution>72</target-resolution>
  <default-page-settings height="11in" width="8.26in"/>
  <renderers>
    <renderer mime="application/pdf">
      <filterList>
        <value>flate</value>
      </filterList>
      <fonts>
        <font metrics-url="Arialuni.xml" kerning="yes"
              embed-url="file:/Library/Fonts/Arialuni.ttf">
          <font-triplet name="Arialuni" style="normal"
                        weight="normal"/>
        </font>
      </fonts>
    </renderer>
  </renderers>
```

```
</fop>
```

The `embed-url` attribute points to the font file to be embedded. Specify it using the URL convention. The `metrics-url` attribute points to the font metrics file with a path relative to the `base` element. The triplet refers to the unique combination of name, weight, and style (italic) for each variation of the font. In our case is just one triplet, but if the font had variants, you would have to specify one for each variant. Here is an example for Arial Unicode if it had italic and bold variants:

```
<fop version="1.0">
...
<fonts>
    <font metrics-url="Arialuni.xml" kerning="yes"
          embed-url="file:/Library/Fonts/Arialuni.ttf">
        <font-triplet name="Arialuni" style="normal"
                      weight="normal"/>
    </font>
    <font metrics-url="Arialuni-Bold.xml" kerning="yes"
          embed-url="file:/Library/Fonts/Arialuni-Bold.ttf">
        <font-triplet name="Arialuni" style="normal"
                      weight="bold"/>
    </font>
    <font metrics-url="Arialuni-Italic.xml" kerning="yes"
          embed-url="file:/Library/Fonts/Arialuni-Italic.ttf">
        <font-triplet name="Arialuni" style="italic"
                      weight="normal"/>
    </font>
</fonts>
...
</fop>
```

More details about the FOP configuration file are available on the FOP website.

- b) [Open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XSLT/FO/XQuery > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

4. Set the font on the document content.

This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

For DocBook documents, you can start with the predefined scenario called [DocBook PDF, edit the XSLT parameters](#), and set the font name (in our example **Arialuni**) to the parameters `body.font.family` and `title.font.family`.

For TEI documents, you can start with the predefined scenario called [TEI PDF, edit the XSLT parameters](#), and set the font name (in our example **Arialuni**) to the parameters `bodyFont` and `sansFont`.

For DITA to PDF transformations using DITA-OT modify the following two files:

- `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `font-face` element included in each element `physical-font` having the attribute `char-set="default"` must contain the name of the font (`Arialuni` in our example)
- `DITA_OT_DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element `font` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`:

```
<renderer mime="application/pdf">
...
<fonts>
    <font metrics-url="Arialuni.xml" kerning="yes"
          embed-url="file:/Library/Fonts/Arialuni.ttf">
        <font-triplet name="Arialuni" style="normal"
                      weight="normal"/>
    </font>
```

```
</fonts>
.
.
</renderer>
```

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

[Edit on GitHub](#)

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

You can extend the functionality of the built-in FO processor by dropping additional libraries in the `[OXYGEN_INSTALL_DIR]/lib/fop` directory.

To add support for hyphenation, follow these steps:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the compiled JAR from [OFFO](#).
3. Copy the `fop-hyph.jar` file into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Author.

Adding Support for PDF Images

To add support for PDF images, follow these steps:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the [`fop-pdf-images`](#) JAR libraries.
3. Copy the libraries into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Author.

Adding Libraries to the Built-in FO Processor (DITA-OT)

[Edit on GitHub](#)

To use additional libraries with the DITA-OT publishing engine, you need to edit the transformation scenario and add the path to the new libraries in the **Libraries** section of the **Advanced** tab.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled JAR from [OFFO](#).
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the `fop-hyph.jar` library.

Adding Support for PDF Images

1. Download the [`fop-pdf-images`](#) JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the libraries.

WebHelp System Output

[Edit on GitHub](#)

Oxygen XML Author allows you to obtain WebHelp Classic and WebHelp Responsive outputs. This section contains information about the WebHelp system, its variants, and ways to customize it to better fit your specific needs.

Table 9: WebHelp System Feature Matrix

Features	WebHelp System Variants				
	Responsive w/ Feedback	Responsive	Classic w/ Feedback	Classic	Classic Mobile

WebHelp Responsive System

[Edit on GitHub](#)

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Author WebHelp system includes several variants to suit your specific needs. The *WebHelp Responsive* variant features a very flexible layout, is designed to adapt to any screen size, and is available for DITA document types.

This type of WebHelp system can be generated by using the [DITA Map WebHelp Responsive transformation scenario](#).

Layout

The layout of the *WebHelp Responsive* system is platform independent and is able to adapt to any screen size. It is highly customizable and relies on a [template mechanism](#) that allows you to control the position of various functional [template components](#) to suit your particular requirements.

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each of these layouts include a collection of skins that you can choose from, or you can customize your own.

The screenshot shows a responsive web page for "Growing Flowers". At the top left is a decorative icon of two stylized flowers. The main title "Growing Flowers" is centered above a navigation bar with three items: "INTRODUCTION", "CARE AND PREPARATION", and "FLOWERS BY SEASON". Below the navigation is a large, close-up photograph of a magnolia flower. Overlaid on the bottom right of the photo is a search bar with the placeholder "Search" and a magnifying glass icon. The page content is organized into three columns. The left column features a purple flower icon with a water spray icon next to it, and the heading "Care and Preparation" followed by text about feeding, pests, and weeds. The middle column has a purple flower icon and the heading "Flowers by Season" followed by text about seasonal specificity. The right column contains a small icon of an open book with a flower inside. At the bottom of the page, a footer note reads "WebHelp output generated by <oxygent/> XML Author".

Growing Flowers

INTRODUCTION CARE AND PREPARATION FLOWERS BY SEASON

Search

Care and Preparation

When caring for your flower garden you want to feed your plants properly, control pests and weeds.

Flowers by Season

Flowers and seasons are intimately bound to each other. Most of the flowers are season-specific.

Flowers by Season

Flowers and seasons are intimately bound to each other. Most of the flowers are season-specific.

Glossary

Definitions of the most commonly used gardening terms.

Search Feature

When you enter search terms in the **Search** field, the results are displayed in the results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
 - The search phrase is included in a meta keyword
 - The search phrase is in the title of the page
 - The search phrase is in bold text in a paragraph
 - The search phrase is in normal text in a paragraph

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "*grow flowers*", returns no results since it searches for two separate words).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside `keywords` elements weighs twice as much as content inside an `H1` HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 815.

This output format is compatible with the most recent versions of the following common browsers:

- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

WebHelp Responsive with Feedback System

[Edit on GitHub](#)

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Author WebHelp system includes several variants to suit your specific needs. The *WebHelp Responsive with Feedback* variant features a very flexible layout, is designed to adapt to any screen size, and includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This variant is available for DITA document types.

This type of WebHelp system can be generated by using the [DITA Map WebHelp Responsive with Feedback transformation scenario](#) and following the [instructions for deploying the system](#).

Layout

The layout of the *WebHelp Responsive with Feedback* system is platform independent and is able to adapt to any screen size. It is highly customizable and relies on a [template mechanism](#) that allows you to control the position of various functional [template components](#) to suit your particular requirements.

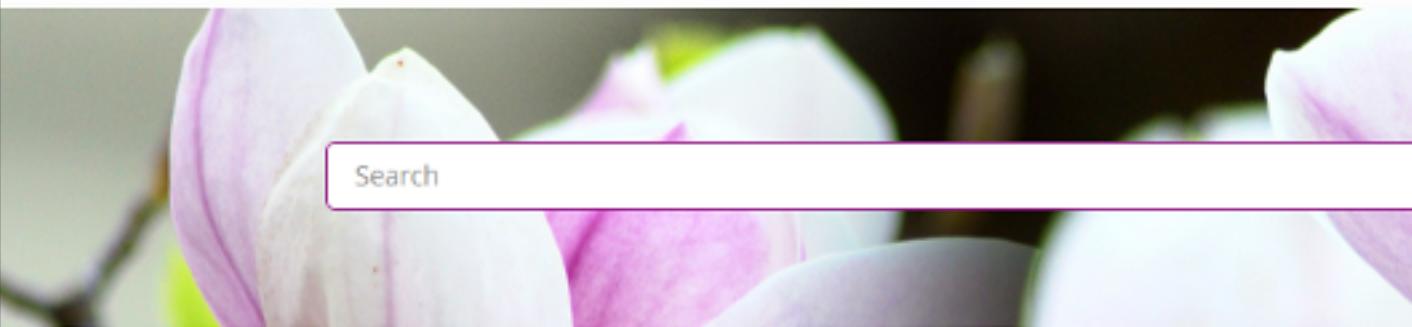

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each of these layouts include a collection of skins that you can choose from, or you can customize your own.

The *WebHelp Responsive with Feedback* system also contains a **Comments** section at the bottom of the pane. This section is where you can interact with users through a comment system.

Growing Flowers

INTRODUCTION CARE AND PREPARATION FLOWERS BY SEASON

Search

Care and Preparation ↗ Pruning

Pruning

Pruning is the process of removing certain above-ground elements from a plant; in landscaping this process usually involves removal of diseased, non-productive, or otherwise unwanted portions from a plant. In nature, certain meteorological conditions such as wind, snow or seawater mist can conduct a when for natural pruning process. The purpose of anthropomorphic pruning is to shape the plant by controlling or directing plant growth, to maintain the health of the plant, or to increase the yield or quality of flowers and fruits.

In general the smaller the wound (smaller the branch that is cut) the less harm to the tree. It is therefore typically better to formative prune the tree when juvenile than try to cut off large branches on a mature tree.

Managing Comments

To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
 - When a comment is left on a page that you commented on.
 - When a comment is left on any topic in the WebHelp Classic system.
 - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

Note: The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see [Managing Users and Comments in a WebHelp Responsive with Feedback System](#) on page 790.

Search Feature

When you enter search terms in the **Search** field, the results are displayed in the results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
 - The search phrase is included in a meta keyword
 - The search phrase is in the title of the page
 - The search phrase is in bold text in a paragraph
 - The search phrase is in normal text in a paragraph

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "*grow flowers*", returns no results since it searches for two separate words).
- **indexterm** and **keywords** DITA elements are an effective way to increase the ranking of a page (for example, content inside **keywords** elements weighs twice as much as content inside an **H1** HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 815.

This output format is compatible with the most recent versions of the following common browsers:

- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

Deploying the WebHelp Responsive with Feedback System

[Edit on GitHub](#)

System Requirements

The *WebHelp Responsive with Feedback* system of Oxygen XML Author requires a standard server deployment. You can request this from your server admin and it needs the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

Oxygen XML WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Internet Explorer, Safari, Opera.

Create WebHelp Responsive with Feedback Database

The *WebHelp Responsive with Feedback* system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

For example, the following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp Responsive with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the *WebHelp Responsive with Feedback* output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the *DOCUMENT_ROOT* folder.
4. Rename it to something relevant (for example, *myProductWebHelp*).

5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/`). You are redirected to the installation wizard. Proceed with the installation as follows:
 - a. Verify that the prerequisites are met.
 - b. Press **Start Installation**.
 - c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

Tip: You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.

 - d. Configure the **MySQL Database Connection Settings** section. Use the information (database name, username, password) from the [Create WebHelp Responsive with Feedback Database section](#) to fill-in the appropriate text boxes.

Warning: Checking the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the *WebHelp Responsive with Feedback* system, but you do not want to select this option on subsequent deployments.

- e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, check the **Enable LDAP Authentication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
- f. If the **Create new database structure** option is checked, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple *WebHelp Responsive with Feedback* deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, enable the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

- g. Press **Next Step**.
- h. Remove the installation folder from your web server.

Important: When you publish subsequent iterations of your *WebHelp Responsive with Feedback* system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

- i. In your Web browser, go to your *WebHelp Responsive with Feedback* system main page.

Testing Your WebHelp Responsive with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable *JavaScript* logging by doing one of the following:
 - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
 - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a **WebHelp Responsive with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The *WebHelp Responsive with Feedback* installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

Refreshing the Content of a WebHelp Responsive with Feedback System

[Edit on GitHub](#)

It is common to update the content of an existing installation of a *WebHelp Responsive with Feedback* system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp Responsive with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp Responsive with Feedback* system installation directory, overwriting the existing content.

Managing Users and Comments in a WebHelp Responsive with Feedback System

[Edit on GitHub](#)

When you installed the *WebHelp Responsive with Feedback* system the first time (assuming the [Create new database structure option](#) was enabled), you should have been prompted to create an administrator account (or a user named `administrator` was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp Responsive system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

The screenshot shows the 'oxy-webhelp 1.0 - Administrative Page'. At the top, there are three buttons: 'Delete Orphan Comments', 'Delete Pending Users', and 'View All Posts'. Below these is a search bar labeled 'Search User Information'. The main area displays a table of user information with columns: User Name, Name, Level, Company, E-Mail, Date, WebHelp Notification, Reply Notification, and Page Notification. Two users are listed: 'admin' (Administrator level) and 'user' (user level).

User Name	Name	Level	Company	E-Mail	Date	WebHelp Notification	Reply Notification	Page Notification
admin	Administrator	admin	NA	admin@sync.ro	2015-08-04 08:56:55	yes	no	no
user	user	user	noCompany	user@sync.ro	2015-08-04 08:57:46	no	yes	yes

Figure 265: Administrative Page

3. Use this page to manage the following options:

Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export

comments, and set the version of the feedback-enabled WebHelp system.

- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When enabled, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

Reply Notification

When enabled, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When enabled, the user receives notifications when comments are posted on a topic where they previously posted a comment.

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.

- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

Warning: The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

WebHelp Responsive Template Mechanism

[Edit on GitHub](#)

The WebHelp Responsive template mechanism is the base of the system and it is responsible for defining its output. It consists of a set of HTML template files and other additional resources (such as images, CSS, and JavaScript files). Each of the HTML template files contain one or more template components (such as title, table of contents, search input, etc.) whose placement inside the template will define the final layout of the output.

This mechanism allows you to create multiple layouts simply by creating templates that define the location of where the various components will be displayed.

Creating WebHelp Responsive Templates

To create a new WebHelp Responsive template, follow these steps:

1. Locate the following folder in your DITA-OT directory (*DITA_OT_DIR*):

DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/

2. Duplicate the *bootstrap* folder and rename it to whatever you want your new template to be identified as (for example, *myTemplate*).
3. Customize the structure of the new template according to your needs. For example, if you only want to keep one of the template variants, open the *myTemplate/variants* folder and delete all of its subdirectories, except for that one (for instance, the *tiles* directory). Keep in mind that the structure of the template directory is important. The names of folders at certain levels correspond to the names of templates and skins, while components and resources are defined and referenced in certain files or folders at specific locations within the directory structure. For more information, see *WebHelp Responsive Template Directory Structure* on page 793.
4. You can also customize the structure of the skins within the template variants. For example, if you only want to keep one of the skins in the *tiles* variant, open the *myTemplate/variants/tiles* folder and delete all of its subdirectory skins, except for that one (for instance, the *light* directory). You can also edit the *skin.css* file that is located in the skin directory to customize the styling. If your customization of the CSS file requires additional resources (such as images, fonts, or other CSS files), they need to be placed in the *resources* folder at the same level with the *skin.css* file.
5. To customize the components that appear in the WebHelp Responsive output, you can modify the HTML template files that define the output. For more information, see *WebHelp Responsive Template Files* on page 795.

Related information

[Customizing the WebHelp Responsive Output](#) on page 807

WebHelp Responsive Template Directory Structure

[Edit on GitHub](#)

A certain directory structure is required for the WebHelp Responsive templates. The names of folders at certain levels correspond to the names of template variants and skins, components are defined in specific files, and various resources need to be located in specific locations within the directory structure.

The templates are stored in `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita`.

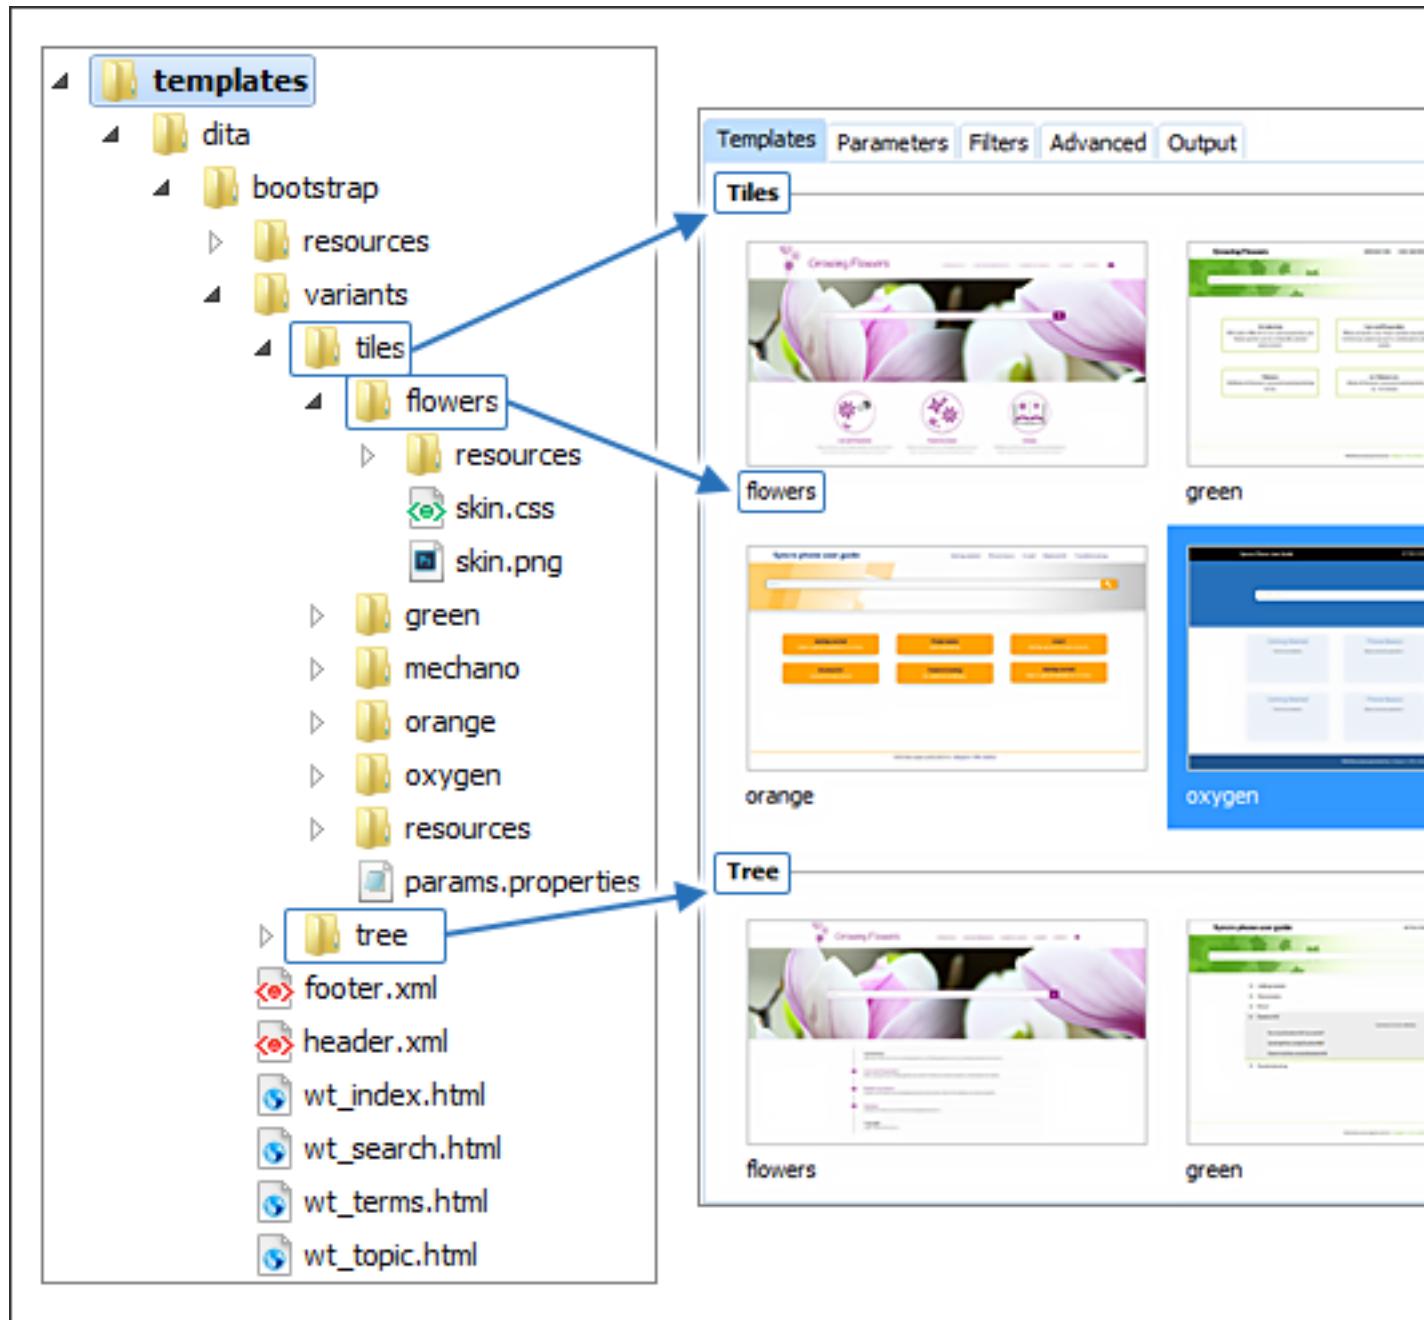

Figure 266: Templates Directory Structure

At the first level of the template directory we can find the following predefined files and folders:

- **resources Folder** - Contains all additional resources used by the template, such as images, CSS, and JavaScript files.
- **variants Folder** - Contains the template variants, including folders for each skin. See [Template Variants and Skins](#) on page 795.
- **Template Files** - The HTML template files that are used to generate the output:
 - `wt_index.html` - Used to produce the main home page of the WebHelp Responsive output. See [WebHelp Responsive Main Page Template](#) on page 796.
 - `wt_topic.html` - Used to generate the HTML pages associated with individual topics. See [WebHelp Responsive Topic Template](#) on page 797.

- `wt_search.html` - Used to generate the HTML page that presents the search results. See [WebHelp Responsive Search Results Template](#) on page 799.
- `wt_terms.html` - Used to generate the HTML page that presents the documentation index. See [WebHelp Responsive Index Terms Template](#) on page 800.

After the transformation scenario is executed, the resources and variants folders are copied in the `/oxygen-webhelp/template/` folder within the output directory (defined in the **Output** tab of the transformation scenario).

Template Variants and Skins

You could think of a *template* as being a set of WebHelp components that are placed in a predefined HTML layout. You can have multiple variants of the template. A WebHelp *template variant* is an instance of the template with a specific set of parameters. For example, you could have two variants of the WebHelp main page, one that displays the topics in a *tiles* style of layout, and another one that displays the topics in a *tree* style.

Each variant has its own directory that corresponds to the name of the variant. The name of the variant is displayed in the user interface when the variants are displayed (for example, in the **templates** tab of the transformation scenario).

Each variant directory may contain the following resources:

- **Skin Directories** - These folders represent skin templates for the current variant.
- **params.properties File** - This file specifies the values for the parameters imposed by the variant.
- **resources Folder** - This is an optional directory that contains resources that are specific to the current variant (such as images, CSS files, etc.) They will be copied to the output directory.

Skins

A variant *skin* represents a CSS file that allows you to alter the styling of the template. The CSS associated with a skin must be named `skin.css` and it must be stored as a first child of the skin directory.

Each skin might need additional resources (images, fonts) that must be stored in the `resources` directory in the root folder for that particular skin. The name of the skin directory is displayed in the user interface when you choose a skin (in the **templates** tab of the transformation scenario).

Each skin directory can also contain a `skin.png` preview image that will be displayed in the user interface and a properties file that contains a URL for the online preview of the skin. This image file must be stored as a first child of the skin directory.

For information about creating or customizing skins, see [Create or Customize a WebHelp Responsive Skin](#) on page 810.

WebHelp Responsive Template Files

[Edit on GitHub](#)

The HTML pages that comprise the output of a WebHelp Responsive system are obtained after processing HTML template files. These files correspond to the type of page they generate in the output.

There are four types of template pages and corresponding HTML template files:

1. **Main Page Template** (`wt_index.html` file) - Used to produce the main home page of the WebHelp Responsive output.
2. **Topic Template** (`wt_topic.html` file) - Used to generate the HTML pages associated with individual topics.
3. **Search Results Template** (`wt_search.html` file) - Used to generate the HTML page that presents the search results.
4. **Index Terms Template** (`wt_terms.html` file) - Used to generate the HTML page that presents the documentation index.

The HTML template files are located in the following directory:

`DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/`

WebHelp Responsive Main Page Template

[Edit on GitHub](#)

The *Main Page Template* is used to generate the home page of the WebHelp Responsive output. The name of the template file is `wt_index.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The main function of the home page is to display top level information and provide links that help you easily navigate to any of the top level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

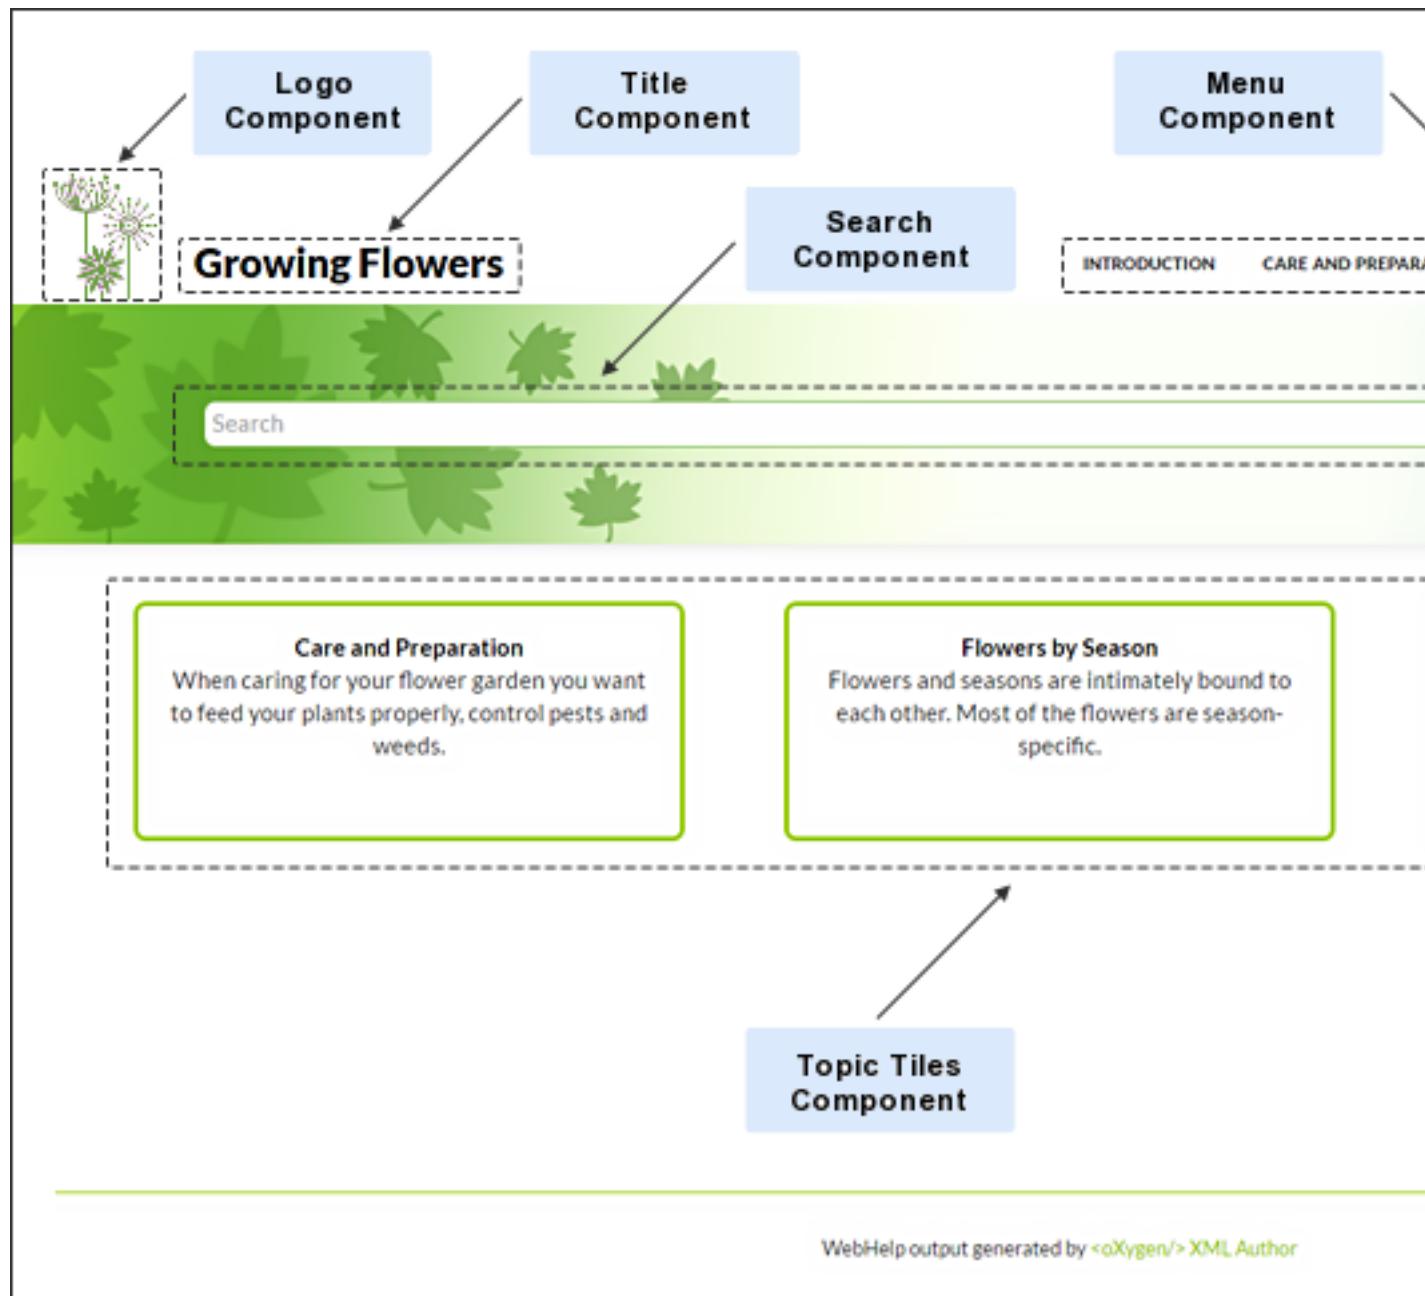

Figure 267: Example: Main Page Components of a Tiles Style of Layout

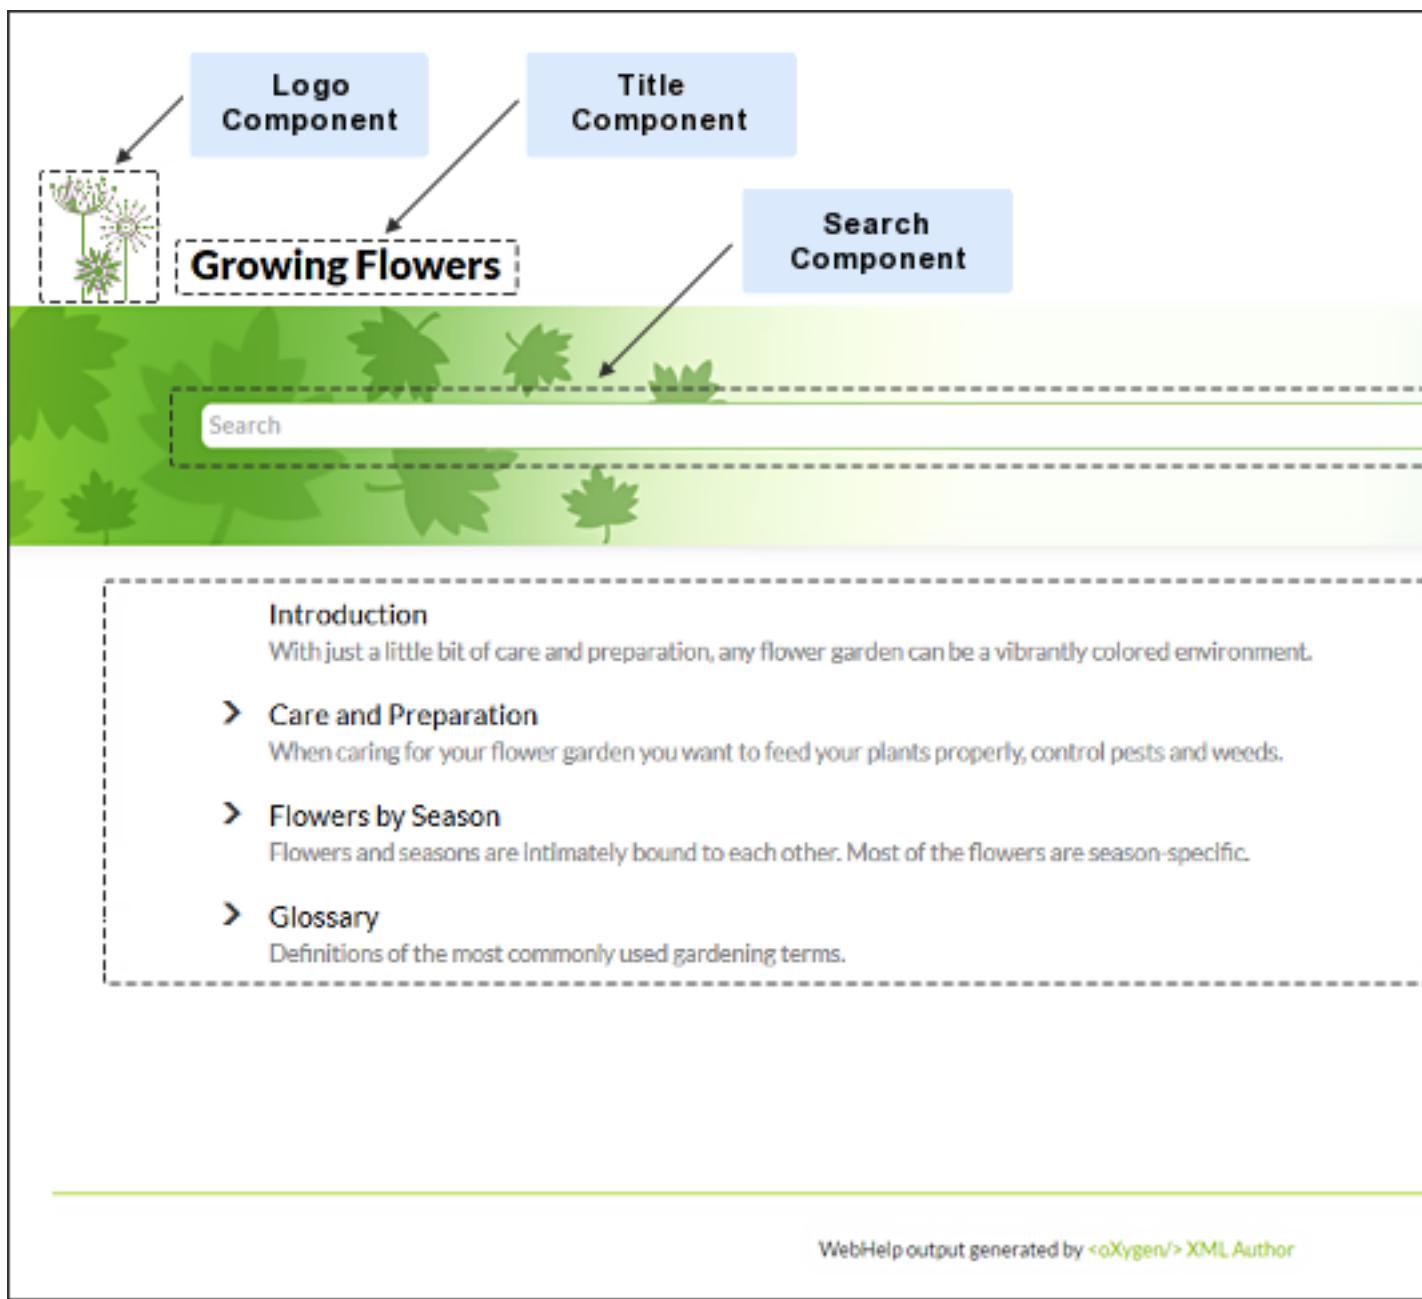

Figure 268: Example: Main Page Components of a Tree Style of Layout

The components that can be referenced in the `wt_index.html` template file are as follows:

- *Publication Title*
- *Publication Logo*
- *Search Input*
- *Print Link*
- *Main Page Menu*
- *Main Page Topic Tiles*
- *Main Page Table of Contents*
- *Index Terms Link*

WebHelp Responsive Topic Template[Edit on GitHub](#)

The *Topic Template* is used to generate HTML pages for each topic in the WebHelp Responsive output. The name of the template file is `wt_topic.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

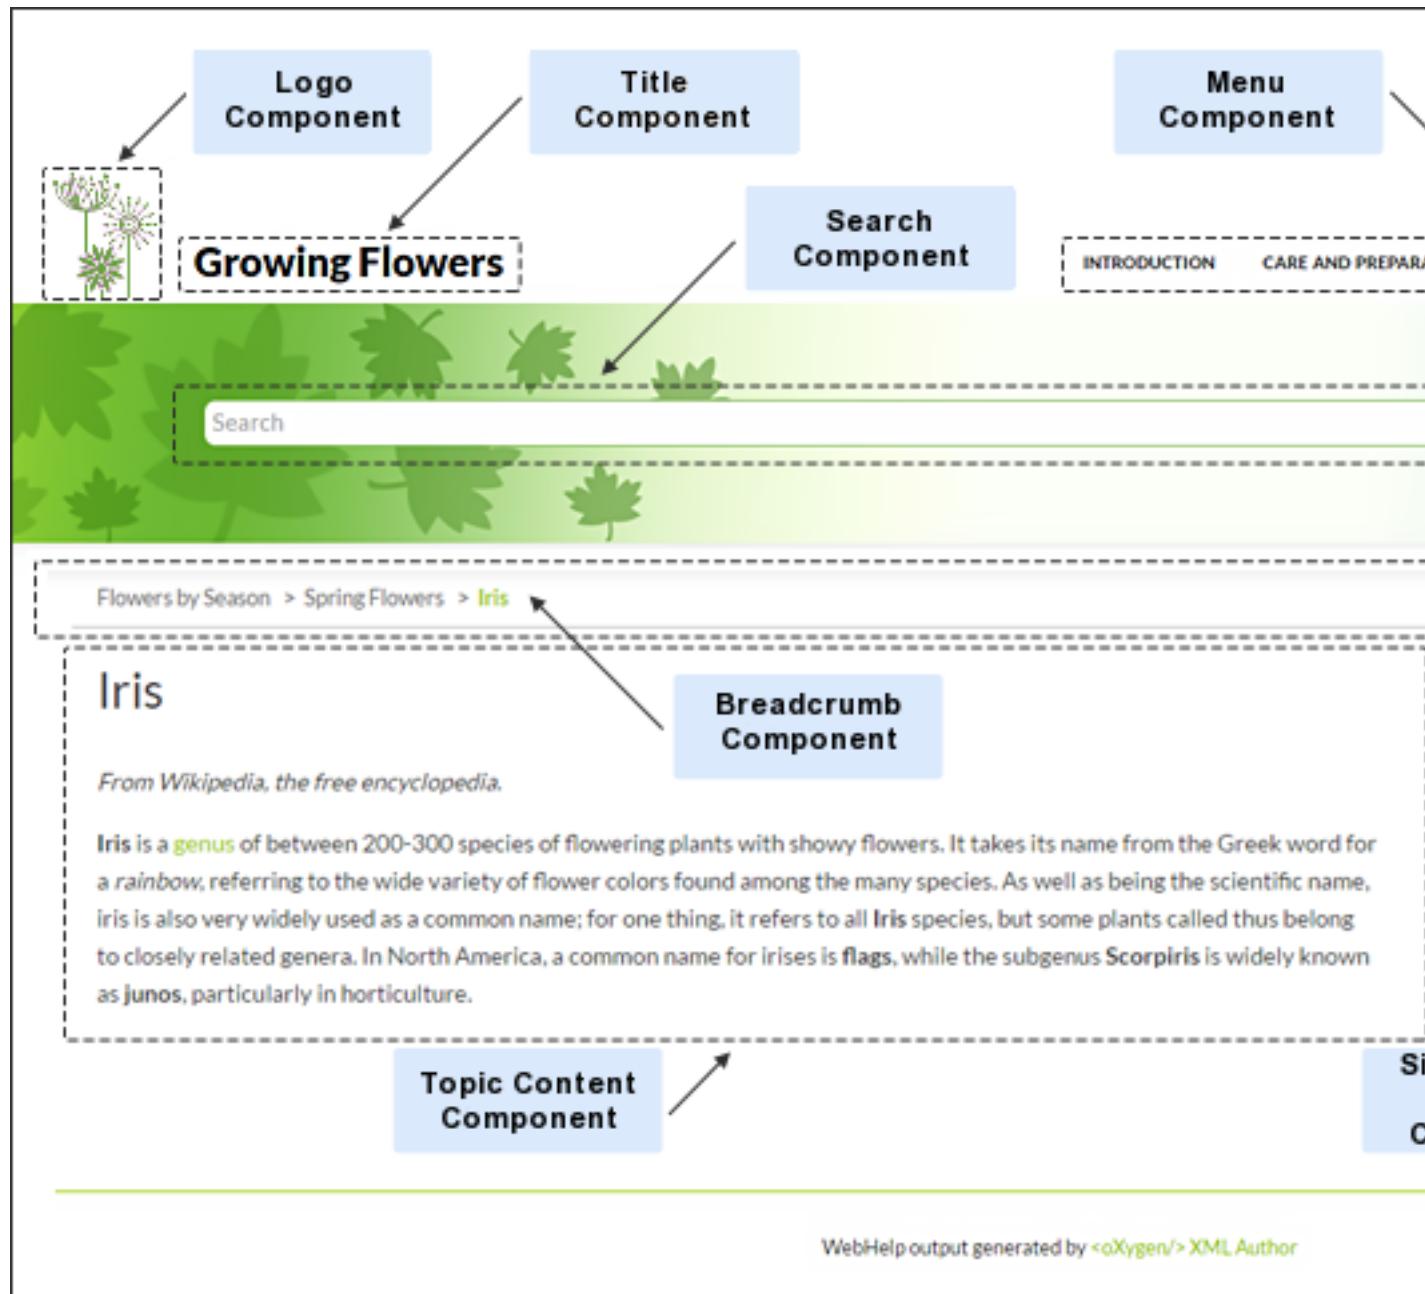

Figure 269: Example: Topic Page Components

The components that can be referenced in the `wt_topic.html` template file are as follows:

- *Publication Title*
- *Publication Logo*
- *Search Input*

- [Topic Breadcrumb](#)
- [Navigational Links](#)
- [Print Link](#)
- [Topic Content](#)
- [Topic Side TOC](#)
- [Topic Feedback](#)
- [Main Page Menu](#)
- [Index Terms Link](#)

WebHelp Responsive Search Results Template

[Edit on GitHub](#)

The *Search Results Template* is used to generate HTML pages that present search results in the WebHelp Responsive output. The name of the template file is `wt_search.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

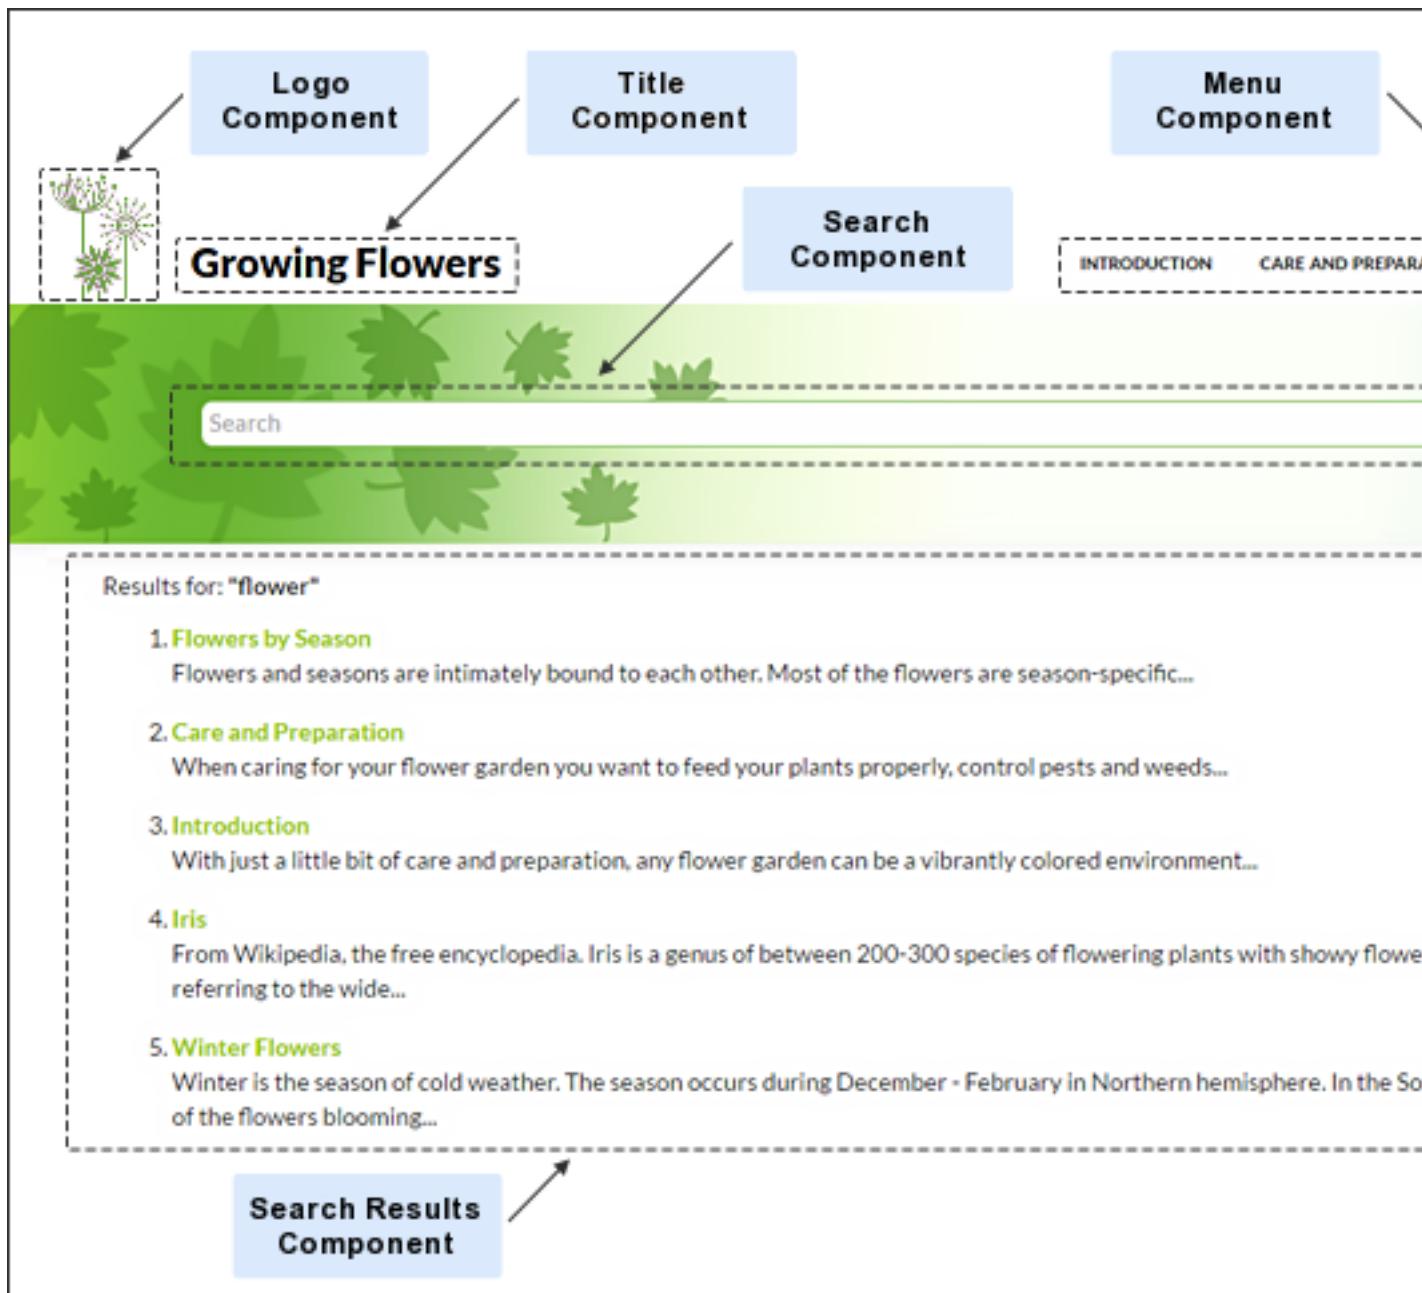

Figure 270: Example: Search Results Page Components

The components that can be referenced in the `wt_search.html` template file are as follows:

- *Publication Title*
- *Publication Logo*
- *Search Input*
- *Search Results*
- *Print Link*
- *Main Page Menu*
- *Index Terms Link*

WebHelp Responsive Index Terms Template[Edit on GitHub](#)

The *Index Terms Template* is used to generate HTML pages that present index terms in the WebHelp Responsive output. The name of the template file is `wt_terms.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

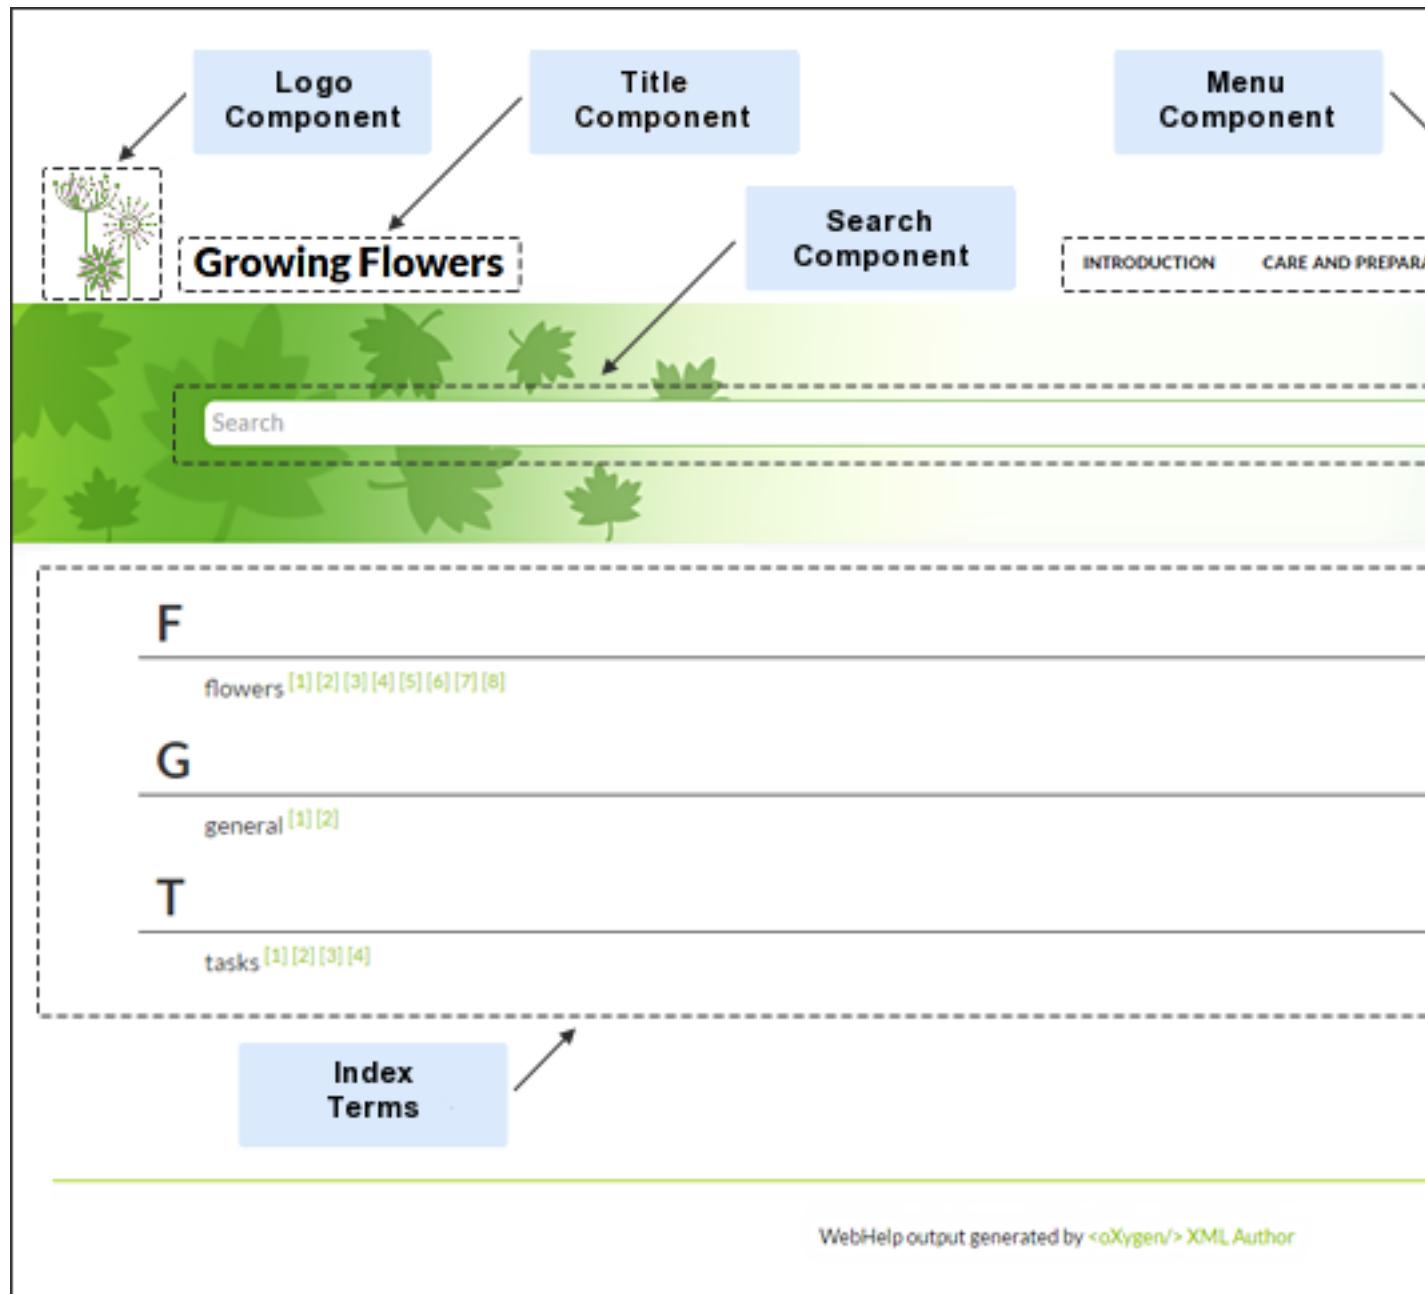

Figure 271: Example: Index Terms Page Components

The components that can be referenced in the `wt_terms.html` template file are as follows:

- *Publication Title*
- *Publication Logo*
- *Search Input*

- [Print Link](#)
- [Main Page Menu](#)
- [Index Terms Link](#)

WebHelp Responsive Template Components

[Edit on GitHub](#)

A WebHelp Responsive *template component* adds dynamics to a WebHelp *template page*. The rendering of a component depends on the context of where it is placed and its content depends on the transformed DITA Map.

Some of the template components can be used in all the [types of template pages](#), while some are only available for certain template pages. For instance, the *Publication Title* component can be used in all pages, but the *Navigation Breadcrumb* component can only be used in *Topic Template* pages.

To include a *template component* in the output of a particular type of *template page*, you have to reference a specific element in the particular [template file](#). All the elements associated with a template component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component could contain custom content or reference another component. To specify where the component content will be located in the output you can use the `component_content` element as a descendant of the `component` element.

Example:

```
<whc:webhelp_search_input class="navbar-form"
    webhelp_main_page_search" role="form" >
    <whc:include_html href="${$webhelp.include.before.search}" />
    <div class="search_input">
        <whc:component_content/>
    </div>
</whc:webhelp_search_input>
```

The various components and where they can be used are as follows:

Publication Title [webhelp_publication_title]

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt_index.html file\)](#)
- [Topic Template \(wt_topic.html file\)](#)
- [Search Results Template \(wt_search.html file\)](#)
- [Index Terms Template \(wt_terms.html file\)](#)

In the template file, the `webhelp_publication_title` element can be specified as in the following example:

```
<whc:webhelp_publication_title xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo [webhelp_logo]

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt_index.html file\)](#)
- [Topic Template \(wt_topic.html file\)](#)
- [Search Results Template \(wt_search.html file\)](#)

- *[Index Terms Template \(wt_terms.html file\)](#)*

In the template file, the webhelp_logo element can be specified as in the following example:

```
<whc:webhelp_logo xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the webhelp_logo.image transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the webhelp_logo.image.target.url parameter to generate a link to a URL when you click the logo image. If this parameter is not set, a link to the home page will automatically be generated.

In the output, you will find an element with the class: wh_logo.

Search Input [webhelp_search_input]

This component is used to generate the input widget associated with search function in the output. To generate this component, the webhelp_search_input element must be specified in the template file. It can be used in all four types of template pages:

- *[Main Page Template \(wt_index.html file\)](#)*
- *[Topic Template \(wt_topic.html file\)](#)*
- *[Search Results Template \(wt_search.html file\)](#)*
- *[Index Terms Template \(wt_terms.html file\)](#)*

In the template file, the webhelp_search_input element can be specified as in the following example:

```
<whc:webhelp_search_input xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: webhelp_search_input.

Search Results [webhelp_search_results]

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the webhelp_search_results element must be specified in the template file. It can be used in the following type of template page:

- *[Search Results Template \(wt_search.html file\)](#)*

In the template file, the webhelp_search_results element can be specified as in the following example:

```
<whc:webhelp_search_results xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: wh_search_results.

Topic Breadcrumb [webhelpBreadcrumb]

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the webhelpBreadcrumb element must be specified in the template file. It can be used in the following type of template page:

- *[Topic Template \(wt_topic.html file\)](#)*

In the template file, the webhelpBreadcrumb element can be specified as in the following example:

```
<whc:webhelpBreadcrumb xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: wh_breadcrumb. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the home class. The last item in the list corresponds to the current topic and has the active class set.

Navigational Links [webhelp_navigation_links]

This component generates navigation links to the next and previous topics. To generate this component, the webhelp_navigation_links element must be specified in the template file. It can be used in the following type of template page:

- *Topic Template (wt_topic.htmlfile)*

In the template file, the webhelp_navigation_links element can be specified as in the following example:

```
<whc:webhelp_navigation_links xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: wh_navigation_links. This element will contain the links to the next and previous topics.

Topic Content [webhelp_topic_content]

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the webhelp_topic_content element must be specified in the template file. It can be used in the following type of template page:

- *Topic Template (wt_topic.htmlfile)*

In the template file, the webhelp_topic_content element can be specified as in the following example:

```
<whc:webhelp_topic_content xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: wh_topic_content.

Topic Side TOC [webhelp_side_toc]

This component generates a mini table of contents for the current topic. It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the webhelp_side_toc element must be specified in the template file. It can be used in the following type of template page:

- *Topic Template (wt_topic.htmlfile)*

In the template file, the webhelp_side_toc element can be specified as in the following example:

```
<whc:webhelp_side_toc xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: wh_side_toc. This element will contain links to the topics that are close to the current topic.

Topic Feedback [webhelp_feedback]

This component generates a placeholder for where the comments section will be presented. To generate this component, the webhelp_feedback element must be specified in the template file. It can be used in the following type of template page:

- *Topic Template (wt_topic.htmlfile)*

In the template file, the `webhelp_feedback` element can be specified as in the following example:

```
<whc:webhelp_feedback xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Main Page Topic Tiles [webhelp_tiles]

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that corresponds to the topic title, short description, and image. To generate this component, the `webhelp_tiles` element must be specified in the template file. It can be used in the following type of template page:

- [Main Page Template \(wt_index.html file\)](#)

In the template file, the `webhelp_tiles` element can be specified as in the following example:

```
<whc:webhelp_tiles xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `whc:webhelp_tile` component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="webhelp_tile_text">
    <!-- Place holder for tile's title -->
    <whc:webhelp_tile_title/>

    <!-- Place holder for tile's shordesc -->
    <whc:webhelp_tile_shortdesc/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see [Configuring the Tiles on the Main Page](#) on page 812.

Main Page Table of Contents [webhelp_main_page_toc]

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `webhelp_main_page_toc` element must be specified in the template file. It can be used in the following type of template page:

- [Main Page Template \(wt_index.html file\)](#)

In the template file, the `webhelp_main_page_toc` element can be specified as in the following example:

```
<whc:webhelp_main_page_toc xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_main_page_toc`.

Main Page Menu [webhelp_topics_menu]

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the template file. It can be used in the following type of template page:

- [Main Page Template \(wt_index.html file\)](#)

In the template file, the `webhelp_topics_menu` element can be specified as in the following example:

```
<whc:webhelp_topics_menu xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [Customizing the Menu](#) on page 814.

Print Link [webhelp_print_link]

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt_index.html file\)](#)
- [Topic Template \(wt_topic.html file\)](#)
- [Search Results Template \(wt_search.html file\)](#)
- [Index Terms Template \(wt_terms.html file\)](#)

In the template file, the `webhelp_print_link` element can be specified as in the following example:

```
<whc:webhelp_print_link xmlns:whc="http://www.oxygenxml.com/webhelp/
components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Include HTML files [webhelp_include_html]

This component can be used to include custom HTML files. To generate this component, the `include_html` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt_index.html file\)](#)
- [Topic Template \(wt_topic.html file\)](#)
- [Search Results Template \(wt_search.html file\)](#)
- [Index Terms Template \(wt_terms.html file\)](#)

In the template file, the `include_html` element can be specified as in the following example:

```
<whc:include_html href="#${wh.param}" />
```

Where the `href` can have the following values:

- **any URL** - In this case, the file to be included is specified as an URL.
- **\${\$oxygen-webhelp-template-dir}/file_to_include.html** - To include resources that are part of the template.
- **\${webhelp.param}** - To include a resource whose path is specified through a WebHelp transformation scenario parameter. The value of this parameter can be a simple HTML fragment, in which case it will be copied to the output.

Index Terms Link [webhelp_indexterms_link]

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt_index.html file\)](#)

- **Topic Template** (`wt_topic.html` file)
- **Search Results Template** (`wt_search.html` file)
- **Index Terms Template** (`wt_terms.html` file)

In the template file, the `webhelp_indexterms_link` element can be specified as in the following example:

```
<whc:webhelp_indexterms_link xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Customizing the WebHelp Responsive Output

[Edit on
GitHub](#)

To change the overall appearance of your WebHelp Responsive output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

WebHelp Responsive Customization Methods

[Edit on
GitHub](#)

There are several methods that you can use to customize your WebHelp Responsive output. Each method has its own advantages and limitations. This topic provides information on each of the methods so that you can choose the best possible method based upon your needs.

Insert Custom HTML Fragments in Predefined Placeholders

The WebHelp Responsive template contains a series of component placeholders. Some of these placeholders are left empty in the default output configurations, but you can use them to display custom content. This method is useful if you want to use an existing skin and simply make some minor changes or additions in certain locations within the final output.

Advantages:

- This method is very easy, since the fragments for the placeholders can be specified in the transformation scenario.
- Advanced knowledge of CSS styling is not required for this method.

Each such placeholder has an associated parameter in the transformation scenario **Parameters** tab. These predefined empty placeholder parameters are illustrated and described below:

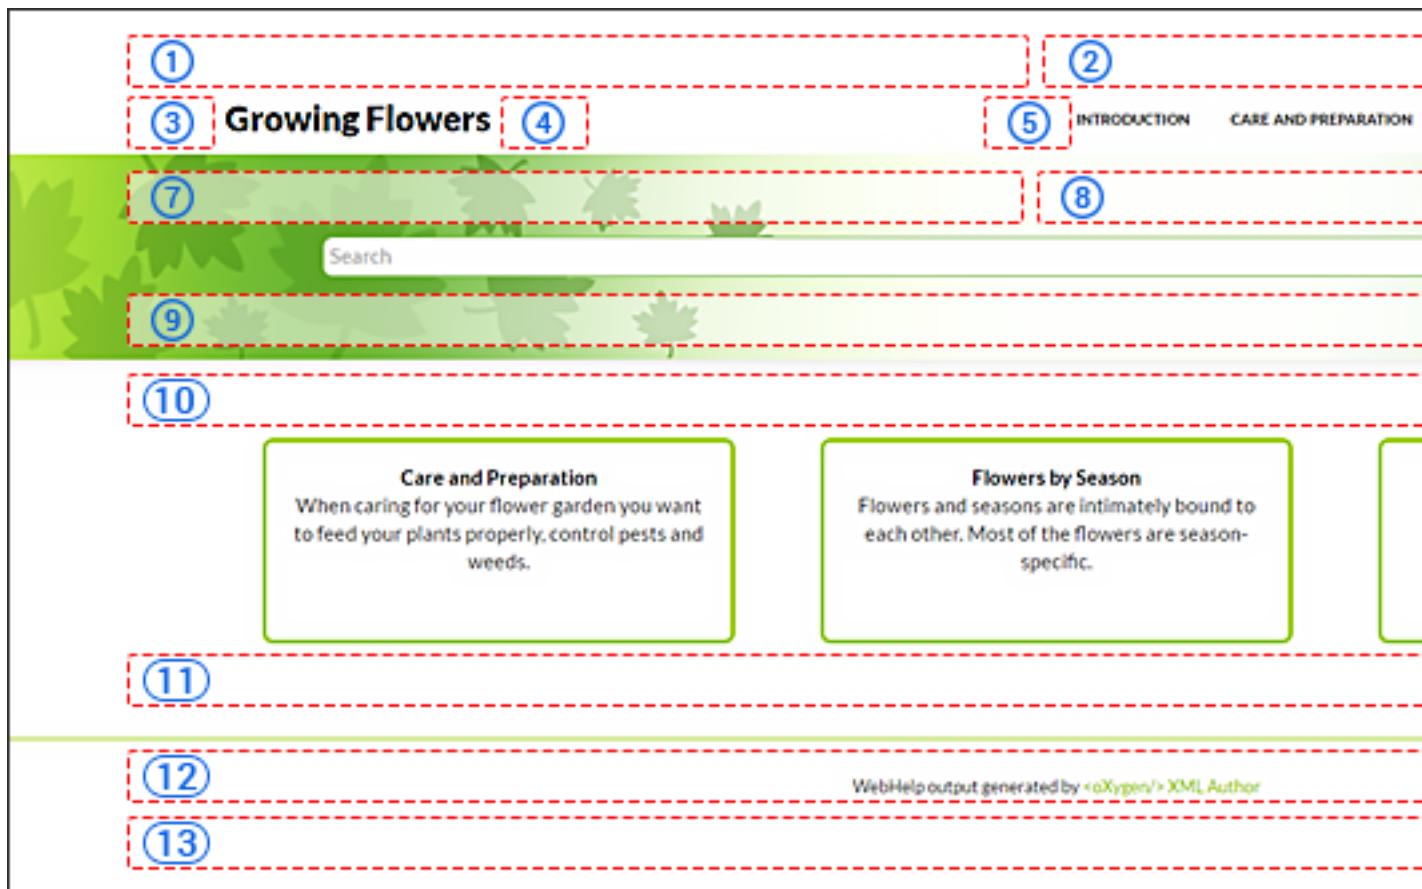

Figure 272: Predefined Placeholders Diagram

- | | |
|--|--|
| 1- webhelp.fragment.head | Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the header in the output. |
| 2- webhelp.fragment.before.body | Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the body in the output. |
| 3-
webhelp.fragment.before.logo_and_title | Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the logo and title in the output. |
| 4-
webhelp.fragment.after.logo_and_title | Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the logo and title in the output. |
| 5- webhelp.fragment.before.top_menu | Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the top menu in the output. |
| 6- webhelp.fragment.after.top_menu | Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the top menu in the output. |
| 7-
webhelp.fragment.before.main.page.search | Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the search field in the output. |

8- webhelp.fragment.welcome	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as a welcome message (or title) in the output.
9- webhelp.fragment.after.main.page.search	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the search field in the output.
10- webhelp.fragment.before.toc_or_tiles	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the table of contents or tiles in the main page of the output.
11- webhelp.fragment.after.toc_or_tiles	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the table of contents or tiles in the main page of the output.
12- webhelp.fragment.footer	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the footer in the output
13- webhelp.fragment.after.body	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the body in the output.

EXAMPLE:

To insert a message above the search field component in the main page of the output, follow this procedure:

1. Edit the *WebHelp Responsive* transformation scenario.
2. Go to **Parameters** tab and find the parameter associated with the place holder that you want to use. In this case, it is called `webhelp.fragment.welcome`.
3. Edit the parameter. Depending on the size of the content you want to add, you can insert one of the following:
 - A small well-formed XHTML fragment, such as: `<i>Welcome to our user guide</i>`.
 - A path to a file that contains well-formed XHTML content.

Customize WebHelp Output with a Custom CSS

This method is useful if you want to use an existing skin and it is very close to what you need, but you want to adjust the styling of the final output. For example, this might be the case if you simply want to change a color, or adjust some of the margins or paddings of certain components.

Advantages:

- This method could be used as a quick and easy way to make small styling changes.
- The custom CSS can be distributed with your project and shared with other members of your team.
- This method can be used for advanced and precise styling.

Additional Notes:

- The fonts, images, and other resources must be stored in a remote server location.
- This type of customization will not appear in the **Templates** tab of the transformation scenario. Instead, the custom CSS needs to be set as a parameter of an existing transformation scenario.

To set a custom CSS to a transformation scenario:

1. Edit the *WebHelp Responsive* transformation scenario.
2. Open the **Parameters** tab.
3. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the

transformation scenario is processed. Also, if your customization CSS requires additional resources, you can copy them to the generated output by specifying [*the webhelp.custom.resources parameter*](#).

Create or Customize a WebHelp Responsive Skin

This method is useful if you want a design that is not similar to any of the predefined skins, or if you want to make a lot of changes to one of the existing skins. This method is also useful if you want to distribute additional resources (such as fonts and images) together with a custom CSS.

Advantages:

- The customized skin will be available in the **Templates** tab of the transformation scenario.
- The resources are encapsulated into the `skin` directory and can be shared with other team members, along with a custom CSS file.

Additional Notes:

- This method requires access to the installation folder, or the use of an external *DITA-OT* engine (with the [*WebHelp plugin*](#) installed).

To create a new WebHelp Responsive skin, follow this procedure:

1. Locate the following folder in your *DITA-OT* directory (*DITA_OT_DIR*):

DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/variants/

2. Here you can see some subdirectories corresponding to different variants for the same template. For instance, the default directories are `tiles` and `tree`.
3. In each of these variants, you will find a directory for each of the skins (for example, the default skins and their corresponding directories are: `flowers`, `green`, `light`, `mechano`, `orange`, etc.)
4. Duplicate one of the skin folders and rename it to whatever you want your new skin to be identified as.
5. Edit the `skin.css` file and customize it the way you want. If your customization of the CSS file requires additional resources (such as images, fonts, or other CSS files), they need to be placed in the `resources` folder at the same level with the `skin.css` file.

Result: Your new skin should now be included in the list of skins in the **Templates** tab of the transformation scenario.

Tip: During development, you may want to regularly test your customization. To shorten the publishing time of your tests, use a small project (you could use one of the Oxygen XML Author sample projects). Also, you can use your web browser CSS inspector tool to lookup the CSS classes you want to modify.

Create a New WebHelp Responsive Template

This method can be used when you need to make significant structural changes to the WebHelp output. For example, if you want to move some components to other positions, or if you want to use a different responsive front-end framework than the default [*Bootstrap framework*](#) (for instance, if you want to switch to [*ZURB Foundation*](#)).

Advantages:

- This method allows you to fully customize the output.
- This method allows you to [*change the structure of the generated HTML files*](#).
- You can [*create your own skins*](#) for the new template.

Additional Notes:

- This method requires access to the installation folder, or the use of an external *DITA-OT* engine (with the [*WebHelp plugin*](#) installed).

To create a new WebHelp Responsive template, follow these steps:

1. Locate the following folder in your DITA-OT directory (*DITA_OT_DIR*):

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/
```

2. Duplicate the `bootstrap` folder and rename it to whatever you want your new template to be identified as (for example, `myTemplate`).
3. Customize the structure of the new template according to your needs. For example, if you only want to keep one of the template variants, open the `myTemplate/variants` folder and delete all of its subdirectories, except for that one (for instance, the `tiles` directory). Keep in mind that the structure of the template directory is important. The names of folders at certain levels correspond to the names of templates and skins, while components and resources are defined and referenced in certain files or folders at specific locations within the directory structure. For more information, see [WebHelp Responsive Template Directory Structure](#) on page 793.
4. You can also customize the structure of the skins within the template variants. For example, if you only want to keep one of the skins in the `tiles` variant, open the `myTemplate/variants/tiles` folder and delete all of its subdirectory skins, except for that one (for instance, the `light` directory).
5. Edit the `skin.css` file that is located in the skin directory (for example, `myTemplate/variants/tiles/light`) and customize it the way you want. If your customization of the CSS file requires additional resources (such as images, fonts, or other CSS files), they need to be placed in the `resources` folder at the same level with the `skin.css` file.

Result: Your new templates and skins should now be included in the **Templates** tab of the transformation scenario.

Tip: During development you regularly need to test your customization. To shorten the publishing time of your test, use a small project (you could use one of the Oxygen XML Author sample projects). Also, you can use your web browser CSS inspector tool to lookup the CSS classes you want to modify.

For more information about WebHelp Responsive templates, see the [WebHelp Responsive Template Mechanism](#) on page 793 section.

Adding a Favicon in WebHelp Systems

[Edit on GitHub](#)

You can add a custom *favicon* to your WebHelp system by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp systems using **WebHelp Responsive**, **WebHelp Responsive with Feedback**, **WebHelp Classic**, **WebHelp Classic with Feedback**, or **WebHelp Classic Mobile** transformation scenarios.

To add a *favicon*, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the *favicon*.
3. Run the transformation scenario.

Adding a Logo Image in the Title Area

[Edit on GitHub](#)

To add a logo in the title area of your WebHelp output, follow this procedure:

1. Edit a WebHelp transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

Adding a Welcome Message in the Home Page

[Edit on GitHub](#)

The main page of the WebHelp Responsive output contains a set of empty placeholders that can be used to display customized text fragments. These placeholders are available to you through [WebHelp Responsive transformation scenario parameters](#). One of these placeholders (identified through the webhelp.fragment.welcome parameter) was designed to display text content above the search box in the main page.

To add a customized welcome message in the main page of the WebHelp Responsive output, follow this procedure:

1. Edit a WebHelp Responsive transformation scenario.
2. Open the [Templates tab](#) and choose a *skin*.
3. Open the [Parameters tab](#) and edit the webhelp.fragment.welcome parameter. The value of this parameter can be one of the following:
 - A small well-formed XHTML fragment (such as: <i>Welcome to the User Guide</i>).
 - Path to a file that contains well-formed XHTML content.
4. Click **OK**, then click the **Apply associated** button to execute the transformation scenario.

Adding Videos in the WebHelp Responsive Output

[Edit on GitHub](#)

Videos can be included and played in all HTML5-based output formats (such as *WebHelp*). For example, to add a YouTube video in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to WebHelp Responsive Output

1. Edit the DITA topic to reference the video using an `object` element, as in the following example:

```
<object outputclass="video">
  <param name="src" value="http://www.youtube.com/watch/v/VideoName"/>
</object>
```

2. Apply a *WebHelp* transformation scenario to obtain the output.

Configuring the Tiles on the Main Page

[Edit on GitHub](#)

The *tiles* version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the DITA map source. However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize these tiles either by setting metadata information in the DITA map or by customizing the CSS that is associated with the DITA map.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the id of the topic.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Open the DITA map in the **Text** editing mode of Oxygen XML Author.

2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an id on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic id `growing-flowers`). The CSS file should have content that is similar to this:

```
.wh_tile [data-id='growing-flowers'] {
  display:none;
}
```

3. Use the [Customizing WebHelp Output with a Custom CSS](#) method to pass the CSS file you just created to the transformation scenario.

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the **Text** editing mode of Oxygen XML Author.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="image" href="img/tile-image.png" format="png">
      <data name="attr-width" value="64"/>
      <data name="attr-height" value="64"/>
    </data>
  </topicmeta>
```

Note: The `attr-width` and `attr-height` attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an id on the topic that you want the tile include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```
.wh_tile[data-id='growing-flowers']> div {
  background-image:url('resources/flower.png');
}
```

3. Use the [Customizing WebHelp Output with a Custom CSS](#) or the [Create a WebHelp Responsive Skin](#) method to pass the CSS file you just created to the transformation scenario.

Change Numbering Styles for Ordered Lists

[Edit on GitHub](#)

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
  list-style-type:lower-alpha;
}
```

3. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.

- a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

Customizing the Menu

[Edit on GitHub](#)

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:

1. Open the DITA map in the **Text** editing mode of Oxygen XML Author.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```
<topicmeta>
  <data name="wh-menu">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an id on the topic that you do not want to include in the menu.

2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic id `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```
.wh_top_menu *[data-id='growing-flowers'] {
    display:none;
}
```

3. Use the *Customizing WebHelp Output with a Custom CSS* method to pass the CSS file you just created to the transformation scenario.

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely. To do so, follow this procedure:

1. Edit a WebHelp Responsive transformation scenario.
2. Open the *Templates tab* and choose a *skin*.
3. Open the *Parameters tab* and set the value of the `webhelp.show.top.menu` parameter to `no`.
4. Click **OK**, then click the **Apply associated** button to execute the transformation scenario.

Editing Scoring Values of Tag Elements in Search Results

[Edit on GitHub](#)

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Author includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
 - a) For DITA WebHelp systems, edit the following file: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties`.
 - b) For DocBook WebHelp system, edit the following file: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties`.

The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp system transformation scenario.

Flag DITA Content in WebHelp Output

[Edit on
GitHub](#)

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag" img="D:\resource
\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
4. Run the transformation scenario.

Indexing Japanese Content for DITA WebHelp Pages

[Edit on
GitHub](#)

To optimize the indexing of Japanese content in WebHelp pages generated from DITA map transformations, the Kuromoji analyzer can be used. This analyzer is not included in the Oxygen XML Author installation kit and must be downloaded and added.

To use the Kuromoji analyzer to index Japanese content in your WebHelp system, follow these steps:

1. Download the analyzer jar file from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0>.
2. Place the Kuromoji analyzer jar file in the following directory: `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib`.
3. For the analyzer to work properly, search terms that are entered into your WebHelp pages must be separated by spaces.

Optionally a Japanese user dictionary can be set with the `webhelp.search.japanese.dictionary` parameter.

Integrating Social Media and Google Tools in WebHelp Output

[Edit on
GitHub](#)

Oxygen XML Author includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output[Edit on GitHub](#)

See how you can add a Facebook widget in your WebHelp Responsive output.

To add a Facebook™ *Like* widget to your WebHelp output, follow these steps:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.
A dialog box that contains code snippets is displayed.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
                var js, fjs = d.getElementsByTagName(s)[0];
                if (d.getElementById(id)) return;
                js = d.createElement(s); js.id = id;
                js.src = "//connect.facebook.net/en_US/
sdk.js#xfbml=1&version=v2.0";
                fjs.parentNode.insertBefore(js, fjs);
                }(document, 'script', 'facebook-jssdk'));
```

-->

```
</script>
<div class="fb-like" data-layout="standard" data-action="like" data-
show-faces="true"
    data-share="true"/>
</div>
```

4. In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab. Depending on where you want to display the button, edit [one of the parameters that begin with webhelp.fragment](#). Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Add a Google+ Button in WebHelp Responsive Output[Edit on GitHub](#)

See how you can add a Google+ widget into your WebHelp Responsive output.

To add a *Google+* widget to your WebHelp Responsive output, follow these steps:

1. Go to the [Google Developers](#) website.
2. Fill-in the displayed form.
The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`.

Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

- In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
 - Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
 - Switch to the **Parameters** tab. Depending on where you want to display the button, edit *one of the parameters that begin with webhelp.fragment*. Set that parameter to reference the `google-plus-button.xml` file that you created earlier.
 - Click **Ok**.
 - Run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

[Edit on GitHub](#)

See how you can add a Twitter widget into your WebHelp Responsive output.

To add a Twitter™ *Tweet* widget to your WebHelp Responsive output, follow these steps:

1. Go to the [Tweet button generator](#) page.
 2. Fill-in the displayed form.
The **Preview and code** area displays the code.
 3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`.

Make sure you follow these rules:

- The file must be well-formed.
 - The code for each `script` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /
^http:/.test(d.location) ? 'http': 'https';
        if (!d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '//platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
    </script>
  </div>
```

```
(document,
'script', 'twitter-wjs');
-->
</script>
</div>
```

4. In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab. Depending on where you want to display the button, edit *one of the parameters that begin with webhelp.fragment*. Set that parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

[Edit on GitHub](#)

See how you can integrate Google Analytics into WebHelp Responsive output.

To enable your WebHelp Responsive system to benefit from Google Analytics reports, follow these steps:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that fits the needs of your website.
3. Follow the on-screen instructions to obtain a *Tracking Code* that contains your *Tracking ID*.

A Tracking Code looks like this:

```
<script>
(function(i,s,o,g,r,a,m)
{i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||
[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
})(window,document,'script','//www.google-analytics.com/
analytics.js','ga');

ga('create', 'UA-XXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new HTML file called `googleAnalytics.html`.
5. In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab. Depending on where you want to display the button, edit *one of the parameters that begin with webhelp.fragment*. Set that parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click **Ok**.
9. Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 693

Localizing the Email Notifications of WebHelp with Feedback Systems

[Edit on
GitHub](#)

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Suppose that you want to localize the emails into Dutch (*nl*). Follow these steps:

DocBook WebHelp Classic with Feedback

1. Create the following directory:

[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl

2. Copy all English template files from *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en* and paste them into the directory you just created.
3. Edit the HTML files from the *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl* directory and translate the content into Dutch.
4. Start Oxygen XML Author and edit the **DocBook WebHelp Classic with Feedback** transformation scenario.
5. In the **Parameters** tab, look for the `110n.gentext.default.language` parameter and set its value to the appropriate language code. In our example, use the value *nl* for Dutch.

Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

DITA WebHelp Classic with Feedback or WebHelp Responsive with Feedback

1. Create the following directory:

DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl

2. Copy all English template files from *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en* and paste them into the directory you just created.
3. Edit the HTML files from the *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl* directory and translate the content into Dutch.
4. Start Oxygen XML Author and edit the **DITA Map WebHelp Classic with Feedback** or **DITA Map WebHelp Responsive with Feedback** transformation scenario.
5. In the **Parameters** tab, look for the `args.default.language` parameter and set its value to the appropriate language code. In our example, use the value *nl* for Dutch.

Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

Localizing the Interface of WebHelp Output (for DITA Map Transformations)

[Edit on
GitHub](#)

Static labels that are used in the WebHelp output are kept in translation files in the *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\localization* folder. Translation files have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English text is kept in the *strings-en-us.xml* file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

1. Look for the *strings-[lang1]-[lang2].xml* file in *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization* directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, create one starting from the *strings-en-us.xml* file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: <str name="Label name">Caption</str>.
3. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the *integrator* is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. Make sure that the new XML file that you created in the previous two steps is listed in the file *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml*. In our example for the Canadian French file, it should be listed as: <lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the args.default.language parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

[Creating New Transformation Scenarios](#) on page 712

Search Engine Optimization for DITA WebHelp

[Edit on GitHub](#)

A **DITA Map WebHelp** transformation scenario can be configured to produce a *sitemap.xml* file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the *sitemap.xml* file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  .
</urlset>
```

Each page has a *<url>* element structure containing additional information, such as:

- *loc* - the URL of the page. This URL must begin with the protocol (such as *http*), if required by your web server. It is constructed from the value of the *webhelp.sitemap.base.url* parameter from the transformation scenario and the relative path to the page (collected from the *href* attribute of a *topicref* element in the DITA map).

Note: The value must have fewer than 2,048 characters.

- *lastmod* - the date when the page was last modified. The date format is *YYYY-MM-DD*.
- *changefreq* - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are:

always, hourly, daily, weekly, monthly, yearly, and never. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- `priority` - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note: `lastmod`, `changefreq`, and `priority` are optional elements.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
 - `webhelp.sitemap.base.url` - the URL of the location where your WebHelp system is deployed
Note: This parameter is required for Oxygen XML Author to generate the `sitemap.xml` file.
 - `webhelp.sitemap.change.frequency` - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
 - `webhelp.sitemap.priority` - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Support for Right-to-Left (RTL) Oriented Languages for DITA WebHelp

[Edit on GitHub](#)

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

WebHelp Responsive Runtime Additional Parameters

[Edit on GitHub](#)

A deployed WebHelp Responsive system can accept the following GET parameters:

- `contextId` - The WebHelp JavaScript engine will look up the value of this parameter in the mapping file and load the corresponding HTML help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.
Note: You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.
- `searchQuery` - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

Context-Sensitive WebHelp Responsive System

[Edit on GitHub](#)

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

When WebHelp Responsive output is generated by Oxygen XML Author, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="annotations-view" path="topics/annotations-view.html"/>
  <appContext helpID="button-editor" path="concepts/button-editor.html"/>
</map>
```

- `helpID` - Unique ID provided by a topic from two possible sources:
 - The `resourceid` element set to it in the `prolog` section:

```
<prolog>
  <resourceid id="context-sensitive-help-system"/>
</prolog>
```

Note: If you need multiple parts of the application (for instance, dialog boxes, views, or editing modes) to open the same contextual help topic, all of the context ID values should be included in the same DITA topic file. For example, if you need both a dialog box and a view to open the same WebHelp page, you can assign both resource IDs in the same DTIA topic.

```
<prolog>
  <resourceid id="dialog1"/>
  <resourceid id="view1"/>
</prolog>
```

- The `id` attribute set on the topic root element.

Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output. In this case, the help system will not work properly.

- `path` - Path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.
- `productID` - ID of the product for which you are writing documentation. **Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario.**
- `productVersion` - Version of the product for which you are writing documentation. **Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario.**

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke the `index.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

The following example will open a WebHelp system showing the page associated with the id dialog1ID:

```
index.html?contextId=dialog1ID
```

WebHelp Classic System

[Edit on GitHub](#)

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Author WebHelp system includes several variants to suit your specific needs. The *WebHelp Classic* variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook and DITA document types.

Layout of the WebHelp Classic System Interface

The layout of the *WebHelp Classic* system is comprised of the following components:

Left Pane or Frame

This section on the left side of the help system includes the following tabs:

Content

A typical table of contents style presentation of your content. You can use the  **Expand**  **Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.

Note: You can enhance the appearance of items in the *Table of Contents*. See the [Customizing WebHelp Classic Systems chapter](#) for more details.

Index

Presents the index terms for your content. If your content does not contain any `indexterm` elements, this tab is not generated.

Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more

details, see the [Search Feature section](#).

Upper Pane or Frame

The upper section of the help system includes the following features:

Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the [Search Feature section](#).

Frames Option

Click on this option to display the output rendered in HTML frames.

Print Option

Opens a dialog box with various printing options and a print preview.

Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you

to move to the Parent

Previous topic,

Next topic. Links to the parent topics of the currently opened topic are also presented at the top of the page.

Note: You can edit the `args.hide.parent.link` parameter to hide the **Parent**, **Next**, and **Previous** links.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

Search Feature

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section, along with a rating scheme for each result. When you click on a result in the **Search**

Results tab, the search terms are highlighted in the main pane. If you click **Enter** with the **Search** field empty, the highlights are removed.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
 - The search phrase is included in a meta keyword
 - The search phrase is in the title of the page
 - The search phrase is in bold text in a paragraph
 - The search phrase is in normal text in a paragraph

Snowdrop

From Wikipedia, the free encyclopedia.

Snowdrop is the common name for members of the [genus Galanthus](#), a [species](#) in the family [Amaryllidaceae](#); snowdrops are among the first [bulbs](#) although certain [species](#) flower in late autumn and winter.

Galanthus nivalis is the best-known and most widespread representative of the genus. It is native to a large area of Europe, stretching from the Pyrenees in the west to Germany to Poland in the north, Italy, Northern Greece and European Turkey and is widely naturalised elsewhere. Although it is often thought of as a British plant, due to its popularity in cultivation, it was probably introduced to the British Isles by the Romans, it was probably introduced in the sixteenth century.

All [species](#) of **Galanthus** are [perennial](#), herbaceous plants which grow from a [bulb](#). It consists of six tepals, the outer three being larger and more [conspicuous](#) than the inner three. An important feature which helps to distinguish between [species](#) (and the parentage of hybrids) is their "vernation" (the arrangement of the emerging leaves in the bud). This can be "[applanate](#)", "[supervolute](#)" or "[explicative](#)". In [applanate](#) plants the leaf blades are pressed flat to each other within the bud and as they emerge they remain flat; in [supervolute](#) plants the leaf blades are also pressed flat against each other, but the edges of the leaves are folded back over each other; in [explicative](#) plants the leaf blades are rolled; in [supervolute](#) plants one leaf is tightly clasped around the other with the tip of the blade remaining at the point where the leaves emerge from the soil.

Figure 274: WebHelp Classic Search Mechanism

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "*grow flowers*", returns no results since it searches for two separate words).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside `keywords` elements weighs twice as much as content inside an *H1* HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 815.

This output format is compatible with the most recent versions of the following common browsers:

- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

Important: Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

Warning: Due to some restrictions in web browsers in regards to JavaScript code, the *frameless* version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the *frameset* version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file:///...`).

WebHelp Classic with Feedback System

[Edit on GitHub](#)

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and a feedback mechanism that allows your authors and audience to interact with one another through comments. The Oxygen XML Author WebHelp system includes several variants to suit your specific needs. The *WebHelp Classic with Feedback* variant is designed for desktop systems, includes a feedback system that allows your users to make comments and allows you to manage and reply to them, and it is available for DocBook and DITA document types.

Layout

The layout of the *WebHelp Classic with Feedback* system is comprised of the following components:

Left Pane or Frame

This section on the left side of the help system includes the following tabs:

	Content	A typical table of contents style presentation of your content. You can use the  Expand and  Collapse all buttons to expand or collapse all the topics presented in the Table of Contents.
		Note: You can enhance the appearance of items in the <i>Table of Contents</i> . See the Customizing WebHelp Classic Systems chapter for more details.
	Index	Presents the index terms for your content. If your content does not contain any <code>indexterm</code> elements, this tab is not generated.
	Search Results	This tab is generated when the Search field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section .
Upper Pane or Frame	The upper section of the help system includes the following features:	
	Search Field	Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the Search Results tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section .
	 Frames Option	Click on this option to display the output rendered in HTML frames.
	 Print Option	Opens a dialog box with various printing options and a print preview.

	Navigation Links	You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the  Parent topic ,  Previous topic , or  Next topic . Links to the parent topics of the currently opened topic are also presented at the top of the page.
Main Pane or Frame	The content of the help pages are rendered and displayed in this main section.	Note: You can edit the <code>args.hide.parent.link</code> parameter to hide the Parent , Next , and Previous links.
Feedback Section	The <i>WebHelp Classic with Feedback</i> system contains a Comments bar at the bottom of the main pane. This section is where you can interact with users through a comment system.

Spring Flowers

Spring Time, the time of growth and renewal of new plant and animal life. Spring comes in the Northern Hemisphere between March and June and between September - November in the Southern hemisphere. Most flowering occurs during spring time. Therefore, flowers that bloom only during spring, Spring Flowers, bloom in the two hemispheres.

Figure 275: WebHelp Classic with Feedback System

Managing Comments

To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
 - When a comment is left on a page that you commented on.
 - When a comment is left on any topic in the WebHelp Classic system.
 - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

Note: The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see [Managing Users and Comments in a WebHelp Classic with Feedback System](#) on page 837.

Search Feature

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section, along with a rating scheme for each result. When you click on a result in the **Search Results** tab, the search terms are highlighted in the main pane. If you click **Enter** with the **Search** field empty, the highlights are removed.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
 - The search phrase is included in a meta keyword
 - The search phrase is in the title of the page
 - The search phrase is in bold text in a paragraph
 - The search phrase is in normal text in a paragraph

Important: Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

Deploying the WebHelp Classic with Feedback System

[Edit on GitHub](#)

System Requirements

The *WebHelp Classic with Feedback* system of Oxygen XML Author requires a standard server deployment. You can request this from your server admin and it needs the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

Oxygen XML WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Internet Explorer, Safari, Opera.

Create WebHelp Classic with Feedback Database

The *WebHelp Classic with Feedback* system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

For example, the following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp Classic with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the *WebHelp Classic with Feedback* output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the *DOCUMENT_ROOT* folder.
4. Rename it to something relevant (for example, *myProductWebHelp*).
5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/`). You are redirected to the installation wizard. Proceed with the installation as follows:
 - a. Verify that the prerequisites are met.
 - b. Press **Start Installation**.
 - c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

Tip: You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.

- d. Configure the **MySQL Database Connection Settings** section. Use the information (database name, username, password) from the [Create WebHelp Classic with Feedback Database section](#) to fill-in the appropriate text boxes.

Warning: Checking the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the *WebHelp Classic with Feedback* system, but you do not want to select this option on subsequent deployments.

- e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, check the **Enable LDAP Authentication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
- f. If the **Create new database structure** option is checked, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple *WebHelp Classic with Feedback* deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, enable the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

- g. Press **Next Step**.
- h. Remove the installation folder from your web server.

Important: When you publish subsequent iterations of your *WebHelp Classic with Feedback* system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

- i. In your Web browser, go to your *WebHelp Classic with Feedback* system main page.

Testing Your WebHelp Classic with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable *JavaScript* logging by doing one of the following:
 - Open the `log.js` file, locate the `var log = new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
 - Append `?log=true` to the *WebHelp* URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a **WebHelp Classic with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple *WebHelp* systems are deployed on the same server. Think of your *WebHelp* output as a *product*. If you have three different *WebHelp* outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The *WebHelp Classic with Feedback* installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

Refreshing the Content of a WebHelp Classic with Feedback System

[Edit on GitHub](#)

It is common to update the content of an existing installation of a *WebHelp Classic with Feedback* system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp Classic with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp Classic with Feedback* system installation directory, overwriting the existing content.

Managing Users and Comments in a WebHelp Classic with Feedback System

[Edit on GitHub](#)

When you installed the *WebHelp Classic with Feedback* system the first time (assuming the [Create new database structure option](#) was enabled), you should have been prompted to create an administrator account (or a user named

administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp Classic system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

User Name	Name	Level	Company	E-Mail	Date	WebHelp Notification	Reply Notification	Page Notification
admin	Administrator	admin	NA	admin@sync.ro	2015-08-04 08:56:55	yes	no	no
user	user	user	noCompany	user@sync.ro	2015-08-04 08:57:46	no	yes	yes

Figure 277: Administrative Page

3. Use this page to manage the following options:

Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments

- and receive e-mail notifications.
- **Moderator** - In addition to the regular User rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
 - **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company	The name of the organization associated with the user.
E-Mail	The contact email address for the user. This is also the address where the WebHelp system sends notifications.
WebHelp Notification	When enabled, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.
Reply Notification	When enabled, the user receives notifications when comments are posted as a reply to one of their comments.
Page Notification	When enabled, the user receives notifications when comments are posted on a topic where they previously posted a comment.
Date	The date the user registered is displayed.
Status	Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

Warning: The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

Customizing WebHelp Classic Systems

[Edit on GitHub](#)

To change the overall appearance of the WebHelp output, you can use the visual [WebHelp Skin Builder tool](#), which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

Adding a Button in Code Snippet Areas in DITA WebHelp Classic Output

[Edit on GitHub](#)

This task will get you started with how to add an action (such as a button or link) in the code snippet areas that are displayed in WebHelp Classic output created from a DITA Map transformation. You can then attach your code that does the actual processing for the action.

Follow these steps:

1. Open the `DITA_OT_DIR\plugins\org.dita.xhtml\xsl\xslhtml\dita2htmlImpl.xsl` file.
2. Locate the `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to check the default behavior of this template.
3. Open the `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\fixup.xsl` file.
4. Create a `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to override the default processing.
5. This new template will include your code for creating the button. It will have the action code that does the actual processing attached to it (this can be written in JavaScript, for example).

Example of a *Select all* button:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">
  <button onclick="SelectText(element)">Select all</button>
  <script>
```

```

function SelectText(element) {
    var text = document.getElementById(element);
    var range = document.body.createTextRange();
    range.moveToElementText(text);
    range.select();
}
</script>
</xsl:template>

```

Adding a Favicon in WebHelp Systems

[Edit on GitHub](#)

You can add a custom *favicon* to your WebHelp system by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp systems using **WebHelp Responsive**, **WebHelp Responsive with Feedback**, **WebHelp Classic**, **WebHelp Classic with Feedback**, or **WebHelp Classic Mobile** transformation scenarios.

To add a *favicon*, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the *favicon*.
3. Run the transformation scenario.

Adding a Logo Image in the Title Area

[Edit on GitHub](#)

To add a logo in the title area of your WebHelp output, follow this procedure:

1. Edit a WebHelp transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

Adding Videos in the WebHelp Classic Output

[Edit on GitHub](#)

Videos can be included and played in all HTML5-based output formats (such as *WebHelp*). For example, to add a YouTube video in the WebHelp output generated from DITA or DocBook documents, follow the procedures below.

Adding Videos to WebHelp Classic Generated from DITA Maps

1. Edit the DITA topic to reference the video using an `object` element, as in the following example:

```

<object outputclass="video">
    <param name="src" value="http://www.youtube.com/watch/v/VideoName"/>
</object>

```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

Adding Videos to WebHelp Classic Generated from DocBook

1. Edit the DocBook document and reference the video using an `mediaobject` element, as in the following example:

```

<mediaobject>
    <videoobject>
        <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
    </videoobject>
</mediaobject>

```

```
</videoobject>
</mediaobject>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

Change Numbering Styles for Ordered Lists

[Edit on GitHub](#)

Ordered lists (ol) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
  list-style-type:lower-alpha;
}
```

3. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.

b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the transformation scenario.

Changing the Icons in a WebHelp Classic Table of Contents

[Edit on GitHub](#)

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, the icons for the WebHelp Classic table of contents are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
  background: url('../img/book_closed16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}
```

```
.hasSubMenuOpened{
  background: url('../img/book_opened16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}
```

To assign other icons, use the following procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
  background: url('TOC-my-closed-button.png') no-repeat;
```

```

    }

    .hasSubMenuOpened{
        background: url('TOC-my-opened-button.png') no-repeat;
    }

```

2. It is recommended that you store the image files in the same directory as the default icons.
 - a) For DITA transformations: *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\img*.
 - b) For DocBook transformations: *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\img*.
3. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.
 - a) For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b) For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

Customize the Appearance of Selected Items in the Table of Contents

[Edit on GitHub](#)

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory:
 - a. For DITA transformations: *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\css*.
 - b. For DocBook transformations: *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\css*.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.

Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario (see step 3 in the *Changing the Icons in a WebHelp Classic Table of Contents* topic).

Customizing the Header and Footer in WebHelp Classic Output

[Edit on GitHub](#)

In the transformation scenario, you can use the `args.hdr` and `args.ftr` parameters to point to resources that contain your custom HTML `<div>` blocks. These are included in the header and footer of each generated topic.

As a practical example, to hide the horizontal separator line between the content and footer, follow these steps:

1. Create a custom CSS file that contains the following snippet:

```

.footer_separator {
    display:none;
}

```

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.
 - a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the transformation scenario.

Customizing WebHelp Output with a Custom CSS

[Edit on GitHub](#)

By creating your own custom CSS stylesheet, you can customize the look and style of WebHelp output to fit your specific needs.

To use a custom CSS in WebHelp output, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
 - a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
2. Run the transformation scenario.

Disable Caching in WebHelp Classic Output

[Edit on GitHub](#)

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
 - For DITA WebHelp systems, edit the following file: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\createMainFiles.xsl`.
 - For DocBook WebHelp system, edit the following file: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\xsl\createMainFiles.xsl`.
2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note: The code should look like this:

```
<html>
  <head>
    <xsl:if test="$withFrames">
      <base target="contentwin"/>
    </xsl:if>
    <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
      <!-- Disable caching of WebHelp pages in web browser. -->
    <meta http-equiv="Pragma" content="no-cache" />
    <meta http-equiv="Expires" content="-1" />
  ....
```

3. Save your changes to the file.
4. Re-run your WebHelp system transformation scenario.

Editing Scoring Values of Tag Elements in Search Results

[Edit on GitHub](#)

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Author includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.

- a) For DITA WebHelp systems, edit the following file: *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties*.
- b) For DocBook WebHelp system, edit the following file: *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties*.

The values that can be edited in the *scoring.properties* file:

```

h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3

toc

=-10
title=20

ignore

=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25

```

2. Save your changes to the file.
3. Re-run your WebHelp system transformation scenario.

Flag DITA Content in WebHelp Output

[Edit on GitHub](#)

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as *audience-flag-build.ditaval*.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the *audience* attribute set to *programmer*, the content of the DITAVAL file should look like the following example:

```

<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag" img="D:\resource\delta.gif" alt="sample alt text"/>
</val>

```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.

4. Run the transformation scenario.

Indexing Japanese Content for DITA WebHelp Pages

[Edit on GitHub](#)

To optimize the indexing of Japanese content in WebHelp pages generated from DITA map transformations, the Kuromoji analyzer can be used. This analyzer is not included in the Oxygen XML Author installation kit and must be downloaded and added.

To use the Kuromoji analyzer to index Japanese content in your WebHelp system, follow these steps:

1. Download the analyzer jar file from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0>.
2. Place the Kuromoji analyzer jar file in the following directory: *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib*.
3. For the analyzer to work properly, search terms that are entered into your WebHelp pages must be separated by spaces.

Optionally a Japanese user dictionary can be set with the `webhelp.search.japanese.dictionary` parameter.

Integrating Social Media and Google Tools in WebHelp Output

[Edit on GitHub](#)

Oxygen XML Author includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

[Edit on GitHub](#)

See how you can add a Facebook widget into your WebHelp output.

To add a Facebook™ *Like* widget to your WebHelp output, follow these steps:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.
A dialog box that contains code snippets is displayed.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/
sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
    })()
  </script>
</div>
```

```

        }(document, 'script', 'facebook-jssdk'));  
-->  
</script>  
<div class="fb-like" data-layout="standard" data-action="like" data-  
show-faces="true"  
data-share="true"/>  
</div>

```

4. In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Add a Google+ Button in WebHelp Classic Output
See how you can add a Google+ widget into your WebHelp output.

[Edit on GitHub](#)

To add a *Google+* widget to your WebHelp output, follow these steps:

1. Go to the [Google Developers](#) website.
2. Fill-in the displayed form.
The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`.
Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```

<div id="google-plus">  
    <!-- Place this tag in your head or just before your close body tag. -->  
    <script src="https://apis.google.com/js/platform.js" async defer></script>  
  
    <!-- Place this tag where you want the +1 button to render. -->  
    <div class="g-plusone" data-annotation="inline" data-width="300"></div>

```

4. In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Add Tweet Button in WebHelp Classic Output

[Edit on GitHub](#)

See how you can add a Twitter widget into your WebHelp output.

To add a Twitter™ *Tweet* widget to your WebHelp output, follow these steps:

1. Go to the [Tweet button generator](#) page.
2. Fill-in the displayed form.
The **Preview and code** area displays the code.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /
          ^http://.test(d.location) ? 'http': 'https';
        if (!d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '//platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
      (document,
       'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Integrate Google Analytics in WebHelp Classic Output

[Edit on GitHub](#)

See how you can integrate Google Analytics into WebHelp output.

To enable your WebHelp system to benefit from Google Analytics reports, follow these steps:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that fits the needs of your website.

- Follow the on-screen instructions to obtain a *Tracking Code* that contains your *Tracking ID*.

A Tracking Code looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){
  {i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
    (i[r].q=i[r].q||[])
    .push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
    m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','//www.google-analytics.com/
  analytics.js','ga');

  ga('create', 'UA-XXXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

- Save the Tracking Code (obtained in the previous step) in a new HTML file called `googleAnalytics.html`.
- In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
- Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
- Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
- Click **Ok**.
- Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 693

How to Integrate Google Search in WebHelp Classic Output
See how you can integrate a Google Custom Search Engine into WebHelp output.

[Edit on GitHub](#)

You can integrate Google Search into your WebHelp output.

To enable your WebHelp system to use Google Search, follow these steps:

- Go to the Google Custom Search Engine page using your Google account.
- Press the **Create a custom search engine** button.
- Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet.

A Google Search script looks like this:

```
<script>
  (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +           '//www.google.com/cse/cse.js?cx=' + cx;

  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
  })
()
```

```
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
 - a) Create an HTML file that contains the Google Custom Search Engine element `gcse:searchresults-only`. It is recommended that you set the `linkTarget` attribute value to `frm` for *frameless* versions of the WebHelp system or to `contentWin` for *frameset* versions of WebHelp. The default value is `_blank` and if you do not specify a value the search results will be loaded in a new window.
 - b) Set the value of the `webhelp.google.search.results` parameter to the location of the file you just created. If this parameter is not specified the following code is used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

9. Click **Ok**.

10. Run the transformation scenario.

[Integrating Social Media and Google Tools in WebHelp Output](#) on page 816

Localizing the Email Notifications of WebHelp with Feedback Systems

[Edit on](#)

[GitHub](#)

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Suppose that you want to localize the emails into Dutch (*nl*). Follow these steps:

DocBook WebHelp Classic with Feedback

1. Create the following directory:
`[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl`
2. Copy all English template files from `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en` and paste them into the directory you just created.
3. Edit the HTML files from the `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl` directory and translate the content into Dutch.
4. Start Oxygen XML Author and edit the **DocBook WebHelp Classic with Feedback** transformation scenario.
5. In the **Parameters** tab, look for the `110n.gentext.default.language` parameter and set its value to the appropriate language code. In our example, use the value `nl` for Dutch.

Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

DITA WebHelp Classic with Feedback or WebHelp Responsive with Feedback

1. Create the following directory:

```
DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php
\templates\nl
```

2. Copy all English template files from *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en* and paste them into the directory you just created.
3. Edit the HTML files from the *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl* directory and translate the content into Dutch.
4. Start Oxygen XML Author and edit the **DITA Map WebHelp Classic with Feedback** or **DITA Map WebHelp Responsive with Feedback** transformation scenario.
5. In the **Parameters** tab, look for the `args.default.language` parameter and set its value to the appropriate language code. In our example, use the value `nl` for Dutch.

Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

Localizing the Interface of WebHelp Output

[Edit on GitHub](#)

You can localize the interface of WebHelp output for DITA or DocBook transformations.

Localizing the Interface of WebHelp Output (for DITA Map Transformations)

[Edit on GitHub](#)

Static labels that are used in the WebHelp output are kept in translation files in the *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization* folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization* directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the `integrator` is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. Make sure that the new XML file that you created in the previous two steps is listed in the file *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml*. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the `args.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

Localizing the Interface of WebHelp Output (for DocBook Transformations)

[Edit on GitHub](#)

Static labels that are used in the WebHelp output are kept in translation files in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback, or the mobile version) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

Removing the Previous/Next Links from WebHelp Classic Output

[Edit on GitHub](#)

The **Previous** and **Next** links that are created at the top area of each WebHelp Classic page can be hidden with a CSS code.

To remove these links from WebHelp Classic output, follow these steps:

1. Add the following CSS code in a custom CSS stylesheet:

```
.navparent, .navprev, .navnext {
    visibility:hidden;
}
```

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

- a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

3. Run the transformation scenario.

Search Engine Optimization for DITA WebHelp

[Edit on GitHub](#)

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A `sitemap` lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
```

```

<lastmod>2014-10-24</lastmod>
<changefreq>weekly</changefreq>
<priority>0.5</priority>
</url>
<url>
  <loc>http://www.example.com/topics/care.html#care</loc>
  <lastmod>2014-10-24</lastmod>
  <changefreq>weekly</changefreq>
  <priority>0.5</priority>
</url>
. . .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- `loc` - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

Note: The value must have fewer than 2,048 characters.

- `lastmod` - the date when the page was last modified. The date format is `YYYY-MM-DD`.
- `changefreq` - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- `priority` - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note: `lastmod`, `changefreq`, and `priority` are optional elements.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
 - `webhelp.sitemap.base.url` - the URL of the location where your WebHelp system is deployed

Note: This parameter is required for Oxygen XML Author to generate the `sitemap.xml` file.

 - `webhelp.sitemap.change.frequency` - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
 - `webhelp.sitemap.priority` - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Support for Right-to-Left (RTL) Oriented Languages for DITA WebHelp

[Edit on GitHub](#)

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

WebHelp Skin Builder

[Edit on GitHub](#)

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML Author website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to Oxygen XML Author website.
- A late version web browser.

To start the **Skin Builder**, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to <http://www.oxygenxml.com/webhelp-skin-builder>.
- For DITA WebHelp systems, you can click the **Online preview** link in the **Skins tab** of a DITA OT transformation scenario. In the upper section of the preview, click the **Select Skin** button, then choose **Customize Skin**.

Skin Builder Layout

The left side panel of the *Skin Builder* is divided into 3 sections:

- **Actions** - Contains the following two buttons:
 - **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
 - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
 - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
 - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
 - Header
 - TOC Area
 - Vertical Splitter
 - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Create a Customization Skin

1. The starting point can be either one of the predefined skins or a CSS stylesheet applied over the sample using the **Import** button.

2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the  **Add** button and choosing from the available properties.

Note: If you want to revert a particular property to its initial value, press the  **Reset** button.

3. When you are happy with the skin customizations you have made, press the **Export** button. All settings will be saved in a CSS file.

Apply a Customization Skin to a DITA Map to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Author.
2. Load the DITA map you want to produce as a WebHelp output.
3. Edit a *DITA Map to WebHelp*-type transformation scenario. Set the previously exported CSS file in the **Custom** section of the **Skins** tab.
4. Run the transformation to obtain the WebHelp output.

Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Author.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the **Parameters** tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: `webhelp.logo.image` and `webhelp.logo.image.target.url`.
5. Run the transformation to obtain the WebHelp output.

[Skins Tab \(DITA OT Transformations\)](#) on page 728

WebHelp Classic Runtime Additional Parameters

[Edit on GitHub](#)

A deployed WebHelp system can accept the following GET parameters:

- `log` - The value can be `true` or `false` (default value). When set to `true`, it enables JavaScript debugging.
 - `contextId` - The WebHelp JavaScript engine will look up the value of this parameter in the mapping file and load the corresponding HTML help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.
- Note:** You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.
- `toc.visible` - The value can be `true` (default value) or `false`. When set to `false`, the table of contents will be collapsed when you load the WebHelp page.
 - `searchQuery` - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

Context-Sensitive WebHelp Classic System

[Edit on GitHub](#)

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

When WebHelp Classic output is generated by Oxygen XML Author, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="annotations-view" path="topics/annotations-view.html"/>
  <appContext helpID="button-editor" path="concepts/button-editor.html"/>
</map>
```

- `helpID` - Unique ID provided by a topic from two possible sources:
 - The `resourceid` element set to it in the `prolog` section:

```
<prolog>
  <resourceid id="context-sensitive-help-system"/>
</prolog>
```

Note: If you need multiple parts of the application (for instance, dialog boxes, views, or editing modes) to open the same contextual help topic, all of the context ID values should be included in the same DITA topic file. For example, if you need both a dialog box and a view to open the same WebHelp page, you can assign both resource IDs in the same DTIA topic.

```
<prolog>
  <resourceid id="dialog1"/>
  <resourceid id="view1"/>
</prolog>
```

- The `id` attribute set on the topic root element.
- Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output. In this case, the help system will not work properly.
- `path` - Path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.
 - `productID` - ID of the product for which you are writing documentation. **Applicable only if you are using the WebHelp Classic with Feedback transformation scenario.**
 - `productVersion` - Version of the product for which you are writing documentation. **Applicable only if you are using the WebHelp Classic with Feedback transformation scenario.**

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke one of the WebHelp system files `index.html` or `index_frames.html` and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

The following example will open a *frameless* version of the WebHelp system showing the page associated with the id `dialog1ID`:

```
index.html?contextId=dialog1ID
```

The following example will open a *frameset* version of the WebHelp system showing the page associated with the id view1ID:

```
index_frames.html?contextId=view1ID
```

[WebHelp Classic Runtime Additional Parameters](#) on page 855

WebHelp Classic Mobile System

[Edit on GitHub](#)

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Author WebHelp system includes several variants to suit your specific needs. The *WebHelp Classic Mobile* variant works on multiple platforms (Android, iOS, BlackBerry, Windows Mobile) and is specially designed for mobile devices when feedback from users is not necessary. It is available for DocBook and DITA document types. The functionality of the desktop WebHelp Classic layout is preserved, is organized in an intuitive layout, and offers table of contents, search capabilities, and index navigation.

Figure 278: WebHelp Classic Mobile

Important: Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server.

(with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

Customizing WebHelp Classic Mobile Systems

[Edit on GitHub](#)

If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario. This section includes topics that explain various ways to customize your WebHelp Classic Mobile system output.

Adding a Button in Code Snippet Areas in DITA WebHelp Classic Output

[Edit on GitHub](#)

This task will get you started with how to add an action (such as a button or link) in the code snippet areas that are displayed in WebHelp Classic output created from a DITA Map transformation. You can then attach your code that does the actual processing for the action.

Follow these steps:

1. Open the `DITA_OT_DIR\plugins\org.dita.xhtml\xsl\xslhtml\dita2htmlImpl.xsl` file.
2. Locate the `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to check the default behavior of this template.
3. Open the `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\fixup.xsl` file.
4. Create a `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to override the default processing.
5. This new template will include your code for creating the button. It will have the action code that does the actual processing attached to it (this can be written in JavaScript, for example).

Example of a *Select all* button:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">
    <button onclick="SelectText(element)">Select all</button>
    <script>
        function SelectText(element) {
            var text = document.getElementById(element);
            var range = document.body.createTextRange();
            range.moveToElementText(text);
            range.select();
        }
    </script>
</xsl:template>
```

Adding a Favicon in WebHelp Systems

[Edit on GitHub](#)

You can add a custom *favicon* to your WebHelp system by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp systems using **WebHelp Responsive**, **WebHelp Responsive with Feedback**, **WebHelp Classic**, **WebHelp Classic with Feedback**, or **WebHelp Classic Mobile** transformation scenarios.

To add a *favicon*, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the *favicon*.
3. Run the transformation scenario.

Adding Videos in the WebHelp Classic Output

[Edit on GitHub](#)

Videos can be included and played in all HTML5-based output formats (such as *WebHelp*). For example, to add a YouTube video in the WebHelp output generated from DITA or DocBook documents, follow the procedures below.

Adding Videos to WebHelp Classic Generated from DITA Maps

1. Edit the DITA topic to reference the video using an `object` element, as in the following example:

```
<object outputclass="video">
  <param name="src" value="http://www.youtube.com/watch/v/VideoName"/>
</object>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

Adding Videos to WebHelp Classic Generated from DocBook

1. Edit the DocBook document and reference the video using an `mediaobject` element, as in the following example:

```
<mediaobject>
  <videoobject>
    <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
  </videoobject>
</mediaobject>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

Changing the Style of WebHelp Mobile Pages

[Edit on GitHub](#)

You can change the style for your WebHelp Mobile pages by setting a custom theme created with a third-party tool.

To create a custom theme for WebHelp Mobile pages, use the following procedure:

1. Create a custom theme (the result will be a CSS stylesheet). Use a designer tool, such as the *ThemeRoller for jQuery Mobile*, to create your own custom theme and then download the resulting CSS stylesheet.

Tip: If you are using ThemeRoller for jQuery Mobile, make sure you use a type C swatch.

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.

b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

3. Make sure that the output folder is empty.

4. Run the transformation scenario.

Change Numbering Styles for Ordered Lists

[Edit on GitHub](#)

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
```

```
<li>C</li>
</ol>
```

- Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
    list-style-type: lower-alpha;
}
```

- Edit the WebHelp transformation scenario* and open the **Parameters** tab.

a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.

b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

- Run the transformation scenario.

Changing the Icons in a WebHelp Classic Table of Contents

[Edit on
GitHub](#)

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, the icons for the WebHelp Classic table of contents are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
    background: url('../img/book_closed16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}

.hasSubMenuOpened{
    background: url('../img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

To assign other icons, use the following procedure:

- Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

- It is recommended that you store the image files in the same directory as the default icons.
 - For DITA transformations: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\`.
 - For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\`.
- Edit the WebHelp transformation scenario* and open the **Parameters** tab.
- For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.

- b) For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

Customize the Appearance of Selected Items in the Table of Contents

[Edit on GitHub](#)

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory:
 - a. For DITA transformations: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\css`.
 - b. For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\css`.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.

Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario (see step 3 in the [Changing the Icons in a WebHelp Classic Table of Contents](#) topic).

Customizing the Header and Footer in WebHelp Classic Output

[Edit on GitHub](#)

In the transformation scenario, you can use the `args.hdr` and `args.ftr` parameters to point to resources that contain your custom HTML `<div>` blocks. These are included in the header and footer of each generated topic.

As a practical example, to hide the horizontal separator line between the content and footer, follow these steps:

1. Create a custom CSS file that contains the following snippet:

```
.footer_separator {
  display:none;
}
```

2. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
 - a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the transformation scenario.

Customizing WebHelp Output with a Custom CSS

[Edit on GitHub](#)

By creating your own custom CSS stylesheet, you can customize the look and style of WebHelp output to fit your specific needs.

To use a custom CSS in WebHelp output, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
 - a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
2. Run the transformation scenario.

Disable Caching in WebHelp Classic Output

[Edit on GitHub](#)

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
 - For DITA WebHelp systems, edit the following file: *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\createMainFiles.xsl*.
 - For DocBook WebHelp system, edit the following file: *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\xsl\createMainFiles.xsl*.
2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note: The code should look like this:

```
<html>
  <head>
    <xsl:if test="$withFrames">
      <base target="contentwin"/>
    </xsl:if>
    <meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
      <!-- Disable caching of WebHelp pages in web browser. -->
    <meta http-equiv="Pragma" content="no-cache" />
    <meta http-equiv="Expires" content="-1" />
    ...
  </head>
</html>
```

3. Save your changes to the file.
4. Re-run your WebHelp system transformation scenario.

Editing Scoring Values of Tag Elements in Search Results

[Edit on GitHub](#)

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Author includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
 - a) For DITA WebHelp systems, edit the following file: *DITA_OT_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties*.
 - b) For DocBook WebHelp system, edit the following file: *[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties*.

The values that can be edited in the *scoring.properties* file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
```

```

  b = 5
  strong = 5
  em = 3
i=3
u=3

```

2. Save your changes to the file.
3. Re-run your WebHelp system transformation scenario.

Flag DITA Content in WebHelp Output

[Edit on
GitHub](#)

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the audience attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

```

<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag" img="D:\resource
\delta.gif" alt="sample alt text"/>
</val>

```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
4. Run the transformation scenario.

Indexing Japanese Content for DITA WebHelp Pages

[Edit on
GitHub](#)

To optimize the indexing of Japanese content in WebHelp pages generated from DITA map transformations, the Kuromoji analyzer can be used. This analyzer is not included in the Oxygen XML Author installation kit and must be downloaded and added.

To use the Kuromoji analyzer to index Japanese content in your WebHelp system, follow these steps:

1. Download the analyzer jar file from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0>.
2. Place the Kuromoji analyzer jar file in the following directory: `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib`.

3. For the analyzer to work properly, search terms that are entered into your WebHelp pages must be separated by spaces.

Optionally a Japanese user dictionary can be set with the `webhelp.search.japanese.dictionary` parameter.

Integrating Social Media and Google Tools in WebHelp Output

[Edit on GitHub](#)

Oxygen XML Author includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

[Edit on GitHub](#)

See how you can add a Facebook widget into your WebHelp output.

To add a Facebook™ *Like* widget to your WebHelp output, follow these steps:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.
A dialog box that contains code snippets is displayed.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
                var js, fjs = d.getElementsByTagName(s)[0];
                if (d.getElementById(id)) return;
                js = d.createElement(s); js.id = id;
                js.src = "//connect.facebook.net/en_US/
sdk.js#xfbml=1&version=v2.0";
                fjs.parentNode.insertBefore(js, fjs);
                }(document, 'script', 'facebook-jssdk'));
        --
    </script>
    <div class="fb-like" data-layout="standard" data-action="like" data-
show-faces="true"
        data-share="true"/>
</div>
```

4. In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.

7. Click **Ok**.
8. Run the transformation scenario.

How to Add a Google+ Button in WebHelp Classic Output

[Edit on GitHub](#)

See how you can add a Google+ widget into your WebHelp output.

To add a *Google+* widget to your WebHelp output, follow these steps:

1. Go to the [Google Developers](#) website.
2. Fill-in the displayed form.
The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`.
Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```
<div id="google-plus">
    <!-- Place this tag in your head or just before your close body tag. -->
    <script src="https://apis.google.com/js/platform.js" async defer></script>

    <!-- Place this tag where you want the +1 button to render. -->
    <div class="g-plusone" data-annotation="inline" data-width="300"></div>
```

4. In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Add Tweet Button in WebHelp Classic Output

[Edit on GitHub](#)

See how you can add a Twitter widget into your WebHelp output.

To add a Twitter™ *Tweet* widget to your WebHelp output, follow these steps:

1. Go to the [Tweet button generator](#) page.
2. Fill-in the displayed form.
The **Preview and code** area displays the code.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /
          ^http://.test(d.location) ? 'http': 'https';
        if (!d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '//platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
      (document,
       'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. In Oxygen XML Author, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

How to Integrate Google Analytics in WebHelp Classic Output

[Edit on GitHub](#)

See how you can integrate Google Analytics into WebHelp output.

To enable your WebHelp system to benefit from Google Analytics reports, follow these steps:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that fits the needs of your website.
3. Follow the on-screen instructions to obtain a *Tracking Code* that contains your *Tracking ID*.

A Tracking Code looks like this:

```
<script>
  (function(i,s,o,g,r,a,m)
  {i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
    (i[r].q=i[r].q||
    []).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
    m=s.getElementsByTagName(o)
  [0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','//www.google-analytics.com/
  analytics.js','ga');

  ga('create', 'UA-XXXXXXXX-X', 'auto');
  ga('send', 'pageview');
```

```
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new HTML file called `googleAnalytics.html`.
5. In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click **Ok**.
9. Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 693

How to Integrate Google Search in WebHelp Classic Output

[Edit on GitHub](#)

See how you can integrate a Google Custom Search Engine into WebHelp output.

You can integrate Google Search into your WebHelp output.

To enable your WebHelp system to use Google Search, follow these steps:

1. Go to the Google Custom Search Engine page using your Google account.
2. Press the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet.

A Google Search script looks like this:

```
<script>
(function() {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') + '//www.google.com/cse/cse.js?cx=' + cx;

  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
}
)();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In Oxygen XML Author, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
 - a) Create an HTML file that contains the Google Custom Search Engine element `gcse:searchresults-only`. It is recommended that you set the `linkTarget` attribute value to `frm` for *frameless* versions of the

WebHelp system or to contentWin for *frameset* versions of WebHelp. The default value is _blank and if you do not specify a value the search results will be loaded in a new window.

- b) Set the value of the `webhelp.google.search.results` parameter to the location of the file you just created. If this parameter is not specified the following code is used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

9. Click **Ok**.

10. Run the transformation scenario.

[Integrating Social Media and Google Tools in WebHelp Output](#) on page 816

Localizing the Interface of WebHelp Output

[Edit on GitHub](#)

You can localize the interface of WebHelp output for DITA or DocBook transformations.

Localizing the Interface of WebHelp Output (for DITA Map Transformations)

[Edit on GitHub](#)

Static labels that are used in the WebHelp output are kept in translation files in the `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the `integrator` is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. Make sure that the new XML file that you created in the previous two steps is listed in the file `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the `args.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

Related information

[Creating New Transformation Scenarios](#) on page 712

Localizing the Interface of WebHelp Output (for DocBook Transformations)

[Edit on GitHub](#)

Static labels that are used in the WebHelp output are kept in translation files in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the *strings-[lang1]-[lang2].xml* file in *[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization* directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, create one starting from the *strings-en-us.xml* file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file *[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml*. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback, or the mobile version) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

Removing the Previous/Next Links from WebHelp Classic Output

[Edit on GitHub](#)

The **Previous** and **Next** links that are created at the top area of each WebHelp Classic page can be hidden with a CSS code.

To remove these links from WebHelp Classic output, follow these steps:

1. Add the following CSS code in a custom CSS stylesheet:

```
.navparent, .navprev, .navnext {
    visibility:hidden;
}
```

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

- a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.

- b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

3. Run the transformation scenario.

Search Engine Optimization for DITA WebHelp

[Edit on GitHub](#)

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A `sitemap` lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>

```

```
</url>
.
.
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- `loc` - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

Note: The value must have fewer than 2,048 characters.

- `lastmod` - the date when the page was last modified. The date format is `YYYY-MM-DD`.
- `changefreq` - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- `priority` - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note: `lastmod`, `changefreq`, and `priority` are optional elements.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
 - `webhelp.sitemap.base.url` - the URL of the location where your WebHelp system is deployed
Note: This parameter is required for Oxygen XML Author to generate the `sitemap.xml` file.
 - `webhelp.sitemap.change.frequency` - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
 - `webhelp.sitemap.priority` - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Support for Right-to-Left (RTL) Oriented Languages for DITA WebHelp

[Edit on GitHub](#)

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

WebHelp Classic Runtime Additional Parameters

[Edit on GitHub](#)

A deployed WebHelp system can accept the following GET parameters:

- `log` - The value can be `true` or `false` (default value). When set to `true`, it enables JavaScript debugging.
 - `contextId` - The WebHelp JavaScript engine will look up the value of this parameter in the mapping file and load the corresponding HTML help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.
- Note:** You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.
- `toc.visible` - The value can be `true` (default value) or `false`. When set to `false`, the table of contents will be collapsed when you load the WebHelp page.
 - `searchQuery` - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

Context-Sensitive WebHelp Classic System

[Edit on GitHub](#)

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

When WebHelp Classic output is generated by Oxygen XML Author, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="annotations-view" path="topics/annotations-view.html"/>
  <appContext helpID="button-editor" path="concepts/button-editor.html"/>
  .
  .
</map>
```

- `helpID` - Unique ID provided by a topic from two possible sources:
 - The `resourceid` element set to it in the `prolog` section:

```
<prolog>
  <resourceid id="context-sensitive-help-system"/>
</prolog>
```

Note: If you need multiple parts of the application (for instance, dialog boxes, views, or editing modes) to open the same contextual help topic, all of the context ID values should be included in the same DITA topic file. For example, if you need both a dialog box and a view to open the same WebHelp page, you can assign both resource IDs in the same DTIA topic.

```
<prolog>
  <resourceid id="dialog1"/>
  <resourceid id="view1"/>
</prolog>
```

- The `id` attribute set on the topic root element.
- Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output. In this case, the help system will not work properly.
- `path` - Path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

- `productID` - ID of the product for which you are writing documentation. **Applicable only if you are using the WebHelp Classic with Feedback transformation scenario.**
- `productVersion` - Version of the product for which you are writing documentation. **Applicable only if you are using the WebHelp Classic with Feedback transformation scenario.**

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke one of the WebHelp system files `index.html` or `index_frames.html` and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

The following example will open a *frameless* version of the WebHelp system showing the page associated with the id `dialog1ID`:

```
index.html?contextId=dialog1ID
```

The following example will open a *frameset* version of the WebHelp system showing the page associated with the id `view1ID`:

```
index_frames.html?contextId=view1ID
```

Using the Oxygen XML WebHelp Plugin to Automate Output

[Edit on GitHub](#)

Oxygen XML WebHelp plugin allows you to use a command line interface script to obtain WebHelp output from DITA and DocBook documents. Note that the Oxygen XML WebHelp plugin is a standalone product with its own licensing terms and cannot be used with a Oxygen XML Author license.

The WebHelp output files created with the Oxygen XML WebHelp plugin are the same as the output files produced when you run DITA or DocBook to WebHelp transformation scenarios from within Oxygen XML Author.

When an automated process is required due to the amount of output needed, do the following:

1. Install the Oxygen XML WebHelp plugin.
2. Acquire a Oxygen XML WebHelp license from http://www.oxygenxml.com/buy_webhelp.html.
3. Integrate the Oxygen XML WebHelp plugin with [DITA](#) or [DocBook](#).

Oxygen XML WebHelp Plugin for DITA

[Edit on GitHub](#)

To transform DITA documents using the Oxygen XML WebHelp plugin, first integrate the plugin with the DITA Open Toolkit. The purpose of the integration is to add the following transformation types to the DITA Open Toolkit:

- **webhelp-responsive** - The transformation that produces *WebHelp Responsive* and *WebHelp Responsive with Feedback* output for desktop and mobile devices.
- **webhelp** - The transformation that produces *WebHelp Classic* output for desktop.
- **webhelp-feedback** - The transformation that produces feedback-enabled *WebHelp Classic with Feedback* for desktop.
- **webhelp-mobile** - The transformations that produce *WebHelp Classic Mobile* output for mobile devices.

Integrating the Oxygen XML WebHelp Plugin with the DITA Open Toolkit

[Edit on](#)
[GitHub](#)

This topic includes the procedure for integrating the Oxygen XML WebHelp plugin with the DITA Open Toolkit.

The requirements of the Oxygen XML WebHelp plugin for the DITA Open Toolkit are as follows:

- Java Virtual Machine 1.6 or newer if you want to use DITA-OT 1.8 or Java Virtual Machine 1.8 or newer if you want to use DITA-OT 2.x.
- DITA Open toolkit 1.8 or 2.x (includes Saxon 9.x libraries)

To integrate the Oxygen XML WebHelp plugin with the DITA Open Toolkit, follow these steps:

1. Download and install a *Java Virtual Machine* version compatible with the DITA-OT version.
2. Download and unpack *DITA Open Toolkit* 1.8.x or 2.x.
3. Go to *Oxygen XML WebHelp website*, download the latest installation kit, and unzip it.
4. Copy the com.oxygenxml.webhelp and com.oxygenxml.highlight directories inside the plugins directory of the DITA OT distribution. The com.oxygenxml.highlight directory adds syntax highlight capabilities to your WebHelp output for codeblock sections that contain source code snippets (XML, Java, JavaScript etc.).
5. If you are using DITA-OT version 2.x, the WebHelp plugin contains a plugin_2.x.xml that needs to be renamed to plugin.xml.
6. In the home directory of the DITA Open Toolkit, run ant -f integrator.xml.

Licensing the Oxygen XML WebHelp Plugin for DITA OT

[Edit on](#)
[GitHub](#)

This topic explains how to register the license for the Oxygen XML WebHelp plugin for the DITA Open Toolkit.

To register the license for the Oxygen XML WebHelp plugin for the DITA Open Toolkit, follow these steps:

1. Open the *DITA_OT_DIR/plugins/com.oxygenxml.webhelp* directory and create a file called licensekey.txt.
2. In this file, copy your license key that you purchased for your Oxygen XML WebHelp plugin.

The WebHelp transformation process reads the Oxygen XML WebHelp license key from this file. In case the file does not exist, or it contains an invalid license, an error message will be displayed.

Upgrading the Oxygen XML WebHelp Plugin for DITA OT

[Edit on](#)
[GitHub](#)

This topic describes the procedure for upgrading a Oxygen XML WebHelp plugin for the DITA Open Toolkit.

To upgrade your Oxygen XML WebHelp plugin for the DITA Open Toolkit, follow these steps:

1. Navigate to the *plugins* directory of your DITA OT distribution and delete the old Oxygen XML WebHelp plugin files (oxygen_custom.xsl, oxygen_custom_html.xsl) and directories (com.oxygenxml.highlight, com.oxygenxml.webhelp).
2. Go to *Oxygen XML WebHelp website*, download the latest installation kit, and unzip it.
3. Copy the com.oxygenxml.webhelp and com.oxygenxml.highlight directories inside the *plugins* directory of the DITA OT distribution. The com.oxygenxml.highlight directory adds syntax highlight capabilities to your WebHelp output for codeblock sections that contain source code snippets (XML, Java, JavaScript etc.).
4. If you are using DITA-OT version 2.x, the WebHelp plugin contains a plugin_2.x.xml that needs to be renamed to plugin.xml.
5. In the home directory of the DITA Open Toolkit, run ant -f integrator.xml.

Running an External DITA Transformation Using the Oxygen XML WebHelp Plugin

[Edit on GitHub](#)

This topic explains how to run an external DITA to WebHelp transformation using the Oxygen XML WebHelp plugin.

To run a DITA to WebHelp ([webhelp-responsive](#), [webhelp](#), [webhelp-feedback](#), [webhelp-mobile](#)) transformation using the Oxygen XML WebHelp plugin, use the following:

DITA-OT 2.x versions

- `DITA_OT_DIR\bin\dita.bat -i path_to_input.ditamap -f webhelp` (Windows based systems)
- `DITA_OT_DIR\bin\dita -i path_to_input.ditamap -f webhelp` (Unix/Linux based systems)

DITA-OT 1.x versions

- `WEBHELP_PLUGIN_HOME_DIR\dita.bat` script file (Windows based systems)
- `WEBHELP_PLUGIN_HOME_DIR\dita.sh` script file (Unix/Linux based systems)

Warning: You can also invoke the DITA OT WebHelp publishing using a startup script but you will lose certain small fixes and patches that Oxygen XML Author added to the automated DITA OT processing.

The `dita.bat` and the `dita.sh` files are located in the home directory of the Oxygen XML WebHelp Plugin. Before using them to generate a WebHelp system, customize them to match the paths to the JVM, DITA Open Toolkit, and Saxon engine, and also to set the transformation type. To do this, open the script file and edit the following variables and parameters:

- `JVM_INSTALL_DIR` - Specifies the path to the Java Virtual Machine installation directory on your disk.
- `DITA_OT_INSTALL_DIR` - Specifies the path to DITA Open Toolkit installation directory on your disk.
- **Note:** The `dita.bat` and `dita.sh` scripts reference the `dost-patches-DITA-1.8.jar` JAR file containing DITA OT 1.8-specific patches. If you use DITA OT 1.7, update that reference to `dost-patches-DITA-1.7.jar`. If you use DITA OT 2.0, no patches are needed, so just remove the reference.
- `TRANSTYPE` - Specifies the type of the transformation you want to apply. You can set it to `webhelp`, `webhelp-feedback` and `webhelp-mobile`.
- `DITA_MAP_BASE_DIR` - Specifies the path to the directory where the input DITA map file is located.
- `DITAMAP_FILE` - Specifies the input DITA map file.
- `DITAVAL_FILE` - Specifies the `.ditaval` input filter that the transformation process applies to the input DITA map file.
- `DITAVAL_DIR` - Specifies the path to the directory where the `.ditaval` file is located.
- `-Doutput.dir` - Specifies the output directory of the transformation.

The optional parameter `-Dargs.filter` can be used to specify a filter file to be used to include, exclude, or flag content.

This topic includes the procedure for integrating the Oxygen XML WebHelp plugin with the DITA Open Toolkit.

Additional Oxygen XML WebHelp Plugin Parameters for DITA

[Edit on GitHub](#)

You can append the following parameters to the command line that runs the transformation:

-Dwebhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

-Dwebhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

-Dwebhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

-Dwebhelp.footer.file (not available for WebHelp Responsive systems)

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0";

      fjs.parentNode.insertBefore(js,
      fjs); })(document, 'script',
      'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-
  show-faces="true" data-
  action="like" data-
  layout="standard" class="fb-like"/>
</div>
```

-Dwebhelp.footer.include (not available for WebHelp Responsive systems)

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

-Dwebhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (*iframe*) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

-Dwebhelp.google.search.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
-Dwebhelp.logo.image.target.url (not available for WebHelp Classic Mobile systems)	Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.
-Dwebhelp.logo.image (not available for WebHelp Classic Mobile systems)	Specifies a path to an image displayed as a logo in the left side of the output header.
-Dwebhelp.product.id (available only for Feedback-enabled systems)	This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).
	Note: You can deploy documentation for multiple products on the same server.
	Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.
-Dwebhelp.product.version (available only for Feedback-enabled systems)	Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.
	Note: Multiple documentation versions can be deployed on the same server.
	Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.
-Dwebhelp.search.japanese.dictionary	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
-Dwebhelp.search.ranking	If this parameter is set to <i>false</i> then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is <i>true</i>).
-Dwebhelp.show.changes.and.comments	When set to <i>yes</i> , user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is <i>no</i> .
-Dwebhelp.sitemap.base.url	Base URL for all the <i>loc</i> elements in the generated <i>sitemap.xml</i> file. The value of a <i>loc</i> element is computed as the relative file path from the <i>href</i> attribute of a <i>topicref</i> element from the DITA map, appended to this base URL value. The <i>loc</i> element is mandatory in <i>sitemap.xml</i> . If you leave

-Dwebhelp.sitemap.change.frequency

this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

-Dwebhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

-Dwebhelp.skin.css (available only for WebHelp Classic and WebHelp Classic with Feedback systems)

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins` directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

Parameters Specific to WebHelp Responsive Output (available only for WebHelp Responsive and WebHelp Responsive with Feedback systems)

-Dwebhelp.fragment.after.body

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the body in the output.

-
Dwebhelp.fragment.after.logo_and_title

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the logo and title in the output.

-
Dwebhelp.fragment.after.main.page.search

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the search field in the output.

-Dwebhelp.fragment.after.toc_or_tiles

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the table of contents or tiles in the main page of the output.

-Dwebhelp.fragment.after.top_menu

Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the top menu in the output.

-Dwebhelp.fragment.before.body

Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the body in the output.

-
Dwebhelp.fragment.before.logo_and_title

Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the logo and title in the output.

-	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the search field in the output.
-Dwebhelp.fragment.before.main.page.search	
-Dwebhelp.fragment.before.toc_or_tiles	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the table of contents or tiles in the main page of the output.
-Dwebhelp.fragment.before.top_menu	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the top menu in the output.
-Dwebhelp.fragment.footer	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the footer in the output
-Dwebhelp.fragment.head	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the header in the output.
-Dwebhelp.fragment.welcome	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as a welcome message (or title) in the output.
-Dwebhelp.show.breadcrumb	Specifies if the breadcrumb component will be presented in the output. The default value is yes.
-Dwebhelp.show.indexterms.link	Specifies if an icon that links to the index will be presented in the output. The default value is yes.
-Dwebhelp.show.main.page.tiles	Specifies if the tiles component will be presented in the main page of the output. For a <i>tree</i> style layout, this parameter should be set to no.
-Dwebhelp.show.main.page.toc	Specifies if the table of contents will be presented in the main page of the output. The default value is yes.
-Dwebhelp.show.navigation.links	Specifies if navigation links will be presented in the output. The default value is yes.
-Dwebhelp.show.print.link	Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.
-Dwebhelp.show.side.toc	Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.
-Dwebhelp.show.top.menu	Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.
-Dwebhelp.top.menu.depth	Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

Note: Note that the `fix.external.refs.com.oxygenxml` parameter is not supported in Oxygen XML WebHelp plugin.

If you need to further customize the transformation process, you can append other DITA-OT parameters as well. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, to append the `args.hdr` parameter, use:

```
-Dargs.hdr=[ HEADER_FILE_DIR ]
```

where `[HEADER_FILE_DIR]` is the location of the directory that contains the header file.

Comments Database Configuration for DITA WebHelp Systems with Feedback

[Edit on GitHub](#)

If you run the **webhelp-responsive or webhelp-feedback** transformation using the WebHelp plugin, you need to configure the database that holds the user comments.

The instructions for configuring the database are presented in the `installation.html` file, located at: `[DITA_MAP_BASE_DIR]/out/[TRANSFORM_TYPE]/oxygen-webhelp/resources`. The `installation.html` file is created by the transformation process.

Oxygen XML WebHelp Plugin for DocBook

[Edit on GitHub](#)

To transform DocBook documents using the Oxygen XML WebHelp plugin, first integrate the plugin with the DocBook XSL distribution. The purpose of the integration is to add the following transformation types to the DocBook XSL distribution:

- **webhelp** - The transformation that produces *WebHelp Classic* output for desktop.
- **webhelp-feedback** - The transformation that produces feedback-enabled *WebHelp Classic with Feedback* for desktop.
- **webhelp-mobile** - The transformations that produce *WebHelp Classic Mobile* output for mobile devices.

Integrating the Oxygen XML WebHelp Plugin with the DocBook XSL Distribution

[Edit on GitHub](#)

This topic includes the procedure for integrating the Oxygen XML WebHelp plugin with the DocBook XSL Distribution.

The WebHelp plugin transformations run as an Ant build script. The requirements are:

- Ant 1.8 or later
- Java Virtual Machine 1.6 later
- DocBook XSL 1.78.1 later
- Saxon 6.5.5
- Saxon 9.1.0.8

To integrate the Oxygen XML WebHelp plugin with the DocBook XSL distribution, follow these steps:

1. Download and install a [Java Virtual Machine](#) 1.6 or later.
2. Download and install [Ant 8.0](#) or later.
3. Download and unzip on your computer the DocBook XSL distribution.
4. Unzip the Oxygen XML WebHelp distribution package in the DocBook XSL installation directory.
The DocBook XSL directory now contains a new subdirectory named `com.oxygenxml.webhelp` and two new files, `oxygen_custom.xsl` and `oxygen_custom_html.xsl`.
5. Download and unzip [saxon6-5-5.zip](#) on your computer.
6. Download and unzip [saxonb9-1-0-8j.zip](#) on your computer.

Licensing the Oxygen XML WebHelp Plugin for DocBook

[Edit on GitHub](#)

This topic explains how to register the license for the Oxygen XML WebHelp plugin for the DocBook XSL distribution.

To register the license for the Oxygen XML WebHelp plugin for the DocBook XSL distribution, follow these steps:

1. Create a `.txt` file named `license` in the `com.oxygenxml.webhelp` subdirectory of the DocBook XSL directory.
2. In this file, copy the license key that you purchased for your Oxygen XML WebHelp plugin.

The WebHelp transformation process reads the Oxygen XML Author license key from this file. If the file does not exist, or it contains an invalid license, an error message is displayed.

Upgrading the Oxygen XML WebHelp Plugin for DocBook

[Edit on GitHub](#)

This topic describes the procedure for upgrading a Oxygen XML WebHelp plugin for DocBook.

To upgrade your Oxygen XML WebHelp plugin for DocBook, follow these steps:

1. Navigate to the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl` directory and delete the old Oxygen XML WebHelp plugin files (`oxygen_custom.xsl`, `oxygen_custom_html.xsl`) and directory (`com.oxygenxml.webhelp`).
2. Go to [Oxygen XML WebHelp website](#), download the latest installation kit, and unzip it.
3. Copy the `com.oxygenxml.webhelp` directory in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl`.

Running an External DocBook Transformation Using the WebHelp Plugin

[Edit on GitHub](#)

This topic explains how to run an external DocBook to WebHelp transformation using the Oxygen XML WebHelp plugin.

To run a DocBook to WebHelp ([webhelp](#), [webhelp-feedback](#), [webhelp-mobile](#)) transformation using the Oxygen XML WebHelp plugin, use:

- The `docbook.bat` script file for Windows based systems.
- The `docbook.sh` script file for Unix/Linux based systems.

Note: You can call these files in an automated process or from the command line.

The `docbook.bat` and the `docbook.sh` files are located in the home directory of the Oxygen XML WebHelp Plugin. Before using them to generate an WebHelp system, customize them to match the paths to the JVM, DocBook XSL distribution and Saxon engine, and also to set the transformation type. To do this, open a script file and edit the following variables:

- `JVM_INSTALL_DIR` - Specifies the path to the Java Virtual Machine installation directory on your disk.
- `ANT_INSTALL_DIR` - Specifies the path to the installation directory of Ant.
- `SAXON_6_DIR` - Specifies the path to the installation directory of Saxon 6.5.5.
- `SAXON_9_DIR` - Specifies the path to the installation directory of Saxon 9.1.0.8.
- `DOCBOOK_XSL_DIR` - Specifies the path to the installation directory of the DocBook XSL distribution.
- `TRANSTYPE` - Specifies the type of the transformation you want to apply. You can set it to `webhelp`, `webhelp-feedback` and `webhelp-mobile`.
- `INPUT_DIR` - Specifies the path to the input directory, containing the input XML file.
- `XML_INPUT_FILE` - Specifies the name of the input XML file.
- `OUTPUT_DIR` - Specifies the path to the output directory where the transformation output is generated.
- `DOCBOOK_XSL_DIR_URL` - Specifies the path to the directory of the DocBook XSL distribution in URL format.

Additional Oxygen XML WebHelp Plugin Parameters for DocBook

[Edit on GitHub](#)

You can append the following parameters to the command line that runs the transformation:

-Dwebhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

-Dwebhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

-Dwebhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter

to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0";

      fjs.parentNode.insertBefore(js,
      fjs); })(document, 'script',
      'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-
    show-faces="true" data-
    action="like" data-
    layout="standard" class="fb-like"/>
  </div>
```

-Dwebhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

-Dwebhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

-Dwebhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the -D model of the above parameters. For example, you can append the `html.stylesheet` parameter in the following form:

```
-Dhtml.stylesheet=/path/to/directory/of/stylesheet.css
```

Comments Database Configuration for DocBook WebHelp Classic with Feedback

[Edit on GitHub](#)

If you run the `webhelp-feedback` transformation using the WebHelp plugin, you need to configure the database that holds the user comments. The instructions for configuring the database are presented in the `installation.html` file, located at: `[OUTPUT_DIR]/oxygen-webhelp/resources/installation.html`. The `installation.html` file is created by the transformation process.

Chapter

9

Querying Documents

Topics:

- [*Running XPath Expressions*](#)
- [*Working with XQuery*](#)

This chapter shows how to query XML documents in Oxygen XML Author with XPath expressions and the XQuery language.

This chapter shows how to query XML documents in Oxygen XML Author with XPath expressions and the XQuery language.

Running XPath Expressions

[Edit on GitHub](#)

This section covers the views, toolbars, and dialog boxes in Oxygen XML Author that are dedicated to running XPath expressions.

What is XPath

[Edit on GitHub](#)

XPath is a language for addressing specific parts of an XML document. XPath, such as the Document Object Model (DOM), models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the XML document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

- `child::*` - Selects all children of the root node.
- `.//name` - Selects all elements having the name "name", descendants of the current node.
- `/catalog/cd[price>10.80]` - Selects all the cd elements that have a price element with a value larger than 10.80.

To find out more about XPath, go to <http://www.w3.org/TR/xpath>.

XPath Toolbar

[Edit on GitHub](#)

XPath is a query language for selecting nodes from an XML document. To use XPath expressions effectively, you need a good understanding of [the XPath Core Function Library](#).

XPath Toolbar

Oxygen XML Author provides an XPath toolbar to let you query XML documents fast and easy using XPath expressions.

Figure 279: XPath Toolbar

You can choose the XPath version from the drop-down menu available in the left side of the toolbar. Available options include **XPath 1.0**, **XPath 2.0**, **XPath 2.0 SA**, **XPath 3.0**, **XPath 3.0 SA**.

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Warning: Oxygen XML Author uses Saxon to execute XPath 3.0 expressions, but implements a part of the 3.0 functions. When using a function that is not implemented, Oxygen XML Author can return a compilation error.

XPath scope menu - Oxygen XML Author allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Project** - All the files in the project.

- **Selected project resources** - The files selected in the project.
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view.
- **Opened archive** - Files open in the *Archive Browser* view.
- **Working sets** - The selected working sets.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

The following actions are available in the **Settings** menu:

- **Update on cursor move** - When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
- **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

Note: The **Evaluate as you type** option and the automatic validation are disabled when you edit *huge documents* or when the scope is other than **Current file**.
- **Options** - Opens the Preferences page of the currently selected processing engine.

Note: During the execution of an XPath expression, the XPath toolbar displays a **Stop** button. Press this button to stop the XPath execution.

When you type expressions longer than 60 characters, a dialog box opens that offers you the possibility to switch to the *XPath Builder view*.

Related information

[XPath Expression Results View](#) on page 888

[Edit on GitHub](#)

XPath/XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath and XQuery expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, or XQuery expressions, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Author executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the view contains the following actions:

- A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:
 - XPath 1.0 (Xerces-driven)

- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, XQuery 1.0, XQuery 3.0, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Author uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Author returns a compilation error.

-  **Execute XPath** button - Press this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view** in a separate tab
- **Favorites** button - Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Author automatically groups favorites in folders named after the method of execution
-  **History** drop-down menu - Keeps a list of the last 15 executed XPath or XQuery expressions. Use the  **Clear history** action from the bottom of the list to remove them
-  **Settings** drop-down menu - Contains the following three options:
 -  **Update on cursor move** - When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
 -  **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

Note: The  **Evaluate as you type** option and the automatic validation are disabled when you edit **huge documents** or when the scope is other than **Current file**.

-  **Options** - Opens the Preferences page of the currently selected processing engine.
- **XPath scope** menu - Oxygen XML Author allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:
 -  **Current file** - Current selected file only.
 -  **Project** - All the files in the project.
 -  **Selected project resources** - The files selected in the project.
 -  **All opened files** - All files opened in the application.
 -  **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view.
 -  **Opened archive** - Files open in the **Archive Browser** view.
 -  **Working sets** - The selected working sets.

At the bottom of the scope menu the following scope configuration actions are available:

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
-  **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

The screenshot shows the Oxygen XML Author interface with the 'XPath/XQuery Builder - authors.xquery' tab active. The XQuery code is as follows:

```

1 (: You can activate the content completion by pressing the Ctrl+Space keys. :)
2 xquery version "1.0";
3
4 (: Namespace for the <oXygen/> custom functions and variables :)
5 declare namespace oxy="http://www.oxygenxml.com/xquery/functions";
6
7 (: The URI of the document that is to be queried :)
8 declare variable $oxy:document-to-query as xs:string := "books.xml";
9
10 (: Queries an XML document for authors
11 declare function oxy:list-authors($d
12
13 let $library := doc($document)
14 let $seq := $library//author
15 let $distinct := distinct-values($seq)
16
17 for $a in $distinct
18 return
19 <author>
20 <name> {$a} </name>
21 {
22 for $book in $library/library/publications
23 where (compare($book/author, $a)
24 return $book/title
25 }
26 </author>
27 };
28
29 <author_list>
30 {oxy:list-authors($oxy:document-to-query)}
31 </author_list>
32

```

A context menu is open over the word 'adjust-date-to-timezone' at line 15, showing suggestions like 'fn', 'oxy', 'saxon', and several QName and function proposals. The 'adjust-date-to-timezone(\$arg)' proposal is selected. A tooltip provides the documentation for this function:

adjust-date-to-timezone(\$arg as xs:date?) as xs:date?
Adjusts an xs:date value to the value of the implicit timezone in the dynamic context.
If \$arg is the empty sequence, then the result is the empty sequence.

The URL <http://www.w3.org/TR/xquery-operators/> is also visible in the tooltip area.

Figure 280: XPath/XQuery Builder View

While you edit an XPath or XQuery expression, Oxygen XML Author assists you with the following features:

- **Content Completion Assistant** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the **Content Completion Assistant** also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- **Syntax Highlight** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, *open the Preferences dialog box (Options > Preferences)* and go to *Editor > Syntax Highlight*.

- Automatic validation of the expression as you type.
Note: When you type invalid syntax a red serrated line underlines the invalid fragments.
- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of the top editable part of the view.

[XPath Expression Results View](#) on page 888

XPath Expression Results View

[Edit on GitHub](#)

When you run an XPath expression, Oxygen XML Author displays the results of its execution in the **Results view**.

This view contains the following columns:

- **Description** - The result that Oxygen XML Author displays when you run an XPath expression.
- **Resource** - The name of the document that you run the XPath expression on.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. To group the results by their resource, or by their system id, right-click the header of any column in the results view and select **Group by "Resource"** or **Group by "System ID"**. If no information regarding location is available, Oxygen XML Author displays **Not available** in the **Location** column. Oxygen XML Author displays the results in a valid XPath expression format.

```
- /node[value]/node[value]/node[value] -
```

The screenshot shows the Oxygen XML Author interface. The top navigation bar includes 'XPath 2.0' and a search field containing '/personnel/person/name'. Below the navigation is the document editor titled 'personal.xml' with the following XML code:

```

22         <family>Worker</family>
23             <given>Two</given>
24         </name>
25         <email>two@oxygentools.com</email>
26         <link manager="Big.Boss"/>
27     </person>
28     <person id="three.worker">
29         <name>
30             <family>Worker</family>
31             <given>Three</given>
32         </name>

```

The code at line 22 is highlighted with a blue selection bar. Below the editor is a toolbar with 'Text', 'Grid', and 'Author' buttons, where 'Text' is selected.

Below the toolbar is the 'Results View' table:

Description - 6 items	XPath location	Resource	Location
Boss	/personnel[1]/person[1]/name[1]/family[1]	personal.xml	6:13
Worker	/personnel[1]/person[2]/name[1]/family[1]	personal.xml	14:13
Worker	/personnel[1]/person[3]/name[1]/family[1]	personal.xml	22:13
Worker	/personnel[1]/person[4]/name[1]/family[1]	personal.xml	30:13
Worker	/personnel[1]/person[5]/name[1]/family[1]	personal.xml	38:13
Worker	/personnel[1]/person[6]/name[1]/family[1]	personal.xml	46:13

The row for 'Worker' at line 22 is highlighted with a blue selection bar. At the bottom of the results view is a tab labeled 'XPath - personal.xml'.

Figure 281: XPath Results Highlighted in Editor Panel with Character Precision

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter //chapter in the XPath expression field and press **(Enter)**. This action returns all the chapter nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all example nodes contained in the sect2 nodes of a DocBook XML document, use the following XPath expression: //chapter/sect1/sect2/example. Oxygen XML Author adds a result in the **Results View** for each example node found in any sect2 node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

Catalogs

[Edit on GitHub](#)

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through the [XML catalogs](#). These catalogs are [configured in the Preferences](#) pages and [the current XInclude preferences](#).

As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an XML catalog, specify the class name of the XML catalog enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```
let $docs := collection(iri-to-uri(
    "file:///D:/temp/test/XQuery-catalog/mydocsdir?
    recurse=yes;select='*.xml';
    parser=ro.sync.xml.parser.CatalogEnabledXMLReader" ))
```

XPath Prefix Mapping

[Edit on GitHub](#)

To define default mappings between prefixes (that you can use in the XPath toolbar) and namespace URIs go to the [XPath preferences page](#) and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

Important: If you define a default namespace, Oxygen XML Author binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `level` elements when you define a default namespace in the root element, use this expression: `// default:level` in the XPath toolbar.

Working with XQuery

[Edit on GitHub](#)

This section explains how to edit and run XQuery queries in Oxygen XML Author.

What is XQuery

[Edit on GitHub](#)

XQuery is the query language for XML and is officially defined by [a W3C Recommendation document](#). The many benefits of XQuery include:

- XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.
- XQuery allows you to query both relational sources and XML sources, and create one XML result.

XPath/XQuery Builder View

[Edit on GitHub](#)

The **XPath/XQuery Builder** view allows you to compose complex XPath and XQuery expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, or XQuery expressions, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Author executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the view contains the following actions:

- A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:
 - XPath 1.0 (Xerces-driven)
 - XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, XQuery 1.0, XQuery 3.0, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
 - Custom connection to XML databases that can execute XQuery expressions

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Author uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Author returns a compilation error.

- **Execute XPath** button - Press this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view** in a separate tab
- **Favorites** button - Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Author automatically groups favorites in folders named after the method of execution
- **History** drop-down menu - Keeps a list of the last 15 executed XPath or XQuery expressions. Use the **Clear history** action from the bottom of the list to remove them
- **Settings** drop-down menu - Contains the following three options:
 - **Update on cursor move** - When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
 - **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

Note: The **Evaluate as you type** option and the automatic validation are disabled when you edit **huge documents** or when the scope is other than **Current file**.

- **Options** - Opens the Preferences page of the currently selected processing engine.
- **XPath scope** menu - Oxygen XML Author allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:
 - **Current file** - Current selected file only.
 - **Project** - All the files in the project.
 - **Selected project resources** - The files selected in the project.
 - **All opened files** - All files opened in the application.

-  **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view.
-  **Opened archive** - Files open in the *Archive Browser* view.
-  **Working sets** - The selected working sets.

At the bottom of the scope menu the following scope configuration actions are available:

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
-  **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

The screenshot shows the Oxygen XML Author interface with the 'XPath/XQuery Builder - authors.xquery' tab selected. The XQuery code is as follows:

```

1 (: You can activate the content completion by pressing the Ctrl+Space keys. :)
2 xquery version "1.0";
3
4 (: Namespace for the <oXygen/> custom functions and variables :)
5 declare namespace oxy="http://www.oxygenxml.com/xquery/functions";
6
7 (: The URI of the document that is to be queried :)
8 declare variable $oxy:document-to-query as xs:string := "books.xml";
9
10 (: Queries an XML document for authors
11 declare function oxy:list-authors($d
12
13 let $library := doc($document)
14 let $seq := $library//author
15 let $distinct := distinct-values($seq)
16
17 for $a in $distinct
18 return
19 <author>
20 <name> {$a} </name>
21 {
22 for $book in $library/library/publications
23 where (compare($book/author, $a)
24 return $book/title
25 }
26 </author>
27 };
28
29 <author_list>
30 {oxy:list-authors($oxy:document-to-query)}
31 </author_list>
32

```

A context menu is open over the word 'adjust-date-to-timezone' at line 15, listing several options:

- fn
- oxy
- saxon
- f₀ QName(\$paramURI,\$paramQName)
- f₀ abs(\$arg)
- f₀ adjust-date-to-timezone(\$arg)

The tooltip for 'adjust-date-to-timezone' provides the following information:

adjust-date-to-timezone(\$arg as xs:date?) as xs:date?
Adjusts an xs:date value to the value of the implicit timezone in the dynamic context.
If \$arg is the empty sequence, then the result is the empty sequence.

<http://www.w3.org/TR/xquery-operators/>

Figure 282: XPath/XQuery Builder View

While you edit an XPath or XQuery expression, Oxygen XML Author assists you with the following features:

- **Content Completion Assistant** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the **Content Completion Assistant** also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- **Syntax Highlight** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, *open the Preferences dialog box (Options > Preferences)* and go to *Editor > Syntax Highlight*.

- Automatic validation of the expression as you type.

Note: When you type invalid syntax a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of the top editable part of the view.

Related information

[XPath Expression Results View](#) on page 888

XSLT/XQuery Input View

[Edit on GitHub](#)

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the **XSLT/XQuery Input** view. If the view is not displayed, it can be opened from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

XSLT

If you click a node in the **XSLT/XQuery Input** view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting `xsl:template`, `xsl:for-each`, or other XSLT elements that have the `match/select/test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

XSLT Example:

For the following XML document:

```
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
            <family>Worker</family>
            <given>One</given>
        </name>
        <email>one@oxygenxml.com</email>
        <link manager="Big.Boss"/>
    </person>
</personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="2.0">
    <xsl:template match="personnel">
        <xsl:for-each select="*>
            </xsl:for-each>
    </xsl:template>
```

```
</xsl:stylesheet>
```

if you drag the given element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

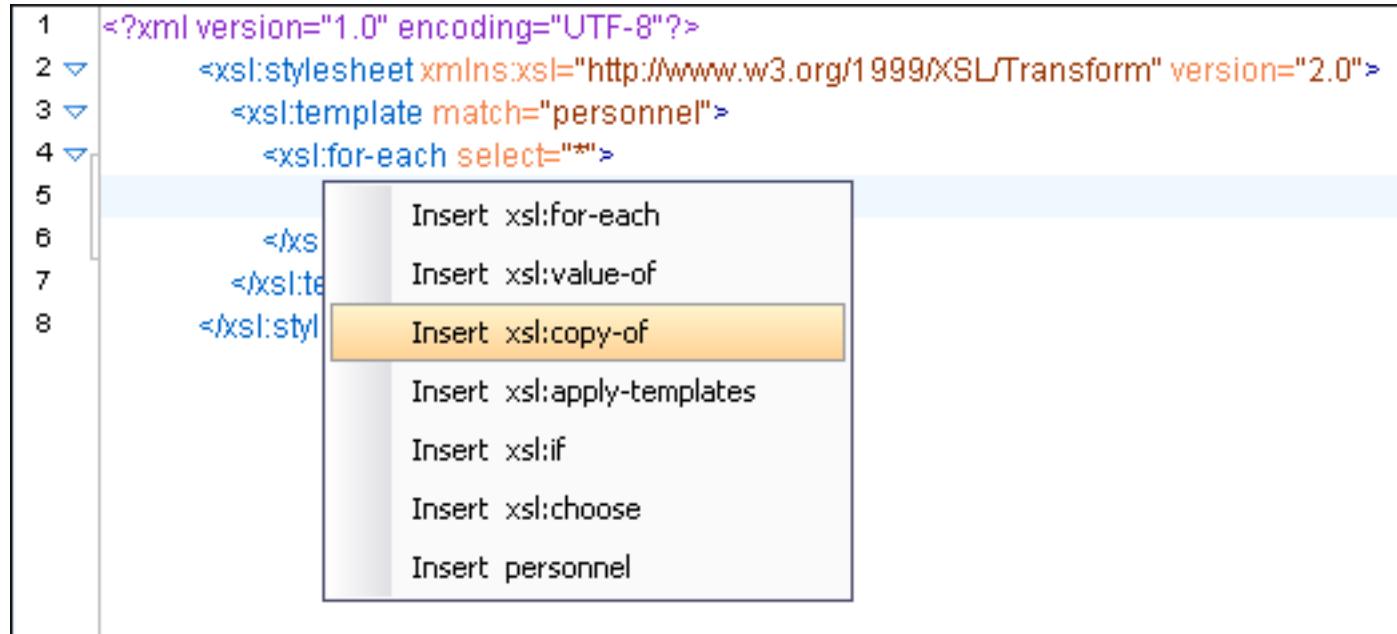

Figure 283: XSLT Input Drag and Drop Pop-up Menu

If you select **Insert `xsl:copy-of`** (for example), the resulting document will look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" v
    <xsl:template match="personnel">
        <xsl:for-each select="*">
            <xsl:copy-of select="name/given"/>

```

Figure 284: XSLT Input Drag and Drop Result

XQuery

You can also use the **XSLT/XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

XQuery Example:

For the following XML documents:

```
<movies>
<movie id="1">
<title>The Green Mile</title>
<year>1999</year>
</movie>
```

```

<movie id="2">
<title>Taxi Driver</title>
<year>1976</year>
</movie>
</movies>

<reviews>
<review id="100" movie-id="1">
<rating>5</rating>
<comment>It is made after a great Stephen King book.</comment>
</comment>
<author>Paul</author>
</review>
<review id="101" movie-id="1">
<rating>3</rating>
<comment>Tom Hanks does a really nice acting.</comment>
<author>Beatrice</author>
</review>
<review id="104" movie-id="2">
<rating>4</rating>
<comment>Robert De Niro is my favorite actor.</comment>
<author>Maria</author>
</review>
</reviews>

```

and the following XQuery:

```

let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{
}

</maxRating>
</movie>

```

If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

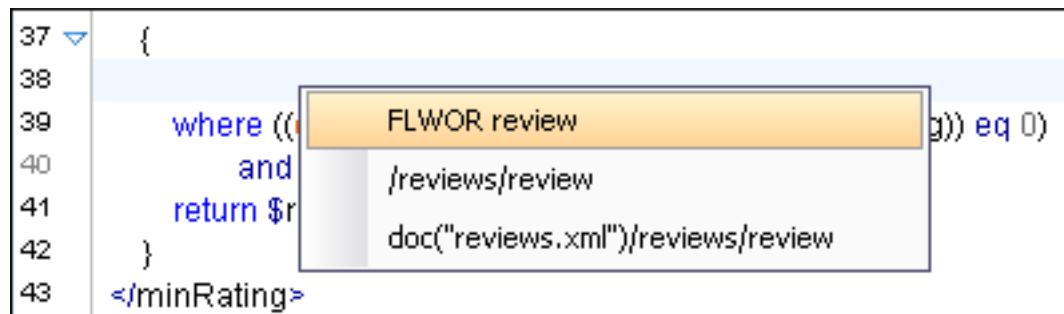

Figure 285: XQuery Input Drag and Drop Pop-up Menu

Select **FLWOR review**, the resulting document will look like this:

```

37      {
38          for $review in doc("reviews.xml")/reviews/review
39          return
40          where ((compare($rev/rating/text(), string($minRating
41                  and ($rev/@movie-id = $movie/@id))
42          return $rev/author
43      }

```

Figure 286: XQuery Input Drag and Drop Result

Transforming XML Documents Using XQuery

[Edit on GitHub](#)

XQuery is similar to XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you *define the transformation scenario*. The result can be saved and opened in the associated application. You can even run a *FO processor* on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are *exported* together with the XSLT scenarios and can be managed in *the Configure Transformation Scenario dialog box*, or in *the Scenarios view*. The transformation can be performed on the XML document specified in the **XML URL** field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in *the Parameters dialog box*. Parameters that are in a namespace must be specified using the qualified name (for example, a `param` parameter in the `http://www.oxygenxml.com/ns` namespace must be set with the name `{http://www.oxygenxml.com/ns}param`).

The transformation uses one of the Saxon 9.6.0.7 HE, Saxon 9.6.0.7 PE, Saxon 9.6.0.7 EE processors, a database connection or any XQuery processor that provides an XQJ API implementation.

The Saxon 9.6.0.7 EE processor also supports XQuery 3.0 transformations.

XQuery XQJ Transformers

[Edit on GitHub](#)

This section describes the necessary procedures before running an XQJ transformation.

How to Configure an XQJ Data Source

[Edit on GitHub](#)

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is *Zorba*.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on OS X. Restart Oxygen XML Author after configuring the environment variables.
2. *Open the Preferences dialog box (Options > Preferences)* and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java(XQJ)** in the **Type** combo box.
6. Press the **Add** button to add XQJ API-specific files.

You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.

Oxygen XML Author detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.

How to Configure an XQJ Connection

[Edit on GitHub](#)

The steps for configuring an XQJ connection are the following:

1. *Open the Preferences dialog box (Options > Preferences)* and go to **Data Sources**.
 2. Click the **New** button in the **Connections** panel.
 3. Enter a unique name for this connection.
 4. Select one of the previously configured *XQJ data sources* in the **Data Source** combo box.
 5. Fill-in the connection details.
- The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button.

Display XQuery Result in Sequence View

[Edit on GitHub](#)

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the *Present as a sequence* option in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

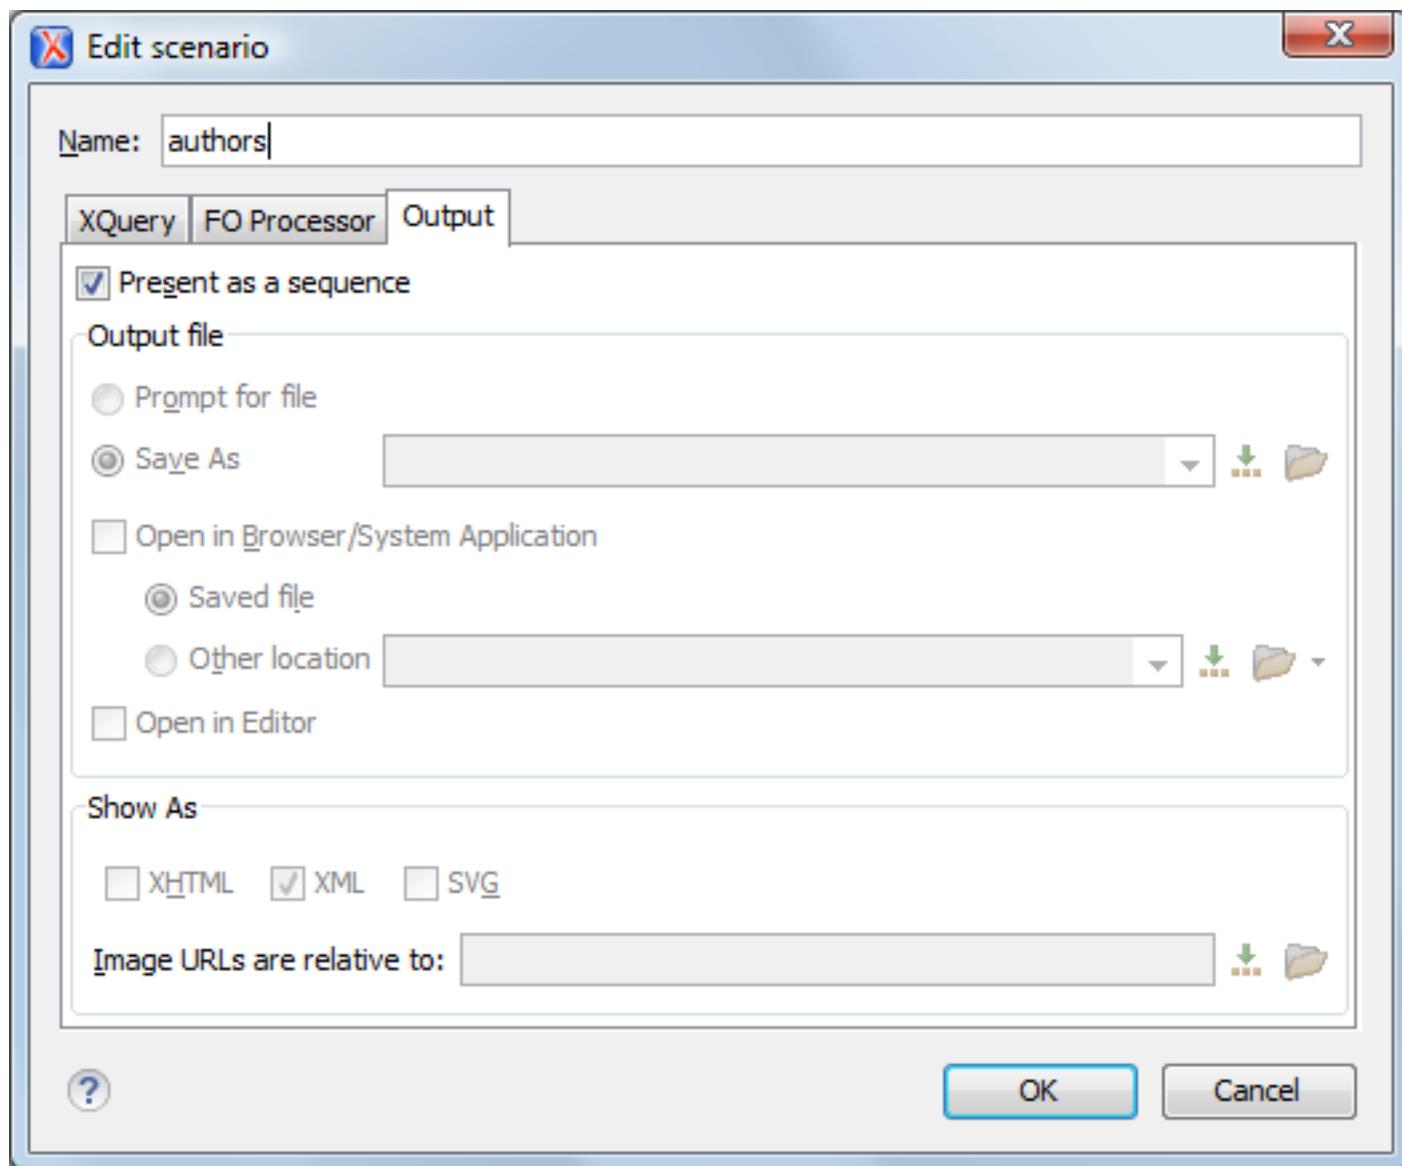

Figure 287: XQuery transformation result displayed in Sequence view

A chunk of the XQuery transformation result is displayed in the **Sequence** view.

The screenshot shows the Sequence view in Oxygen XML Author. On the left, a tree view lists nodes from 42980 to 42995, with node 42991 selected. On the right, a list view shows the corresponding XQuery code for each node, starting from 42989 to 43000. The list view has a scrollbar. At the bottom, there is a toolbar with a gear icon and a 'Sequence - more-results-label.xquery' tab.

```

<element>42988</element>
<element>42989</element>
<element>42990</element>
<element>42991</element>
<element>42992</element>
<element>42993</element>
<element>42994</element>
<element>42995</element>
<element>42996</element>
<element>42997</element>
<element>42998</element>
<element>42999</element>
<element>43000</element>

```

Figure 288: XQuery transformation result displayed in Sequence view

Advanced Saxon HE/PE/EE XQuery Transformation Options

[Edit on GitHub](#)

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespace* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Optimization level (" -opt ")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model (" -tree:linked ")

This option activates the linked tree model.

Enable XQuery 3.0 support (" -qversion:(1.0|3.0) ")

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Use a configuration file (" -config ")

Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

Allow calls on extension functions (" -ext ")

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file (" -val ")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("`-outval`")

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("`--generateByteCode:(on|off)`")

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

Enable XQuery update ("`-update:(on|off)`")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("`-backup:(on|off)`)

If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

Updating XML Documents using XQuery

[Edit on GitHub](#)

Using the bundled Saxon 9.6.0.7 EE XQuery processor Oxygen XML Author offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the [XQuery Update 1.0](#) standard.

Choose Saxon 9.6.0.7 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Author will notify you if the update was successful.

Using XQuery Update to modify a tag name in an XML file

```
rename node doc( "books.xml" )//publisher[1]//book[1] as  
"firstBook"
```

Chapter

10

Working with Archives

Topics:

- [*Browsing and Modifying Archives*](#)
- [*Working with EPUB*](#)
- [*Editing Files From Archives*](#)

Describes the archive support available in Oxygen XML Author.

Oxygen XML Author offers the means to manipulate files directly from ZIP type archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files

This allows you to modify, transform, or validate files directly from OOXML or ODF packages. The structure and content of an EPUB book, OOXML file, or ODF file *can be opened, edited, and saved*, like any other ZIP archive.

You can transform, validate, and perform many other operations on files directly from an archive. When selecting a URL for a specific operation (such as a transformation or validation), you can click the  **Browse for archived file** button to navigate and choose the file from a particular archive.

Browsing and Modifying Archives

[Edit on GitHub](#)

You can open an archive in the **Archive Browser** view by doing one of the following:

- Open an archive from the [Project view](#).
- Choose an archive in the Oxygen XML Author file chooser dialog box.
- Drag an archive from the file explorer and drop it in the **Archives Browser** view.

When displaying an archive, the **Archive Browser** view locks the archive file. It is then automatically unlocked when the **Archive Browser** view is closed.

Important: If a file is not recognized by Oxygen XML Author as a supported archive type, you can add it from the [Archive preferences page](#).

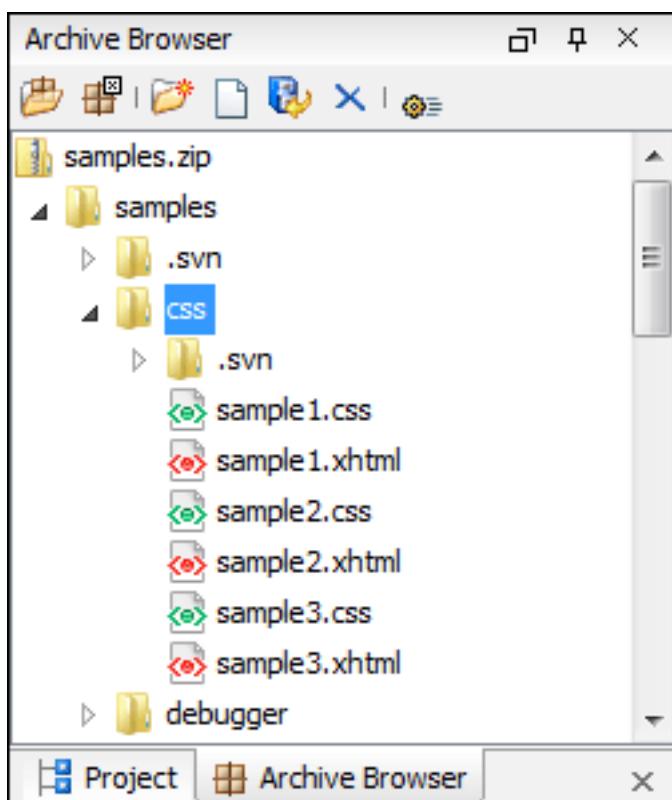

Figure 289: Browsing an Archive

Archive Browser Toolbar

The following actions are available on the **Archive Browser** toolbar:

Reopen

You can use this drop-down to reopen recently edited archives. Apart from the history of the recently edited archives, the drop-down also contains the **Clear history** and  **Open Archive** actions.

Open Archive menu

Provides access to the  **Open Archive** action that opens a new archive in the browser. If the extension is not known as an archive extension, you will be directed to the [Archive preferences page](#) to add a new extension.

The sub-menu keeps a list of recently open archive files and a **Clear history** action that allows you to delete the list.

The following additional operations are available from the **Archive Browser** contextual menu:

Extract

Add files

Rename

Cut

Copy

Paste

Delete

Preview

Copy location

Closes the browsed archive and unlocks the archive file.

Creates a folder as child of the selected folder in the browsed archive.

Creates a file as child of the selected folder in the browsed archive.

Adds existing files as children of the selected folder in the browsed archive.

Note: You can also add files in the archive by dragging them from the file browser or **Project view** and dropping them in the **Archive Browser** view.

Deletes the selected resource in the browsed archive.

Opens the *Archive preferences page*.

Opens a resource from the archive in the editor.

Extracts a resource from the archive in a specified folder.

Creates a folder as child of the selected folder in the browsed archive.

Creates a file as child of the selected folder in the browsed archive.

Adds existing files as children of the selected folder in the browsed archive.

Note: On OS X, the **Add file** action is also available and it allows you to add one file at a time.

Renames a resource in the archive.

Allows you to search for and replace specific pieces of text inside the archive.

Cut the selected archive resource.

Copy the selected archive resource.

Paste a file or folder into the archive.

Note: You can add files in the archive by copying the files from the **Project view** and paste them into the **Archive view**.

Remove a file or folder from archive.

Previews an image contained in the archive See the *Image Preview* section for more details.

Copies the URL location of the selected resource.

Refreshes the selected resource.

Properties

Views properties for the selected resource.

Working with EPUB

[Edit on GitHub](#)

EPUB is a free and open electronic book standard by the International Digital Publishing Forum (IDPF). It was designed for *reflowable content*, meaning that the text display can be optimized for the particular display device used by the reader of the EPUB-formatted book. Oxygen XML Author supports both EPUB 2.0 and EPUB 3.0.

EPUB files are opened in the **Archive Browser** view, exposing all their internal components:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

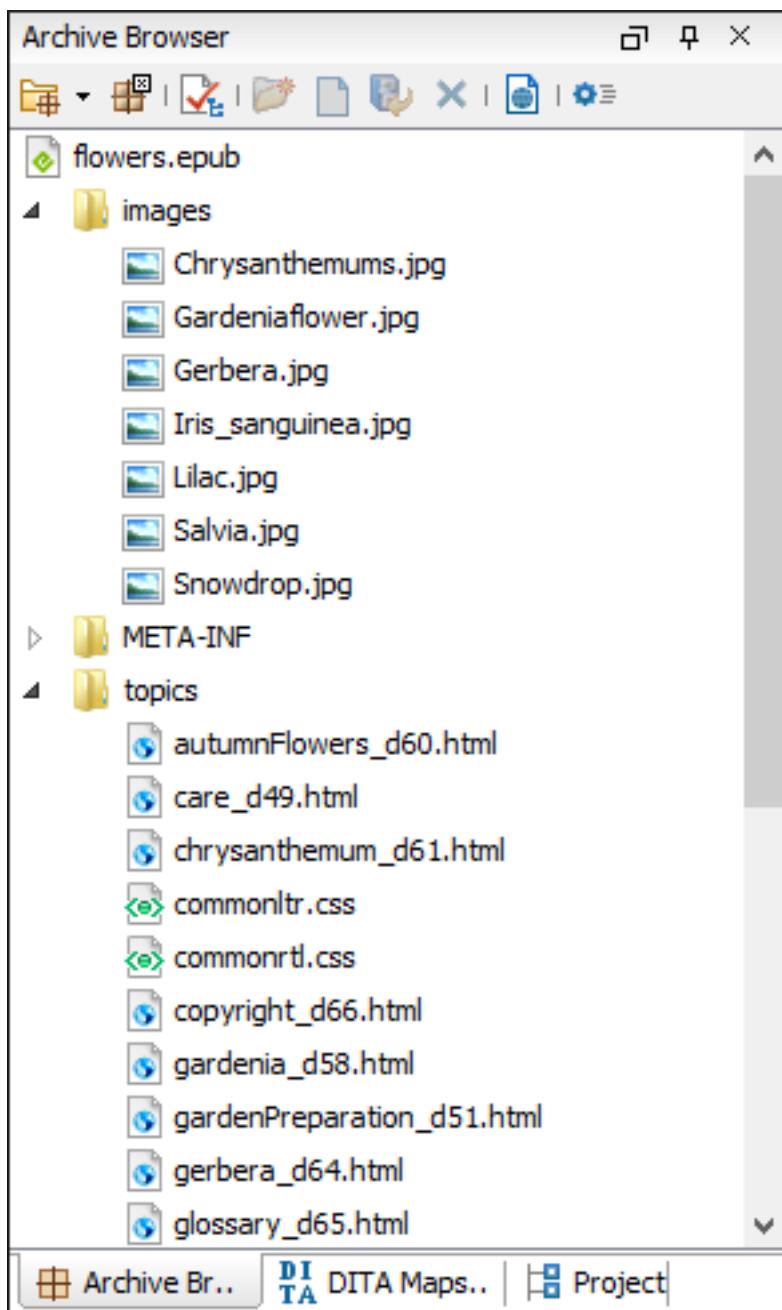

Figure 290: EPUB file displayed in the Archive Browser view

Here you can edit, delete and add files that compose the EPUB structure. To check that the EPUB file you are editing is valid, invoke the **Validate and Check for Completeness** action. Oxygen XML Author uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency. All errors found during validation are displayed in a separate tab in the **Errors** view.

Note: Invoke the **Open in System Application** action to see how the EPUB is rendered in your system default EPUB reader application.

Note: All changes made to the structure of an EPUB, or to the contents of the files inside an EPUB are immediately saved.

To watch our video demonstration about the EPUB support in Oxygen XML Author, go to <http://oxygenxml.com/demo/Epub.html>.

Related information

[The Archive Browser View](#) on page 904

Create an EPUB

[Edit on GitHub](#)

To begin writing an EPUB file from scratch, do the following:

1. Go to **File > New**, press **Ctrl + N (Command + N on OS X)** on your keyboard, or click  **New** on the main toolbar.
2. Choose **EPUB Book** template. Click **Create**. Choose the name and location of the file. Click **Save**. A skeleton EPUB file is saved on disk and open in the **Archive Browser** view.
3. Use the **Archive Browser** view specific actions to edit, add and remove resources from the archive.
4. Use the  **Validate and Check for Completeness** action to verify the integrity of the EPUB archive.

Publish to EPUB

[Edit on GitHub](#)

Oxygen XML Author includes built-in support for publishing DocBook and DITA XML documents directly to EPUB.

1. Open the **Configure Transformation Scenario(s)** dialog box and select a predefined transformation scenario. To publish from DITA, select the **DITA Map EPUB** transformation scenario. To publish from DocBook select the **DocBook EPUB** transformation scenario.
2. Click **Apply associated** to run the transformation scenario.

Related information

[Creating New Transformation Scenarios](#) on page 712

Editing Files From Archives

[Edit on GitHub](#)

You can open and edit files directly from an archive using the **Archive Browser** view. When saving the file back to archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the [Messages preferences page](#).

Note: All changes made to the structure of an archive, or to the contents of the files inside an archive are immediately saved.

Chapter

11

Databases and CMS Integration

Topics:

- *Working with Databases*
- *Content Management System (CMS) Integration*

This chapter provides information about the support for various databases and Content Management Systems.

Oxygen XML Author provides support for various databases and content management systems.

Working with Databases

[Edit on GitHub](#)

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Author offers the means for managing the interaction with some of the most commonly used databases (both *Relational* and *Native XML* databases). Through this interaction, Oxygen XML Author helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

Related information

[Integration with Microsoft SharePoint](#) on page 978

Data Source Explorer View

[Edit on GitHub](#)

The **Data Source Explorer** view displays your database connections. You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Author supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

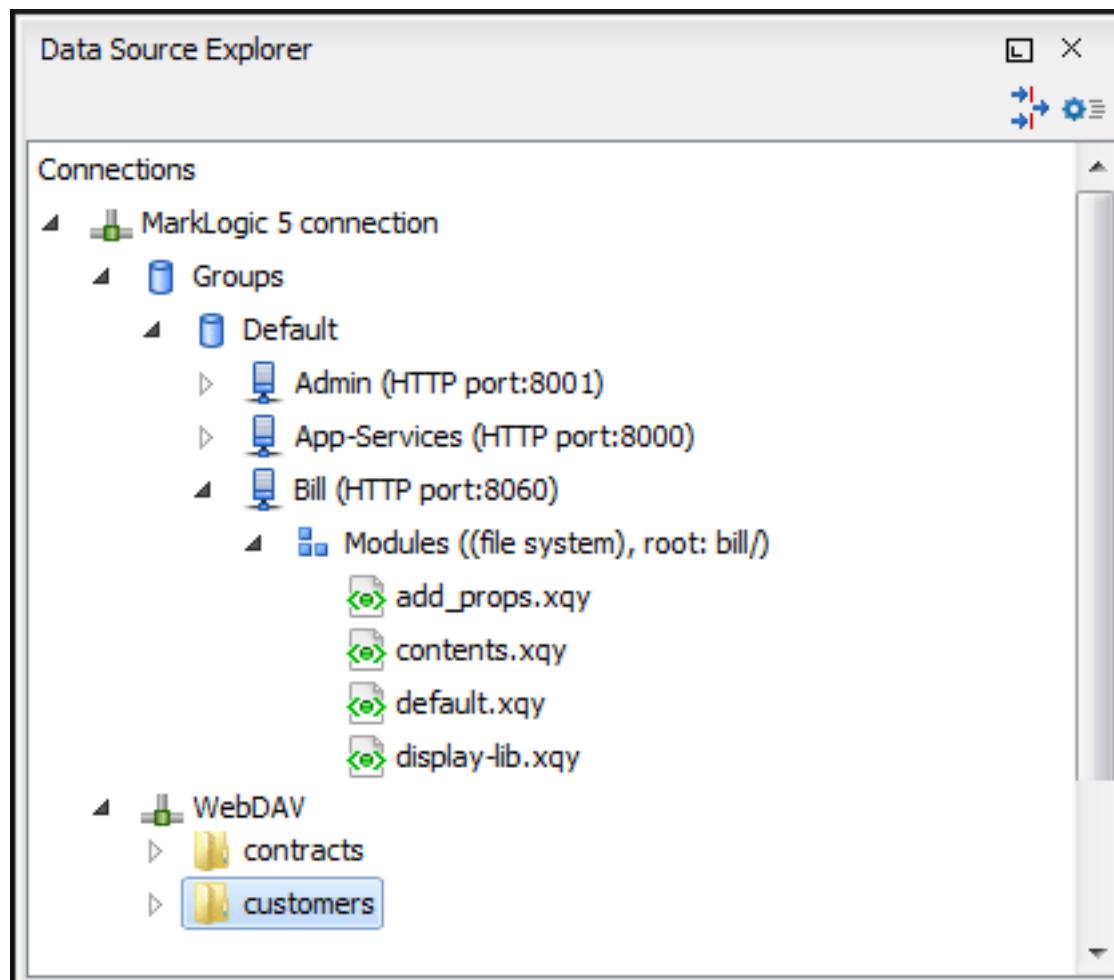

Figure 291: Data Source Explorer View

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project** view, a file browsing application, or another database.

Toolbar Actions

The following actions are available in the toolbar of this view:

Filters

Opens the *Data Sources / Table Filters preferences page*, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

Configure Database Sources

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node in which the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related information

[Data Sources Preferences](#) on page 183

[Edit on GitHub](#)

Table Explorer View

Relational databases tables in the **Data Source Explorer** view can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a **Table** node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Author attempts to update the database with the new cell content.

Table Explorer							
	ID [SMALLINT]	NAME [VARCHAR]	DEPT [SMALLINT]	JOB [CHAR]	YEARS [SMALLINT]	SALARY	
0	10	Sanders	20	Mgr	7	98357.	
1	20	Pernal	20	Sales	8	78171.	
2	30	Marenghi	38	Mgr	5	77506.	
3	40	O'Brien	38	Sales	6	78006.	
4	50	Hanes	15	Mgr	10	80659.	
5	60	Quigley	38	Sales	(null)	66808.	
6	70	Rothman	15	Sales	7	76502.	
7	80	James	20	Clerk	(null)	43504.	
8	90	Koonitz	42	Sales	6	38001.	
9	100	Plotz	42	Mgr	7	78352.	
...							

Figure 292: Table Explorer View

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure)
- Every column header contains the field name and its data type
- The primary key columns are marked with this symbol: 
- Multiple tables are presented in a tabbed manner

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the [Limit the number of cells option in the Data Sources Preferences page](#)). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, the cell is marked by a red square and remains in an editing state until a correct value is inserted. For example, in the following figure `propID` contains `LONG` values. If a character or string is inserted, the cell will look like this:

Table Explorer

	propID [LONG] 	setting [VARCHAR]	value [VARCHAR]
0	8	imagePath	/home/bogdan/projects/c...
1	abc	maxBadPass	3
2	3	pageRefresh	5
3	4	lastUpdate	June 7th, 2002
4	5	adminEmail	bogdan@oxygencxml.com
5	7	moviePath	/home/bogdan/projects/c...
6	6	timeoutReceivingData	300
7	13	firmwareUploadPort	3002
8	11	internalFirmwareUploadHost	10.0.0.16
9	9	uploadPath	/home/bogdan/projects/c...
10	10	imageStreamPath	/home/bogdan/projects/c...
...

testcase user settings

Figure 293: Cell Containing an Invalid Value

- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

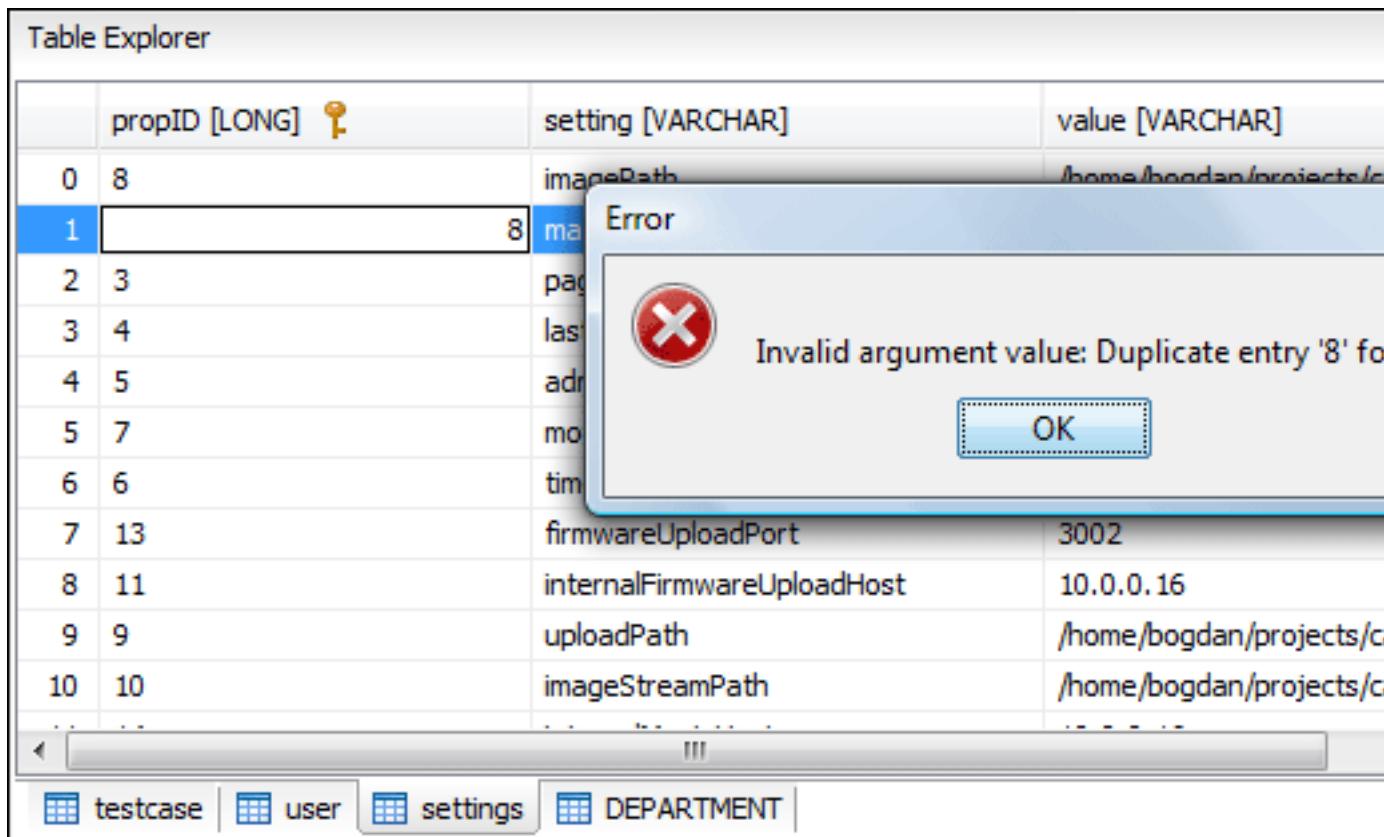

Figure 294: Duplicate Entry for Primary Key

Table Explorer Contextual Menu Actions

Common editing actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

Set NULL

Sets the content of the cell to *null*. This action is disabled for columns that cannot have a value of *null*.

Inserts an empty row in the table.

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commits the selected row.

Deletes the selected row.

Copies the content of the cell.

Pastes copied content into the selected cell.

Table Explorer Toolbar Actions

The toolbar of the **Table Explorer** view also includes the following actions:

 Export to XML	Opens the Export Criteria dialog box .
 Refresh	Performs a refresh for the sub-tree of the selected node.
 Insert row	Inserts an empty row in the table.
 Duplicate row	Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.
 Commit row	Commits the selected row.
 Delete row	Deletes the selected row.

[Edit on GitHub](#)

Database Connection Support

Oxygen XML Author offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the [Data Sources preferences page](#) and once configured, the database connections can be viewed and managed in the [Data Source Explorer view](#). Oxygen XML Author also includes a [Database perspective](#) that helps you to manage databases.

The database support in Oxygen XML Author offers a variety of capabilities, including:

- Browsing the structure of databases in the [Data Source Explorer view](#).
- Viewing relational tables in the [Table Explorer view](#).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Author offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Author also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

To watch our video demonstration about the integration between the relational databases and Oxygen XML Author, go to http://www.oxygenxml.com/demo/Author_Database_Integration.html.

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Author offers support for the most commonly used native XML databases, including:

- Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDB (X-Hive/DB) 10
- Oracle XML DB
- Base X

To watch our video demonstration about the integration between the native XML databases and Oxygen XML Author, go to http://www.oxygenxml.com/demo/Author_Database_XML_Native.html.

IBM DB2 Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for IBM DB2 database connections. Oxygen XML Author allows you to browse the structure of an IBM DB2 database in the [Data Source Explorer view](#), open tables in the [Table Explorer view](#), and perform various operations on the resources in the repository.

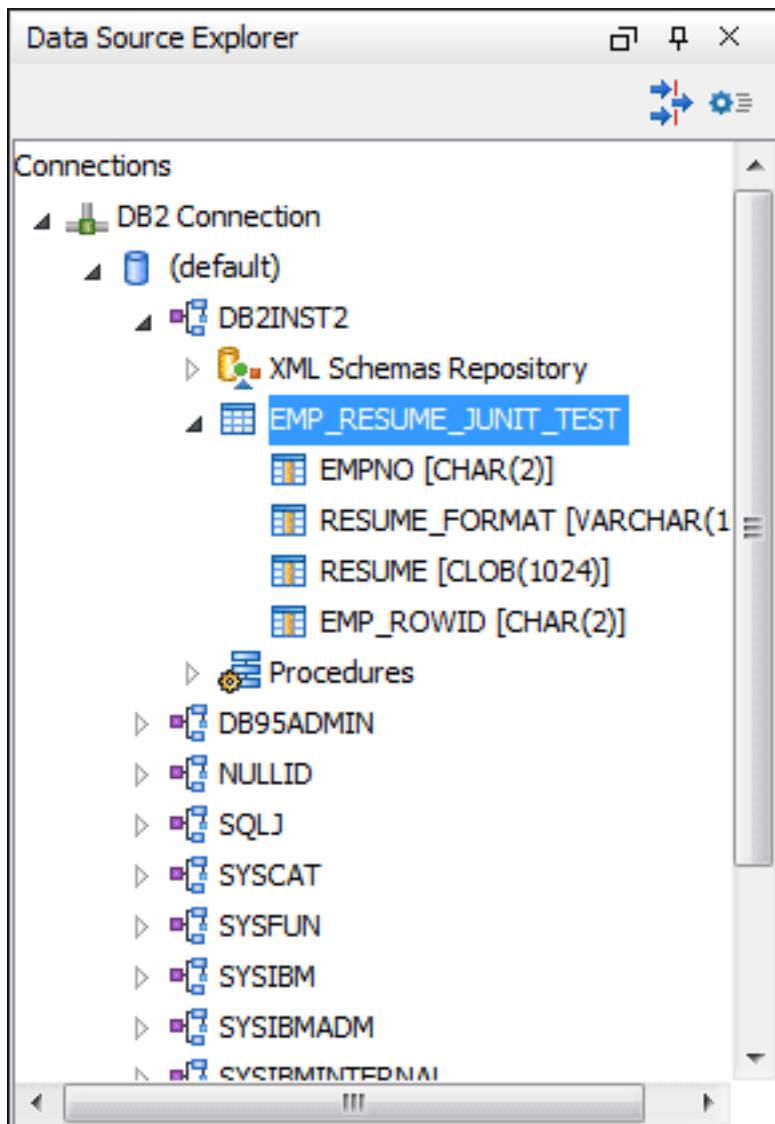

Figure 295: IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection

[Edit on GitHub](#)

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Author for [configuring a DB2 data source](#).
2. [Configure IBM DB2 Data Source drivers](#).
3. [Configure an IBM DB2 Server Connection](#).
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure IBM DB2 Data Source Drivers

[Edit on GitHub](#)

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
4. Click the  New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

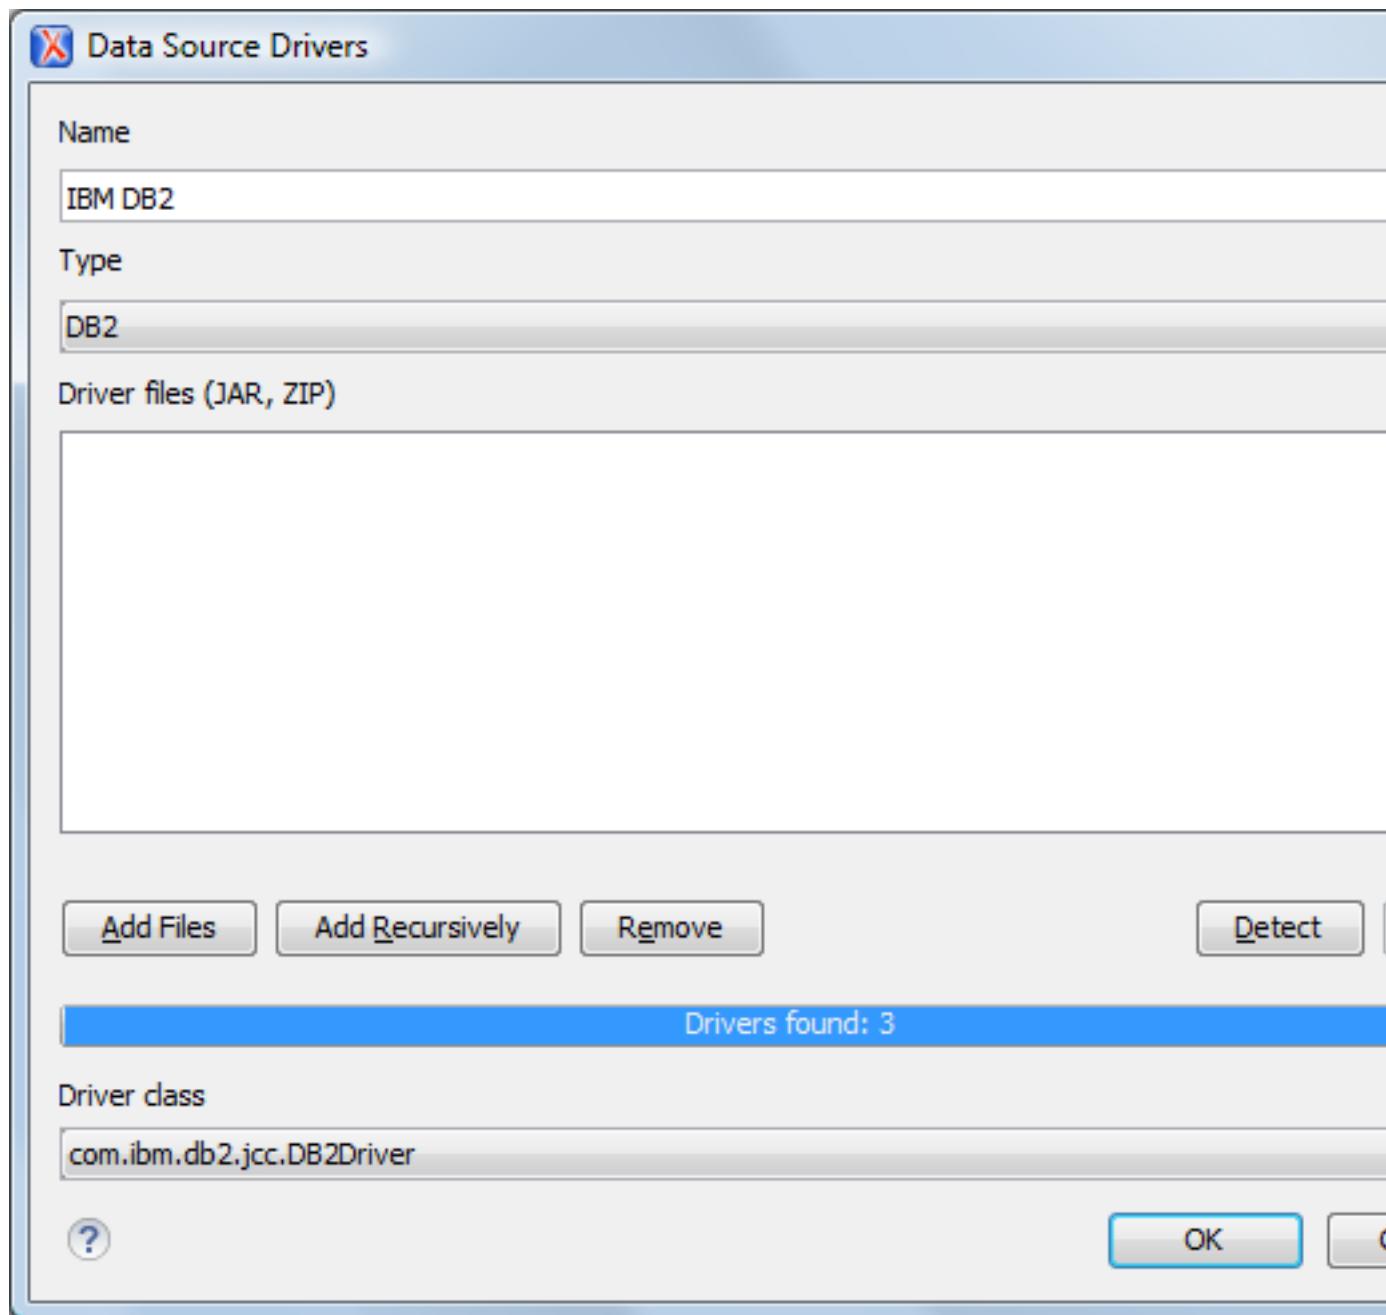

Figure 296: Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select **DB2** in the driver **Type** drop-down menu.

7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

The IBM DB2 driver files are:

- db2jcc.jar
- db2jcc_license_cisuz.jar
- db2jcc_license_cu.jar

8. Select the most appropriate **Driver class**.

9. Click the **OK** button to finish the data source configuration.

10. Continue on to [configure your IBM DB2 connection](#).

To watch our video demonstration about running XQuery against an IBM DB2 Pure XML database, go to <http://www.oxygenxml.com/demo/DB2.html>.

How to Configure an IBM DB2 Connection

[Edit on GitHub](#)

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the  **New** button.

The dialog box for configuring a database connection is displayed.

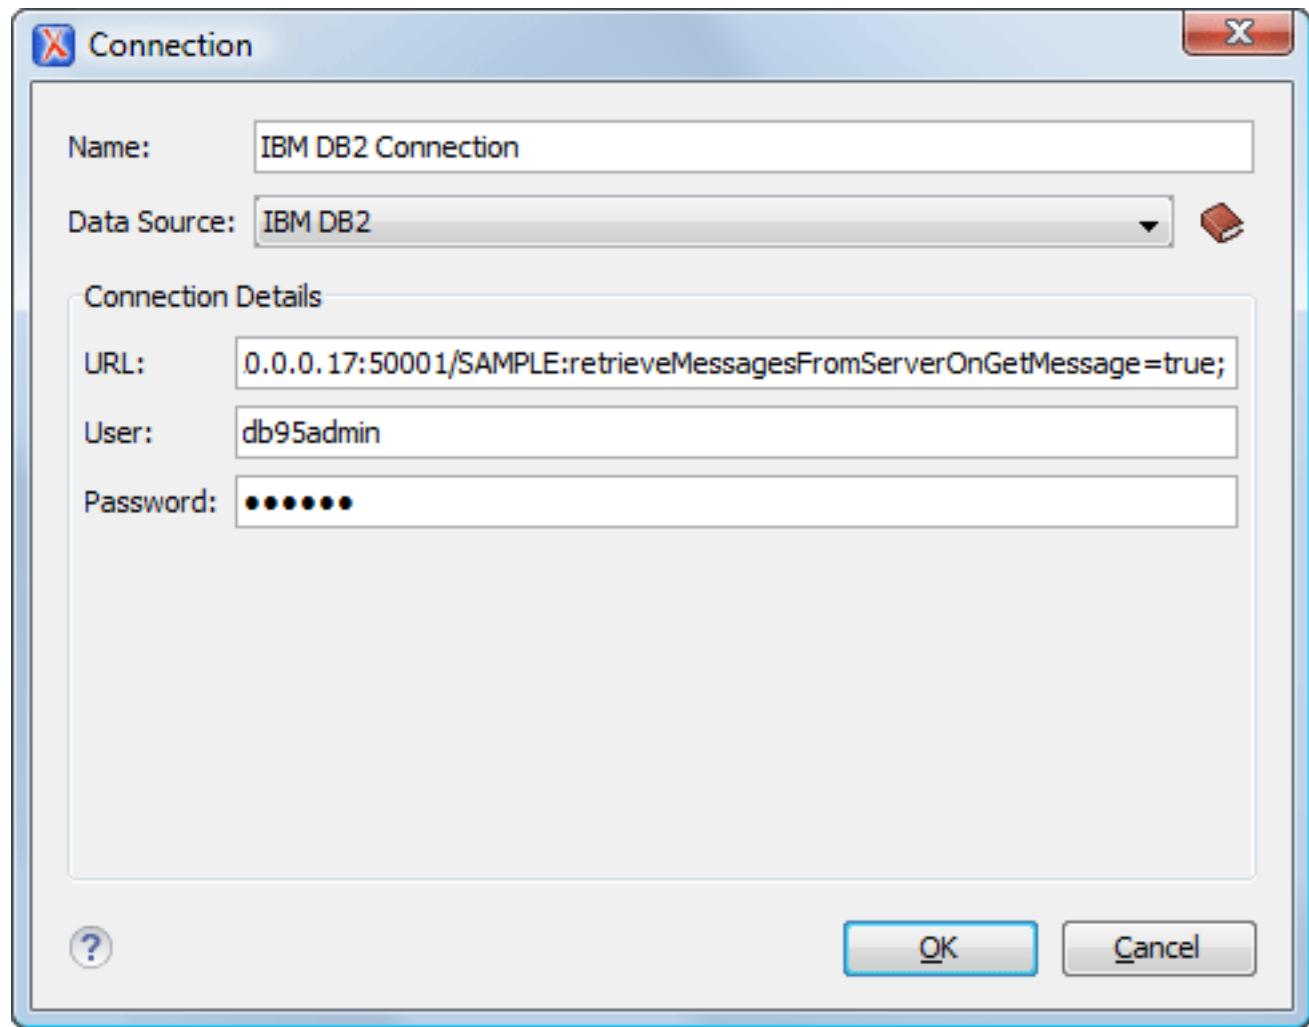

Figure 297: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select an **IBM DB2** data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Enter the URL to the installed IBM DB2 engine.
 - b) Enter the user name to access the IBM DB2 engine.
 - c) Enter the password to access the IBM DB2 engine.
6. Click the **OK** button to finish the configuration of the database connection.

To watch our video demonstration about running XQuery against an IBM DB2 Pure XML database, go to <http://www.oxygenxml.com/demo/DB2.html>.

IBM DB2 Contextual Menu Actions

[Edit on GitHub](#)

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Disconnect (available on Connection nodes)

Configure Database Sources (available on Connection nodes)

Edit (available on Table nodes)

Export to XML (available on Table nodes)

Performs a refresh on the selected node.

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Opens the selected table in the **Table Explorer** view.

Opens the **Export Criteria** dialog box .

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the various nodes in IBM DB2 connections include the following additional contextual menu actions:

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Unregister

Removes the selected schema from the XML Schema Repository.

Opens the selected schema in Oxygen XML Author.

Microsoft SQL Server Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for Microsoft SQL Server database connections. Oxygen XML Author allows you to browse the structure of a SQL Server database in the *Data Source Explorer view*, open tables in the *Table Explorer view*, and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

Configure Microsoft SQL Server database connection

[Edit on GitHub](#)

To configure the support for a Microsoft SQL Server database, follow this procedure:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014 go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
2. *Configure MS SQL Server Data Source drivers.*
3. *Configure a MS SQL Server Connection.*

4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure Microsoft SQL Server Data Source Drivers

[Edit on GitHub](#)

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older, go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014, go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
2. *Open the Preferences dialog box (**Options > Preferences**) and go to **Data Sources**.*
3. Click the  New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

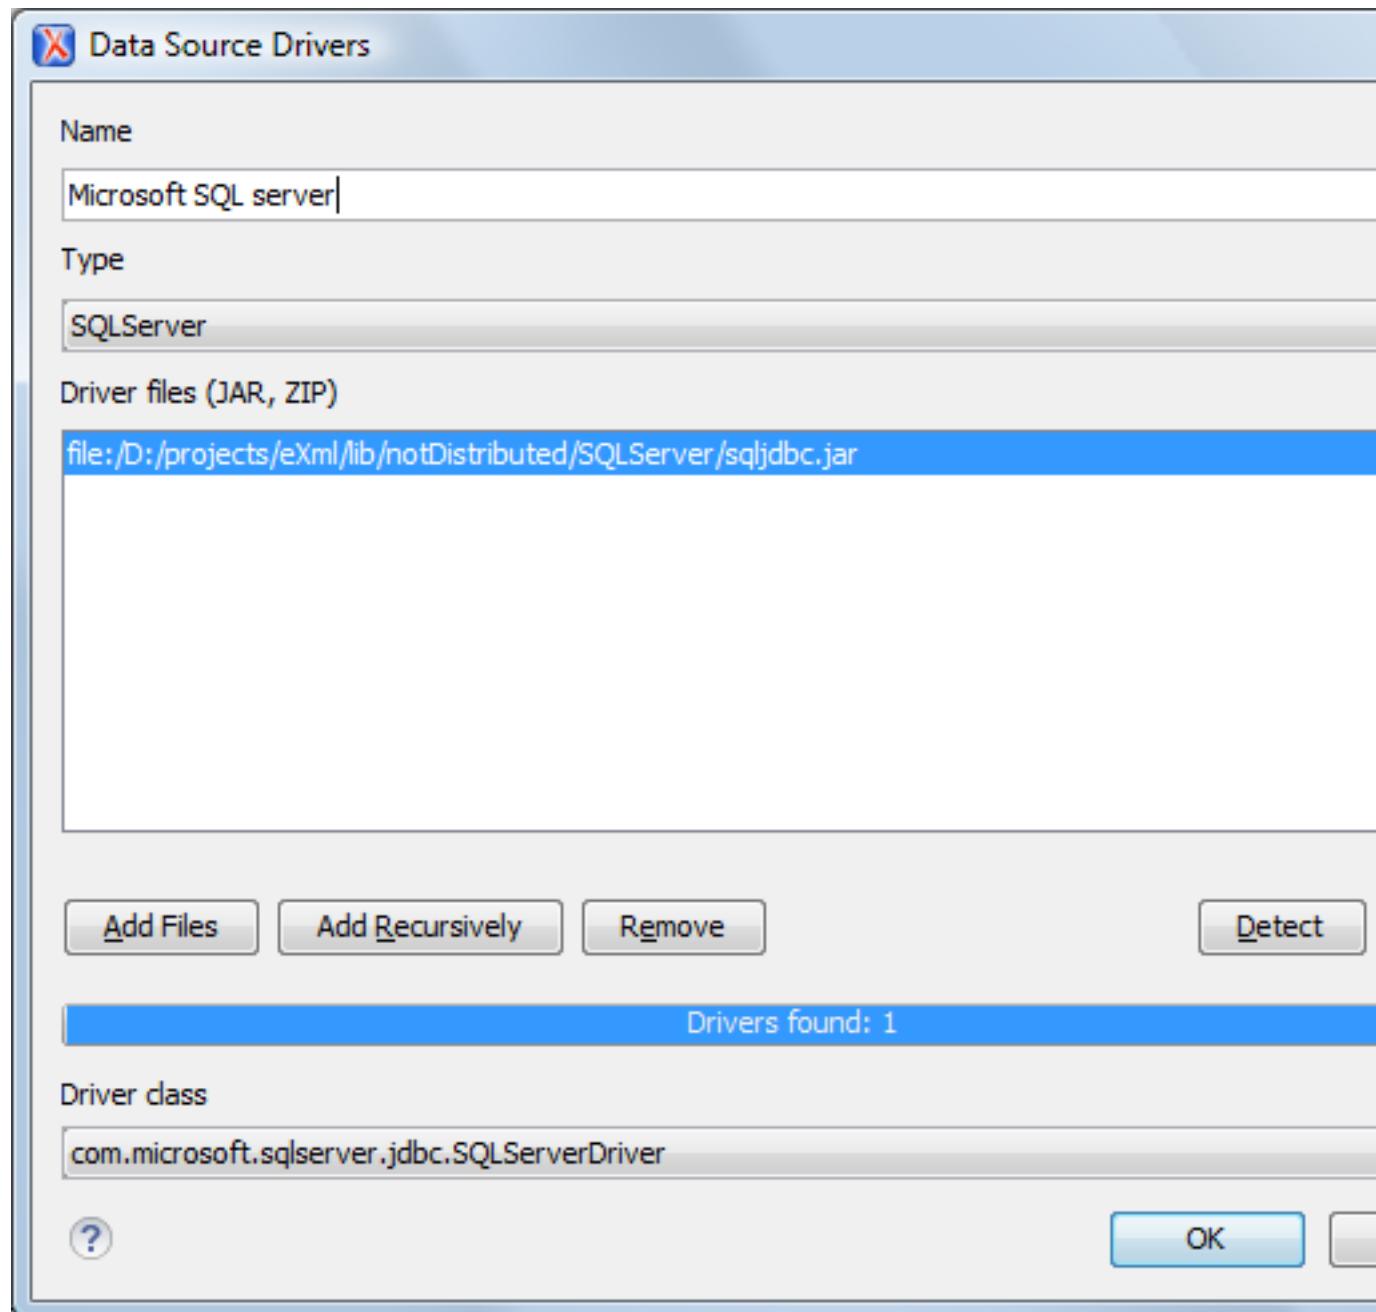

Figure 298: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *SQLServer* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded.
The SQL Server driver file is called `sqljdbc.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Microsoft SQL Server connection](#).

How to Configure a Microsoft SQL Server Connection

[Edit on GitHub](#)

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

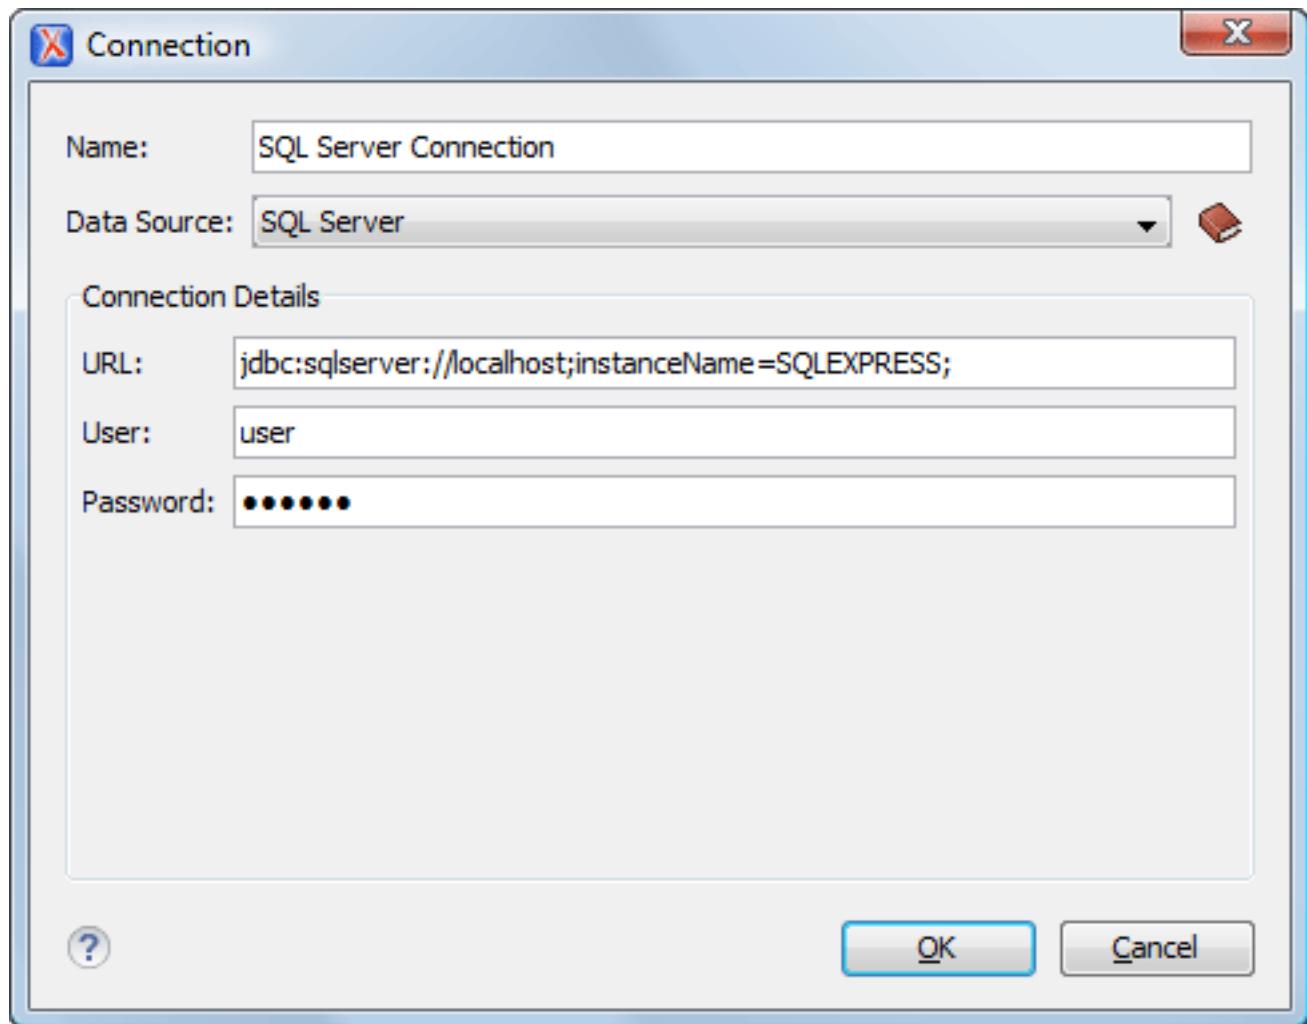

Figure 299: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *SQL Server* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Enter the URL of the SQL Server server.

If you want to connect to the server using Windows integrated authentication, you must add `;integratedSecurity=true` to the end of the URL. The URL will look like this:

```
jdbc:sqlserver://  
localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
```

Note: For integrated authentication, leave the **User** and **Password** fields empty.

- b) Enter the user name for the connection to the SQL Server.
 - c) Enter the password for the connection to the SQL Server.
6. Click the **OK** button to finish the configuration of the database connection.

Microsoft SQL Server Contextual Menu Actions

[Edit on GitHub](#)

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Disconnect (available on Connection nodes)

Configure Database Sources (available on Connection nodes)

Edit (available on Table nodes)

Export to XML (available on Table nodes)

Performs a refresh on the selected node.

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Opens the selected table in the **Table Explorer** view.

Opens the **Export Criteria** dialog box .

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Author.

Oracle Database Connections

[Edit on GitHub](#)

The Oracle database is a common relational type of database system. Oxygen XML Author comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Author allows you to browse Oracle repositories in the [Data Source Explorer view](#), open tables in the [Table Explorer view](#), and perform various operations on the resources in the repository.

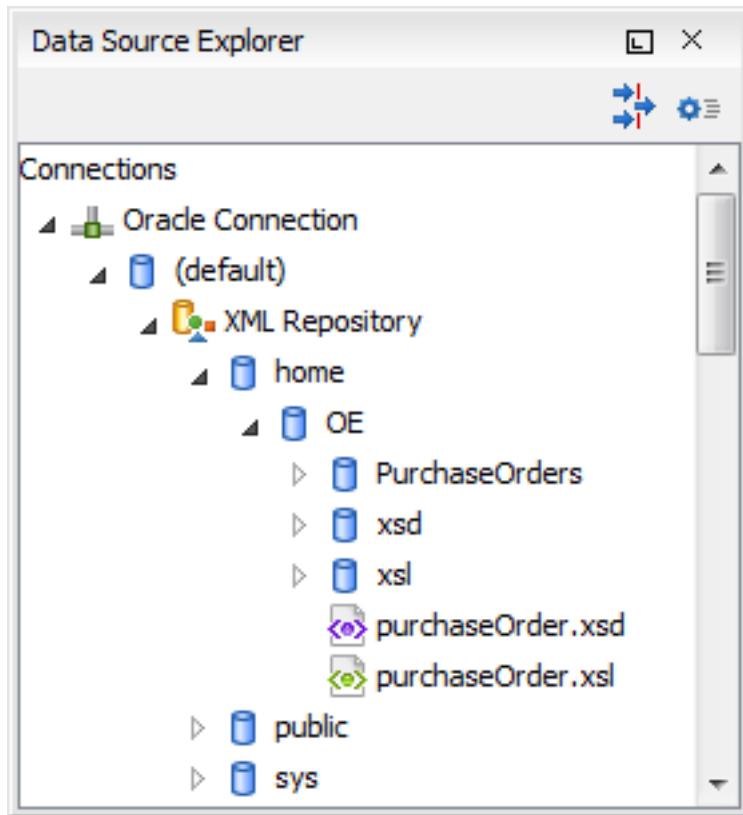

Figure 300: Oracle Database Connection

The Oracle driver file is called `ojdbc5.jar`.

7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Oracle connection](#).

How to Configure an Oracle 11g Connection

[Edit on GitHub](#)

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

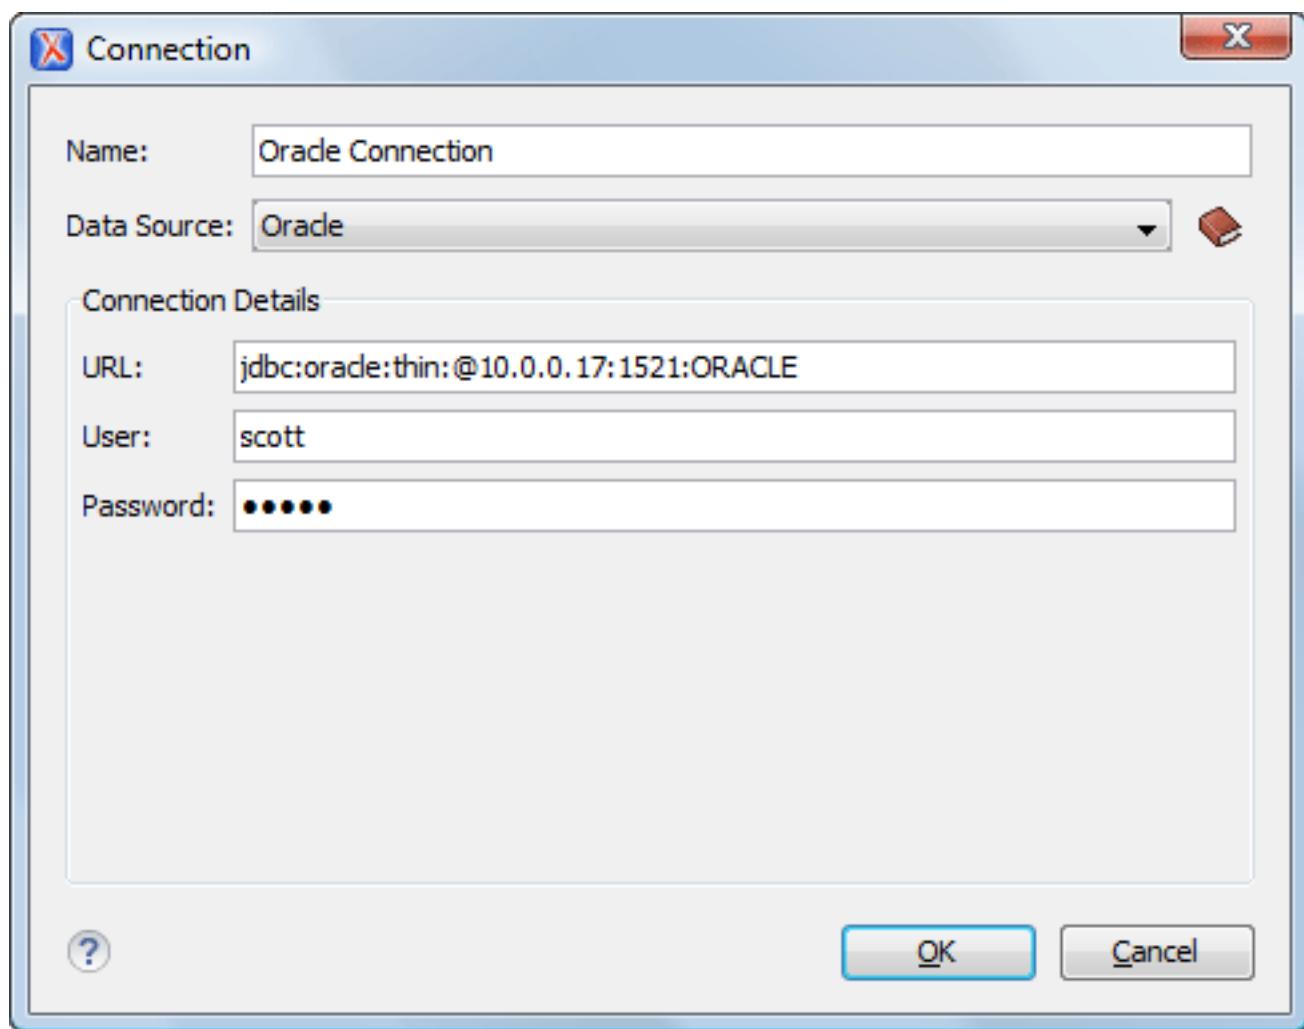

Figure 302: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Enter the URL of the Oracle server.
 - b) Enter the user name for the connection to the Oracle server.
 - c) Enter the password for the connection to the Oracle server.

- Click the **OK** button to finish the configuration of the database connection.

Oracle Database Contextual Menu Actions

[Edit on GitHub](#)

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Disconnect (available on Connection nodes)

Configure Database Sources (available on Connection nodes)

Edit (available on Table nodes)

Export to XML (available on Table nodes)

Performs a refresh on the selected node.

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Opens the selected table in the **Table Explorer** view.

Opens the **Export Criteria** dialog box .

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the various nodes in Oracle database connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

Note: Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered

schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Container Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

 Properties	Shows various properties of the current container.
 Resource Level Nodes	
 Open	Opens the selected resource in the editor.
 Rename	Renames the current resource
 Move	Moves the current resource to a new container (also available through drag and drop).
 Delete	Deletes the current container.
 Copy location	Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.
 Properties	Shows various properties of the current container.
 Compare	Compares two selected resources using the Compare Files tool .

PostgreSQL Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for PostgreSQL database connections. Oxygen XML Author allows you to browse the structure of a PostgreSQL database in the [Data Source Explorer view](#), open tables in the [Table Explorer view](#), and perform various operations on the resources in the repository.

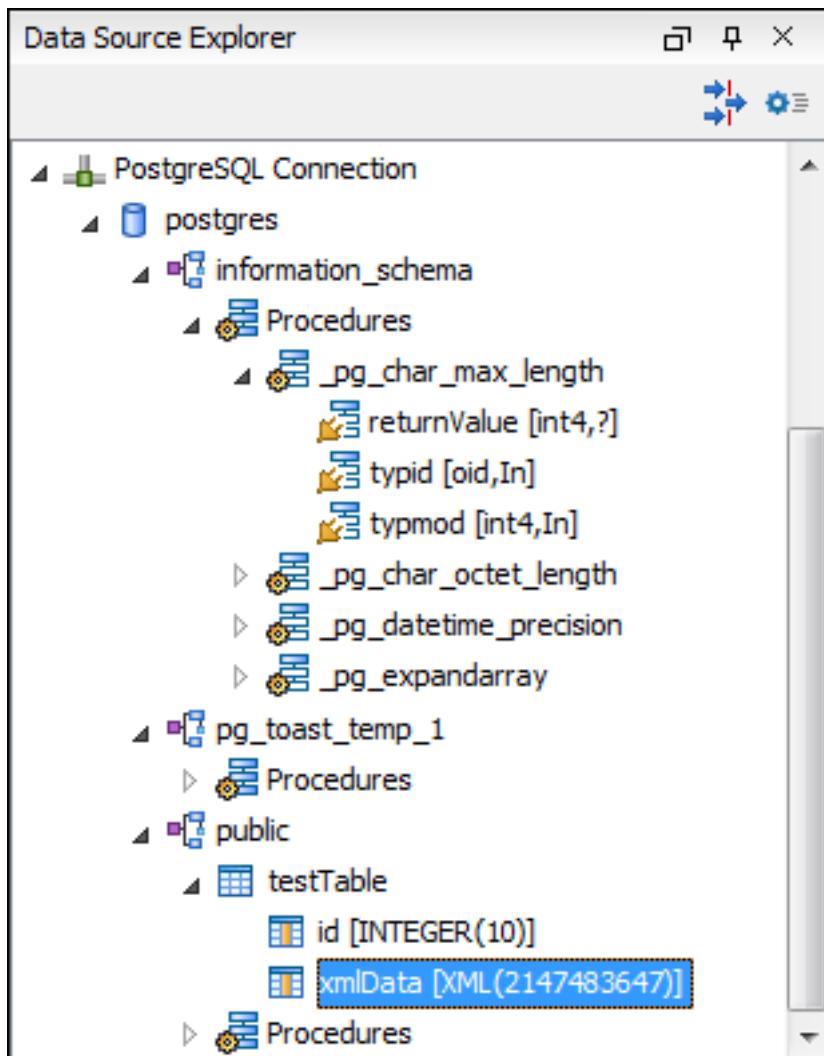

Figure 303: PostgreSQL Database Connection

Configuring a PostgreSQL Database Connection

[Edit on GitHub](#)

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
2. [Configure PostgreSQL Data Source drivers](#).
3. [Configure a PostgreSQL Connection](#).
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure PostgreSQL 8.3 Data Source Drivers

[Edit on GitHub](#)

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
3. Click the New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

4. Enter a unique name for the data source.
5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.
The PostgreSQL driver file is called `postgresql-8.3-603.jdbc3.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your PostgreSQL connection](#).

How to Configure a PostgreSQL 8.3 Connection

[Edit on GitHub](#)

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

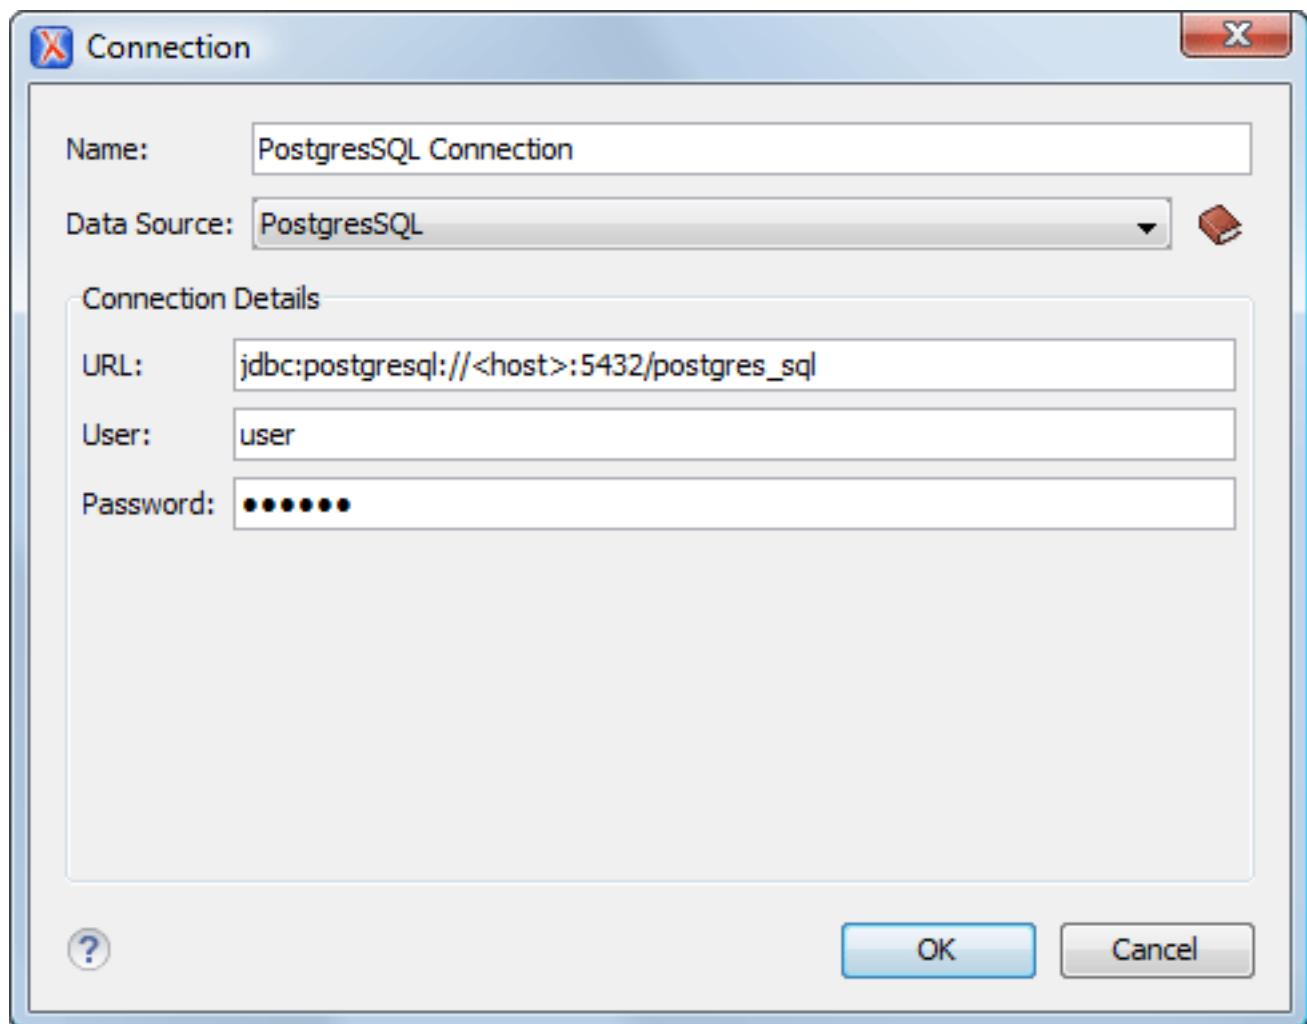

Figure 304: Connection Configuration Dialog Box

3. Enter a unique name for the connection.

4. Select the *PostgreSQL 8.3* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Enter the URL of the PostgreSQL 8.3 server.
 - b) Enter the user name for the connection to the PostgreSQL 8.3 server.
 - c) Enter the password for the connection to the PostgreSQL 8.3 server.
6. Click the **OK** button to finish the configuration of the database connection.

PostgreSQL Contextual Menu Actions

[Edit on GitHub](#)

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Disconnect (available on Connection nodes)

Configure Database Sources (available on Connection nodes)

Edit (available on Table nodes)

Export to XML (available on Table nodes)

Performs a refresh on the selected node.

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Opens the selected table in the **Table Explorer** view.

Opens the **Export Criteria** dialog box .

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

Compare

Compares two selected resources using the *Compare Files tool*.

Berkeley DB XML Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for Berkeley DB XML database connections. Oxygen XML Author allows you to browse the structure of a Berkeley DB XML database in the *Data Source Explorer view* and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: <http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html>.

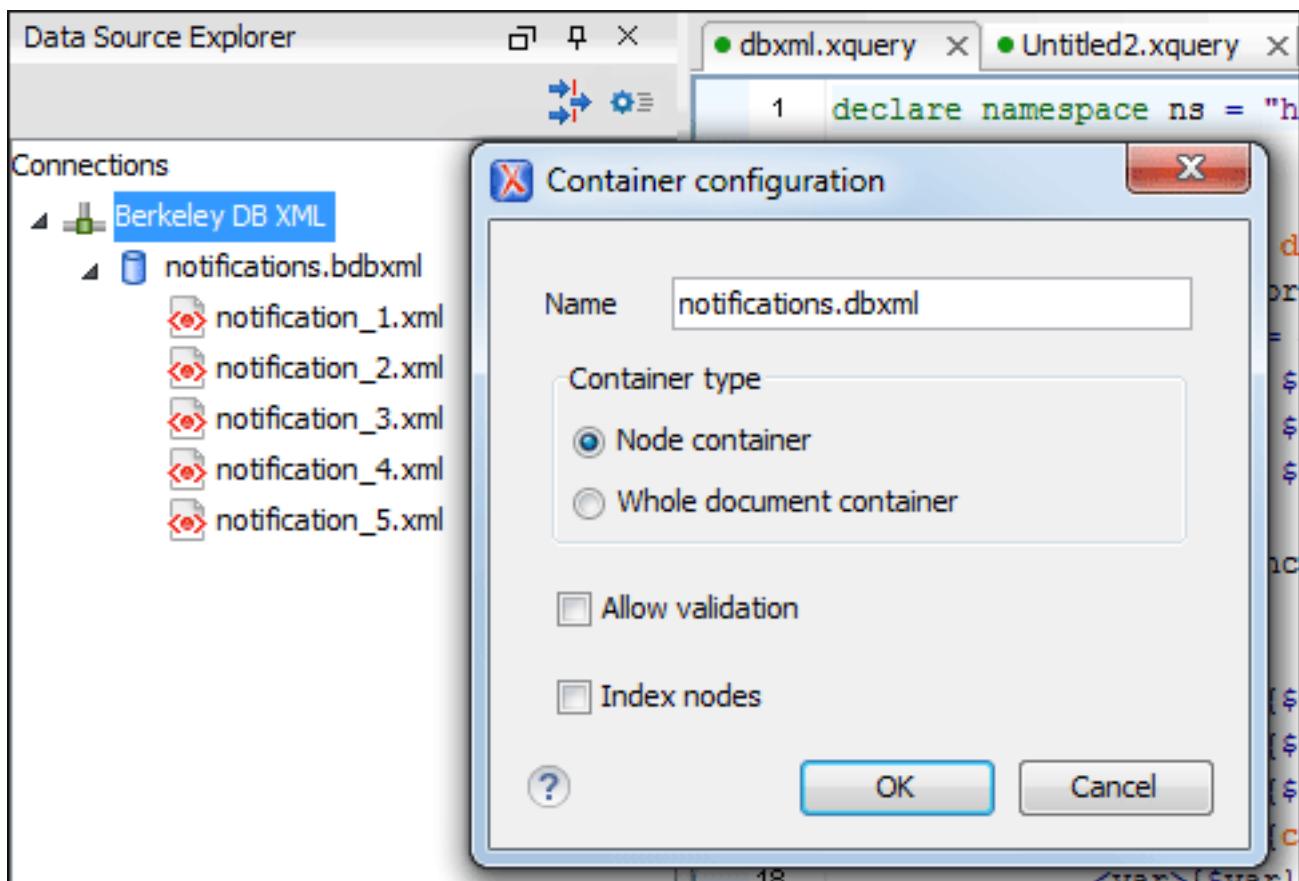

Figure 305: Berkeley DB XML Connection

Configuring a Berkeley DB XML Database Connection

[Edit on GitHub](#)

Follow this procedure to configure the support for a Berkeley DB XML database:

1. [Configure Berkeley DB XML Data Source drivers](#).
2. [Configure a Berkeley DB XML Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure Berkeley DB XML Data Source Drivers

[Edit on GitHub](#)

For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Author supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. [Open the Preferences dialog box \(**Options > Preferences**\)](#) and go to **Data Sources**.
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select **Berkeley DBXML** from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the Berkeley DB driver files.

The driver files for the Berkeley DB database (and their locations) are as follows:

- db.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)
- dbxml.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)

Where [DBXML_DIR] is the Berkeley DB XML database root directory. For example, in Windows it is: C:\Program Files\Oracle\Berkeley DB XML <version>.

6. Click the **OK** button to finish the data source configuration.
7. Continue on to [configure your Berkeley DB XML connection](#).

How to Configure a Berkeley DB XML Connection

[Edit on GitHub](#)

Oxygen XML Author supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Set the path to the Berkeley DB XML database directory in the **Environment home directory field**. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
 - b) Select the **Verbosity** level: *DEBUG*, *INFO*, *WARNING*, or *ERROR*.
 - c) Optionally, you can select the **Join existing environment** checkbox.
If checked, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.
6. Click the **OK** button to finish the connection configuration.

Berkeley DB XML Contextual Menu Actions

[Edit on GitHub](#)

While browsing Berkeley DB XML connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Collection

Opens a **Container configuration** dialog box that allows you to add a new container in the repository.

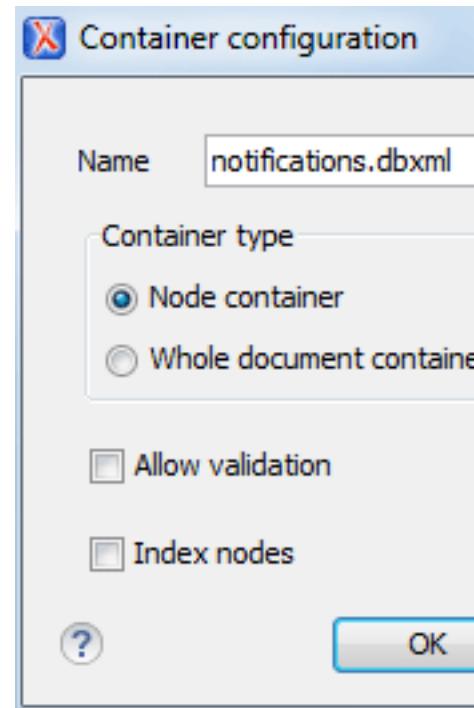

Figure 306: Container Configuration Dialog Box

This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
 - **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying

database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.

- **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- **Allow validation** - If checked, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If checked, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

 **Container Level Nodes**
**Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

**Import Files**

Allows you to add a new file on the connection, in the current folder.

Export**Cut**

Allows you to export the folder on the remote connection to a local folder.

**Paste**

Removes the current selection and places it in the clipboard.

Rename**Delete****Edit indices**

Pastes the copied selection.

Renames the current resource

Deletes the current container.

Opens a **Container Indices** dialog box that allows you to configure indices properties for the selected Berkeley container.

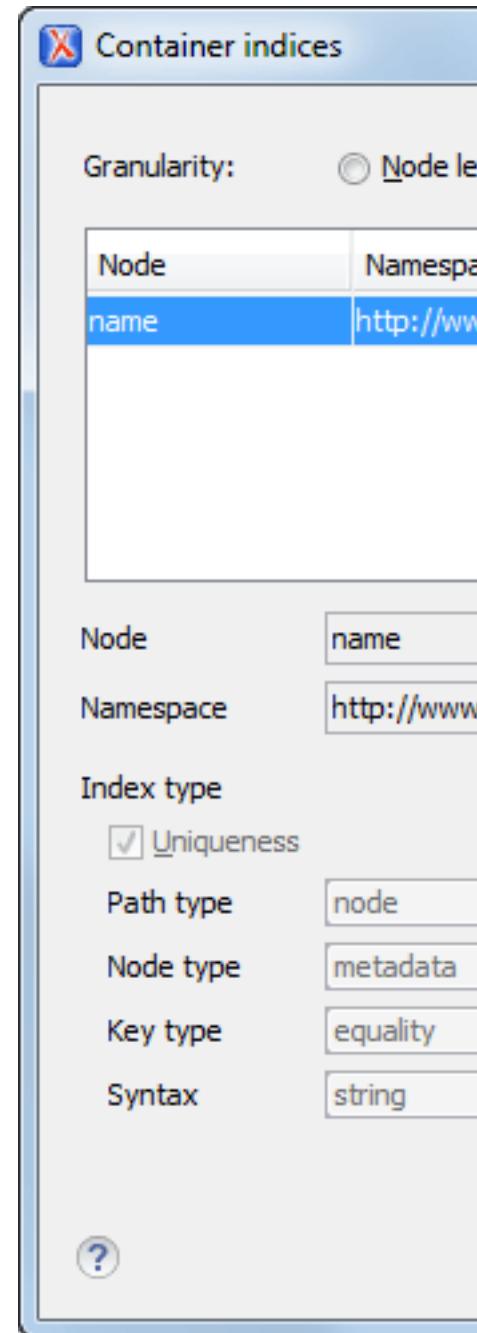

Figure 307: Container Indices Dialog Box

This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:

- **Document level**
- Good option for retrieving large documents.
- **Node level** -
Good option for retrieving nodes from within documents.
- **Node** - The name of the node.
- **Namespace** - The index namespace.
- **Index type:**
 - **Uniqueness** -
Indicates whether or not the indexed value must be unique within the container.
 - **Path type** - Drop-down menu that allows you to select from the following:
 - **node** - Indicates that you want to index a single node in the path.
 - **edge** - Indicates that you want to index the portion of the path where two nodes meet.
 - **Node type** - Drop-down menu that allows you to select from the following:
 - **element** - An element node in the document content.
 - **attribute** - An attribute node in the document content.
 - **metadata** - A node found only in the metadata content of a document.
 - **Key type** - Drop-down menu that

allows you to select from the following:

- **equality** - Improves the performances of tests that look for nodes with a specific value.
- **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.
- **substring** - Improves the performance of tests that look for a node whose value contains a given sub-string.
- **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is **string**.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

Open

Opens the selected resource in the editor.

Cut

Removes the current selection and places it in the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various

	actions, such as opening or transforming the resources.
Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
Compare	Compares two selected resources using the Compare Files tool .

eXist Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for eXist database connections. Oxygen XML Author allows you to browse the structure of a eXist database in the [Data Source Explorer view](#) and perform various operations on the resources in the repository.

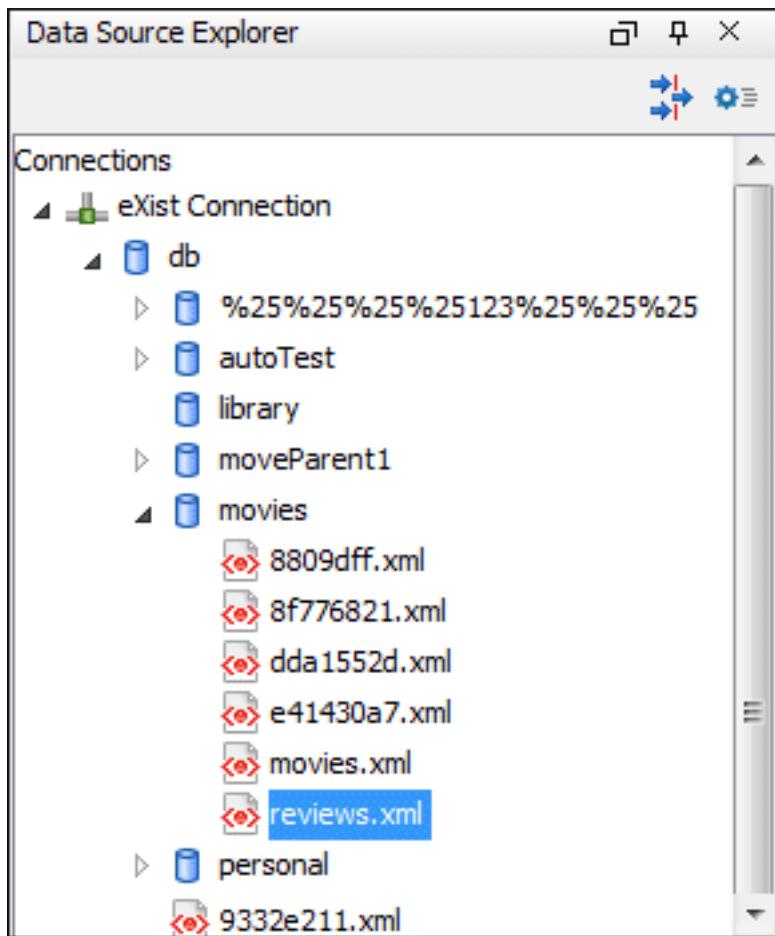

Figure 308: eXist Database Connection

Configuring an eXist Database Connection

[Edit on GitHub](#)

There are two ways to configure the support for an eXist database:

1. Use the dedicated **Create eXist-db XML connection** connection wizard.
 - a. *Open the Preferences dialog box (**Options > Preferences**), go to **Data Sources** and click the **Create eXist-db XML connection** link.*
 - b. *Enter your connection details in the connection wizard and click **OK**.*

Important: To create an eXist connection using this wizard, Oxygen XML Author expects the `exist/webstart/exist.jnlp` path to be accessible at the provided **Host** and **Port**.

 - c. *To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).*
2. Use the **Data Sources** preferences page to configure your connection.
 - a. *Configure eXist Data Source drivers.*
 - b. *Configure an eXist Connection.*
 - c. *To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).*

How to Configure eXist Data Source Drivers

[Edit on GitHub](#)

For this procedure, you need to already have an eXist database server installed.

Oxygen XML Author supports eXist database server versions up to and including version 2.2. To configure a data source for an eXist database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *eXist* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the eXist driver files.

The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Author.

- exist.jar
- lib/core/xmlldb.jar
- lib/core/xmlrpc-client-3.1.x.jar
- lib/core/xmlrpc-common-3.1.x.jar
- lib/core/ws-commons-util-1.0.x.jar
- lib/core/slf4j-api-1.x.x.jar (if available)
- lib/core/slf4j-log4j12-1.x.x.jar (if available)

The version number from the driver file names may be different for your eXist server installation.

6. Click the **OK** button to finish the data source configuration.
7. Continue on to [configure your eXist connection](#).

To watch our video demonstration about running XQuery against an eXist XML database, go to http://www.oxygenxml.com/demo/eXist_Database.html.

How to Configure an eXist Connection

[Edit on GitHub](#)

To configure a connection to an eXist database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Set the URI to the installed eXist engine in the **XML DB URI** field.
 - b) Set the user name in the **User** field.
 - c) Set the password in the **Password** field.
 - d) Enter the start collection in the **Collection** field.

eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the **OK** button to finish the connection configuration.

To watch our video demonstration about running XQuery against an eXist XML database, go to http://www.oxygenxml.com/demo/eXist_Database.html.

eXist Contextual Menu Actions

[Edit on GitHub](#)

While browsing eXist database connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

 **Configure Database Sources**

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

 **Disconnect**

Stops the connection.

 **Refresh**

Performs a refresh on the selected node.

 **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

Container Level Nodes

 **New File**

Creates a new file on the connection, in the current folder.

 **New Collection**

Creates a new collection on the connection.

 **Import Folders**

Imports folders on the server.

 **Import Files**

Allows you to add a new file on the connection, in the current folder.

 **Export**

Allows you to export the folder on the remote connection to a local folder.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Paste**

Pastes the copied selection.

 **Refresh**

Performs a refresh on the selected node.

 **Properties**

Shows various properties of the current container.

 **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

 **Open**

Opens the selected resource in the editor.

Save As	Allows you to save the selected resource as a file on disk.
 Cut	Removes the current selection and places it in the clipboard.
 Copy	Copies the current selection into the clipboard.
Copy location	Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.
Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
Compare	Compares two selected resources using the Compare Files tool .

MarkLogic Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for MarkLogic database connections. Once you [configure a MarkLogic connection](#), you can use the [Data Source Explorer](#) view to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the **Data Source Explorer** view allows you to open and edit these modules.

Note: To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to *manual* or *manual-enforced*, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: <http://blakeley.com/blogofile/2012/03/19/directory-assistance/>.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

Modules Container

For each Application server (for example: *Bill (HTTP port:8060)*), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this  **Modules** container.

Note: You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a  **Requests** container. In this container, Oxygen XML Author displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the **Cancel all requests action**.

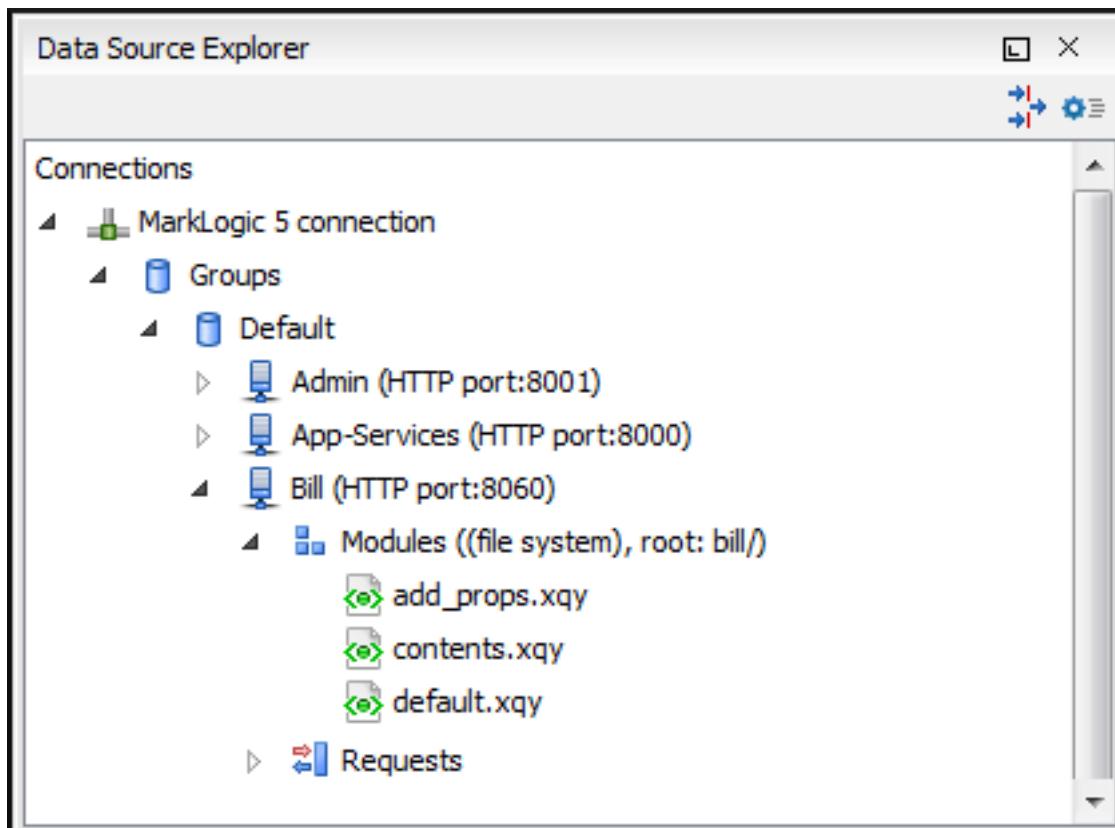

Figure 309: MarkLogic Connection in Data Source Explorer

Configuring a MarkLogic Database Connection

[Edit on GitHub](#)

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from [MarkLogic Community site](#).
2. [Configure MarkLogic Data Source drivers](#).

3. [Configure a MarkLogic Connection.](#)
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure MarkLogic Data Source Drivers

[Edit on GitHub](#)

Available in the Enterprise edition only.

Note: Oxygen XML Author supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

1. Download the **XCC Java distribution** zip file from: <http://developer.marklogic.com/products/xcc>.
2. Unzip the downloaded archive.
3. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
4. Click the  New button in the **Data Sources** panel.
5. Enter a unique name for the data source.
6. Select *MarkLogic* from the driver **Type** drop-down list.
7. Click the **Add Files** button and select the MarkLogic driver file from the `lib` folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where `{server_version}` is the MarkLogic server version.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MarkLogic Connection](#).

How to Configure a MarkLogic Connection

[Edit on GitHub](#)

Available in the Enterprise edition only.

Note: Oxygen XML Author supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.
Oxygen XML Author uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.
 - b) Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the [Use it to execute queries action](#) from Data Source Explorer.
 - c) Set the user name to access the MarkLogic engine in the **User** field.
 - d) Set the password to access the MarkLogic engine in the **Password** field.
 - e) Optionally set the URL used for browsing the MarkLogic database in the **Data Source Explorer** view in the **WebDAV URL** field.
The **Database** field specifies the database for which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.
6. Click the **OK** button to finish the connection configuration.

MarkLogic Contextual Menu Actions

[Edit on
GitHub](#)

While browsing MarkLogic connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

 **Configure Database Sources**

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

 **Disconnect**

Stops the connection.

 **Refresh**

Performs a refresh on the selected node.

 **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

Container Level Nodes

 **Enable Debug Mode**

Switches the server to a debugging mode.

 **Use it to Execute Queries**

The server will be used to process XQuery expressions against it.

 **Refresh**

Performs a refresh on the selected node.

Module or Folder Level Nodes

 **Export**

Allows you to export the folder on the remote connection to a local folder.

 **Refresh**

Performs a refresh on the selected node.

Requests Level Nodes

 **Refresh**

Performs a refresh on the selected node.

 **Cancel all requests**

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

Resource Level Nodes

 **Open**

Opens the selected resource in the editor.

 **Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can

then be used for various actions, such as opening or transforming the resources.

**Compare**

Performs a refresh on the selected node.

Compares two selected resources using the [Compare Files tool](#).

Documentum xDB (X-Hive/DB) 10 Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for Documentum xDB (X-Hive/DB) 10 database connections. Oxygen XML Author allows you to browse the structure of a Documentum xDB (X-Hive/DB) 10 database in the [Data Source Explorer view](#) and perform various operations on the resources in the repository.

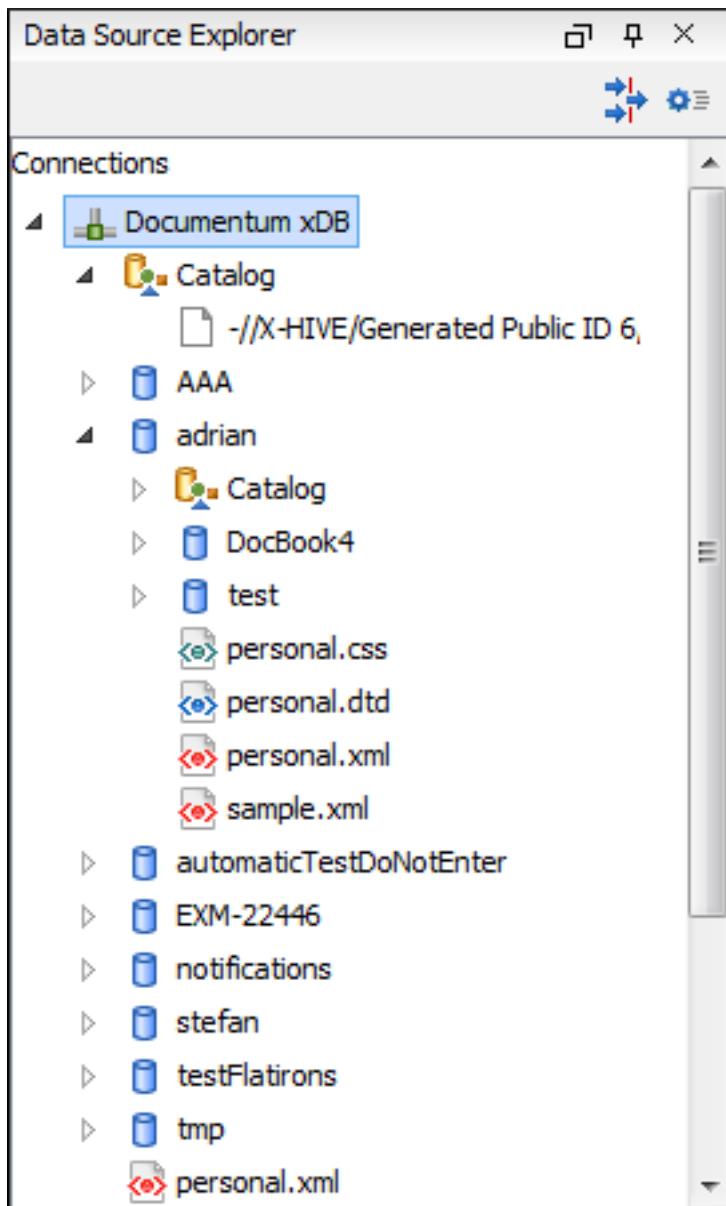

Figure 310: Documentum xDB (X-Hive/DB) 10 Connection

Configuring a Documentum xDB (X-Hive/DB) 10 Database Connection

[Edit on GitHub](#)

Follow this procedure to configure the support for a Documentum xDB (X-Hive/DB) 10 database:

1. [Configure Documentum xDB Data Source drivers](#).
2. [Configure a Documentum xDB Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure Documentum xDB (X-Hive/DB) 10 Data Source Drivers

[Edit on GitHub](#)

Available in the Enterprise edition only. For this procedure, you need to already have a Documentum xDB server installed.

To configure a data source for Documentum xDB (X-Hive/DB) 10, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Documentum xDB* from the driver **Type** drop-down menu.
5. Click the **Add** button to add the driver files.

The driver files for the Documentum xDB (X-Hive/DB) 10 database are found in the Documentum xDB (X-Hive/DB) 10 lib directory from the server installation folder:

- antlr-runtime.jar
- aspectjrt.jar
- icu4j.jar
- xhive.jar
- google-collect.jar

6. Click the **OK** button to finish the data source configuration.
7. Continue on to [configure your Documentum xDB \(X-Hive/DB\) 10 connection](#).

How to Configure an Documentum xDB (X-Hive/DB) 10 Connection

[Edit on GitHub](#)

To configure a connection to a Documentum xDB (X-Hive/DB) 10 database, follow these steps:

Note: The bootstrap type of X-Hive/DB connections is not supported in Oxygen XML Author. The following procedure explains the `xhive://` protocol connection type.

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Set the URL property of the connection in the **URL** field.
If the property is a URL of the form `xhive://host:port`, the Documentum xDB (X-Hive/DB) 10 connection will attempt to connect to a Documentum xDB (X-Hive/DB) 10 server running behind the specified TCP/IP port.
 - b) Set the user name to access the Documentum xDB (X-Hive/DB) 10 engine in the **User** field.
 - c) Set the password to access the Documentum xDB (X-Hive/DB) 10 engine in the **Password** field.
 - d) Set the name of the database to access from the Documentum xDB (X-Hive/DB) 10 engine in the **Database** field.
 - e) Check the **Run XQuery in read / write session (with committing)** checkbox if you want to end the session with a commit. Otherwise, the session ends with a rollback.
6. Click the **OK** button to finish the connection configuration.

Documentum xDB (X-Hive/DB) 10 Contextual Menu Actions

[Edit on GitHub](#)

While browsing Documentum xDB (X-Hive/DB) 10 connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

 Catalog Level Nodes

Disconnect Stops the connection.

Add Library Allows you to add a new library.

 **Insert XML Instance** Allows you to add a new XML resource directly into the database root. See [Documentum xDB \(X-Hive/DB\) 10 Parser Configuration](#) for more details.

 **Insert non-XML Instance** Allows you to add a new non-XML resource directly in the database root.

 **Refresh** Performs a refresh on the selected node.

 **Find/Replace in Files** Allows you to find and replace text in multiple files from the connection.

Add AS Models Allows you to add a new abstract schema model to the selected catalog.

Export Allows you to export the folder on the remote connection to a local folder.

Set Default Schema Allows you to set a default DTD to be used for parsing. It is not possible to set a default XML Schema.

Clear Default Schema Allows you to clear the default DTD. The action is available only if there is a DTD set as default.

 **Refresh** Performs a refresh on the selected node.

 **Properties** Shows various properties of the current container.

 **Find/Replace in Files** Allows you to find and replace text in multiple files from the connection.

 Container (Library) Level Nodes

New File Creates a new file on the connection, in the current folder.

Add Library Allows you to add a new library.

 Import Folders	Imports folders on the server.
 Add Local Catalog	Adds a catalog to the selected library. By default, only the root-library has a catalog, and all models are stored there.
 Insert XML Instance	Allows you to add a new XML resource directly into the database root. See Documentum xDB (X-Hive/DB) 10 Parser Configuration for more details.
 Insert non-XML Instance	Allows you to add a new non-XML resource directly in the database root.
 Export	Allows you to export the folder on the remote connection to a local folder.
 Cut	Removes the current selection and places it in the clipboard.
 Copy	Copies the current selection into the clipboard.
 Paste	Pastes the copied selection.
 Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
 Resource Level Nodes	
 Open	Opens the selected resource in the editor.
 Save As	Allows you to save the selected resource as a file on disk.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Add AS model

Allows you to add an XML schema to the selected XML resource.

Set AS model

Allows you to set an active AS model for the selected XML resource.

Clear AS model

Allows you to clear the active AS model of the selected XML resource.

Properties

Displays the resource properties. Available only for XML resources.

Set Default Schema

Allows you to set the selected DTD to be used as default for parsing. The action is available only for DTD.

Clear Default Schema

Allows you to unset the selected DTD. The action is available only if the selected DTD is the current default to be used for parsing.

Rename

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the [Compare Files tool](#).

Documentum xDB (X-Hive/DB) 10 Parser Configuration for Adding XML Instances

[Edit on GitHub](#)

When an XML instance document is added to a Documentum xDB (X-Hive/DB) 10 connection or library, it is parsed with an internal XML parser of the database server. The following options are available for configuring this parser:

- DOM Level 3 parser configuration parameters. More about each parameter can be found here: [DOM Level 3 Configuration](#).
- Documentum xDB (X-Hive/DB) 10 specific parser parameters (for more information, consult the Documentum xDB (X-Hive/DB) 10 manual):
 - **xhive-store-schema** - If checked, the corresponding DTD or XML schemas are stored in the catalog during validated parsing.
 - **xhive-store-schema-only-internal-subset** - Stores only the internal sub-set of the document (not an external sub-set). This option modifies the **xhive-store-schema** (only has a function when that parameter is set to true, and when a DTD is involved). Select this option if you only want to store the internal sub-set of the document (not the external sub-set).
 - **xhive-ignore-catalog** - Ignores the corresponding DTD and XML schemas in the catalog during validated parsing.
 - **xhive-psvi** - Stores **psvi** information about elements and attributes. Documents parsed with this feature turned on give access to **psvi** information and enable support of data types by XQuery queries.
 - **xhive-sync-features** - With this convenience setting turned on, parameter settings of `XhiveDocumentIF` are synchronized with the parameter settings of `LSParser`. Note that parameter settings **xhive-psvi** and **schema-location** are always synchronized.

Troubleshooting Documentum xDB

[Edit on GitHub](#)

Cannot save the file. DTD factory class `org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl` does not extend from `DTDDVFactory`

Question:

I am able to access my XML Database in the **Data Source Explorer** and open files for reading but when I try to save changes to a file back into the database, I receive the following error: "Cannot save the file. DTD factory class `org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl` does not extend from `DTDDVFactory`." How can I fix this?

Answer:

`xhive.jar` contains a `MANIFEST.MF` with a classpath:

```
Class-Path: core/antlr-runtime.jar core/aspectjrt.jar core/fastutil-
shrinked.jar
           core/google-collect.jar core/icu4j.jar core/lucene-regex.jar
           core/lucene.jar
           core/serializer.jar core/xalan.jar core/xercesImpl.jar
```

Since the driver was configured to use `xhive.jar` directly from the `xDB` installation (where many other jars are located), `core/xercesImpl.jar` from the `xDB` installation directory is loaded even though it is not specified in the list of jars from the data source driver configuration (it is in the classpath from `xhive.jar` - `MANIFEST.MF`). A simple workaround for this issue is to copy **ONLY** the jar files used in the driver configuration to a separate folder and configure the data source driver to use them from there.

MySQL Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for MySQL database connections.

Configuring a MySQL Database Connection

[Edit on GitHub](#)

To configure the support for a MySQL database, follow this procedure:

1. [Configure MySQL Data Source drivers](#).
2. [Configure a MySQL Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure MySQL Data Source Drivers

[Edit on GitHub](#)

To connect to a MySQL server, you need to create a generic JDBC type data source based on [the MySQL JDBC driver available on the MySQL website](#).

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
3. Click the  New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

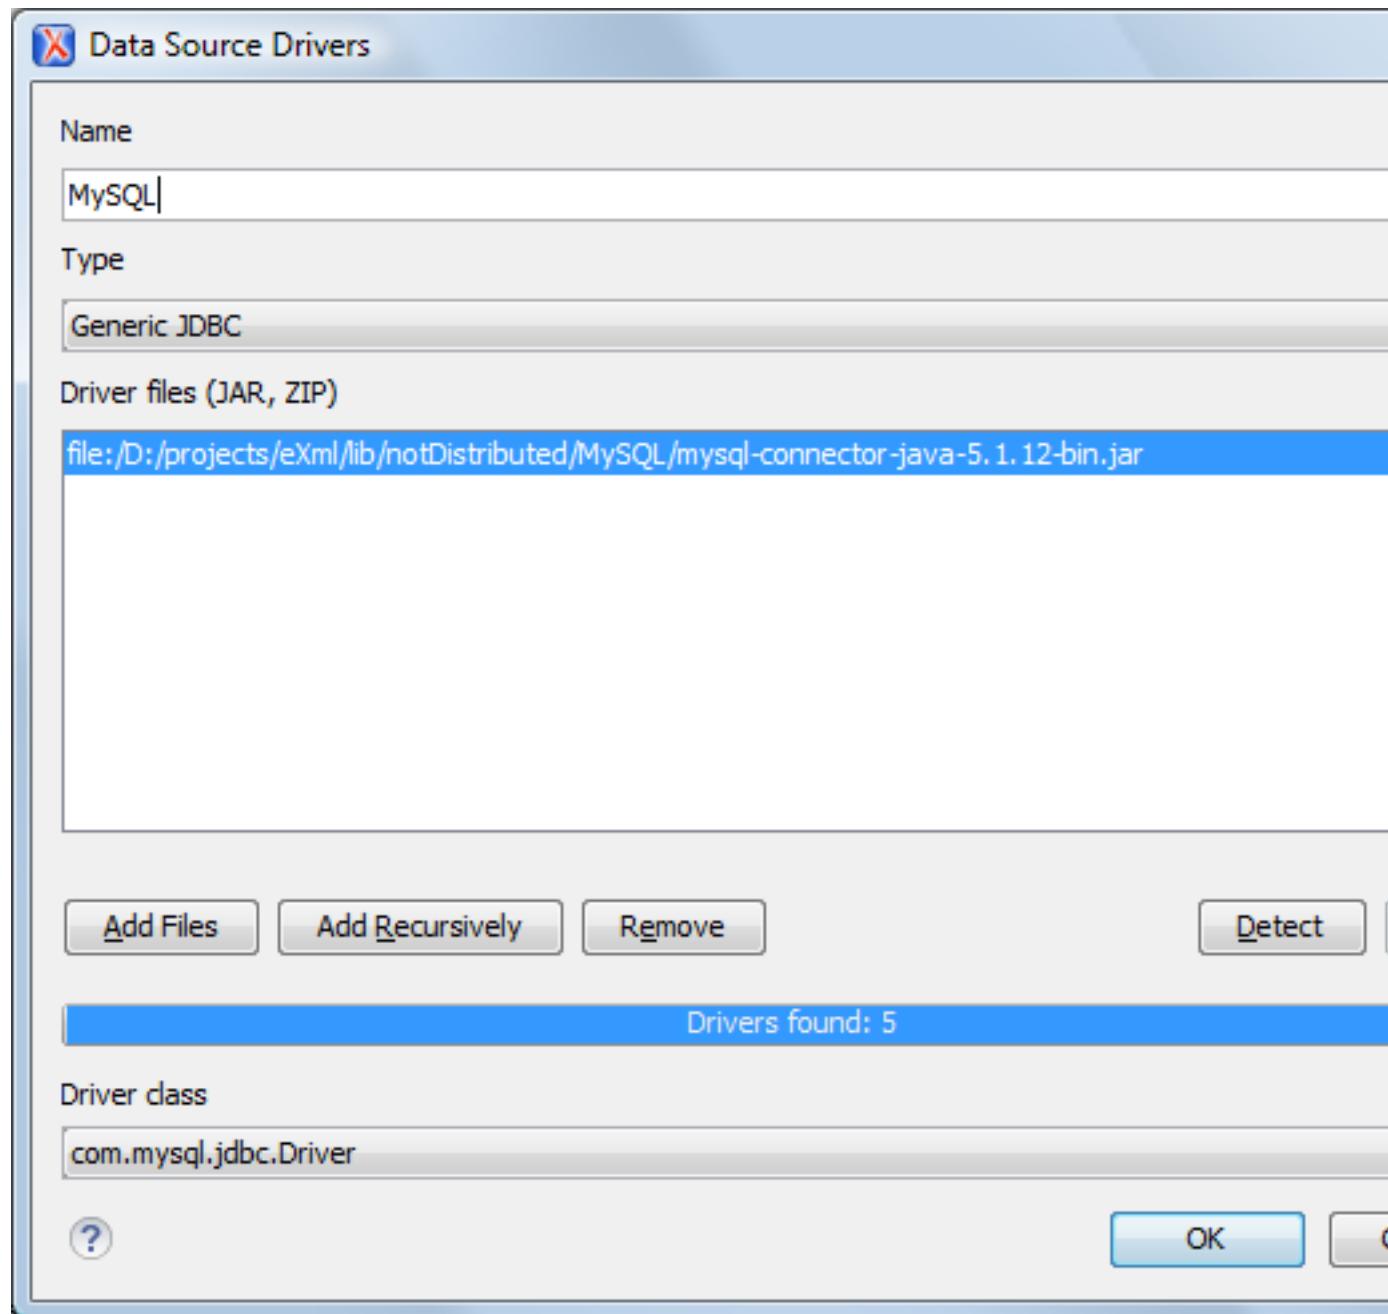

Figure 311: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select **Generic JDBC** in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
The driver file for the MySQL server is called mysql-com.jar.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MySQL connection](#).

How to Configure a MySQL Connection

[Edit on GitHub](#)

To configure a connection to a MySQL server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

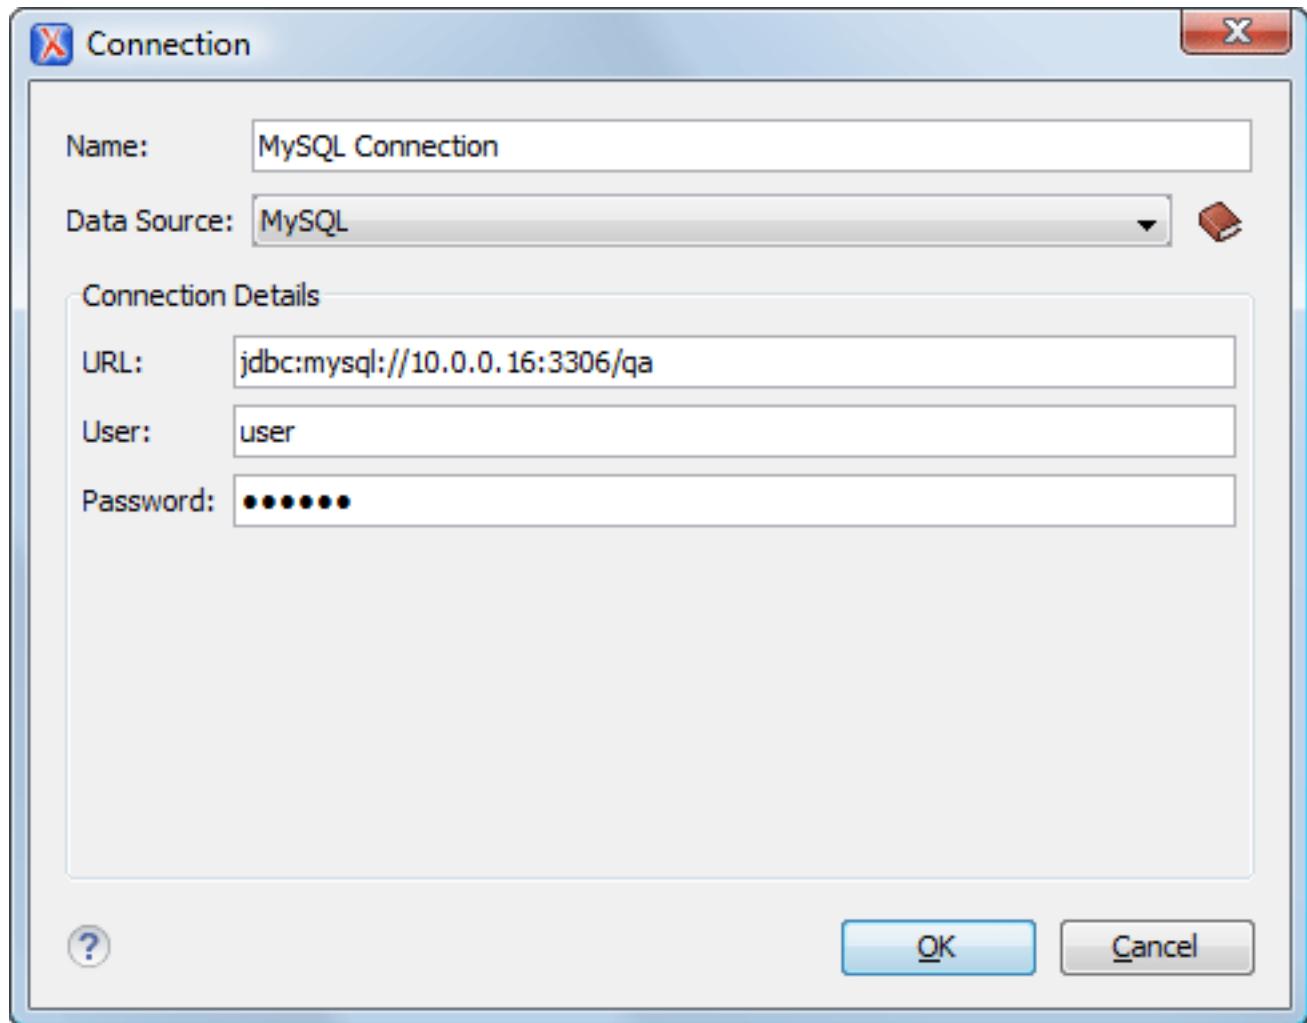

Figure 312: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the **MySQL** data source in the **Data Source** drop-down list.
5. Enter the connection details.
 - a) Enter the URL of the MySQL server.
 - b) Enter the user name for the connection to the MySQL server.
 - c) Enter the password for the connection to the MySQL server.
6. Click the **OK** button to finish the configuration of the database connection.

Generic JDBC Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

[Edit on GitHub](#)

To configure the support for a generic JDBC database, follow this procedure:

1. [Configure Generic JDBC Data Source drivers](#).
2. [Configure a Generic JDBC Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure Generic JDBC Data Source Drivers

[Edit on GitHub](#)

Starting with version 17, Oxygen XML Author comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  New button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Generic JDBC* in the driver **Type** drop-down list.
5. Add the driver file(s) using the **Add Files** button.
6. Select the most appropriate **Driver class**.
7. Click the **OK** button to finish the data source configuration.
8. Continue on to [configure a generic JDBC connection](#).

How to Configure a Generic JDBC Connection

[Edit on GitHub](#)

To configure a connection to a generic JDBC database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the  New button.
3. Enter a unique name for the connection.
4. Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a) Enter the URL of the generic JDBC database, with the following format: `jdbc: <subprotocol>: <subname>`.
 - b) Enter the user name for the connection to the generic JDBC database.
 - c) Enter the password for the connection to the generic JDBC database.
6. Click the **OK** button to finish the configuration of the database connection.

JDBC-ODBC Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

[Edit on](#)
[GitHub](#)

Starting with version 17, Oxygen XML Author comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the New button.

The dialog box for configuring a database connection is displayed.

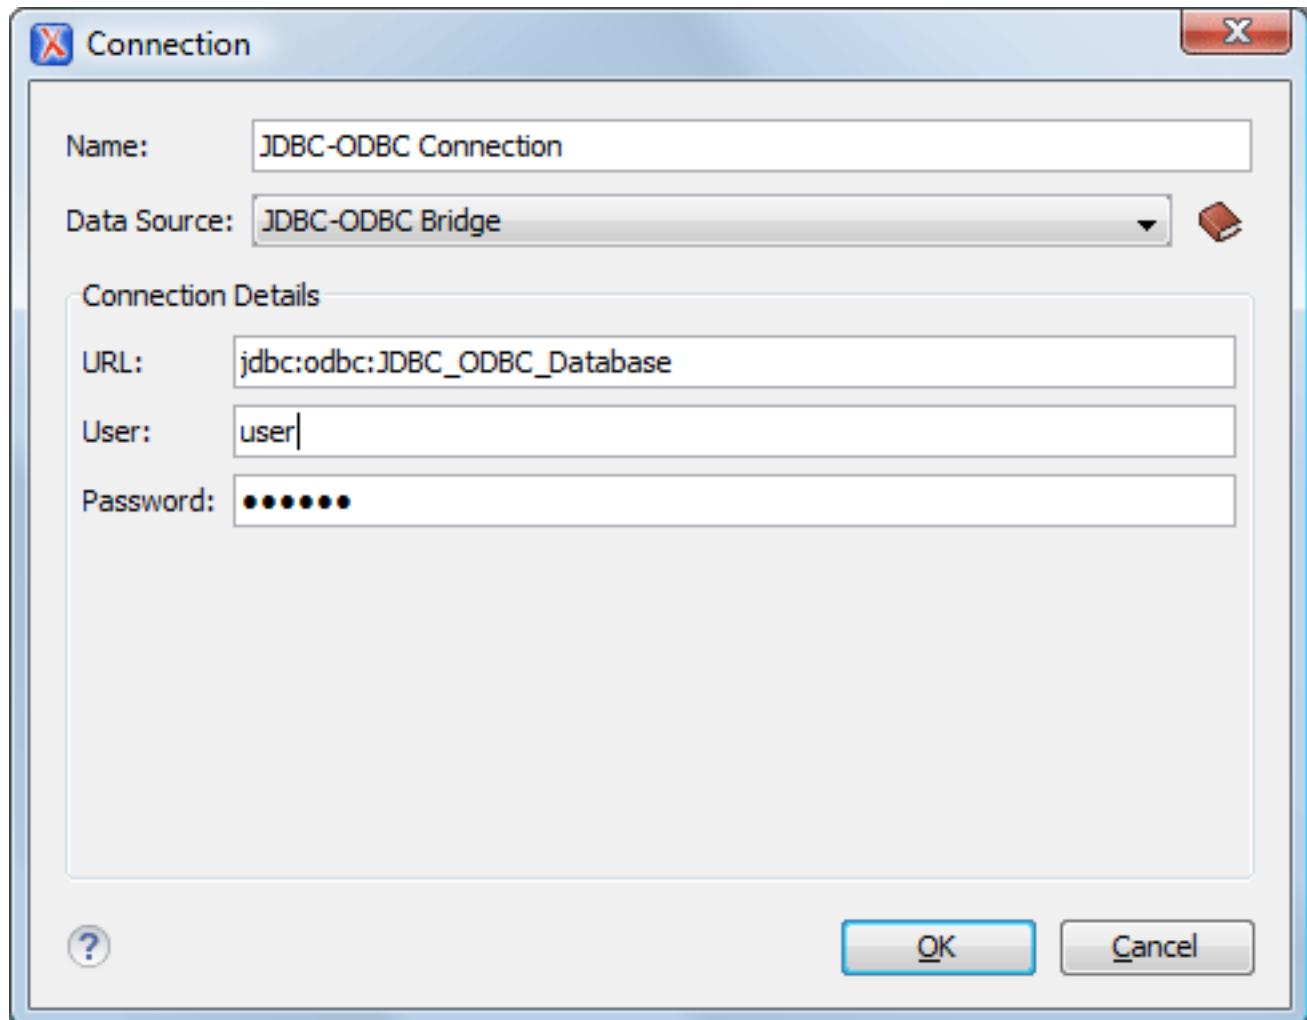

Figure 313: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select **JDBC-ODBC Bridge** in the **Data Source** drop-down list.
5. Enter the connection details.
 - a) Enter the URL of the ODBC source.
 - b) Enter the user name of the ODBC source.
 - c) Enter the password of the ODBC source.
6. Click the **OK** button to finish the configuration of the database connection.

- To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

BaseX Database Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Author allows you to browse the structure of a BaseX database in the [Data Source Explorer view](#) and perform XQuery executions.

How to Configure a BaseX Connection

[Edit on GitHub](#)

To configure a BaseX connection, follow these steps:

- First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named .basex and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server uses. The default port for BaseX WebDAV is 8984.
- To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.
- Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Author as described in [How to Configure a WebDAV Connection](#) on page 966. The WebDAV URL should resemble this: `http://{hostname}:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
 - WebDAV URL: `http://localhost:8984/webdav`
 - User: admin
 - Password: admin
- Once the WebDAV connection is created, to view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

BaseX Contextual Menu Actions

[Edit on GitHub](#)

While browsing BaseX connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

**Folder Level Nodes**

Find/Replace in Files Allows you to find and replace text in multiple files from the connection.

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Pastes the copied selection.

Rename

Renames the current resource

Deletes the current container.

Performs a refresh on the selected node.

Allows you to find and replace text in multiple files from the connection.

**Resource Level Nodes****Open**

Opens the selected resource in the editor.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can

	then be used for various actions, such as opening or transforming the resources.
 Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
 Compare	Compares two selected resources using the <i>Compare Files tool</i> .

Base X XQJ Connection

[Edit on GitHub](#)

XQuery execution is possible in a BaseX connection through an XQJ connection.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in [How to Configure an XQJ Data Source](#) on page 897. The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `baseX-xqj-1.2.3.jar` (the version names of the JAR file may differ). These libraries can be downloaded from xqj.net/baseX/baseX-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the `lib` sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection as described in [How to Configure an XQJ Connection](#) on page 898.

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- *Port*: 1984
- *serverName*: localhost
- *user*: admin
- *password*: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Author and create a *Transformation Scenario* as described in [XQuery Transformation](#) on page 754. In the **Transformer** drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

WebDAV Connections

[Edit on GitHub](#)

Oxygen XML Author includes support for WebDAV server connections. Oxygen XML Author allows you to browse the structure of a WebDAV connection in the **Data Source Explorer view** and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

[Edit on GitHub](#)

By default, Oxygen XML Author contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer view**.

To configure a WebDAV connection, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the  New button.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.
5. Enter the connection details:
 - a) Set the URL to the WebDAV repository in the field **WebDAV URL**.
 - b) Set the user name that is used to access the WebDAV repository in the **User** field.
 - c) Set the password that is used to access the WebDAV repository in the **Password** field.
6. Click the **OK** button.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

To watch our video demonstration about the WebDAV support in Oxygen XML Author, go to http://www.oxygenxml.com/demo/WebDAV_Support.html.

WebDAV Contextual Menu Actions

[Edit on GitHub](#)

While browsing WebDAV connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

**Folder Level Nodes**

Find/Replace in Files Allows you to find and replace text in multiple files from the connection.

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Pastes the copied selection.

Rename

Renames the current resource

Deletes the current container.

Performs a refresh on the selected node.

Allows you to find and replace text in multiple files from the connection.

**Resource Level Nodes****Open**

Opens the selected resource in the editor.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can

	then be used for various actions, such as opening or transforming the resources.
 Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
 Compare	Compares two selected resources using the <i>Compare Files tool</i> .

SQL Execution Support

[Edit on GitHub](#)

The database support in Oxygen XML Author includes support for writing SQL statements, syntax highlighting, folding, and dragging and dropping from the *Data Source Explorer view*. It also includes transformation scenarios for executing the statements, and the results are displayed in the *Table Explorer view*.

Drag and Drop from Data Source Explorer View

[Edit on GitHub](#)

Drag and drop operations from the **Data Source Explorer** view to the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the *Database Connection Support* section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- `SELECT `field1`, `field2`, ... FROM `catalog`.`table`` (for example: `SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc``)
- `UPDATE `catalog`.`table` SET `field1` =, `field2` =, ...` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =, `DEPTNAME` =, `LOCATION` =`)
- `INSERT INTO `catalog`.`table`(`field1`, `field2`, ...) VALUES (, ,)` (for example: `INSERT INTO `camera`.`cameraDesc`(`DEPT`, `DEPTNAME`, `LOCATION`) VALUES (, ,)`)
- `DELETE FROM `catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc``)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- `SELECT `field` FROM `catalog`.`table`` (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc``)
- `UPDATE `catalog`.`table` SET `field` =` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =`)
- `INSERT INTO `catalog`.`table` (`field1`) VALUES ()` (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES ()`)
- `DELETE FROM `catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT` =`)

SQL Validation

[Edit on GitHub](#)

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

[Edit on GitHub](#)

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a *transformation scenario* using the **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu.

A SQL transformation scenario needs a database connection. You can configure a connection using the **Preferences** button from the SQL transformation dialog box.

The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box. For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

Restriction: When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing in-line parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

The result of a SQL transformation is *displayed in a view* at the bottom of the Oxygen XML Author window.

4. View more complex return values of the SQL transformation in a separate editor panel.

A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

- a) Right-click the cell containing the complex value.
- b) Select the action **Copy cell** from the contextual menu.
The action copies the value in the clipboard.
- c) Paste the value into an appropriate editor.
For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Author.

Content Management System (CMS) Integration

[Edit on GitHub](#)

Describes how you can integrate Oxygen XML Author with content management systems.

This chapter explains how you can use Oxygen XML Author with Documentum CMS and Microsoft SharePoint. You can use the [plugin support](#) to develop your own integration with other content management systems..

All the major CMS vendors that are listed in the [CMS Solution Partners section of our website](#) also provide CMS integration with Oxygen XML Author.

Related concepts

[General Configuration of an Oxygen XML Author Plugin](#) on page 1322

Related information

[Working with Databases](#) on page 910

Integration with Documentum (CMS) (deprecated)

[Edit on GitHub](#)

Important: Starting with version 17.0, the support for Documentum (CMS) is deprecated and will no longer be actively maintained.

Oxygen XML Author provides support for browsing and managing Documentum (CMS) connections in the [Data Source Explorer view](#). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

Oxygen XML Author supports Documentum (CMS) version 6.5 and 6.6 with *Documentum Foundation Services 6.5 or 6.6* installed.

Attention: It is recommended to use the latest 1.6.x Java version. It is possible that the Documentum (CMS) support will not work properly if you use other Java versions.

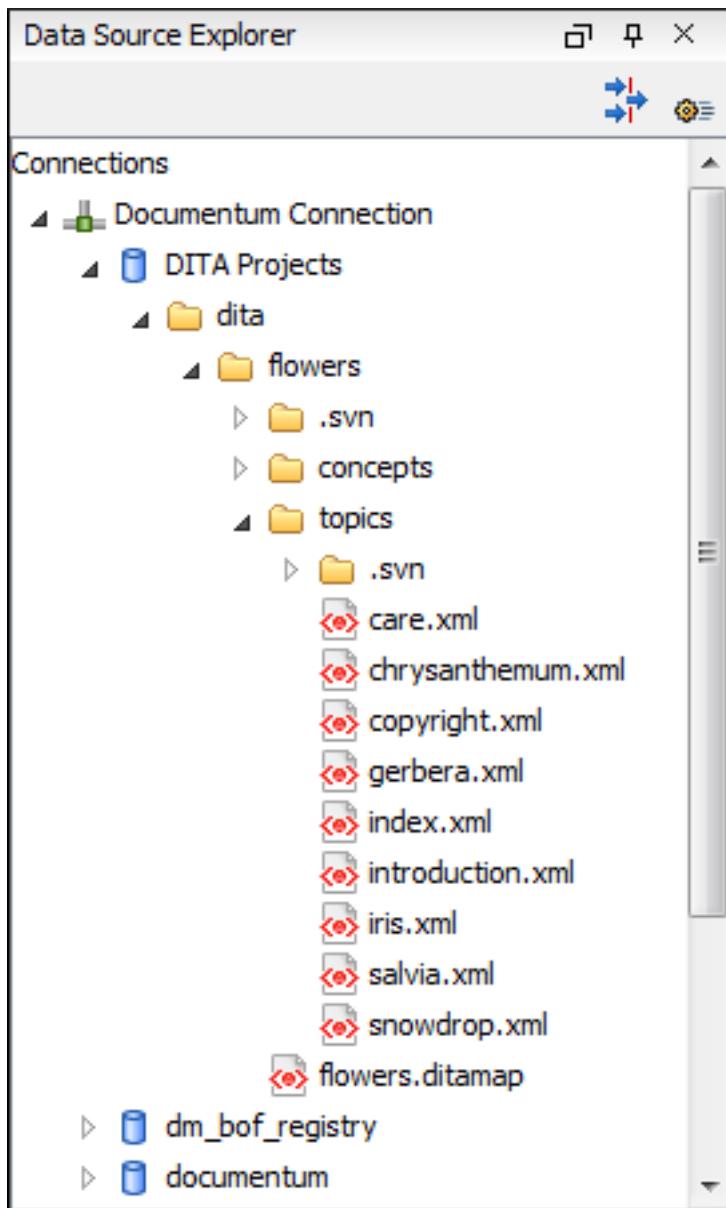

Figure 314: Documentum (CMS) Connection

Configuring a Documentum (CMS) Database Connection

[Edit on GitHub](#)

Follow this procedure to configure the support for a Documentum (CMS) database:

1. [Configure Documentum xDB Data Source drivers.](#)
2. [Configure a Documentum xDB Connection.](#)
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

How to Configure Documentum (CMS) Data Source Drivers

[Edit on GitHub](#)

Available in the Enterprise edition only.

To configure a Documentum (CMS) data source you need the Documentum Foundation Services Software Development Kit (*DFS SDK*) corresponding to your server version. The *DFS SDK* can be found in the Documentum (CMS) server installation kit or it can be downloaded from [EMC Community Network](#).

Note: The *DFS SDK* can be found in the form of an archive named for Documentum (CMS) 6.5 (for example, *emc-dfs-sdk-6.5.zip*).

To configure a data source for Documentum (CMS), follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Data Sources** panel click the  **New** button.
3. Enter a unique name for the data source.
4. Select **Documentum (CMS)** from the driver type combo box.
5. Press the **Choose DFS SDK Folder** button.
6. Select the folder where you have unpacked the *DFS SDK* archive file.

If you have indicated the correct folder the following Java libraries (jar files) will be added to the list (some variation of the library names is possible in future versions of the *DFS SDK*):

- lib/java/emc-bpm-services-remote.jar
- lib/java/emc-ci-services-remote.jar
- lib/java/emc-collaboration-services-remote.jar
- lib/java/emc-dfs-rt-remote.jar
- lib/java/emc-dfs-services-remote.jar
- lib/java/emc-dfs-tools.jar
- lib/java/emc-search-services-remote.jar
- lib/java/ucf/client/ucf-installer.jar
- lib/java/commons/*.jar (multiple jar files)
- lib/java/jaxws/*.jar (multiple jar files)
- lib/java/utils/*.jar (multiple jar files)

Note: If for some reason the jar files are not found, you can add them manually by using the **Add Files** and **Add Recursively** buttons and navigating to the lib/java folder from the *DFS SDK*.

7. Click the **OK** button to finish the data source configuration.
8. Continue on to [configure your Documentum connection](#).

How to Configure a Documentum (CMS) Connection

[Edit on GitHub](#)

Available in the Enterprise edition only.

To configure a connection for a Documentum (CMS) server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel click the  **New** button.
3. Enter a unique name for the connection.
4. Select one of the previously configured Documentum (CMS) data sources in the **Data Source** combo box.
5. Fill-in the connection details:
 - **URL** - The URL to the Documentum (CMS) server: `http://<hostname>:<port>`
 - **User** - The user name to access the Documentum (CMS) repository.
 - **Password** - The password to access the Documentum (CMS) repository.
 - **Repository** - The name of the repository to log into.
6. Click the **OK** button to finish the configuration of the connection.

Known Issues with Documentum (CMS)

[Edit on
GitHub](#)

The following are known issues with the Documentum (CMS):

- There is a known problem in the UCF Client implementation for Mac OS X from Documentum 6.5 that prevents you from viewing or editing XML documents from the repository on Mac OS X. The UCF Client is the component responsible for file transfer between the repository and the local machine. This component is deployed automatically from the server. Documentum 6.6 does not exhibit this problem.
- Note:** This issue was reproduced with Documentum 6.5 SP1. In Documentum 6.6 this is no longer reproducing.
- For the Documentum driver to work faster on Linux, you need to specify to the JVM to use a weaker random generator, instead of the very slow native implementation. This can be done by modifying in the Oxygen XML Author startup scripts (or in the * .vmoptions file) the system property:

```
-Djava.security.egd=file:/dev/./urandom
```

Documentum (CMS) Contextual Menu Actions

[Edit on
GitHub](#)

While browsing Documentum (CMS) connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Cabinet

Creates a new cabinet in the repository. The cabinet properties are:

- Type** - The type of the new cabinet (default is **dm_cabinet**).
- Name** - The name of the new cabinet.
- Title** - The title property of the cabinet.
- Subject** - The subject property of the cabinet.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

Container (Cabinet) Level Nodes

New Folder

Creates a new folder in the current cabinet / folder. The folder properties are the following:

- **Path** - Shows the path where the new folder will be created.
- **Type** - The type of the new folder (default is **dm_folder**).
- **Name** - The name of the new folder.
- **Title** - The title property of the folder.
- **Subject** - The subject property of the folder.

New Document

Creates a new document in the current cabinet / folder. The document properties are the following:

- **Path** - Shows the path where the new document will be created.
- **Name** - The name of the new document.
- **Type** - The type of the new document (default is **dm_document**).
- **Format** - The document content type format.

Import

Imports local files / folders in the selected cabinet / folder of the repository. Actions available when performing an import:

- **Add Files** - Opens a file browse dialog box and allows you to select files to add to the list.
- **Add Folders** - Opens a folder browse dialog box that allows you to select folders to add to the list. The subfolders will be added recursively.
- **Edit** - Opens a dialog box where you can change the properties of the selected file / folder from the list.

	<ul style="list-style-type: none"> • Remove - Removes the selected files / folders from the list.
 Export	Allows you to export the folder on the remote connection to a local folder.
 Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
 Edit	Checks out and opens the selected resource in the editor (if it is not already checked out).
 Edit with	Checks out and opens the selected resource in the specified editor or tool (if it is not already checked out).
 Open (Read-only)	Opens the selected resource in the editor. The resources are marked as read-only in the editor using a lock icon on the file tab. If you want to edit those resources, enable the <i>Can edit read only files option</i> in the Editor preferences page.
 Open with	Opens the selected resource in the specified editor or tool.
 Check Out	Checks out the selected resource from the repository. The action is not available if the resource is already checked out.
 Check In	Opens the Check In dialog box that allows you to check in the

selected resource
(commits changes) into the
repository and configure
some properties for the
resource. The action
is only available if the
resource is checked out.

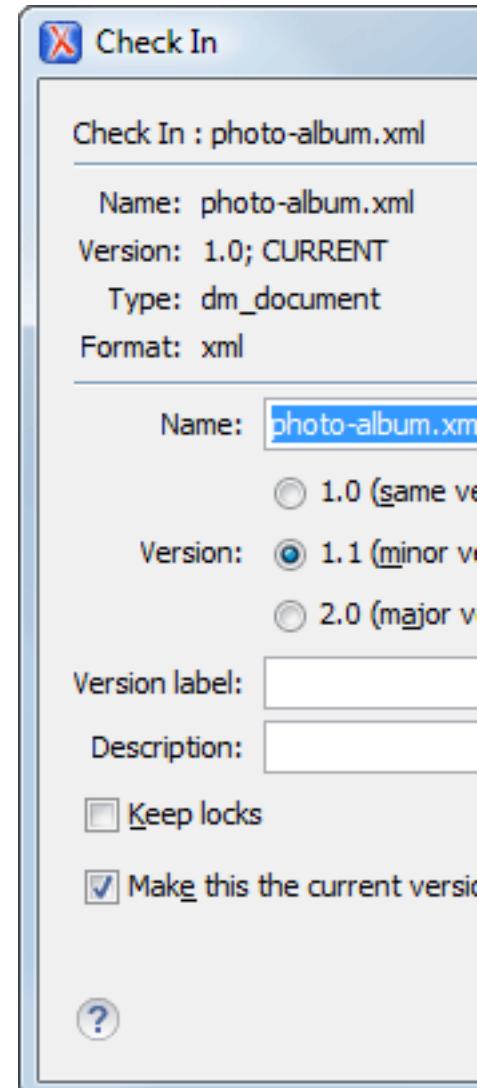

Figure 315: Check In Dialog Box

The following resource properties can be configured in this dialog box:

- **Name** - The resource name in the repository.
- **Version** - Allows you to choose what version the resource will have after being checked in.

- **Version label** - The label of the updated version.
- **Description** - An optional description of the resource.
- **Keep Locks** - When this option is enabled, the updated resource is checked into the repository but it also keeps it locked.
- **Make this the current version** - Makes the updated resource the current version (will have the *CURRENT* version label).

Cancel Checkout

Cancels the checkout process and loses all modifications since the checkout. Action is only available if the resource is checked out.

Export

Allows you to export the folder on the remote connection to a local folder.

Copy

Copies the selected resource to another location in the tree. This action is not available on virtual document descendants. This action can also be performed with drag and drop while holding the **Ctrl (Meta on OS X)** key pressed.

Move

Moves the selected resource to another location in the tree. Action is not available on virtual document descendants and on checked out resources. This action can also be performed with drag and drop.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various

		actions, such as opening or transforming the resources.
 Rename	Renames the current resource	
 Delete	Deletes the current container.	
 Add Relationship	Adds a new relationship for the selected resource. This action can also be performed with drag and drop between resources.	
 Convert to Virtual Document	Allows you to convert a simple document to a virtual document. Action is available only if the resource is a simple document.	
 Convert to Simple Document	Allows you to convert a virtual document to a simple document. Action is available only if the resource is a virtual document with no descendants.	
 Refresh	Performs a refresh on the selected node.	
 Properties	Shows various properties of the current container.	
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.	
 Compare	Compares two selected resources using the <i>Compare Files tool</i> .	

Integration with Microsoft SharePoint

[Edit on GitHub](#)

Oxygen XML Author provides support for browsing and managing SharePoint connections in the *Data Source Explorer view*. You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

Note: You can access documents stored on SharePoint Online for Office 365 sites that use either *Cloud identity (default)* or *Federated identity (ADFS)* as the authentication method.

Restriction: The SharePoint connection is only available in the Enterprise edition of Oxygen XML Author.

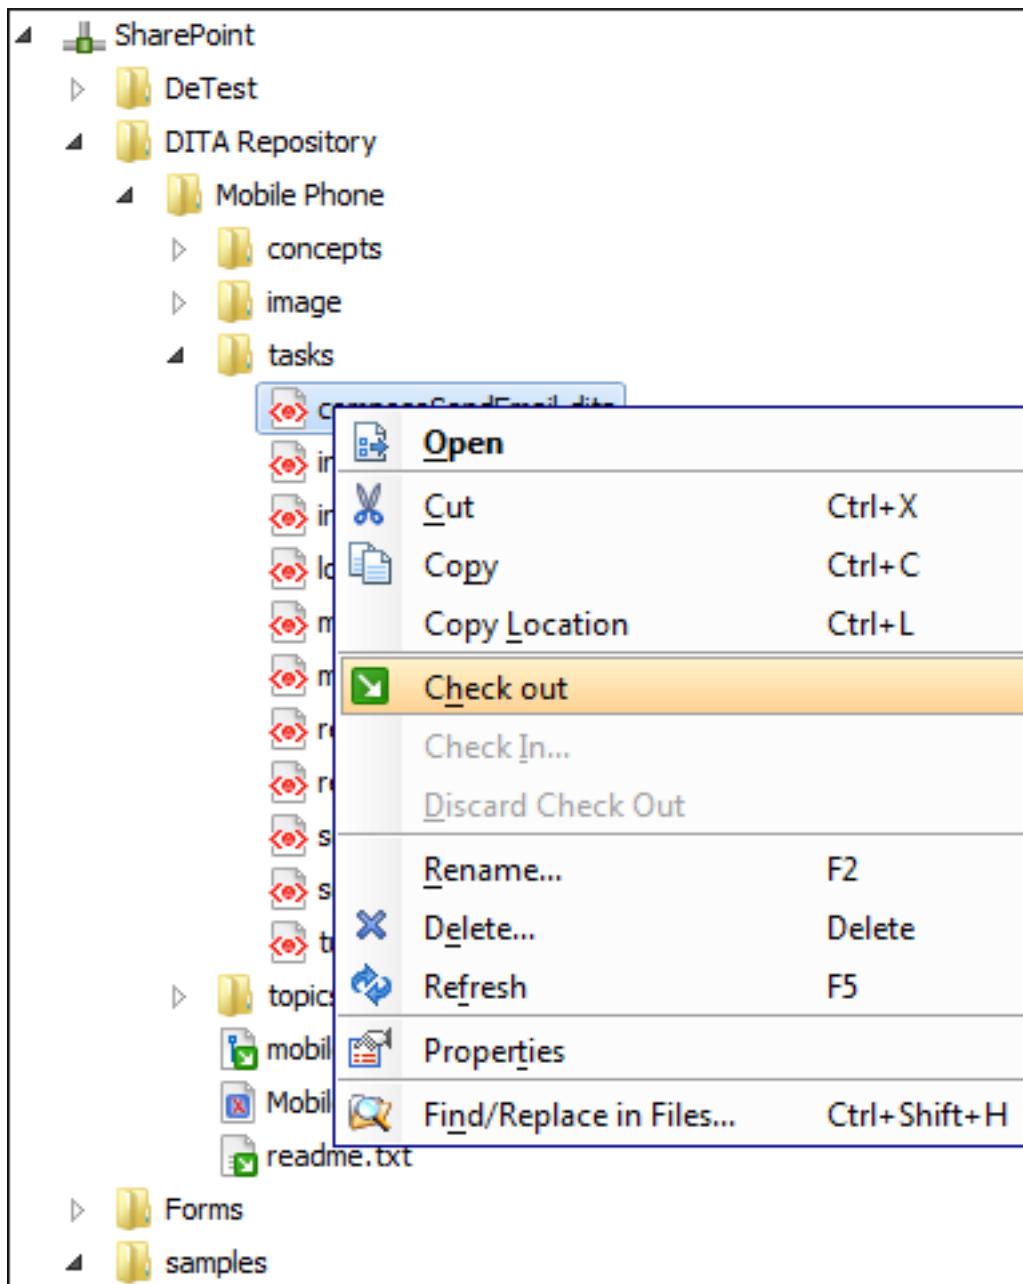

Figure 316: SharePoint Connection

How to Configure a SharePoint Connection

[Edit on GitHub](#)

By default, Oxygen XML Author contains built-in data source drivers for **SharePoint**. Use this data source to create a connection to a SharePoint server that will be available in the [Data Source Explorer view](#).

To configure a SharePoint connection, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel click the New button.

3. Enter a unique name for the connection.
4. Select SharePoint in the **Data Source** combo box.
5. Fill-in the connection details:
 - a) Set the URL to the SharePoint repository in the field **SharePoint URL**.
 - b) Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
 - c) Set the user name to access the SharePoint repository in the **User** field.
 - d) Set the password to access the SharePoint repository in the **Password** field.

To watch our video demonstration about connecting to repository located on a SharePoint server, go to http://www.oxygenxml.com/demo/SharePoint_Support.html.

SharePoint Browser View

[Edit on
GitHub](#)

The **SharePoint Browser** view allows you to connect to a SharePoint repository and perform SharePoint-specific actions on the available resources. To display this view, go to **Window > Show View > SharePoint Browser**.

SharePoint Browser

Site: MySharePointSite

The screenshot shows the SharePoint Browser interface. On the left, there is a tree view of the SharePoint site structure under the root <oXygen/> Team Site. The visible branches include Automatic Tests, Documents [All Documents], Documents [Only DITA], Site Pages [All Pages], and Style Library. Under Documents [Only DITA], the 'Shared Documents' folder is selected. On the right, a detailed list of files is displayed in a table format. The columns are Type, Name, and Modified. The list contains 20 entries, all of which are DITA files (dita) and were modified on January 27, 2014, at various times between 04:53:15 and 04:55:00.

Type	Name	Modified
File	autumnFlowers.dita	2014-01-27 04:53:15
File	glossaryBulb.dita	2014-01-27 04:53:15

File	lilac.dita	2014-01-27 04:55:00

Figure 317: SharePoint Browser View

The view is split in several functional areas:

Connection Area

The following controls are available:

- The **Site** combo box allows you to select and connect to an already *defined SharePoint connection*.
- The **Disconnect** action terminates the current connection.

- The  **Settings** drop-down menu contains actions that help you to quickly define a new connection or manage the existing ones from the **Data Source** options page: **New SharePoint Connection** and **Configure Database Sources**. Also, here you can choose one of the predefined view layouts.

SharePoint Site Navigation Area

If there is no connection selected in the **Site** combo box, this area is left blank and promotes the actions that allow you to quickly add SharePoint connections. Otherwise, the navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

Note: The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

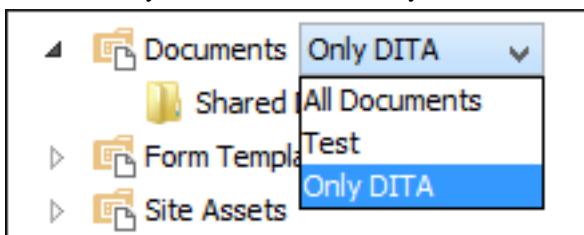

Figure 318: Drop-Down Menu to Select Which Items to Display

Folder Content Area

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

Action	Description	Available for	
		folders	documents
 Open	Displays the content of the currently selected folder. Opens the current document for editing.	#	#
Rename	Renames the current node on server.	#	#
Import	Import files or folders into the currently selected folder.	#	#
 Delete	Deletes the current node from the server.	#	#
Copy Location	Copies to clipboard the URL of the current node.	#	#
 Check Out	Reserves the current document for your use so that other users cannot change it while you are editing it.		#
Check In	Commits on the server the changes you made to the document, so that other users can see them. It also makes the document available for editing to other users.		#
Discard Check Out	Discards the previous checkout operation, making the file available for editing to other users.		#

Action	Description	Available for	
		folders	documents
Refresh	Queries the server to refresh the available properties of the current node.	#	#
Drag and Drop	You can drag documents from the SharePoint Browser view and drop them in the main editor area to open them with ease.		#

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Note: A column can be filtered or sorted only if it was configured this way on the server side.

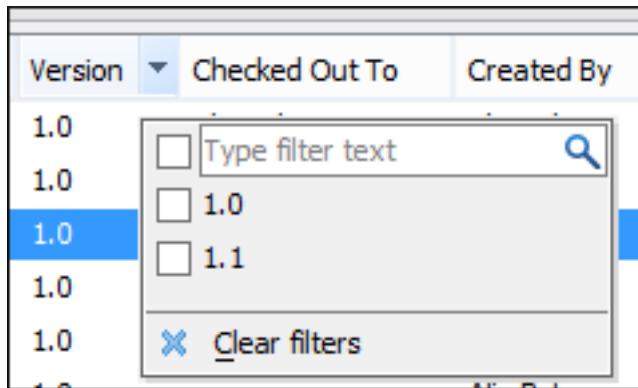

Figure 319: Column Filter

SharePoint Contextual Menu Actions

[Edit on GitHub](#)

While browsing SharePoint connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Configure Database Sources

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

**Folder Level Nodes**

Find/Replace in Files Allows you to find and replace text in multiple files from the connection.

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Pastes the copied selection.

Rename

Renames the current resource

Deletes the current container.

Performs a refresh on the selected node.

Allows you to find and replace text in multiple files from the connection.

**Resource Level Nodes****Open**

Opens the selected resource in the editor.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can

	then be used for various actions, such as opening or transforming the resources.
Check Out	Checks out the selected document on the server.
Check In	Checks in the selected document on the server. This action opens the Check In dialog box. In this dialog box, the following options are available: <ul style="list-style-type: none"> • Minor Version - Increments the minor version of the file on the server. • Major Version - Increments the major version of the file on the server. • Overwrite - Overwrites the latest version of the file on the server. • Comment - Allows you to comment on a file that you check in.
Discard Check Out	Discards the previous checkout operation, making the file available for editing to other users.
Rename	Renames the current resource
 Delete	Deletes the current container.
 Refresh	Performs a refresh on the selected node.
 Properties	Shows various properties of the current container.
 Find/Replace in Files	Allows you to find and replace text in multiple files from the connection.
Compare	Compares two selected resources using the <i>Compare Files tool</i> .

Chapter

12

Importing Data

Topics:

- *Import from Text Files*
- *Import from MS Excel Files*
- *Import Database Data as an XML Document*
- *Import from HTML Files*
- *Import Content Dynamically*

This chapter explains how to import data from various sources into XML documents.

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Author offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the [*Transform features*](#).

Import from Text Files

[Edit on GitHub](#)

To import a text file into an XML file, follow these steps:

1. Go to **File > Import > Text File**.
A **Select text file** dialog box is displayed.
2. Select the URL of the text file.
3. Select the encoding of the text file.
4. Click the **Next** button.
The **Import Criteria** dialog box is displayed.

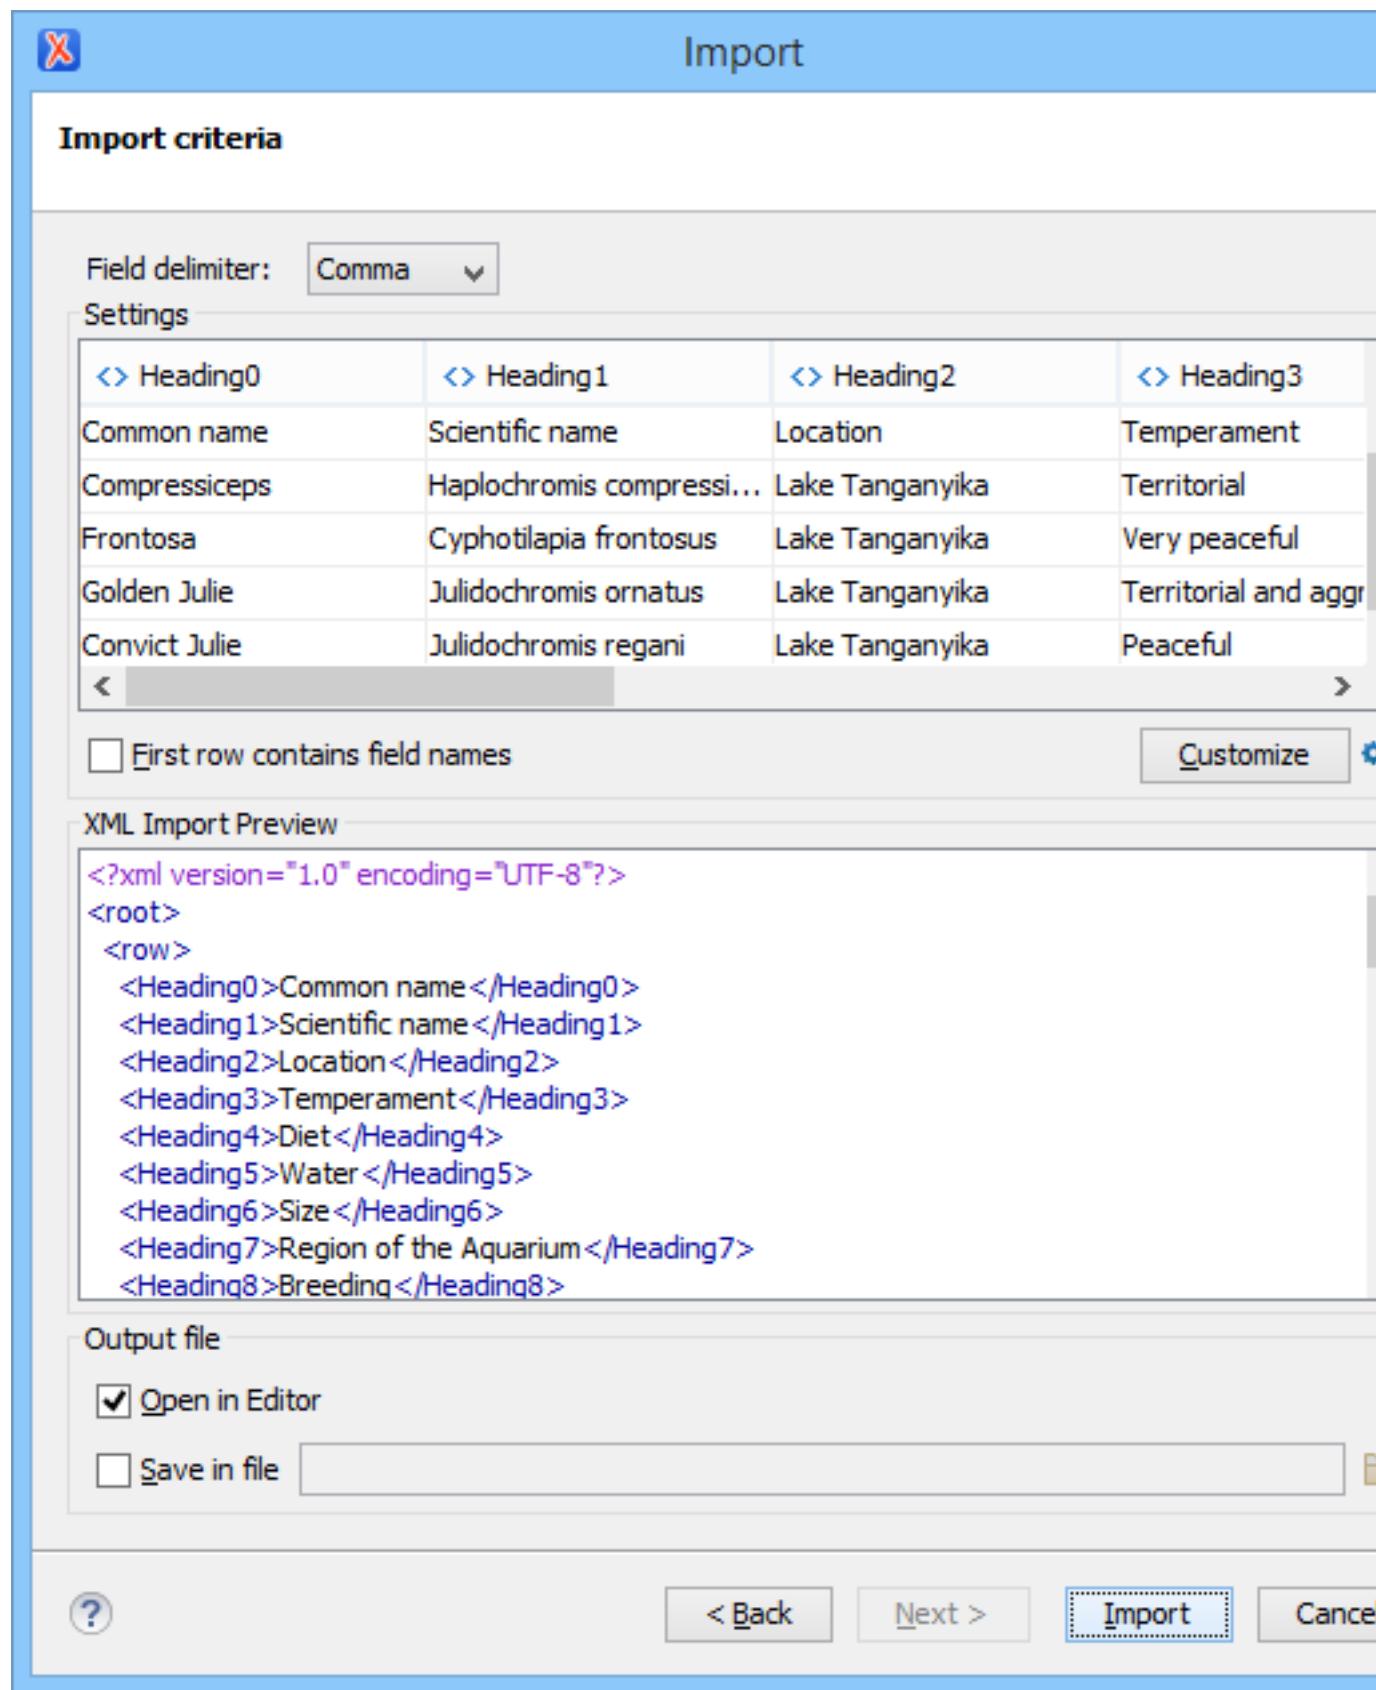

Figure 320: Import Criteria Dialog Box

5. Configure the settings for the conversion.
 - a) Select the **Field delimiter** for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, or Pipe.
 - b) The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
 - c) **First row contains field names** - If this option is enabled, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
 - d) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
 - e) **Import Settings** - Clicking this button opens the *Import preferences page* that allows you to configure more import options.
 - f) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
 - g) **Open in editor** - If checked, the new XML document created from the imported text file is opened in the editor.
 - h) **Save in file** - If checked, the new XML document is saved in the specified path.
6. Click **Import** to generate the XML document.

Import from MS Excel Files

[Edit on GitHub](#)

By default, importing Excel 97/2000/XP/2003 formats are supported out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See [Import Data from MS Excel 2007 or Newer](#) on page 992 for instructions on adding more libraries.

Oxygen XML Author offers support for importing MS Excel Files.

To import an Excel file into an XML file, follow these steps:

1. Go to **File > Import > MS Excel file**.
2. Select the URL of the Excel file.

The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.

3. Click the **Next** button.
Opens the **Import criteria** dialog box.

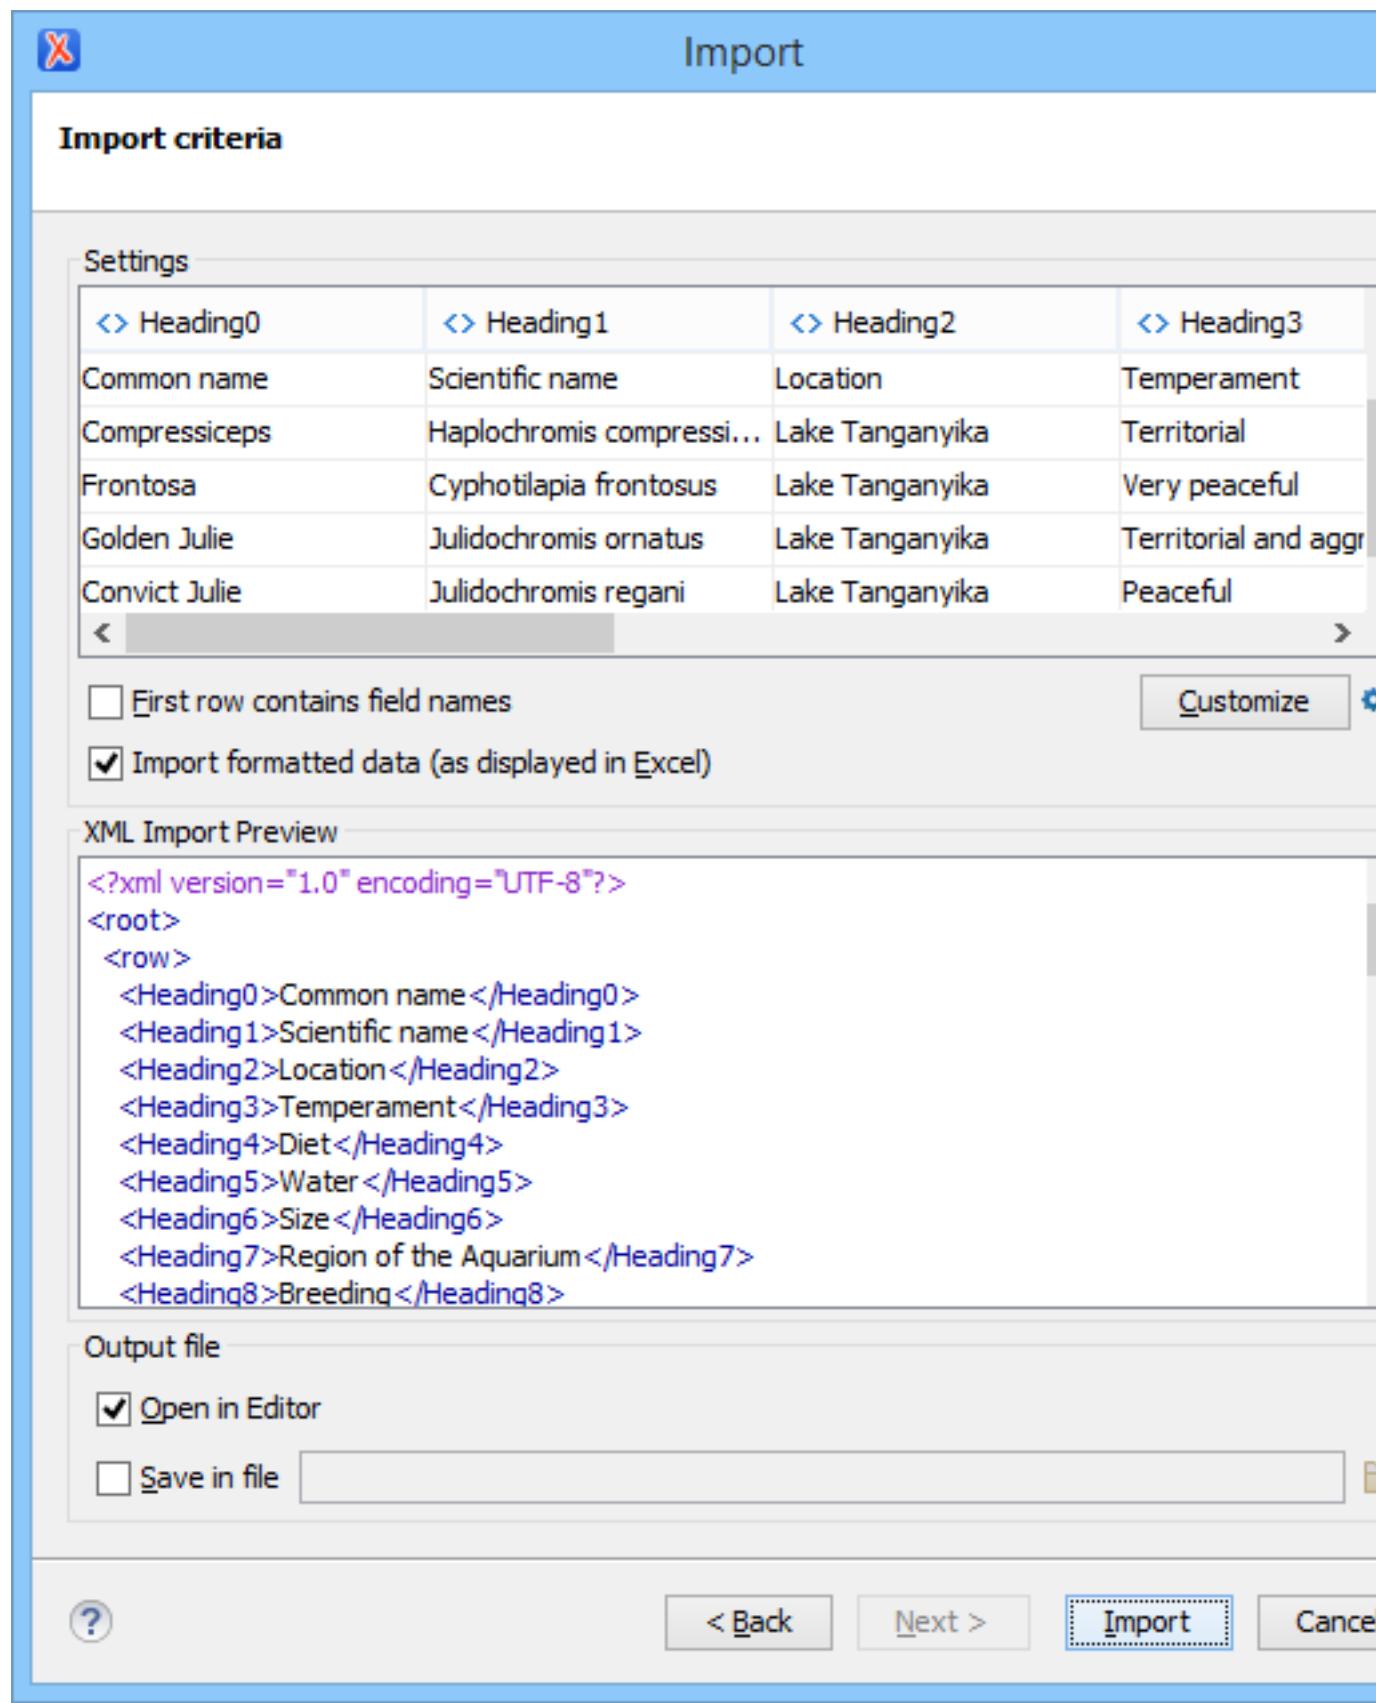

Figure 321: Import Criteria Dialog Box

4. Configure the settings for the conversion.
 - a) The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
 - b) **First row contains field names** - If this option is enabled, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
 - c) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
 - d) **Import Settings** - Clicking this button opens the *Import preferences page* that allows you to configure more import options.
 - e) **Import formatted data (as displayed in Excel)** - If this option is selected, the imported data retains the Excel styling. If deselected, the data formatting is not imported.
 - f) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
 - g) **Open in editor** - If checked, the new XML document created from the imported file is opened in the editor.
 - h) **Save in file** - If checked, the new XML document is saved in the specified path.
5. Click **Import** to generate the XML document.

Import Data from MS Excel 2007 or Newer

[Edit on GitHub](#)

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Author needs additional libraries from the release 3.10 of the Apache POI project.

To add the libraries, follow these steps:

1. Download version 3.10 of the Apache POI project from <http://archive.apache.org/dist/poi/release/bin/>. The specific ZIP file that you need is: poi-bin-3.10-FINAL-20140208.zip.
2. Unpack poi-bin-3.10-FINAL-20140208.zip.
3. Copy the following .jar files in the lib directory of the installation folder of Oxygen XML Author :
 - dom4j-1.6.1.jar
 - poi-ooxml-3.10-FINAL-20140208.jar
 - poi-ooxml-schemas-3.10-FINAL-20140208.jar
 - xmlbeans-2.3.0.jar

Import Database Data as an XML Document

[Edit on GitHub](#)

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File > Import > Database Data** to start the **Import** wizard.

This opens a **Select database table** dialog box that lists all the defined database connections:

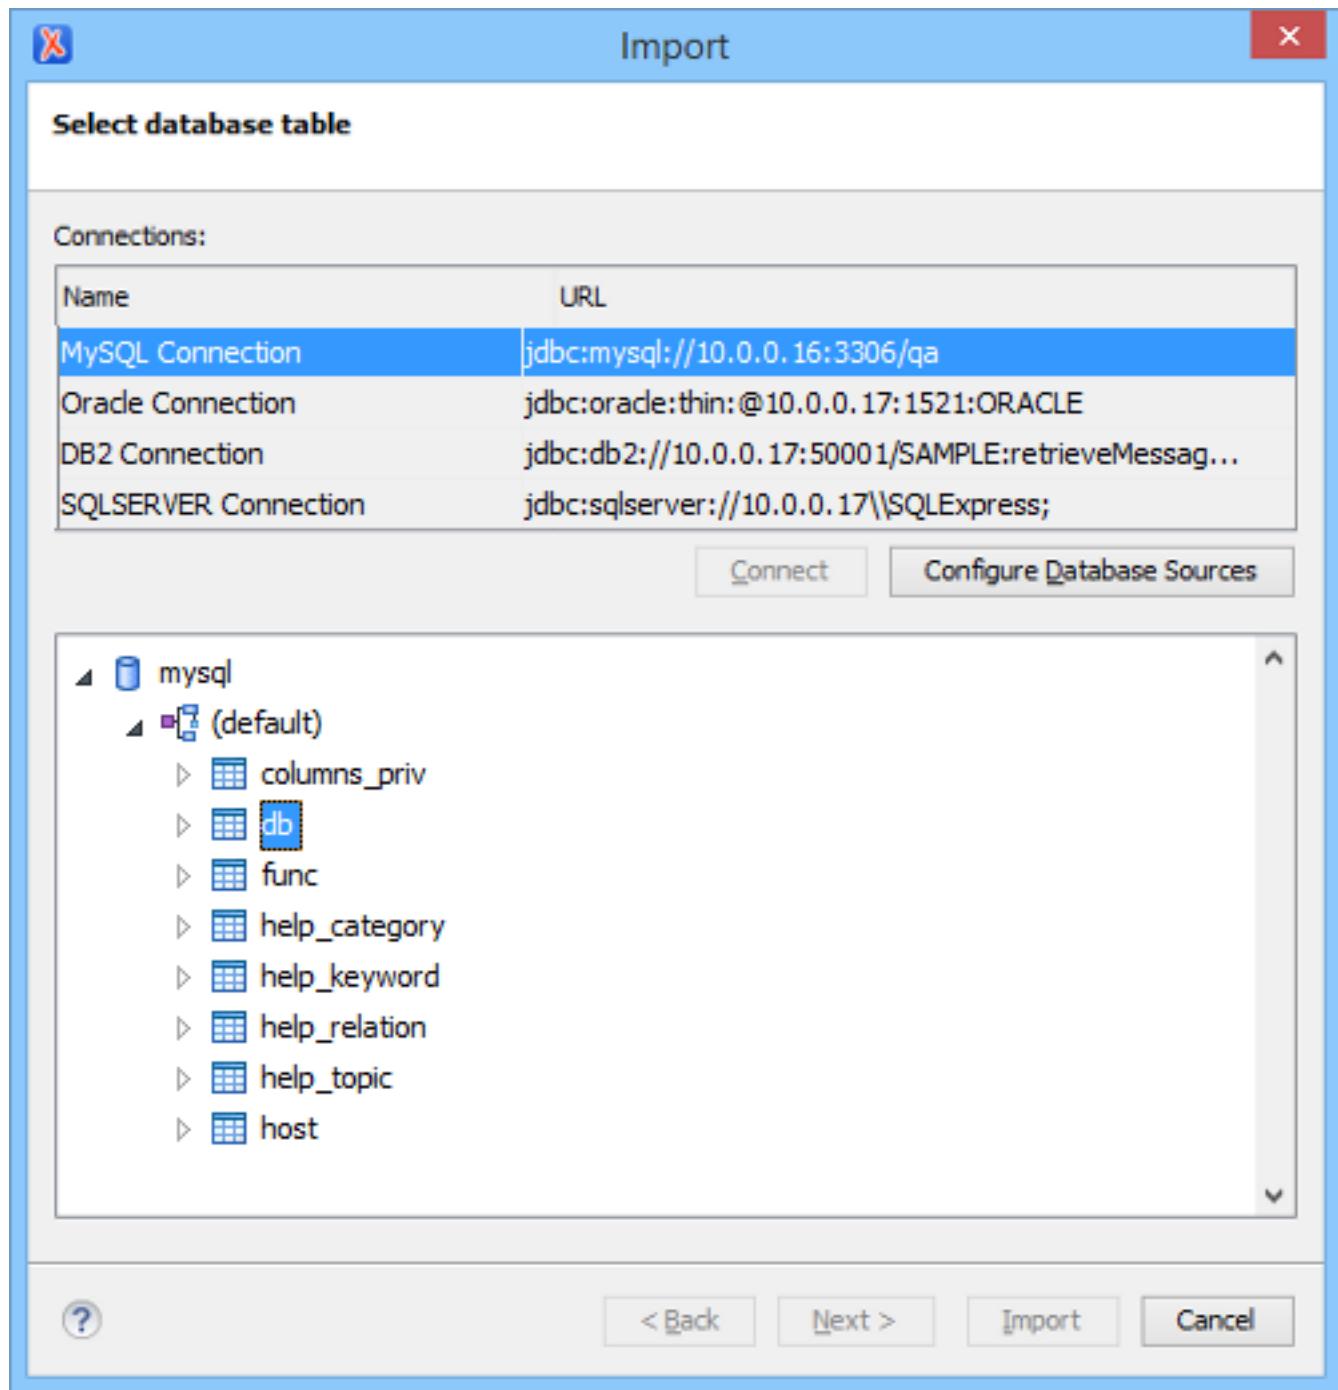

Figure 322: Select Database Table Dialog Box

2. Select the connection to the database that contains the appropriate data.
Only connections configured in relational data sources can be used to import data.
3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button.
The **Preferences/Data Sources** option page is opened.
4. Click **Connect**.
5. In the list of sources, expand a schema and choose the required table.
6. Click the **Next** button.

The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

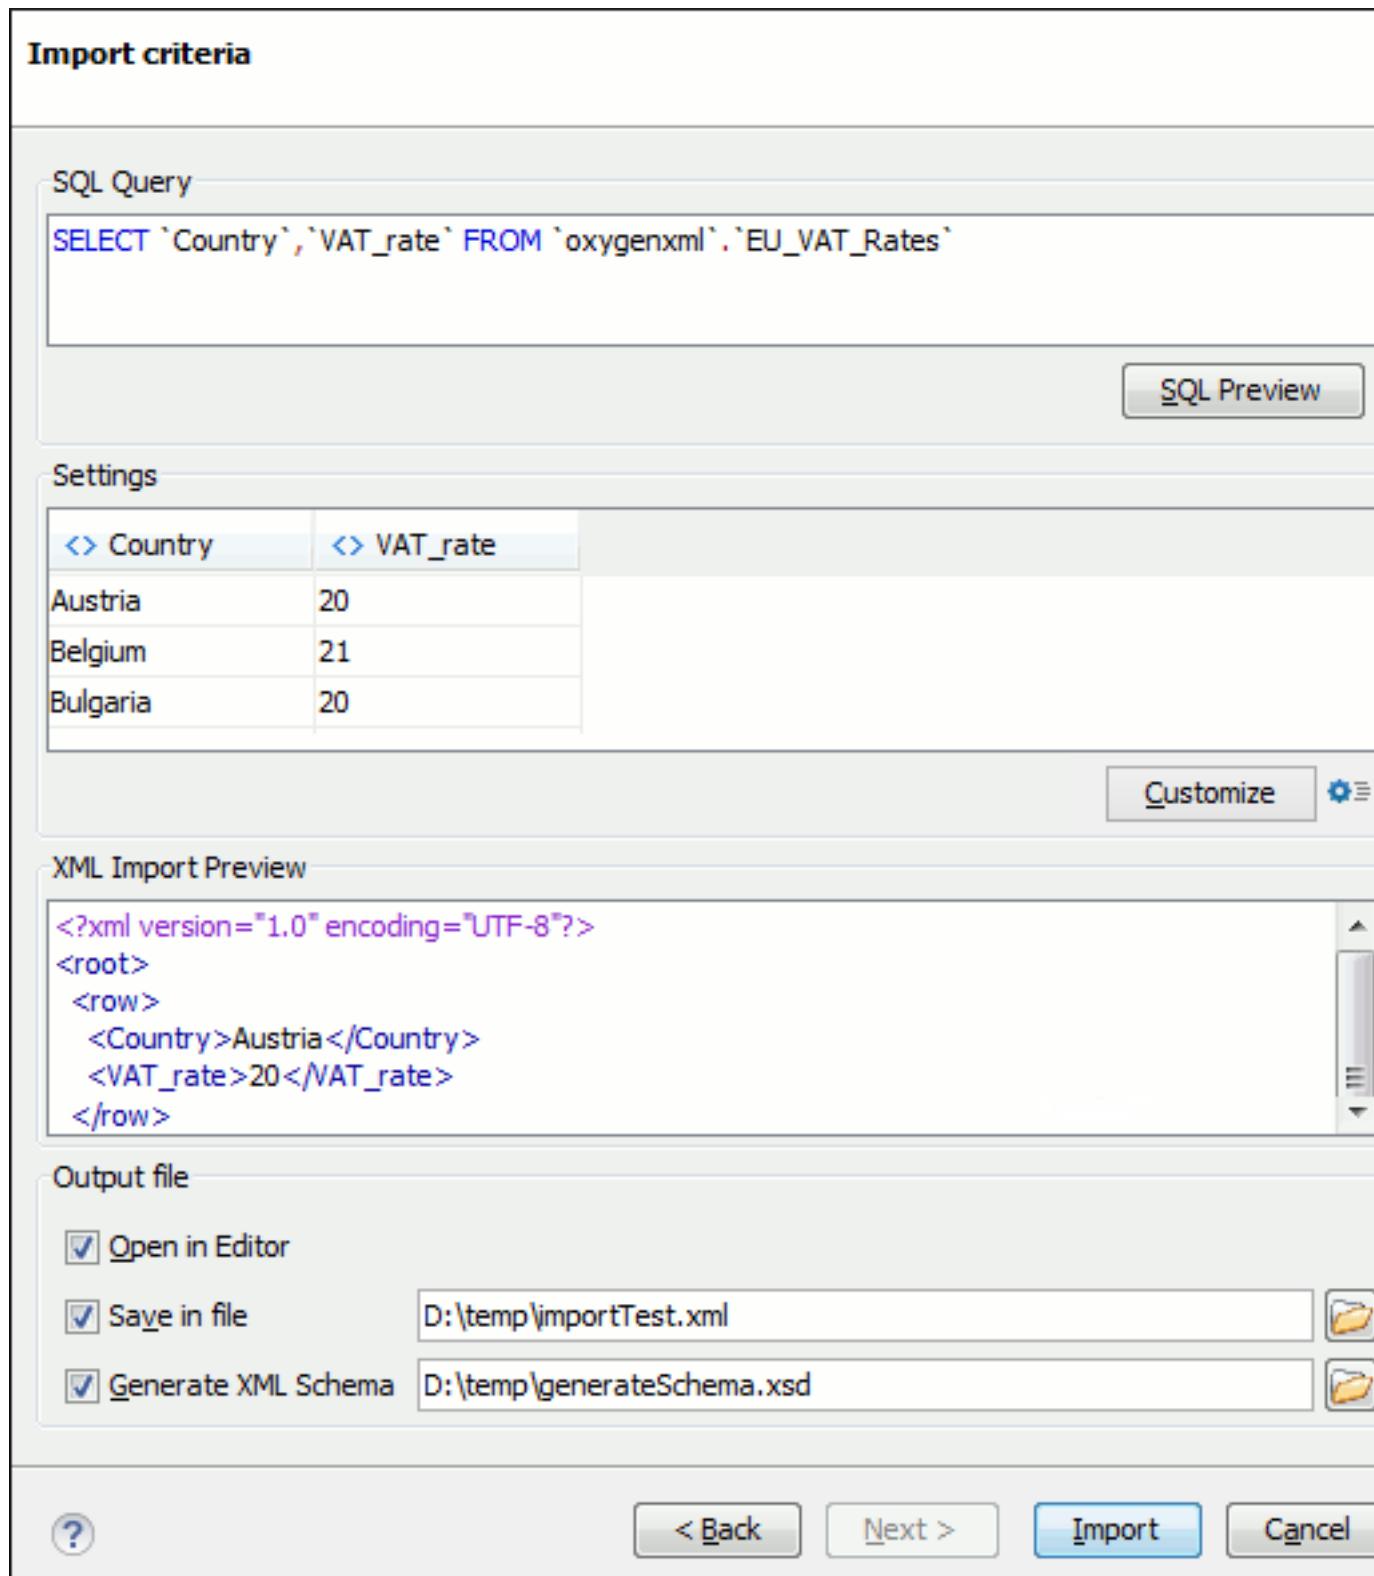

Figure 323: Import from Database Criteria Dialog Box

7. Configure the settings for the conversion.
 - a) **SQL Preview** - If this button is pressed, the **Settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content

(symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

- b) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
- c) **Import Settings** - Clicking this button opens the *Import preferences page* that allows you to configure more import options.
- d) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
- e) **Open in editor** - If checked, the new XML document created from the imported file is opened in the editor.
- f) **Save in file** - If checked, the new XML document is saved in the specified path.
- g) **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Import** to generate the XML document.

Import from HTML Files

[Edit on GitHub](#)

Oxygen XML Author offers support for importing HTML files as an XML document.

To import from HTML files, follow these steps:

1. Go to **File > Import > HTML File**.
The **Import HTML** dialog box is displayed.
2. Enter the URL of the HTML document.
3. Select the type of the resulting XHTML document:
 - XHTML 1.0 Transitional
 - XHTML 1.0 Strict
4. Click the **OK** button.

The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML Transitional or XHTML Strict depending on the option you chose when performing the import operation.

Import Content Dynamically

[Edit on GitHub](#)

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Author also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xls/processor=excel!/
urn:files:sample.xls
```

The previous example first applies a processor (excel) on a target identified by the identifier (urn:files:sample.xls) and converts the Excel™ resource to XML. The second applied processor (xslt) applies an XSLT stylesheet identified using the identifier (urn:processors:excel2d.xls) over the resulting

content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uristartString="urn:files:" rewritePrefix=".//resources//"/>
  <rewriteURI uristartString="urn:processors:" rewritePrefix=".//processors//"/>
>
</catalog>
```

The target resource part of the conversion URL must always follow the ! / pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the XML Catalog support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the XML catalog.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a DITA map with a `topicref` such as:

```
<topicref href="convert://processor=excel!//resources/sample.xls"/>
```

the `resources/sample.xls` path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a *DITA map*.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: <https://github.com/oxygenxml/dita-glass>.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Author. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using XSLT 2.0 processing. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1!/
urn:files:sample.xml
```

- **xquery Processor** - Converts an XML input using XQuery processing. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/
urn:files:sample.xml
```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

```
convert:/processor=excel;sn=test!//urn:files:sample.xls
```

- **java Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of JAR libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

```
public void convert(String systemID, String originalSourceSystemID,
InputStream is,
```

```
OutputStream os, LinkedHashMap<String, String> properties) throws
IOException

convert:/processor=java;jars=libs;ccn=test.JavaToXML!/
urn:files:java/WSEditorBase.java
```

- **js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/
urn:files:sample.md
```

- **json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

- **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

- **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

- **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (**File > C Reload (F5)**) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;....! /urn:files:test.csv
```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/
urn:files:sample.html
```

Important: If you are publishing a DITA map that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to `true`. This will instruct Oxygen XML Author to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libaries** button in the **Advanced** tab of the transformation scenario.

Chapter

13

Document Types (Frameworks)

Topics:

- *Predefined Document Types (Frameworks)*

Presents the built-in support for various document types.

A *document type* or *framework* is associated to an XML file according to a set of rules. It also includes a variety of settings that improve editing capabilities in the **Author** mode for its particular file type. These settings include:

- A default grammar used for validation and content completion in both **Author** mode and **Text** mode.
- CSS stylesheets for rendering XML documents in **Author** mode.
- User actions invoked from toolbars or menus in **Author** mode.
- Predefined scenarios used for transformations for the class of XML documents defined by the document type.
- XML catalogs.
- Directories with file templates.
- User-defined extensions for customizing the interaction with the content author in **Author** mode.

Oxygen XML Author includes built-in support for many common document types. Each document type is defined in a framework. You can create new frameworks or make changes to existing frameworks to suit your individual requirements.

To see a video on configuring a framework in Oxygen XML Author, go to <http://oxygenxml.com/demo/FrameworkConfiguration.html>.

Predefined Document Types (Frameworks)

[Edit on GitHub](#)

Predefined Document Types

The following predefined document types (frameworks) are fully supported in Oxygen XML Author and each of these document types include built-in transformation scenarios, validation, content completion, file templates , default CSS files for rendering content in **Author** mode, and default actions for editing in **Author** mode:

- [DocBook 4](#) - A document type standard for books, articles, and other prose documents (particularly technical documentation).
- [DocBook 5](#) - An enhanced (version 5) document type standard designed for a variety of documents (particularly technical documentation).
- [DITA](#) - An XML-based architecture designed for authoring, producing, and delivering technical information.
- [DITA Map](#) - A document type that collects and organizes references to DITA topics or other maps.
- [XHTML](#) - Extensible HyperText Markup Language includes the same depth of expression as HTML, but also conforms to XML syntax.
- [TEI ODD](#) - Text Encoding Initiative One Document Does it all is an XML-conformant specification that allows you to create TEI P5 schema in a literate programming style.
- [TEI P4](#) - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- [TEI P5](#) - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- [JATS](#) - The NISO Journal Article Tag Suite is a technical standard that defines an XML format for scientific literature.

Other Document Types

Oxygen XML Author also provides limited support (including file templates) for a variety of other document types, including:

- [EPUB \(NCX, OCF, OPF 2.0 & 3.0\)](#) - A standard for e-book files.
- [DocBook Targetset](#) - For resolving cross-references when using *olinks*.
- [Schematron Quick Fixes \(SQF\)](#) - An extension of the ISO standard Schematron, allows developers to define *QuickFixes* for Schematron errors.
- [StratML \(Part 1 & 2\)](#) - Part 1 and 2 of the Strategy Markup Language specification.
- [SVG](#) - Scalable Vector Graphics is a language for describing two-dimensional graphics in XML.
- [MathML](#) - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- [XLIFF \(1.2 & 2.0\)](#) - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- [XQuery](#) - The common query language for XML.
- [CSS](#) - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- [LESS](#) - A dynamic style sheet language that can be compiled into CSS.
- [JavaScript](#) - Programming language of HTML and the Web.
- XML Spec - A markup language for W3C specifications and other technical reports.
- DITAVAL - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- Daisy - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- EAD - Encoded Archival Description is an XML standard for encoding archival finding aids.
- KML - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.

- Maven Project & Settings - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- Oasis XML Catalog - A document that describes a mapping between external entity references and locally-cached equivalents.

DocBook 4 Document Type

[Edit on GitHub](#)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation.

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is `book` or `article`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/4.5/dtd/`.

The default CSS files used for rendering DocBook content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

The default XML catalog, `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/`.

To watch our video demonstration about editing DocBook documents, go to http://oxygentools.com/demo/DocBook_Editing_in_Author.html.

DocBook 4 Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the DocBook 4 framework that can be added to the **DocBook4** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

DocBook 4 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook4** menu and in various submenus of the contextual menu):

B Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">`. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">`. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">`. You can use this action on multiple non-contiguous selections.

*Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)	Inserts a cross reference to other parts of the document.
Web Link (ulink)	Inserts a link that addresses its target with a URL (Universal Resource Locator).
Insert OLink	Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the <code>targetdoc</code> and <code>targetptr</code> values that are present in a <i>Targetset</i> file.

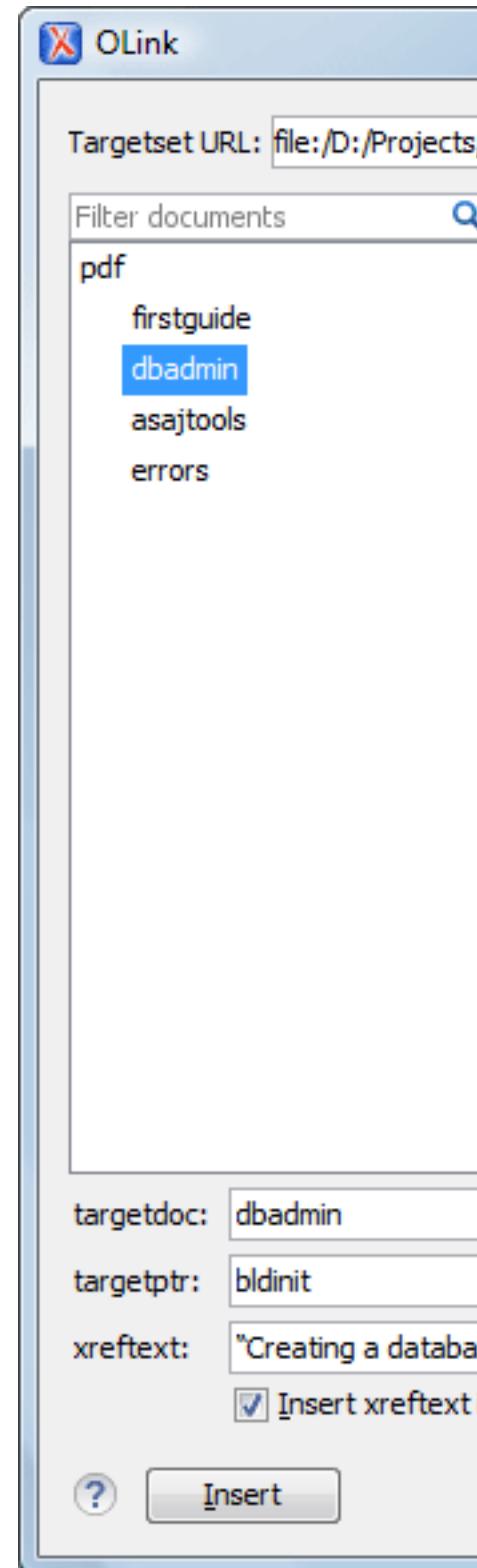

Figure 324: Insert
OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target

documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for `targetdoc` and `targetptr`, you can insert them directly in the corresponding fields. You can also edit an `olink` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `olink`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is enabled.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

 Insert Paragraph	Inserts a new paragraph element at current cursor position.
 Insert Equation	Opens the XML Fragment Editor that allows you to insert and <i>edit MathML notations</i> .
 Insert List Item	Inserts a list item in the current list type.
 Insert Ordered List	Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.
 Insert Itemized List	Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default.
 Insert Variable List	Inserts a DocBook variable list. A child list item is also inserted automatically by default.
 Insert Procedure List	Inserts a DocBook <code>procedure</code> element. A step child item is also inserted automatically.
 Sort	Sorts cells or list items in a table.
 Insert Table	Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.
 Insert Row Below	Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.
 Delete Row(s)	Deletes the table row located at cursor position or multiple rows in a selection.
 Insert Column After	Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook4 Menu Actions

In addition, the following default actions are available in the **DocBook4** menu when editing in **Author** mode:

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted.

	(Above or Below the current column).
 Insert Cell	Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author adds a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.
ID Options	Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:
ID Pattern	The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author <i>Editor Variables</i> .
Element name or class value to generate ID for	The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add , Edit , or Remove buttons.
Auto generate IDs for elements	If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document	When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.
Note: This option does not have an effect on content that is <i>cut</i> and <i>pasted</i> .	

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

Tags display mode Submenu

-  **Full Tags with Attributes** - Displays full tag names with attributes for both block level and in-line level elements.
-  **Full Tags** - Displays full tag names without attributes for both block level and in-line level elements.
-  **Block Tags** - Displays full tag names for block level elements and simple tags without names for in-line level elements.
-  **Inline Tags** - Displays full tag names for inline level elements, while block level elements are not displayed.
-  **Partial Tags** - Displays simple tags without names for in-line level elements, while block level elements are not displayed.
-  **No Tags** - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

 **Profiling Settings** - Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

DocBook 4 Contextual Menu Actions

In addition to many of the [DocBook 4 toolbar actions](#) and the [general Author mode contextual menu actions](#), the following DocBook 4 framework-specific actions are also available in the contextual menu when editing in **Author** mode:

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted

 Link > Edit OLink	Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.
Generate IDs	Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked: <ul style="list-style-type: none"> When invoked on a single selection, an ID is generated for the selected element at the cursor position.
 Delete Row(s)	(Above or Below the current row). Deletes the table row located at cursor position or multiple rows in a selection.
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
 Sort	Sorts cells or list items in a table.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Other Actions submenu	This submenu give you access to all the usual contextual menu actions.

- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DocBook 4 Drag/Drop Actions

Dragging a file from *the Project view* or *DITA Maps Manager view* and dropping it into a DocBook 4 document that is edited in **Author** mode, creates a link to the dragged file (the `ulink` DocBook element) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DocBook 4 document inserts an image element (for example, the `inlinegraphic` DocBook element with a `fileref` attribute) at the drop location, similar to the  **Insert Image** toolbar action.

DocBook 4 Transformation Scenarios

[Edit on GitHub](#)

Default transformation scenarios allow you to convert DocBook 4 to DocBook 5 documents and transform DocBook documents to WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, EPUB and EPUB 3.

Related information

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

[Editing a Transformation Scenario](#) on page 763

DocBook 4 to WebHelp Output

[Edit on GitHub](#)

DocBook 4 documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output

To publish a DocBook 4 document as a *WebHelp Classic* system, follow these steps:

- Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
- Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** section.
- Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook 4 document as a *WebHelp Classic with Feedback* system, follow these steps:

- Click  **Configure Transformation Scenarios**.
- Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** section.
- Click **Apply associated**.
- Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system

requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see [Deploying the WebHelp Classic with Feedback System](#) on page 835.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Classic Mobile Output

To publish a DocBook 4 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

l10n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
```

```

<div id="fb-root"/>
<script>
    <!-- (function(d,
s, id) { var js, fjs =
d.getElementsByTagName(s)[0]; if
(d.getElementById(id)) return;
js = d.createElement(s);
js.id = id; js.src = "//
connect.facebook.net/en_US/
sdk.js#xfbml=1&version=v2.0";

fjs.parentNode.insertBefore(js,
fjs); })(document, 'script',
'facebook-jssdk')); -->
</script>
<div data-share="true" data-
show-faces="true" data-
action="like" data-
layout="standard" class="fb-like"/>
</div>

```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen

XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0> and add it in the *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib* directory.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the *OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins* directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

[WebHelp System Output](#) on page 780

DocBook to PDF Output Customization

[Edit on GitHub](#)

Main steps for customization of PDF output generated from DocBook XML documents.

When the default layout and output look of the DocBook to PDF transformation need to be customized, the following main steps should be followed. In this example a company logo image is added to the front matter of a book. Other types of customizations should follow some similar steps.

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file *[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml* and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
  <mediaobject/>
  <title
    t:named-template="book.verso.title"
    font-size="&hsiz2;"
    font-weight="bold"
    font-family="${title.font.family}" />
  <corpaauthor/>
  ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply *[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl* to the title spec file. The result is an XSLT stylesheet (for example, *mytitlepages.xsl*).

3. Import *mytitlepages.xsl* in a *DocBook customization layer*.

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Author and set the customization layer in *the XSL URL property of the scenario*.

Related information

The book DocBook XSL: The Complete Guide by Bob Stayton contains more details about customizing the PDF output.

Video demonstration for creating a DocBook customization layer in Oxygen XML Author.

DocBook to EPUB Transformation

[Edit on GitHub](#)

The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for `h1` elements, use the `font-family` rule, as in the following example:

```
h1 {
  font-size: 20pt;
  margin-bottom: 20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

3. In your DocBook to EPUB transformation, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

Note: The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

DocBook to DITA Transformation

[Edit on GitHub](#)

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:

- To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu.

- To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
 3. Click the **Apply associated** button to run the transformation.
- Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

DocBook 4 Templates

[Edit on](#)
[GitHub](#)

Default templates are available in the *New File* wizard. You can use them to create a skeletal form of a DocBook 4 book or article. These templates are stored in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/DocBook_4` folder.

Here are some of the DocBook 4 templates available when creating *new documents from templates*:

- Article
- Article with MathML
- Article with SVG
- Article with XInclude
- Book
- Book with XInclude
- Chapter
- Section
- Set of Books

Inserting an olink in DocBook Documents

[Edit on](#)
[GitHub](#)

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: <dir name="directory_name">, in the target database document.

3. Create the target database document.

Each collection of documents has a master target database document that is used to resolve all olinks from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.

The following is an example of a target database document. It structures a collection of documents in a sitemap element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
                     baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agttargets;
          </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
          <document targetdoc="MailReference">
            &reftargets;
          </document>
        </dir>
      </dir>
    </sitemap>
  </targetset>
```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

An example of a target.db file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
    <ttl>Administering User Accounts</ttl>
    <xreftext>How to administer user accounts</xreftext>
    <div element="part" href="#d5e4" number="I">
        <ttl>First Part</ttl>
        <xreftext>Part I, "First Part"</xreftext>
        <div element="chapter" href="#d5e6" number="1">
            <ttl>Chapter Title</ttl>
            <xreftext>Chapter 1, Chapter Title</xreftext>

            <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
                <ttl>Section1 Title</ttl>
                <xreftext>xreflabel_here</xreftext>
            </div>
        </div>
    </div>
</div>
```

5. Insert olink elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the

Link drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (**targetdoc**), its content is displayed, allowing you to easily identify the appropriate **targetptr**. You can also use the search fields to quickly identify a target. If you already know the values for the **targetdoc** and **targetptr** attributes, you can insert them directly in the corresponding fields. In the following image, the target database document is called **target.xml**, **dbadmin** is selected for the target document (**targetdoc**), and **bldinit** is selected as the value for the **targetptr** attribute. Notice that you can also add XREF text into the olink by using the **xreftext** field.

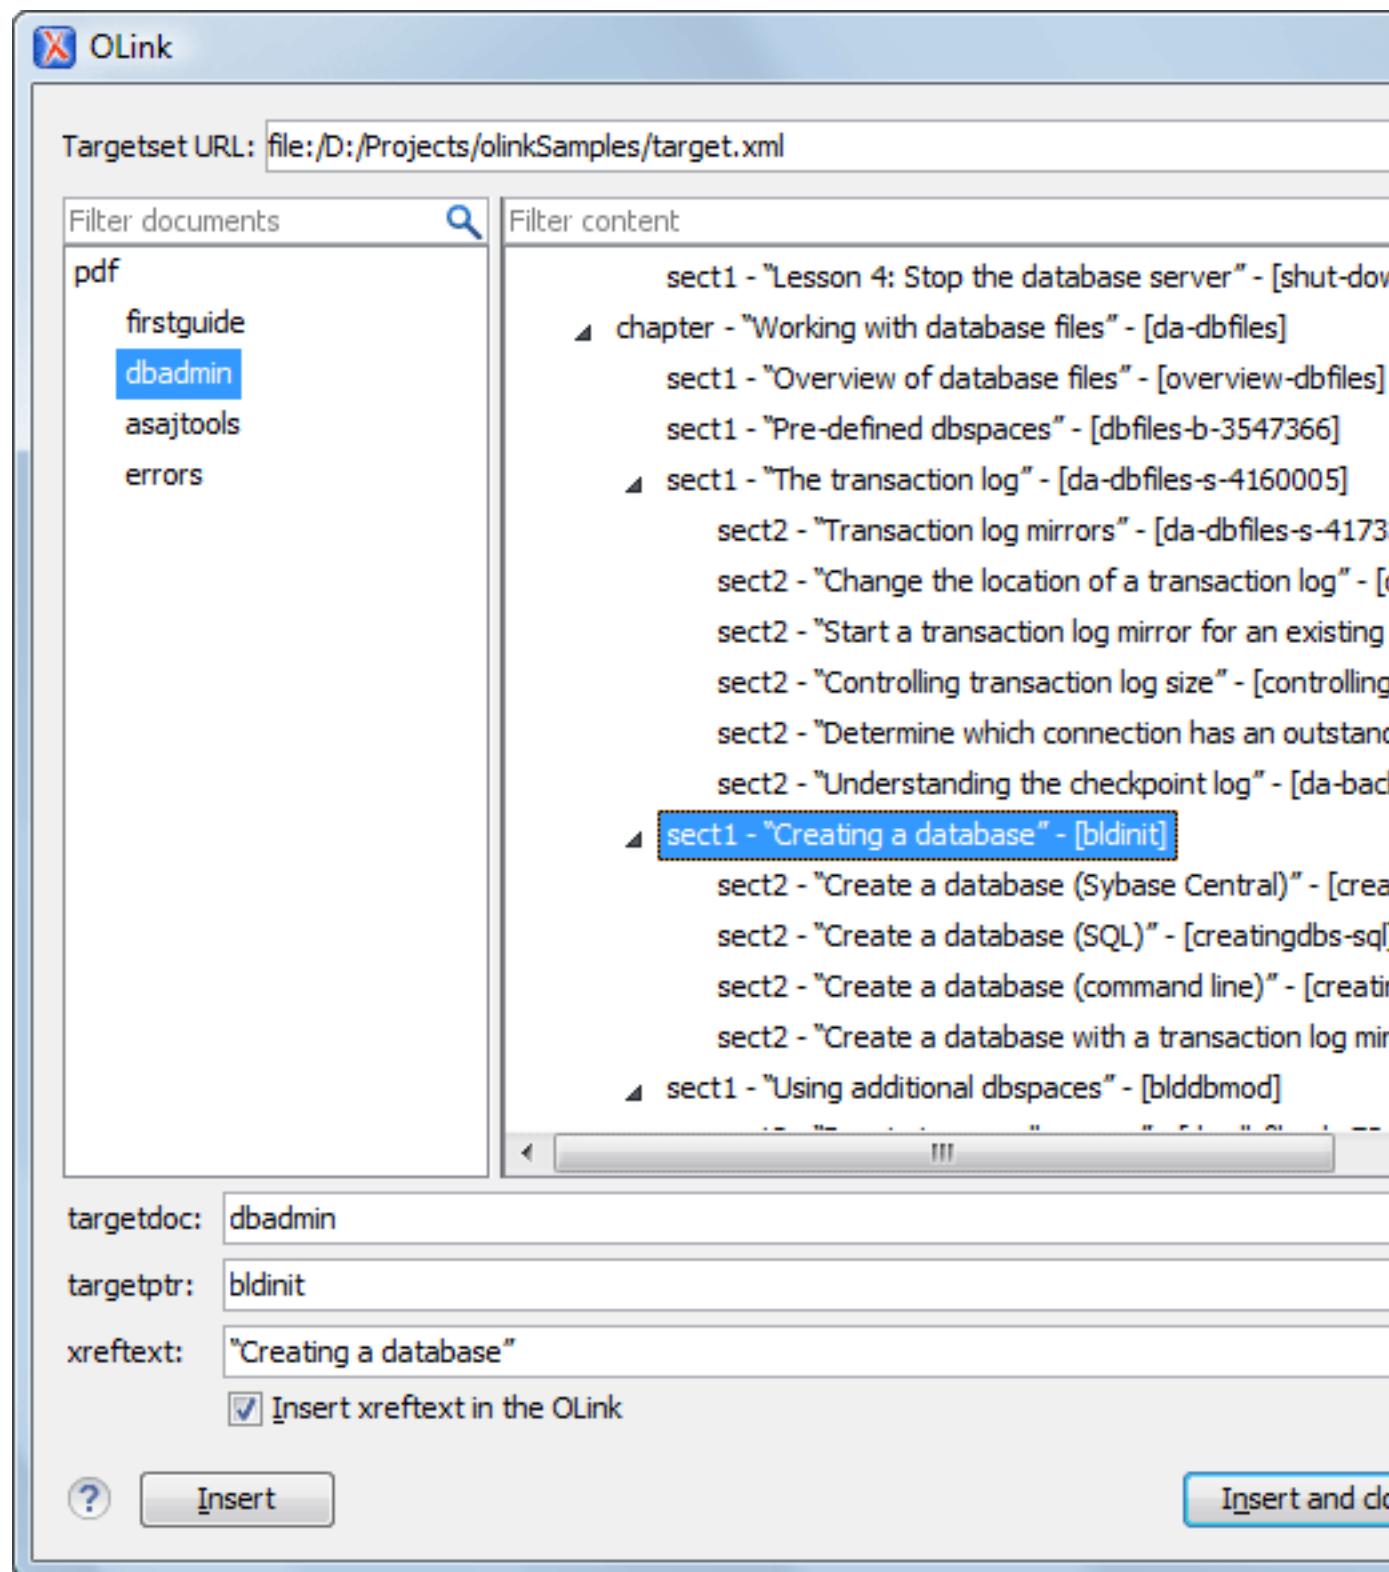

Figure 325: Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
 - a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.

- b) Apply the transformation scenario.

DocBook 5 Document Type

[Edit on GitHub](#)

A file is considered to be a DocBook 5 document when the namespace is `http://docbook.org/ns/docbook`.

The default schema that is used if one is not detected in the DocBook 5 file is `docbookxi.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/`. Other types of schemas are also located in various folders inside the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/` directory (for example, XML Schema files are located in the `xsd` folder).

The default CSS files used for rendering DocBook content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

The default XML catalog, `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/`.

Note: A default XML catalog and schema files for experimental DocBook 5.1 documents are also available in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/` directory.

To watch our video demonstration about editing DocBook documents, go to http://oxygentools.com/demo/DocBook_Editing_in_Author.html.

DocBook 5 Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the DocBook 5 framework that can be added to the **DocBook5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

DocBook 5 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook5** menu and in various submenus of the contextual menu):

B Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

* Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a

URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a *Targetset* file.

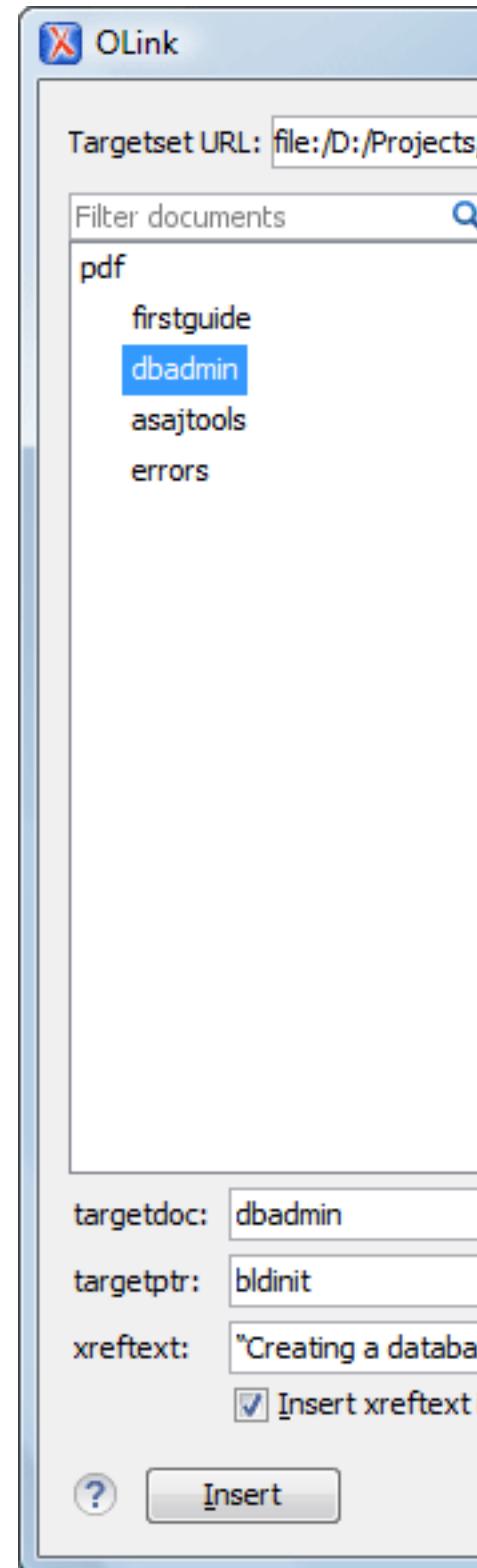

Figure 326: Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target

documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for `targetdoc` and `targetptr`, you can insert them directly in the corresponding fields. You can also edit an `olink` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `olink`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is enabled.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

 Insert Paragraph	Inserts a new paragraph element at current cursor position.
 Insert Equation	Opens the XML Fragment Editor that allows you to insert and <i>edit MathML notations</i> .
 Insert List Item	Inserts a list item in the current list type.
 Insert Ordered List	Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.
 Insert Itemized List	Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default.
 Insert Variable List	Inserts a DocBook variable list. A child list item is also inserted automatically by default.
 Insert Procedure List	Inserts a DocBook <code>procedure</code> element. A step child item is also inserted automatically.
 Sort	Sorts cells or list items in a table.
 Insert Table	Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.
 Insert Row Below	Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.
 Delete Row(s)	Deletes the table row located at cursor position or multiple rows in a selection.
 Insert Column After	Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook5 Menu Actions

In addition, the following default actions are available in the **DocBook5** menu when editing in **Author** mode:

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted.

	(Above or Below the current column).
 Insert Cell	Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author adds a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.
ID Options	Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:
ID Pattern	The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author <i>Editor Variables</i> .
Element name or class value to generate ID for	The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add , Edit , or Remove buttons.
Auto generate IDs for elements	If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document	When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.
Note: This option does not have an effect on content that is <i>cut</i> and <i>pasted</i> .	

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

Tags display mode Submenu

-  **Full Tags with Attributes** - Displays full tag names with attributes for both block level and in-line level elements.
-  **Full Tags** - Displays full tag names without attributes for both block level and in-line level elements.
-  **Block Tags** - Displays full tag names for block level elements and simple tags without names for in-line level elements.
-  **Inline Tags** - Displays full tag names for inline level elements, while block level elements are not displayed.
-  **Partial Tags** - Displays simple tags without names for in-line level elements, while block level elements are not displayed.
-  **No Tags** - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

 **Profiling Settings** - Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

DocBook 5 Contextual Menu Actions

In addition to many of the [DocBook 5 toolbar actions](#) and the [general Author mode contextual menu actions](#), the following DocBook 5 framework-specific actions are also available in the contextual menu when editing in **Author** mode:

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted

 Link > Edit OLink	Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.
Generate IDs	Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked: <ul style="list-style-type: none"> When invoked on a single selection, an ID is generated for the selected element at the cursor position.
 Delete Row(s)	(Above or Below the current row). Deletes the table row located at cursor position or multiple rows in a selection.
Insert Columns	Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
 Sort	Sorts cells or list items in a table.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Other Actions submenu	This submenu give you access to all the usual contextual menu actions.

- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DocBook 5 Drag/Drop Actions

Dragging a file from *the Project view* or *DITA Maps Manager view* and dropping it into a DocBook 5 document that is edited in **Author** mode, creates a link to the dragged file (the `link` DocBook element) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DocBook 5 document inserts an image element (the `imageobject` DocBook element with an `imagedata` child element and a `fileref` attribute) at the drop location, similar to the  **Insert Image** toolbar action.

DocBook 5 Transformation Scenarios

[Edit on GitHub](#)

Default transformation scenarios allow you to transform DocBook 5 documents to WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, EPUB, and EPUB 3.

Related information

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

[Editing a Transformation Scenario](#) on page 763

DocBook 5 to WebHelp Output

[Edit on GitHub](#)

DocBook 5 documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output

To publish a DocBook 5 document as a *WebHelp Classic* system, follow these steps:

- Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
- Select the **DocBook WebHelp Classic** scenario from the **DocBook 5** section.
- Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook 5 document as a *WebHelp Classic with Feedback* system, follow these steps:

- Click  **Configure Transformation Scenarios**.
- Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 5** section.
- Click **Apply associated**.
- Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system

requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see [Deploying the WebHelp Classic with Feedback System](#) on page 835.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Classic Mobile Output

To publish a DocBook 5 document as a **WebHelp Classic Mobile** system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

110n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
```

```

<div id="fb-root"/>
<script>
    <!-- (function(d,
s, id) { var js, fjs =
d.getElementsByTagName(s)[0]; if
(d.getElementById(id)) return;
js = d.createElement(s);
js.id = id; js.src = "//
connect.facebook.net/en_US/
sdk.js#xfbml=1&version=v2.0";

fjs.parentNode.insertBefore(js,
fjs); })(document, 'script',
'facebook-jssdk')); -->
</script>
<div data-share="true" data-
show-faces="true" data-
action="like" data-
layout="standard" class="fb-like"/>
</div>

```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' () { } = ; * % + &.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen

XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0> and add it in the *DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib* directory.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the *OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins* directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

[WebHelp System Output](#) on page 780

DocBook to PDF Output Customization

[Edit on GitHub](#)

Main steps for customization of PDF output generated from DocBook XML documents.

When the default layout and output look of the DocBook to PDF transformation need to be customized, the following main steps should be followed. In this example a company logo image is added to the front matter of a book. Other types of customizations should follow some similar steps.

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file *[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml* and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
  <mediaobject/>
  <title
    t:named-template="book.verso.title"
    font-size="&hsiz2;"
    font-weight="bold"
    font-family="${title.font.family}" />
  <corpaauthor/>
  ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply *[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl* to the title spec file. The result is an XSLT stylesheet (for example, *mytitlepages.xsl*).

3. Import *mytitlepages.xsl* in a *DocBook customization layer*.

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Author and set the customization layer in *the XSL URL property of the scenario*.

Related information

The book DocBook XSL: The Complete Guide by Bob Stayton contains more details about customizing the PDF output.

Video demonstration for creating a DocBook customization layer in Oxygen XML Author.

DocBook to EPUB Transformation

[Edit on GitHub](#)

The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for `h1` elements, use the `font-family` rule, as in the following example:

```
h1 {
  font-size: 20pt;
  margin-bottom: 20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

3. In your DocBook to EPUB transformation, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

Note: The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

DocBook to DITA Transformation

[Edit on GitHub](#)

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:

- To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu.

- To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
 3. Click the **Apply associated** button to run the transformation.
- Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

DocBook 5 Templates

[Edit on](#)
[GitHub](#)

Default templates are available in the *New File wizard* and can be used for easily creating a skeletal form of a DocBook 5 book or article. These templates are stored in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/DocBook 5` folder.

Here are some of the DocBook 5 templates available when creating *new documents from templates*:

- **Article**
- **Article with MathML**
- **Article with SVG**
- **Article with XInclude**
- **Book**
- **Book with XInclude**
- **Chapter**
- **Section**
- **Set of Books**

Some experimental DocBook 5.1 templates are also available and are stored in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/DocBook 5.1 (Experimental)` folder. They include the following:

- **Assembly**
- **Topic**

Inserting an olink in DocBook Documents

[Edit on](#)
[GitHub](#)

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

You may need to update your
`<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>`
when you get a new machine.

To use an olink to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an olink. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: <dir name="directory_name">, in the target database document.

3. Create the target database document.

Each collection of documents has a master target database document that is used to resolve all olinks from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.

The following is an example of a target database document. It structures a collection of documents in a sitemap element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
  <!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
  <!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
  <!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
                     baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agttargets;
          </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
          <document targetdoc="MailReference">
            &reftargets;
          </document>
        </dir>
      </dir>
    </sitemap>
  </targetset>
```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

An example of a `target.db` file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
    <ttx>Administering User Accounts</ttx>
    <xreftext>How to administer user accounts</xreftext>
    <div element="part" href="#d5e4" number="I">
        <ttx>First Part</ttx>
        <xreftext>Part I, "First Part"</xreftext>
        <div element="chapter" href="#d5e6" number="1">
            <ttx>Chapter Title</ttx>
            <xreftext>Chapter 1, Chapter Title</xreftext>

            <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
                <ttx>Section1 Title</ttx>
                <xreftext>xreflabel_here</xreftext>
            </div>
        </div>
    </div>
</div>
```

5. Insert `olink` elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the

Link drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `olink` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`targetdoc`), and `bldinit` is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the `olink` by using the `xreftext` field.

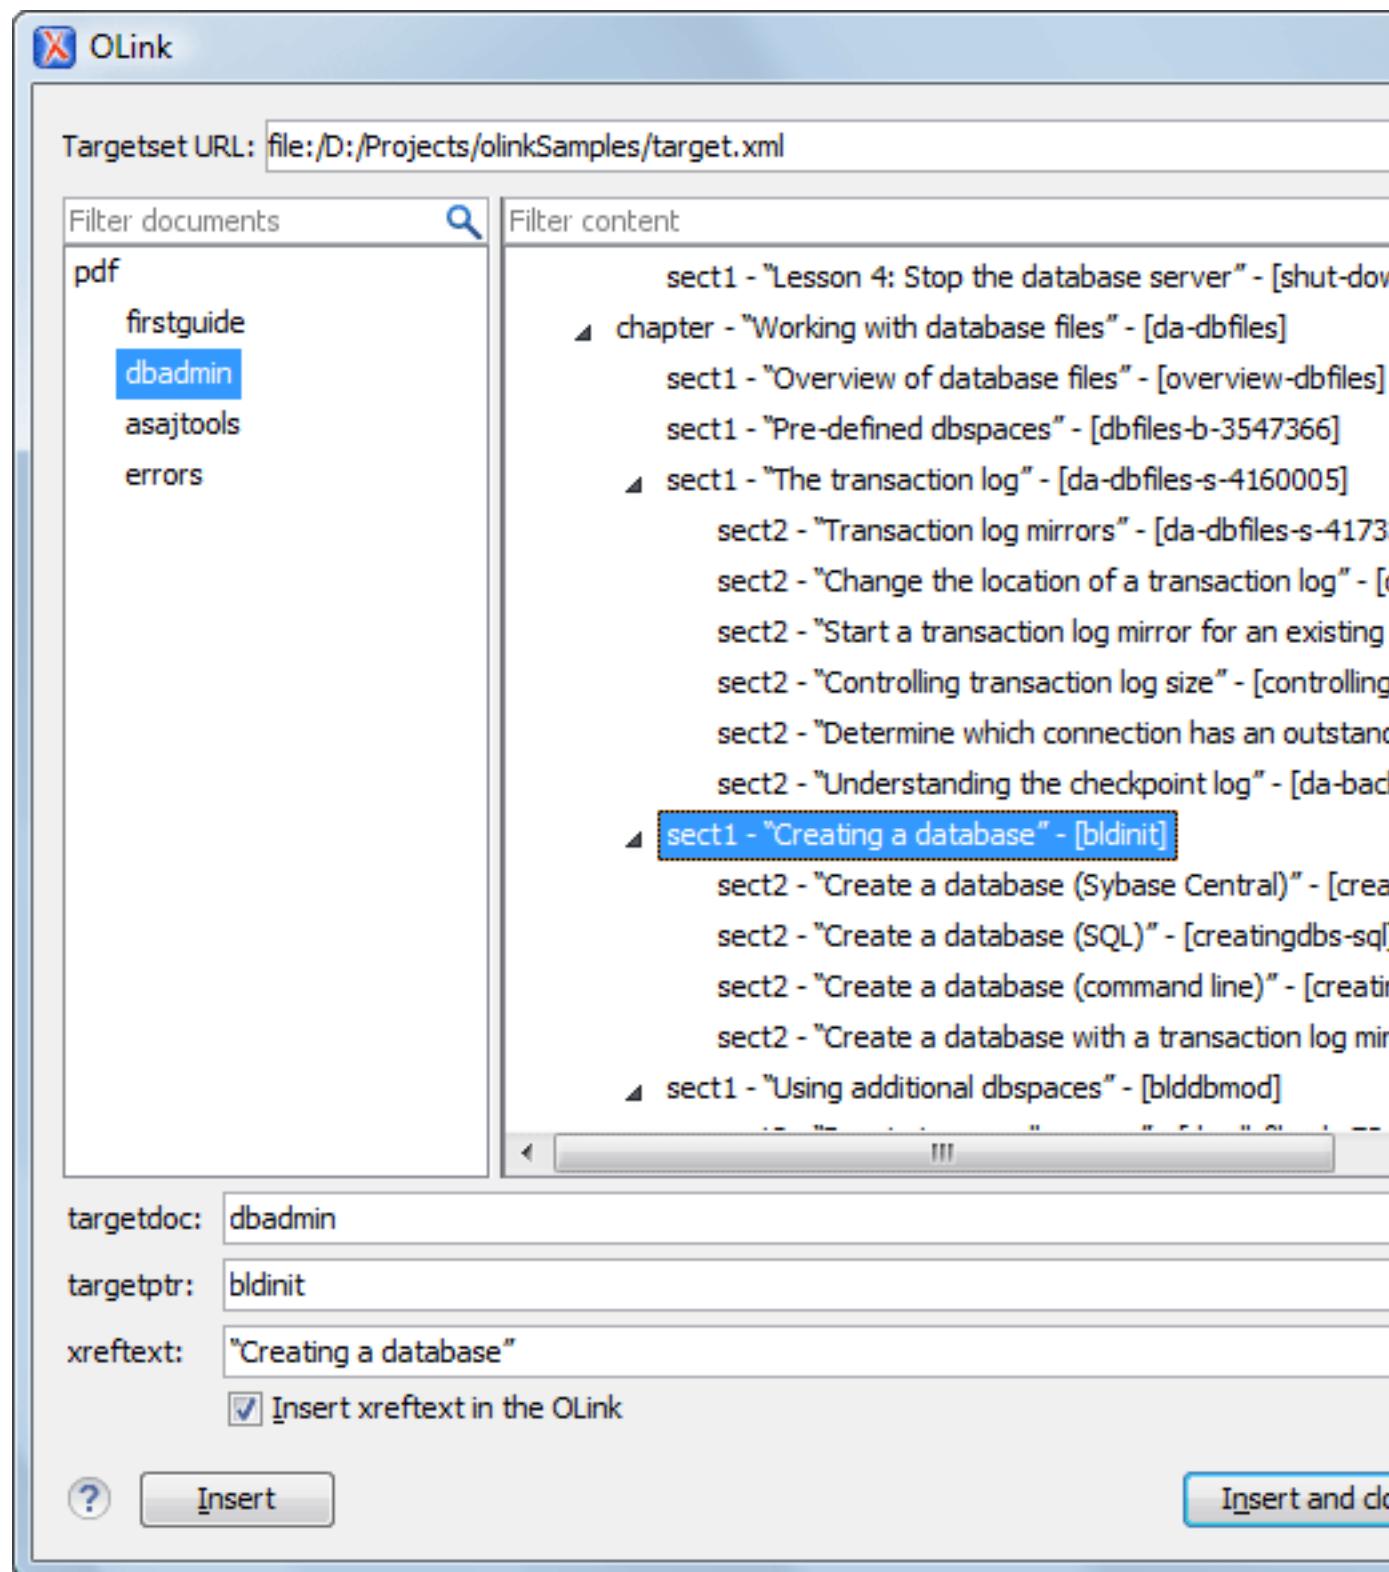

Figure 327: Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
 - a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.

- b) Apply the transformation scenario.

DocBook Targetset Document Type

[Edit on GitHub](#)

DocBook *Targetset* documents are used to resolve cross references with the DocBook olink.

A file is considered to be a *Targetset* when the root name is `targetset`.

The default schema, `targetdatabase.dtd`, for this type of document is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/common/`.

Document Templates

The default template for DocBook *Targetset* documents is located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset` folder.

The following DocBook *Targetset* template is available when creating [new document from templates](#):

- **DocBook Targetset - Map** - New Targetset map.

DITA Topics Document Type

[Edit on GitHub](#)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture oriented to authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. Oxygen XML Author provides schema-driven (DTD, RNG, XSD) templates for DITA documents.

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `concept`, `task`, `reference`, `dita`, or `topic`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has an attribute named `DITAArchVersion` for the “`http://dita.oasis-open.org/architecture/2005/`” namespace. This enhanced case of matching is only applied when the [Enable DTD/XML Schema processing in document type detection option](#) is enabled from the [Document Type Association preferences page](#).

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside `DITA_OT_DIR/dtd/` or `DITA_OT_DIR/schema/`.

The default CSS files used for rendering DITA content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

The default catalogs for the DITA topic document type are as follows:

- `DITA_OT_DIR/catalog-dita.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/plugin/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/styleguide/catalog.xml`

DITA Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the DITA framework that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

DITA Toolbar Actions

The following default actions are readily available on the **DITA (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

B Bold

Surrounds the selected text with a **b** tag. You can use this action on multiple non-contiguous selections.

I Italic

Surrounds the selected text with an **i** tag. You can use this action on multiple non-contiguous selections.

U Underline

Surrounds the selected text with a **u** tag. You can use this action on multiple non-contiguous selections.

*Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the [Cross Reference \(xref\) dialog box](#) that allows you to insert a link to a target resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see [Linking in DITA Topics](#) on page 1666.

File Reference

Opens the [File Reference dialog box](#) that allows you to insert a link to a target file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see [Linking in DITA Topics](#) on page 1666.

Web Link

Opens the [Web Link dialog box](#) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already

defined in your DITA map structure. For more information, see [Linking in DITA Topics](#) on page 1666.

Related Link to Topic

Opens the [Cross Reference \(xref\) dialog box](#) that allows you to insert a link to a target resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1666.

Related Link to File

Opens the [File Reference dialog box](#) that allows you to insert a link to a target file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1666.

Related Link to Web Page

Opens the [Web Link dialog box](#) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA

map structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1666.

Insert Image

Opens the [Insert Image dialog box](#) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

§ **Insert Section Drop-Down Menu**

§ **Insert Section**

Inserts a new `section` element in the document, depending on the current context.

§ **Insert Concept**

Inserts a new `concept` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

§ **Insert Task**

Inserts a new `task` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will enable a user to perform a task.

§ **Insert Topic**

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

§ **Insert Reference**

Inserts a new `reference` element, depending on the current context. A reference is a top-level container for a reference topic.

¶ **Insert Paragraph**

Inserts a new paragraph at current cursor position.

¶ **Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the [Reuse Content dialog box](#)

 +Insert step or list item	that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include <i>content references (conref)</i> , <i>content key references (conkeyref)</i> , or <i>key references to metadata (keyref)</i> .
 Insert Unordered List	Inserts a new list or step item in the current list type.
 Insert Ordered List	Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default.
 Sort	Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.
 Insert Table	Sorts cells or list items in a table.
 +Insert Row Below	Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.
 Delete Row(s)	Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.
 +Insert Column After	Deletes the table row located at cursor position or multiple rows in a selection.
 Delete Column(s)	Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.
 Table Properties	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
 Split Cell	Joins the content of the selected cells (both horizontally and vertically).
	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Menu Actions

In addition to the *DITA toolbar actions*, the following default actions are available in the **DITA** menu when editing in **Author** mode:

This action provides a mechanism for reusing content fragments. It opens the *Reuse Content dialog box* that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include *content references (conref)*, *content key references (conkeyref)*, or *key references to metadata (keyref)*.

Push Current Element	Opens the Push current element dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.				
Edit Content Reference	This action is available for elements with a <code>conref</code> or <code>conkeyref</code> attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (<code>conref/conkeyref</code> and <code>conrefend</code> attributes). For more information, see Reuse Content Dialog Box on page 1651.				
Replace Reference with content	Replaces the referenced fragment (<code>conref</code> or <code>conkeyref</code>) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.				
Remove Content Reference	Removes the content reference (<code>conref</code> or <code>conkeyref</code>) inside the element at the cursor position.				
Create Reusable Component	Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1663.				
Insert Reusable Component	Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1664.				
 Paste special submenu	<p>This submenu includes the following special paste actions that are specific to the DITA framework:</p> <table border="0"> <tr> <td>Paste as content reference</td><td>Inserts a content reference (a DITA element with a <code>conref</code> attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The <code>conref</code> attribute will point to this ID value.</td></tr> <tr> <td>Paste as content key reference</td><td>Allows you to indirectly reference content using the <code>conkeyref</code> attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following: <ol style="list-style-type: none"> 1. Make sure the DITA element that contains </td></tr> </table>	Paste as content reference	Inserts a content reference (a DITA element with a <code>conref</code> attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The <code>conref</code> attribute will point to this ID value.	Paste as content key reference	Allows you to indirectly reference content using the <code>conkeyref</code> attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following: <ol style="list-style-type: none"> 1. Make sure the DITA element that contains
Paste as content reference	Inserts a content reference (a DITA element with a <code>conref</code> attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The <code>conref</code> attribute will point to this ID value.				
Paste as content key reference	Allows you to indirectly reference content using the <code>conkeyref</code> attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following: <ol style="list-style-type: none"> 1. Make sure the DITA element that contains 				

the copied content has an ID attribute assigned to it.

2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Inserts a `link` element or an `xref` (depending on the location of the paste operation) that points to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `href` attribute of `link`/`href` will point to this ID value.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key

assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author creates a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Insert > Insert Equation

ID Options

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#).

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using

	constant strings or any of the Oxygen XML Author <i>Editor Variables</i> .
Element name or class value to generate ID for	The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add , Edit , or Remove buttons.
Auto generate IDs for elements	If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document	When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.
	Note: This option does not have an effect on content that is <i>cut</i> and <i>pasted</i> .

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of

Tags display mode Submenu

the documentation tips that are displayed by the **Content Completion Assistant**.

You can use this action to manually trigger a refresh and update of all referenced resources.

Full Tags with Attributes - Displays full tag names with attributes for both block level and in-line level elements.

Full Tags - Displays full tag names without attributes for both block level and in-line level elements.

Block Tags - Displays full tag names for block level elements and simple tags without names for in-line level elements.

Inline Tags - Displays full tag names for inline level elements, while block level elements are not displayed.

Partial Tags - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

No Tags - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

Profiling Settings - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

DITA Contextual Menu Actions

In addition to many of the *DITA toolbar actions* and the *general Author mode contextual menu actions*, the following DITA framework-specific actions are also available in the contextual menu when editing in **Author** mode:

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Inserts a `link` element or an `xref` (depending on the location of the paste operation) that points to the DITA XML element from the clipboard. An

		entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The href attribute of link(href will point to this ID value.
Paste as link (keyref)	Inserts a link to the element that you want to reference. To use this action, you must first do the following:	
		<ol style="list-style-type: none"> 1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it. 2. In the DITA Maps Manager view, make sure that the Root map combo box points to the correct map that stores the keys. 3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.
Image Map Editor	This action is available in the contextual menu when it is invoked on an image. This action applies an <i>image map</i> to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.	
Table Actions	The following table editing actions are available in the contextual menu when it is invoked on a table:	
	Insert Rows	Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

 Delete Row(s)	Deletes the table row located at cursor position or multiple rows in a selection.
 Insert Columns	Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
 Sort	Sorts cells or list items in a table.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Other Actions submenu	This submenu give you access to all the usual contextual menu actions.
Insert >  Insert Equation	Opens the XML Fragment Editor that allows you to insert and edit MathML notations .
Generate IDs	Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked: <ul style="list-style-type: none"> • When invoked on a single selection, an ID is generated for the selected element at the cursor position. • When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Reuse submenu

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

This submenu includes the following actions in regards to reusing content in DITA:

Push Current Element	Opens the <i>Push current element dialog box</i> that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.
Edit Content Reference	This action is available for elements with a <code>conref</code> or <code>conkeyref</code> attribute. it opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (<code>conref/conkeyref</code> and <code>conrefend</code> attributes). For more information, see <i>Reuse Content Dialog Box</i> on page 1651.
Replace Reference with content	Replaces the referenced fragment (<code>conref</code> or <code>conkeyref</code>) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.
Remove Content Reference	Removes the content reference (<code>conref</code> or <code>conkeyref</code>) inside the element at the cursor position.
Create Reusable Component	Creates a reusable component from the selected fragment of text. For more information, see <i>Creating a Reusable</i>

 Search References (Ctrl + Shift + G)	<i>Content Component</i> on page 1663.
Insert Reusable Component	Inserts a reusable component at cursor location. For more information, see <i>Inserting a Reusable Content Component</i> on page 1664.

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (opened in the **DITA Maps Manager** view). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

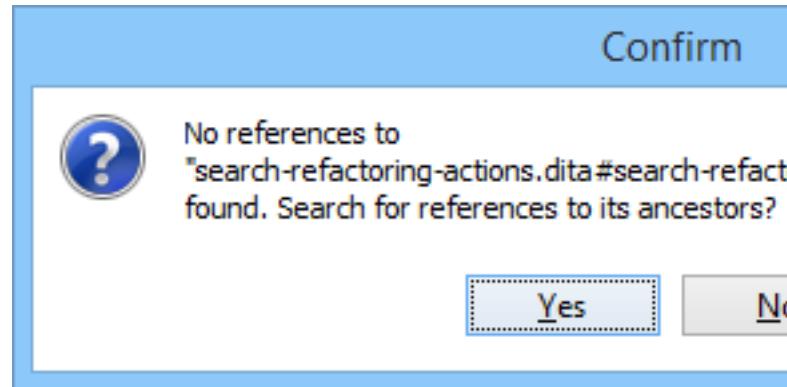

Figure 328: Search References to Ancestors Dialog Box

About Element submenu

This submenu includes the following actions:

 Style Guide	Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element submenu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant .
 Browse reference manual	Opens a reference to the documentation of the XML element closest to

Opens a reference to the documentation of the XML element closest to

the cursor position in a web browser.

Moves the cursor to the definition of the current element.

DITA Drag/Drop Actions

Dragging a file from *the Project view* or *DITA Maps Manager view* and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DITA document inserts an image element (the `image` DITA element with the `href` attribute) at the drop location.

DITA Topic Transformation Scenarios

[Edit on GitHub](#)

The following default transformation scenarios are available for DITA Topics:

- **DITA XHTML** - Transforms a DITA topic to XHTML using DITA Open Toolkit.
- **DITA PDF** - Transforms a DITA topic to PDF using the DITA Open Toolkit and the Apache FOP engine.

Related information

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

[Editing a Transformation Scenario](#) on page 763

DITA Templates

[Edit on GitHub](#)

The default templates available for DITA topics are stored in various sub-folders inside the `[OXYGEN_INSTALL_DIR]/frameworks/dita/templates/` folder. They can be used for easily creating a DITA concept, reference, task, topic, or other DITA documents.

Here are some of the DITA templates available when creating *new documents from templates*:

- **Composite** - New DITA Composite
- **Concept** - New DITA Concept
- **General Task** - New DITA Task
- **Glossentry** - New DITA Glossentry
- **Glossgroup** - New DITA Glossgroup
- **Machinery Task** - New DITA Machinery Task
- **Reference** - New DITA Reference
- **Task** - New DITA Task
- **Topic** - New DITA Topic
- **Learning Assessment** - New DITA Learning Assessment (learning specialization in DITA 1.2)
- **Learning Content** - New DITA Learning Content (learning specialization in DITA 1.2)
- **Learning Summary** - New DITA Learning Summary (learning specialization in DITA 1.2)
- **Learning Overview** - New DITA Learning Overview (learning specialization in DITA 1.2)
- **Learning Plan** - New DITA Learning Plan (learning specialization in DITA 1.2)
- **Troubleshooting** - DITA 1.3 Troubleshooting specialization

DITA for Publishers topic specialization templates (available only when using the *built-in DITA-OT 1.8 version*):

- **D4P Article** - New DITA for Publishers article
- **D4P Chapter** - New DITA for Publishers chapter

- **D4P Concept** - New DITA for Publishers concept
- **D4P Conversion Configuration** - New DITA for Publishers conversion configuration
- **D4P Cover** - New DITA for Publishers cover
- **D4P Part** - New DITA for Publishers part
- **D4P Sidebar** - New DITA for Publishers sidebar
- **D4P Subsection** - New DITA for Publishers subsection
- **D4P Topic** - New DITA for Publishers topic

DITA Map Document Type

[Edit on GitHub](#)

DITA maps are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects.

Maps allow scalable reuse of content across multiple contexts. They can be used by information architects, authors, and publishers to plan, develop, and deliver content.

A file is considered to be a DITA map document when either of the following is true:

- The root element name is one of the following: map, bookmap.
- The public id of the document is - //OASIS//DTD DITA Map or - //OASIS//DTD DITA BookMap.
- The root element of the file has an attribute named class that contains the value map/map and a DITAArchVersion attribute from the <http://dita.oasis-open.org/architecture/2005/> namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection option** from the **Document Type Association preferences page** is enabled.

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside *DITA_OT_DIR/dtd/* or *DITA_OT_DIR/schema/*.

The default CSS files used for rendering DITA content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]/frameworks/dita/css/*.

The default catalogs for the *DITA Map* document type are as follows:

- *[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml*
- *DITA_OT_DIR/catalog-dita.xml*

Related information

[Selecting a Root Map](#) on page 1594

DITA Map Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the DITA Map framework that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

DITA Map Toolbar and Menu Actions

When a DITA map is opened in **Author** mode, the following default actions are available on the **DITA Map Author Custom Actions** toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

Insert New Topic

Opens a [New DITA topic dialog box](#) that allows you to create a new topic and inserts a reference to it at the cursor position.

**Insert Topic Reference**

Opens the [Insert Reference dialog box](#) that allows you to insert and configure a reference to a topic at the cursor position.

**Reuse Content**

Opens the [Reuse Content dialog box](#) that allows you to insert and configure a content reference (conref), or a content key reference (conkeyref) at the cursor position.

**Insert Topic Heading**

Opens the [Insert Reference dialog box](#) that allows you to insert a topic heading at the cursor position.

**Insert Topic Group**

Opens the [Insert Reference dialog box](#) that allows you to insert a topic group at the cursor position.

**Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

**Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

**Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

**Delete Relationship Column**

Deletes the table column where the cursor is located.

**Delete Relationship Row**

Deletes the table row where the cursor is located.

DITA Menu Actions

In addition, the following default actions are available in the **DITA** menu when editing a DITA map in **Author** mode:

**Tags display mode Submenu**

You can use this action to manually trigger a refresh and update of all referenced resources.

Full Tags with Attributes - Displays full tag names with attributes for both block level and in-line level elements.

Full Tags - Displays full tag names without attributes for both block level and in-line level elements.

Block Tags - Displays full tag names for block level elements and simple tags without names for in-line level elements.

Inline Tags - Displays full tag names for inline level elements, while block level elements are not displayed.

 **Partial Tags** - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

 **No Tags** - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

 **Profiling Settings** - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

DITA Map Contextual Menu Actions

In addition to many of the *DITA Map toolbar actions* and the *general Author mode contextual menu actions*, the following DITA map framework-specific actions are also available in the contextual menu when editing in **Author** mode:

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box* on 1609.

Search References

Finds the references to the href or keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the **DITA Maps Manager** view). The current topic/map reference element must have an href or keys attribute defined to complete the search.

DITA Map Drag/Drop Actions

Dragging a file from *the Project view* or *DITA Maps Manager view* and dropping it into a DITA map document that is edited in **Author** mode creates a link to the dragged file (a topicref element, chapter, part, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a DITA map is opened in **Author** mode, you can click the  icon to the left of a topic to open that particular topic in the editor.

DITA Map Transformation Scenarios

[Edit on GitHub](#)

The following default transformations scenarios are available:

- Predefined transformation scenarios allow you to transform a DITA map to a variety of outputs, such as PDF, ODF, XHTML, WebHelp, EPUB, and CHM files.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to *integrate a DITA-OT plugin*. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this transformation scenario if you want to generate a DITA map statistics report containing information such as:
 - The number of processed maps and topics.
 - Content reuse percentage.
 - Number of elements, attributes, words, and characters used in the entire DITA map structure.
 - DITA conditional processing attributes used in the DITA maps.
 - Words count.
 - Information types such as number of containing maps, bookmaps, or topics.

DITA Map to WebHelp Output

[Edit on GitHub](#)

DITA maps can be transformed into a variety of WebHelp systems designed to suit your specific needs. This section contains the procedures for obtaining the output for the variants of the WebHelp system.

Related information

[WebHelp System Output](#) on page 780

WebHelp Responsive Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Responsive* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.

- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from <http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0> and add it in the `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib` directory.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.sitemap.change.frequency

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

Parameters Specific to WebHelp Responsive Output

webhelp.fragment.after.body

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the body in the output.

webhelp.fragment.after.logo_and_title

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the logo and title in the output.

webhelp.fragment.after.main.page.search

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the search field in the output.

webhelp.fragment.after.toc_or_tiles

Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the table of contents or tiles in the main page of the output.

webhelp.fragment.after.top_menu

Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the top menu in the output.

webhelp.fragment.before.body

Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the body in the output.

webhelp.fragment.before.logo_and_title

Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the logo and title in the output.

<code>webhelp.fragment.before.main.page.search</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the search field in the output.
<code>webhelp.fragment.before.toc_or_tiles</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the table of contents or tiles in the main page of the output.
<code>webhelp.fragment.before.top_menu</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the top menu in the output.
<code>webhelp.fragment.footer</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the footer in the output.
<code>webhelp.fragment.head</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the header in the output.
<code>webhelp.fragment.welcome</code>	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as a welcome message (or title) in the output.
<code>webhelp.show.breadcrumb</code>	Specifies if the breadcrumb component will be presented in the output. The default value is yes.
<code>webhelp.show.indexterms.link</code>	Specifies if an icon that links to the index will be presented in the output. The default value is yes.
<code>webhelp.show.main.page.tiles</code>	Specifies if the tiles component will be presented in the main page of the output. For a <i>tree</i> style layout, this parameter should be set to no.
<code>webhelp.show.main.page.toc</code>	Specifies if the table of contents will be presented in the main page of the output. The default value is yes.
<code>webhelp.show.navigation.links</code>	Specifies if navigation links will be presented in the output. The default value is yes.
<code>webhelp.show.print.link</code>	Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.
<code>webhelp.show.side.toc</code>	Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.
<code>webhelp.show.top.menu</code>	Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.
<code>webhelp.top.menu.depth</code>	Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

WebHelp Responsive with Feedback Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Responsive with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- *Templates Tab* - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- *Parameters Tab* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the *Parameters section* below for details about the most commonly used parameters for WebHelp Responsive transformations.
- *Filters Tab* - This tab allows you to filter certain content elements from the generated output.
- *Advanced Tab* - This tab allows you to specify some advanced options for the transformation scenario.
- *Output Tab* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the *instructions to complete the system deployment*.

Parameters for Customizing WebHelp Responsive with Feedback Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen

	XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.search.ranking	If this parameter is set to <code>false</code> then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is <code>true</code>).
webhelp.show.changes.and.comments	When set to <code>yes</code> , user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is <code>no</code> .
webhelp.sitemap.base.url	Base URL for all the <code>loc</code> elements in the generated <code>sitemap.xml</code> file. The value of a <code>loc</code> element is computed as the relative file path from the <code>href</code> attribute of a <code>topicref</code> element from the DITA map, appended to this base URL value. The <code>loc</code> element is mandatory in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>sitemap.xml</code> file is not generated.
webhelp.sitemap.change.frequency	The value of the <code>changefreq</code> element in the generated <code>sitemap.xml</code> file. The <code>changefreq</code> element is optional in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>changefreq</code> element is not added in <code>sitemap.xml</code> . Allowed values: <empty string> (default), <code>always</code> , <code>hourly</code> , <code>daily</code> , <code>weekly</code> , <code>monthly</code> , <code>yearly</code> , <code>never</code> .
webhelp.sitemap.priority	The value of the <code>priority</code> element in the generated <code>sitemap.xml</code> file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The <code>priority</code> element is optional in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>priority</code> element is not added in <code>sitemap.xml</code> .

Parameters Specific to WebHelp Responsive with Feedback Output

webhelp.fragment.after.body	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the body in the output.
webhelp.fragment.after.logo_and_title	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the logo and title in the output.
webhelp.fragment.after.main.page.search	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the search field in the output.
webhelp.fragment.after.toc_or_tiles	Specifies an XML fragment (or a path to a file that contains well formed XML content) that will be

webhelp.fragment.after.top_menu	Displayed after the table of contents or tiles in the main page of the output.
webhelp.fragment.before.body	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed after the top menu in the output.
webhelp.fragment.before.logo_and_title	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the body in the output.
webhelp.fragment.before.main.page.search	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the search field in the output.
webhelp.fragment.before.toc_or_tiles	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the table of contents or tiles in the main page of the output.
webhelp.fragment.before.top_menu	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed before the top menu in the output.
webhelp.fragment.footer	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the footer in the output.
webhelp.fragment.head	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as the header in the output.
webhelp.fragment.welcome	Specify an XML fragment (or a path to a file that contains well formed XML content) that will be displayed as a welcome message (or title) in the output.
webhelp.show.breadcrumb	Specifies if the breadcrumb component will be presented in the output. The default value is yes.
webhelp.show.indexterms.link	Specifies if an icon that links to the index will be presented in the output. The default value is yes.
webhelp.show.main.page.tiles	Specifies if the tiles component will be presented in the main page of the output. For a <i>tree</i> style layout, this parameter should be set to no.
webhelp.show.main.page.toc	Specifies if the table of contents will be presented in the main page of the output. The default value is yes.
webhelp.show.navigation.links	Specifies if navigation links will be presented in the output. The default value is yes.
webhelp.show.print.link	Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.
webhelp.show.side.toc	Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `2`.

WebHelp Classic Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Classic* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0" ;

      fjs.parentNode.insertBefore(js,
      fjs); })(document, 'script',
      'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-
  show-faces="true" data-
  action="like" data-
  layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to

webhelp.google.search.script	frm for frameless (<i>iframe</i>) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
webhelp.head.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
webhelp.logo.image.target.url	URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.
webhelp.logo.image	Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.
webhelp.reload.stylesheet	Specifies a path to an image displayed as a logo in the left side of the output header.
webhelp.search.japanese.dictionary	Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.
webhelp.search.ranking	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.show.changes.and.comments	If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).
webhelp.sitemap.base.url	When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.
webhelp.sitemap.change.frequency	Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.
	The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter

webhelp.sitemap.priority

set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

WebHelp Classic Mobile Output[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Classic Mobile* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic Mobile** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** below for details about the most commonly used parameters for WebHelp Responsive transformations.
 - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
 - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

Parameters for Customizing WebHelp Classic Mobile Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d,
      s, id) { var js, fjs =
      d.getElementsByTagName(s)[0]; if
      (d.getElementById(id)) return;
      js = d.createElement(s);
      js.id = id; js.src = "//
      connect.facebook.net/en_US/
      sdk.js#xfbml=1&version=v2.0" ;

      fjs.parentNode.insertBefore(js,
      fjs); }(document, 'script',
      'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-
  show-faces="true" data-
  action="like" data-
  layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.

webhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `linkTarget` attribute to

	frm for frameless (<i>iframe</i>) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
webhelp.google.search.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
webhelp.head.script	URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.
webhelp.reload.stylesheet	Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.
webhelp.search.japanese.dictionary	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.sitemap.base.url	Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.
webhelp.sitemap.change.frequency	The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.
webhelp.sitemap.priority	The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

WebHelp Classic With Feedback Output

[Edit on GitHub](#)

To publish a DITA map as a *WebHelp Classic with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
 - **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** below for details about the most commonly used parameters for WebHelp Responsive transformations.
 - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
 - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
 5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the [instructions to complete the system deployment](#).

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

Parameters for Customizing WebHelp Classic with Feedback Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

webhelp.copyright	Adds a small copyright text that appears at the end of the <i>Table of Contents</i> pane.
webhelp.custom.resources	The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.
webhelp.favicon	The file path that points to an image to be used as a <i>favicon</i> in the WebHelp output.
webhelp.footer.file	Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate <code>div</code> or <code>span</code> element, and the code for each <code>script</code> element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:
	<pre><div id="facebook"> <div id="fb-root"/> <script> <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0]; if (d.getElementById(id)) return; js = d.createElement(s); js.id = id; js.src = "// connect.facebook.net/en_US/ sdk.js#xfbml=1&version=v2.0" ; fjs.parentNode.insertBefore(js, fjs); })(document, 'script', 'facebook-jssdk')); --> </script> <div data-share="true" data- show-faces="true" data- action="like" data- layout="standard" class="fb-like"/> </div></pre>
webhelp.footer.include	Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the <code>webhelp.footer.file</code> parameter has a value, then the content of that file is used as footer. If the <code>webhelp.footer.file</code> has no value then the default Oxygen XML Author footer is inserted in each WebHelp page.
webhelp.google.search.results	URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element <code>gcse:searchresults-only</code> . You can use all supported attributes for this element. It is recommended to set the <code>linkTarget</code> attribute to <code>frm</code> for frameless (<code>iframe</code>) version of WebHelp or to <code>contentWin</code> for the frameset version of WebHelp. The default value for this attribute is <code>_blank</code> and

webhelp.google.search.script	the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
webhelp.head.script	Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be a URL.
webhelp.logo.image.target.url	URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.
webhelp.logo.image	Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.
webhelp.reload.stylesheet	Specifies a path to an image displayed as a logo in the left side of the output header.
webhelp.search.japanese.dictionary	Set this parameter to <code>true</code> if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is <code>false</code> .
webhelp.search.ranking	The file path of the dictionary that will be used by the <i>Kuromoji</i> morphological engine that Oxygen XML Author uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Author or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the <i>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</i> directory.
webhelp.show.changes.and.comments	If this parameter is set to <code>false</code> then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is <code>true</code>).
webhelp.sitemap.base.url	When set to <code>yes</code> , user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is <code>no</code> .
webhelp.sitemap.change.frequency	Base URL for all the <code>loc</code> elements in the generated <code>sitemap.xml</code> file. The value of a <code>loc</code> element is computed as the relative file path from the <code>href</code> attribute of a <code>topicref</code> element from the DITA map, appended to this base URL value. The <code>loc</code> element is mandatory in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>sitemap.xml</code> file is not generated.
	The value of the <code>changefreq</code> element in the generated <code>sitemap.xml</code> file. The <code>changefreq</code> element is optional in <code>sitemap.xml</code> . If you leave this parameter set to its default empty value, then the <code>changefreq</code> element is not added in <code>sitemap.xml</code> . Allowed

webhelp.sitemap.priority

values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF WYSIWYG Transformation
[Edit on GitHub](#)

Oxygen XML Author comes bundled with a DITA OT plugin that converts DITA maps to PDF using a CSS layout processor. Oxygen XML Author supports the following processors (not included in the Oxygen XML Author installation kit):

- **Prince Print with CSS** - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

The DITA-OT plugin is located in the following directory: `DITA_OT_DIR/plugins/com.oxygenxml.pdf.css`.

Although it includes a set of CSS files in its `css` subfolder, when this plugin is used in Oxygen XML Author, the CSS files located in the `${frameworks}` directory take precedence.

Creating the Transformation Scenario

To create an experimental DITA map to PDF WYSIWYG transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG - Experimental**.
3. When applied, this new transformation scenario uses the currently selected CSS files for the opened topic files. These CSS files can be selected from the **Styles** drop-down menu from the toolbar.
- Important:** The author could open the map in the editor and change its style, but this is ignored in the publishing stage. Since authors usually edit topics instead of the map, Oxygen XML Author uses the styles selected in the opened topics.
4. In the **Parameters** tab, configure the following parameters:
 - `css.processor.path.prince` (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
 - `css.processor.path.antenna-house` (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
 - `webhelp.show.changes.and.comments` - When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

Customizing the Styles (for Output and Editing)

If you need to change the styles in the associated CSS, make sure you install Oxygen XML Author in a folder in which you have full read and write privileges (for instance, your user home directory). This is due to the fact that all the installed files are usually read-only (for instance, in Windows, Oxygen XML Author is installed in the `Program Files` folder where the users do not have change rights).

If you want to change the style of an element, open a document in the editor and select **Inspect Styles** from the contextual menu. *The CSS Inspector view* that shows all the CSS rules that apply to the selected element will be displayed. Click the link for the CSS selector that you need to change and Oxygen XML Author will open the CSS file and position the cursor at that selector. Simply add the properties you need and to see the changes in the editor, press **F5** to reload the document. Once you are satisfied with how it looks, use the transformation scenario and check for the changes in the PDF output.

Note: This experimental transformation scenario also allows you to present colored highlights in the PDF output.

Compiled HTML Help (CHM) Output Format

[Edit on GitHub](#)

To perform a **Compiled HTML Help (CHM)** transformation Oxygen XML Author needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Author automatically detects HTML Help Workshop and uses it.

Note: HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

Changing the Output Encoding

Oxygen XML Author uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. The **Compiled HTML Help (CHM)** default scenario that comes bundled with Oxygen XML Author has the `htmlhelp.locale` parameter set to `en-US`.

The default value of the `htmlhelp.locale` is `en-US`. To customize this parameter, go to  **Configure Transformation Scenarios** and click the  **Edit** button. In the parameter tab search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`US`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

Kindle Output Format

[Edit on GitHub](#)

Oxygen XML Author requires KindleGento generate Kindle output from DITA maps. To install KindleGen for use by Oxygen XML Author, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author and open a DITA map in the **DITA Maps Manager** view.
4. In the **DITA Maps Manager** view, open the  **Configure Transformation Scenario(s)** dialog box.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the `kindlegen.executable` parameter as the path to the `KindleGen` directory.
7. Accept the changes.

DITA Map Templates

[Edit on GitHub](#)

The default templates available for DITA maps are stored in `[OXYGEN_INSTALL_DIR]/frameworks/dita/templates/map` folder.

Here are some of the DITA map templates available when creating [new documents from templates](#):

- **DITA Map - Bookmap** - New DITA Bookmap.
- **DITA Map - Map** - New DITA map.
- **DITA Map - Learning Map** - New DITA learning and training content specialization map.
- **DITA Map - Learning Bookmap** - New DITA learning and training content specialization bookmap.
- **DITA Map - Eclipse Map** - IBM specialization of DITA map used for producing Eclipse Help plugins.

DITA for Publishers Map specialization templates:

- **D4P Map** - New DITA for Publishers map.
- **D4P Pub-component-map** - New DITA for Publishers pub-component-map.
- **D4P Pubmap** - New DITA for Publishers pubmap.

XHTML Document Type

[Edit on GitHub](#)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

A file is considered to be an XHTML document when the root element name is `html`.

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/`.
- XHTML 5 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/xhtml5 (epub3)/`.

The CSS options for the XHTML document type are set to merge the CSS stylesheets specified in the document with the CSS stylesheets defined in the XHTML document type.

The default CSS files used for rendering XHTML content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/css/`.

The default catalogs for the XHTML document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/relaxng/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/nvdl/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/xhtml15 (epub3)/catalog-compat.xml`

XHTML Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the XHTML framework that can be added to the **XHTML** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

XHTML Toolbar Actions

The following default actions are readily available on the **XHTML (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **XHTML** menu and some of them are in various submenus of the contextual menu):

**B Bold**

Changes the style of the selected text to **bold** by surrounding it with **b** tag. You can use this action on multiple non-contiguous selections.

**I Italic**

Changes the style of the selected text to **italic** by surrounding it with **i** tag. You can use this action on multiple non-contiguous selections.

**U Underline**

Changes the style of the selected text to **underline** by surrounding it with **u** tag. You can use this action on multiple non-contiguous selections.

**Link**

Inserts an **a** element with an **href** attribute at the cursor position. You can type the URL of the reference you

want to insert or use the **Browse** drop-down menu to select it using one of the following options:

- **Browse for local file** - Displays the **Open** dialog box to select a local file.
- **Browse for remote file** - Displays the **Open URL** dialog box to select a remote file.
- **Browse for archived file** - Opens the **Archive Browser** to select a file from an archive.
- **Browse Data Source Explorer** - Open the **Data Source Explorer** to select a file from a connected data source.
- **Search for file** - Opens the **Find Resource** dialog box to search for a file.

**Insert Image**

Inserts a graphic object at the cursor position. This is done by inserting an **img** element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

**H Headings Drop-down Menu**

A drop-down menu that includes actions for inserting **h1**, **h2**, **h3**, **h4**, **h5**, **h6** elements.

**T Insert Paragraph**

Insert a new paragraph element at current cursor position.

**Σ Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations*.

**+ Insert List Item**

Inserts a list item in the current list type.

**≡ Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default.

**≡ Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.

**≡≡ Insert a definition list at the cursor position**

Inserts a definition list (**dl** element) with one list item (a **dt** child element and a **dd** child element).

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Deletes the table column located at cursor position or multiple columns in a selection.

Deletes the table row located at cursor position or multiple rows in a selection.

Joins the content of the selected cells (both horizontally and vertically).

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

XHTML Menu Actions

In addition, the following default actions are available in the **XHTML** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes - Displays full tag names with attributes for both block level and in-line level elements.

Full Tags - Displays full tag names without attributes for both block level and in-line level elements.

Block Tags - Displays full tag names for block level elements and simple tags without names for in-line level elements.

Inline Tags - Displays full tag names for inline level elements, while block level elements are not displayed.

Partial Tags - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

No Tags - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

Profiling Settings - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

XHTML Contextual Menu Actions

In addition to many of the *XHTML toolbar actions* and the *general Author mode contextual menu actions*, the following XHTML framework-specific actions are also available in the contextual menu when editing in **Author mode**:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature

Table Actions

allows you to create hyperlinks in specific areas of an image that will link to various destinations.

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sorts cells or list items in a table.

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

XHTML Drag/Drop Actions

Dragging a file from [the Project view](#) or [DITA Maps Manager view](#) and dropping it into an XHTML document that is edited in **Author** mode creates a link to the dragged file (the `a` element with the `href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into an XHTML document inserts an image element (the `img` element with the `src` attribute) at the drop location, similar to the  [Insert Image](#) toolbar action.

XHTML Transformation Scenarios

[Edit on GitHub](#)

The following default transformation scenarios are available for XHTML:

- **XHTML to DITA concept** - Converts an XHTML document to a DITA concept document.
- **XHTML to DITA reference** - Converts an XHTML document to a DITA reference document.
- **XHTML to DITA task** - Converts an XHTML document to a DITA task document.
- **XHTML to DITA topic** - Converts an XHTML document to a DITA topic document.

Related information

[Editing a Transformation Scenario](#) on page 763

XHTML Templates

[Edit on GitHub](#)

Default templates are available for XHTML. They are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/templates` folder and they can be used for easily creating basic XHTML documents.

Here are some of the XHTML templates available when creating [new documents from templates](#).

- **XHTML - 1.0 Strict** - New Strict XHTML 1.0
- **XHTML - 1.0 Transitional** - New Transitional XHTML 1.0
- **XHTML - 1.1 DTD Based** - New DTD based XHTML 1.1
- **XHTML - 1.1 DTD Based + MathML 2.0 + SVG 1.1** - New XHTML 1.1 with MathML and SVG insertions
- **XHTML - 1.1 Schema based** - New XHTML 1.1 XML Schema based

TEI ODD Document Type

[Edit on GitHub](#)

The **Text Encoding Initiative - One Document Does it all (TEI ODD)** is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called [Roma](#) was created by the TEI Consortium for manipulating the ODD files.

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is `.odd`.
- The document namespace is <http://www.tei-c.org/ns/1.0>.

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

The default CSS files used for rendering TEI ODD content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

The default catalogs for the TEI ODD document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/catalog.xml`

To watch our video demonstration about TEI editing, go to http://oxygentools.com/demo/WYSIWYG_TEI_Editing.html.

TEI ODD Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the TEI ODD framework that can be added to the **TEI ODD** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

TEI ODD Toolbar Actions

The following default actions are readily available on the **TEI ODD (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI ODD** menu and some of them are in various submenus of the contextual menu):

B Bold

Changes the style of the selected text to **bold** by surrounding it with **hi** tag and setting the **r:rend** attribute to **bold**. You can use this action on multiple non-contiguous selections.

I Italic

Changes the style of the selected text to **italic** by surrounding it with **hi** tag and setting the **r:rend** attribute to **italic**. You can use this action on multiple non-contiguous selections.

U Underline

Changes the style of the selected text to **underline** by surrounding it with **hi** tag and setting the **r:rend** attribute to **u:l**. You can use this action on multiple non-contiguous selections.

S Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is **div1**, then a **div2** is inserted. By default, this action also inserts a paragraph element as a child node.

P Insert Paragraph

Insert a new paragraph element at current cursor position.

Image Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

L+ Insert List Item

Inserts a list item in the current list type.

O= Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.

I= Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default.

T Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.

R Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

C Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Deletes the table column located at cursor position or multiple columns in a selection.

Deletes the table row located at cursor position or multiple rows in a selection.

Joins the content of the selected cells (both horizontally and vertically).

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI ODD Menu Actions

In addition, the following default actions are available in the **TEI ODD** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field

	can be customized using constant strings or any of the Oxygen XML Author <i>Editor Variables</i> .
Element name or class value to generate ID for	The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add , Edit , or Remove buttons.
Auto generate IDs for elements	If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document	When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option. Note: This option does not have an effect on content that is <i>cut</i> and <i>pasted</i> .

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Tags display mode Submenu

You can use this action to manually trigger a refresh and update of all referenced resources.

Full Tags with Attributes - Displays full tag names with attributes for both block level and in-line level elements.

Full Tags - Displays full tag names without attributes for both block level and in-line level elements.

Block Tags - Displays full tag names for block level elements and simple tags without names for in-line level elements.

Inline Tags - Displays full tag names for inline level elements, while block level elements are not displayed.

Partial Tags - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

No Tags - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

Profiling Settings - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

TEI Contextual Menu Actions

In addition to many of the *TEI toolbar actions* and the *general Author mode contextual menu actions*, the following TEI framework-specific actions are also available in the contextual menu when editing in **Author** mode:

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

e:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted

	(Above or Below the current row).
 Delete Row(s)	Deletes the table row located at cursor position or multiple rows in a selection.
Insert Columns	Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
 Sort	Sorts cells or list items in a table.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Other Actions submenu	This submenu give you access to all the usual contextual menu actions.

TEI ODD Drag/Drop Actions

Dragging a file from *the Project view* or *DITA Maps Manager view* and dropping it into a TEI ODD document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

TEI ODD Transformation Scenarios

[Edit on GitHub](#)

The following default transformations are available:

- **TEI ODD XHTML** - Transforms a TEI ODD document into an XHTML document
- **TEI ODD PDF** - Transforms a TEI ODD document into a PDF document using the Apache FOP engine
- **TEI ODD EPUB** - Transforms a TEI ODD document into an EPUB document
- **TEI ODD DOCX** - Transforms a TEI ODD document into a DOCX document
- **TEI ODD ODT** - Transforms a TEI ODD document into an ODT document
- **TEI ODD RelaxNG XML** - Transforms a TEI ODD document into a RelaxNG XML document
- **TEI ODD to DTD** - Transforms a TEI ODD document into a DTD document
- **TEI ODD to XML Schema** - Transforms a TEI ODD document into an XML Schema document
- **TEI ODD to RelaxNG Compact** - Transforms a TEI ODD document into an RelaxNG Compact document

Related information

TEI ODD Templates

[Edit on GitHub](#)

There is only one default template that is stored in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI_ODD` folder and can be used for easily creating a basic TEI ODD document. This template is available when creating [new documents from templates](#).

- **TEI ODD** - New TEI ODD document

TEI P4 Document Type

[Edit on GitHub](#)

The **Text Encoding Initiative (TEI) Guidelines** is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

A file is considered to be a TEI P4 document when one of the following conditions are true:

- The local name of the root is `TEI` . `2`.
- The public id of the document is `-//TEI` `P4`.

The default schema that is used if one is not detected in the TEI P4 document is `tei2.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/schema/dtd/`.

The default CSS files used for rendering TEI P4 content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

The default catalogs for the TEI P4 document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/stylesheets/catalog.xml`

To watch our video demonstration about TEI editing, go to http://oxygentools.com/demo/WYSIWYG_TEI_Editing.html.

TEI P4 Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the TEI P4 framework that can be added to the **TEI P4** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

TEI P4 Toolbar Actions

The following default actions are readily available on the **TEI P4 (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI P4** menu and some of them are in various submenus of the contextual menu):

B Bold

Changes the style of the selected text to **bold** by surrounding it with **hi** tag and setting the **r:rend** attribute to **bold**. You can use this action on multiple non-contiguous selections.

I Italic

Changes the style of the selected text to **italic** by surrounding it with **hi** tag and setting the **r:rend** attribute to **italic**. You can use this action on multiple non-contiguous selections.

U Underline

Changes the style of the selected text to **underline** by surrounding it with **hi** tag and setting the **r:rend** attribute to **u1**. You can use this action on multiple non-contiguous selections.

S Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is **div1**, then a **div2** is inserted. By default, this action also inserts a paragraph element as a child node.

T Insert Paragraph

Insert a new paragraph element at current cursor position.

—+ Insert List Item

Inserts a list item in the current list type.

1— Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.

•— Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default.

A↓ Sort

Sorts cells or list items in a table.

Table Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.

Table Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Table Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Table Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Table Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Joins the content of the selected cells (both horizontally and vertically).

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI P4 Menu Actions

In addition, the following default actions are available in the **TEI P4** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author *Editor Variables*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the

	Add, Edit, or Remove buttons.
Auto generate IDs for elements	If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document	When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option. Note: This option does not have an effect on content that is <i>cut</i> and <i>pasted</i> .

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

Tags display mode Submenu

You can use this action to manually trigger a refresh and update of all referenced resources.

-   **Full Tags with Attributes** - Displays full tag names with attributes for both block level and in-line level elements.
-   **Full Tags** - Displays full tag names without attributes for both block level and in-line level elements.
-   **Block Tags** - Displays full tag names for block level elements and simple tags without names for in-line level elements.
-   **Inline Tags** - Displays full tag names for inline level elements, while block level elements are not displayed.

Profiling/Conditional Text Submenu

 **Partial Tags** - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

 **No Tags** - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

 **Profiling Settings** - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

TEI Contextual Menu Actions

In addition to many of the *TEI toolbar actions* and the *general Author mode contextual menu actions*, the following TEI framework-specific actions are also available in the contextual menu when editing in **Author** mode:

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows	Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).
 Delete Row(s)	Deletes the table row located at cursor position or multiple rows in a selection.
Insert Columns	Opens a dialog box that allows you to insert any number of columns and

	specify the position where they will be inserted (Above or Below the current column).
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
 Sort	Sorts cells or list items in a table.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Other Actions submenu	This submenu give you access to all the usual contextual menu actions.

TEI P4 Drag/Drop Actions

Dragging a file from [the Project view](#) or [DITA Maps Manager view](#) and dropping it into a TEI P4 document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

TEI P4 Transformation Scenarios

[Edit on GitHub](#)

The following default transformations are available:

- **TEI HTML** - Transforms a TEI document into an HTML document.
- **TEI P4 - TEI P5 Conversion** - Convert a TEI P4 document into a TEI P5 document.
- **TEI PDF** - Transforms a TEI document into a PDF document using the Apache FOP engine.

TEI P4 Templates

[Edit on GitHub](#)

The default templates are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI P4` folder and they can be used for easily creating basic TEI P4 documents. These templates are available when creating [new documents from templates](#).

- **TEI P4 - Lite** - New TEI P4 Lite
- **TEI P4 - New Document** - New TEI P4 standard document

Customization of TEI Frameworks Using the Latest Sources

[Edit on GitHub](#)

The [TEI P4](#) and [TEI P5](#) frameworks are available as a public project at the following SVN repository: <https://github.com/TEIC/oxygen-tei>. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.
This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.
2. Customize the TEI framework in Oxygen XML Author.
 - a) Set the Oxygen XML Author `frameworks` folder to the `oxygen/frameworks` subfolder of the folder of the SVN working copy.
[Open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set the path of the SVN working copy in the **Use custom frameworks** option.
 - b) [Open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association > Locations**, and select **Custom**.
3. Build a jar file with the TEI framework.

The SVN project includes a `build.xml` file that can be used for building a jar file using the Ant tool. The command that should be used:

```
ant -f build.xml
```

4. Distribute the jar file to the users that need the customized TEI framework.

The command from the above step creates a file `tei.zip` in the `dist` subfolder of the SVN project. Each user that needs the customized TEI framework will receive the `tei.zip` file and will unzip it in the `frameworks` folder of the Oxygen XML Author install folder.

TEI P5 Document Type

[Edit on GitHub](#)

The **Text Encoding Initiative (TEI) Guidelines** is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is `http://www.tei-c.org/ns/1.0`.
- The public id of the document is `-//TEI P5`.

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

The CSS file used for rendering TEI P5 content in **Author** mode is located in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/tei_oxygen.css`.

The default catalogs for the TEI P5 document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheets/catalog.xml`

To watch our video demonstration about TEI editing, go to http://oxygentools.com/demo/WYSIWYG_TEI_Editing.html.

TEI P5 Author Mode Actions

[Edit on](#)

[GitHub](#)

A variety of actions are available in the TEI P5 framework that can be added to the **TEI P5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

TEI P5 Toolbar Actions

The following default actions are readily available on the **TEI P5 (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI P5** menu and some of them are in various submenus of the contextual menu):

B Bold

Changes the style of the selected text to `bold` by surrounding it with `hi` tag and setting the `rrend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

I Italic

Changes the style of the selected text to `italic` by surrounding it with `hi` tag and setting the `rrend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

U Underline

Changes the style of the selected text to `underline` by surrounding it with `hi` tag and setting the `rrend` attribute to `u1`. You can use this action on multiple non-contiguous selections.

S Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

P Insert Paragraph

Insert a new paragraph element at current cursor position.

Image Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

LI Insert List Item

Inserts a list item in the current list type.

OL Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.

UL Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default.

Sort

Sorts cells or list items in a table.

Table Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed.

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Deletes the table column located at cursor position or multiple columns in a selection.

Deletes the table row located at cursor position or multiple rows in a selection.

Joins the content of the selected cells (both horizontally and vertically).

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI P5 Menu Actions

In addition, the following default actions are available in the **TEI P5** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern	The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author <i>Editor Variables</i> .
Element name or class value to generate ID for	The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add , Edit , or Remove buttons.
Auto generate IDs for elements	If enabled, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document	When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.
	Note: This option does not have an effect on content that is <i>cut</i> and <i>pasted</i> .

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Tags display mode Submenu

You can use this action to manually trigger a refresh and update of all referenced resources.

Full Tags with Attributes - Displays full tag names with attributes for both block level and in-line level elements.

Full Tags - Displays full tag names without attributes for both block level and in-line level elements.

Block Tags - Displays full tag names for block level elements and simple tags without names for in-line level elements.

Inline Tags - Displays full tag names for inline level elements, while block level elements are not displayed.

Partial Tags - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

No Tags - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

Profiling Settings - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

TEI Contextual Menu Actions

In addition to many of the *TEI toolbar actions* and the *general Author mode contextual menu actions*, the following TEI framework-specific actions are also available in the contextual menu when editing in **Author** mode:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and

Table Actions

opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows	Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).
 Delete Row(s)	Deletes the table row located at cursor position or multiple rows in a selection.
Insert Columns	Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).
 Delete Column(s)	Deletes the table column located at cursor position or multiple columns in a selection.
 Join Cells	Joins the content of the selected cells (both horizontally and vertically).
 Split Cell	Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
 Sort	Sorts cells or list items in a table.
 Table Properties	Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Other Actions submenu	This submenu give you access to all the usual contextual menu actions.

TEI P5 Drag/Drop Actions

Dragging a file from [the Project view](#) or [DITA Maps Manager view](#) and dropping it into a TEI P5 document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a TEI P5 document inserts a graphic element (the `graphic` element with the `uri` attribute) at the drop location, similar to the  [Insert Image](#) toolbar action.

TEI P5 Transformation Scenarios

[Edit on](#)
[GitHub](#)

The following default transformations are available:

- **TEI P5 XHTML** - transforms a TEI P5 document into an XHTML document.
- **TEI P5 PDF** - transforms a TEI P5 document into a PDF document using the Apache FOP engine.
- **TEI EPUB** - transforms a TEI P5 document into an EPUB output. The EPUB output will contain any images referenced in the TEI XML document.
- **TEI DOCX** - transforms a TEI P5 document into a DOCX (OOXML) document. The DOCX document will contain any images referenced in the TEI XML document.
- **TEI ODT** - transforms a TEI P5 document into an ODT (ODF) document. The ODT document will contain any images referenced in the TEI XML document.

Related information

[Editing a Transformation Scenario](#) on page 763

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

TEI P5 Templates

[Edit on](#)
[GitHub](#)

The default templates are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI P5` folder and they can be used for easily creating basic TEI P5 documents. These templates are available when creating [new documents from templates](#):

- **TEI P5 - All** - New TEI P5 All.
- **TEI P5 - Bare** - New TEI P5 Bare.
- **TEI P5 - Lite** - New TEI P5 Lite.
- **TEI P5 - Math** - New TEI P5 Math.
- **TEI P5 - Speech** - New TEI P5 Speech.
- **TEI P5 - SVG** - New TEI P5 with SVG extensions.
- **TEI P5 - XInclude** - New TEI P5 XInclude aware.

Customization of TEI Frameworks Using the Latest Sources

[Edit on](#)
[GitHub](#)

The [TEI P4](#) and [TEI P5](#) frameworks are available as a public project at the following SVN repository: <https://github.com/TEIC/oxygen-tei>. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.

This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.

2. Customize the TEI framework in Oxygen XML Author.

a) Set the Oxygen XML Author `frameworks` folder to the `oxygen/frameworks` subfolder of the folder of the SVN working copy.

[Open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set the path of the SVN working copy in the Use custom frameworks option.

- b) [Open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association > Locations**, and select **Custom**.

3. Build a jar file with the TEI framework.

The SVN project includes a `build.xml` file that can be used for building a jar file using the Ant tool. The command that should be used:

```
ant -f build.xml
```

4. Distribute the jar file to the users that need the customized TEI framework.

The command from the above step creates a file `tei.zip` in the `dist` subfolder of the SVN project. Each user that needs the customized TEI framework will receive the `tei.zip` file and will unzip it in the `frameworks` folder of the Oxygen XML Author install folder.

Customization of TEI Frameworks Using the Compiled Sources

[Edit on GitHub](#)

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI framework for Oxygen XML Author.

1. Go to <https://code.google.com/p/oxygen-tei/>;
2. Go to **Downloads**;
3. Download the latest uploaded `.zip` file;
4. Unpack the `.zip` file and copy its content in the Oxygen XML Author `frameworks` folder.

JATS Document Type

[Edit on GitHub](#)

The JATS (NISO Journal Article Tag Suite) document type is a technical standard that defines an XML format for scientific literature.

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string `-//NLM//DTD`.

Default schemas that are used if one is not detected in the JATS document are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/O2-DTD/`.

The default CSS files used for rendering JATS content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/css/`.

The default XML catalog, `JATS-catalog-O2.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/O2-DTD/`.

JATS Author Mode Actions

[Edit on GitHub](#)

A variety of actions are available in the JATS framework that can be added to the **JATS** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

JATS Toolbar Actions

The following default actions are readily available on the **JATS (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **JATS** menu and in various submenus of the contextual menu):

Surrounds the selected text with a **bold** tag. You can use this action on multiple non-contiguous selections.

Surrounds the selected text with an *italic* tag. You can use this action on multiple non-contiguous selections.

Surrounds the selected text with an underline tag. You can use this action on multiple non-contiguous selections.

Insert a new paragraph element at current cursor position.

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Inserts a list item in the current list type.

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default.

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default.

JATS Menu Actions

In addition, the following default actions are available in the **JATS** menu when editing in **Author** mode:

Tags display mode Submenu

You can use this action to manually trigger a refresh and update of all referenced resources.

► **Full Tags with Attributes** - Displays full tag names with attributes for both block level and in-line level elements.

► **Full Tags** - Displays full tag names without attributes for both block level and in-line level elements.

► **Block Tags** - Displays full tag names for block level elements and simple tags without names for in-line level elements.

► **Inline Tags** - Displays full tag names for inline level elements, while block level elements are not displayed.

► **Partial Tags** - Displays simple tags without names for in-line level elements, while block level elements are not displayed.

► **No Tags** - No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Profiling/Conditional Text Submenu

Edit Profiling Attributes - Allows you to configure the *profiling attributes* and their values.

Show Profiling Colors and Styles - Select this option to turn on conditional styling.

Show Profiling Attributes - Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content - When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type - You can click a listed condition set to activate it.

 **Profiling Settings** - Opens the *profiling options preferences page*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* and the *attributes rendering preferences page*.

JATS Drag/Drop Actions

Dragging a file from *the Project view* or *DITA Maps Manager view* and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the `ext-link` element with the `xlink:href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a JATS document inserts an image element (the `inline-graphic` element with the `xlink:href` attribute) at the drop location, similar to the **Insert Image** toolbar action.

JATS Transformation Scenarios

[Edit on GitHub](#)

The following default transformation scenario is available for JATS documents:

- **JATS Preview (simple HTML)** - Converts a JATS document to a simple HTML document.

Related information

[Editing a Transformation Scenario](#) on page 763

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 764

JATS Templates

[Edit on GitHub](#)

Default templates are available for JATS documents. They are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/templates` folder and they can be used for easily creating basic JATS documents.

The default JATS templates that are available when creating [new documents from templates](#) are as follows:

- **Archiving** - JATS archiving tag set version 1.1.
- **Authoring** - JATS authoring tag set version 1.1.
- **Book** - JATS book tag set version 1.1.
- **Publishing** - JATS publishing tag set version 1.1.

EPUB Document Type

[Edit on GitHub](#)

Three distinct frameworks are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.

- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

Note: Oxygen XML Author supports both OPF 2.0 and OPF 3.0.

Document Templates

The default templates for the *NCX* document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ncx/templates` folder.

The default templates for the *OCF* document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ocf/templates` folder.

The default template for the *OPF 2.0* document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/2.0` folder.

The default template for the *OPF 3.0* document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/3.0` folder.

The following EPUB templates are available when creating [new documents from templates](#):

- **NCX - Toc** - New table of contents.
- **OCF - Container** - New container based OCF.
- **OCF - Encryption** - New encryption based OCF.
- **OCF - Signatures** - New signature based OCF.
- **OPF 2.0 - Content (2.0)** - New OPF 2.0 content.
- **OPF 3.0 - Content (3.0)** - New OPF 3.0 content.

Chapter

14

Author Mode Customization

Topics:

- [Author Mode Customization Guide](#)
- [CSS Support in Author Mode](#)
- [Creating and Running Automated Tests](#)
- [API Frequently Asked Questions \(API FAQ\)](#)

This chapter provides details for customizing Author mode.

This section contains an [Author Mode Customization Guide](#) on page 1106, [CSS Support in Author Mode](#) on page 1222, a collection of [Frequently Asked Questions regarding the Oxygen XML Author API](#), and other topics in regards to customizing the **Author** mode.

Author Mode Customization Guide

[Edit on GitHub](#)

The **Author** mode editor of Oxygen XML Author was designed to provide a friendly user interface for editing XML documents. **Author** combines the power of source editing with the intuitive interface of a word processor. You can customize the **Author** mode editor to support new custom XML formats or to change how standard XML formats are edited.

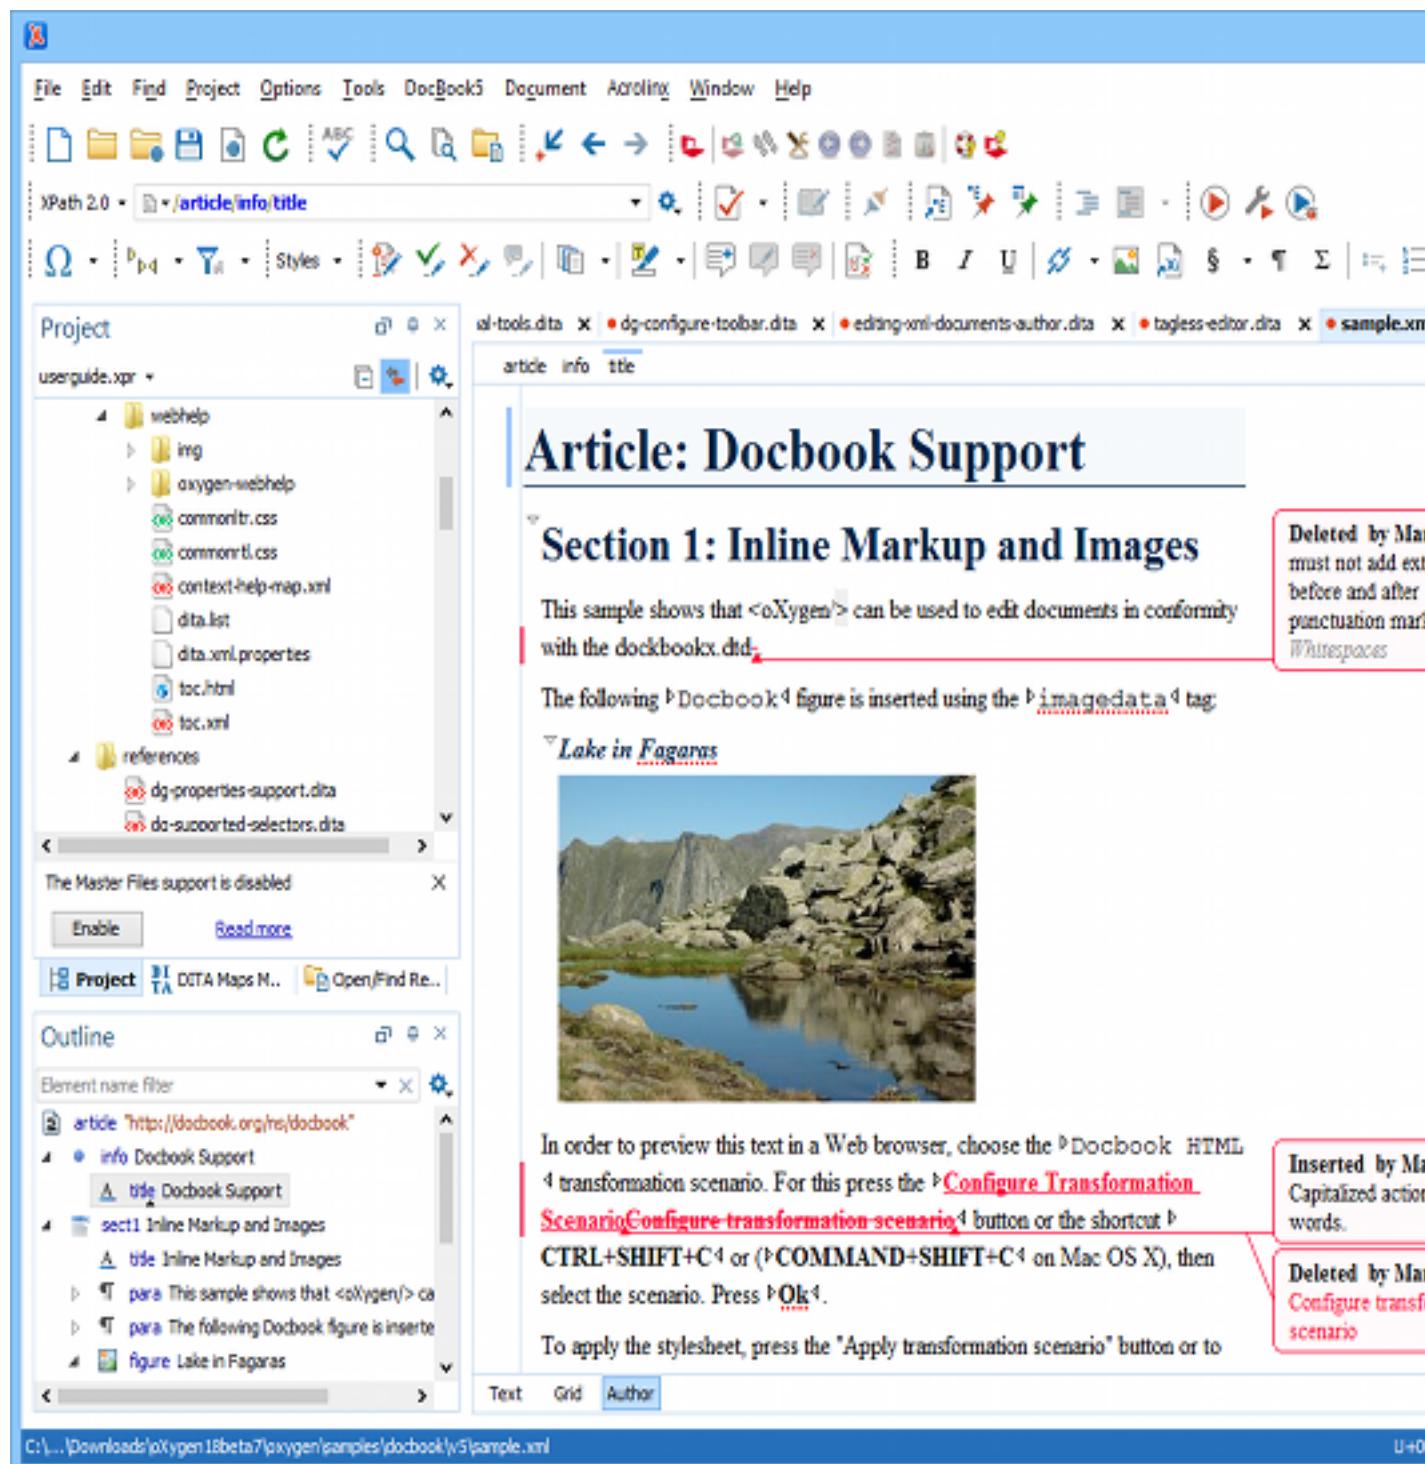

Figure 329: Oxygen XML Author Author Visual Editor

Although Oxygen XML Author includes built-in, configured frameworks for DocBook, DITA, TEI, and XHTML you might need to create a customization of the editor to handle other types of documents. A common use case is when your organization holds a collection of XML document types used to define the structure of internal documents and they need to be visually edited by people with no experience working with XML files.

There are several ways to customize the editor:

1. Create a CSS file defining styles for the XML elements you will work with, and create XML files that reference the CSS through an `xmlstylesheet` processing instruction.
2. Fully configure a document type association. This involves putting together the CSS stylesheets, XML schemas, actions, menus, bundling them, and distributing an archive. The CSS and GUI elements are settings for the Oxygen XML Author **Author** mode. The other settings such as the templates, catalogs, and transformation scenarios are general settings and are enabled whenever the association is active, regardless of the editing mode (**Text**, **Grid**, or **Author**).

Simple Customization Tutorial

[Edit on GitHub](#)

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

XML Schema

[Edit on GitHub](#)

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Author needs an XML grammar (XML Schema, DTD, or RelaxNG) associated to the XML. The grammar specifies how the internal structure of the XML is defined.

Consider a use-case in which several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for these kind of documents. The following XML Schema, `test_report.xsd` defines a report with results of a testing session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0"
                         maxOccurs="unbounded">
              <xs:element name="important"
                          type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="entry">
          <xs:complexType>
```

```

<xs:sequence>
  <xs:element name="test_name"
    type="xs:string"/>
  <xs:element name="passed"
    type="xs:boolean"/>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:schema>

```

CSS Stylesheet

[Edit on
GitHub](#)

A set of rules must be defined for describing how the XML document is to be rendered in **Author** mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called in-line boxes. There are also other type of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contains in-line boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as in-line boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a *table-row* style. Similarly, the `row` elements must contain elements with a *table-cell* style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

report

This element is the root element of a report document. It should be rendered as a box that contains all other elements. To achieve this the display type is set to **block**. Additionally, some margins are set for it. The CSS rule that matches this element is:

```

report{
  display:block;
  margin:1em;
}

```

title

The title of the report. Usually titles have a large font. The **block** display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```

title {
  display:block;
  font-size:2em;
}

```

description

This element contains several lines of text describing the report. The lines of text are displayed one below the

other, so the description has the **block** display. Also, the background color is changed to make it standout.

```
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
```

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be **block** style.

```
line {
    display:block;
}
```

important

The **important** element defines important text from the description. Since it can be mixed with text, its display property must be set to **inline**. Also, the text is emphasized with **bold** to make it easier to spot.

```
important {
    display:inline;
    font-weight:bold;
}
```

results

The **results** element displays the list of *test_names* and the results for each one. To make it easier to read, it is displayed as a **table**, with a green border and margins.

```
results{
    display:table;
    margin:2em;
    border:1px solid green;
}
```

entry

An item in the results element. The results are displayed as a table so the entry is a row in the table. Thus, the display is **table-row**.

```
entry {
    display:table-row;
}
```

test_name, passed

The name of the individual test, and its result. They are cells in the results table with the display set to **table-cell**. Padding and a border are added to emphasize the table grid.

```
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}
```

```
passed{
    font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```
report {
    display:block;
    margin:1em;
}

description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}

line {
    display:block;
}

important {
    display:inline;
    font-weight:bold;
}

title {
    display:block;
    font-size:2em;
}

results{
    display:table;
    margin:2em;
    border:1px solid green;
}

entry {
    display:table-row;
}

test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}
```

report description line important

```
xmlstylesheet type="text/css" href="test_report.css"
```

Automated test report

This is the report of the test automatically ran. Each test suite is ran at 20:00h each day. Please check the failed ones!

Database connection test	true
XSLT Transformation test	true
DTD validation test	false

Text Grid Author

Figure 330: Report Rendered in Author Mode

Note: You can edit attributes in-place in the **Author** mode using *form-based controls*.

Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `xmlstylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, [you should create a new document type \(framework\)](#).

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```
<?xml-stylesheet type="text/css" href="test.less"?>
```

Note: XHTML documents need a `link` element, with the `href` and `type` attributes in the head child element, as specified in the [W3C CSS specification](#). XHTML example:

```
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

Tip: You can also insert the `xml-stylesheet` processing instruction by using the  **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **Document > XML Document** menu.

- Configure a *Document Type Association* by adding a new CSS or LESS file in the settings. To do so, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Edit the appropriate framework, open the **Author** tab, then the **CSS** tab. Press the  **New** button to add a new CSS or LESS file.

Note: The Document Type Associations are read-only, so you need to extend an existing one.

You can read more about associating a CSS to a document in the section about [customizing the CSS of a document type](#).

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

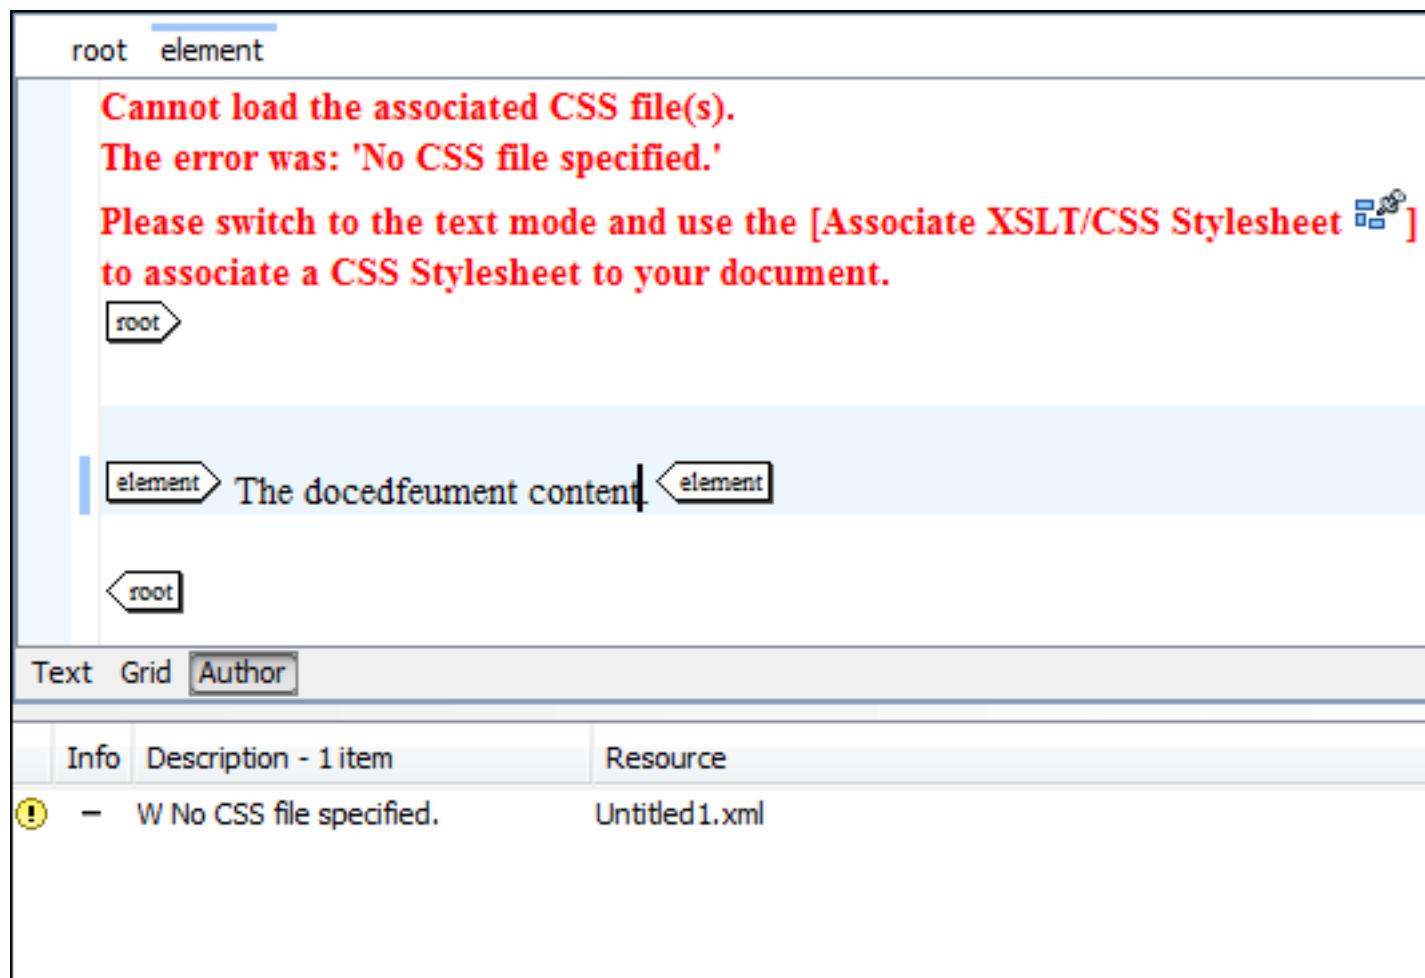

Figure 331: Document with no CSS association default rendering

XML Instance Template

[Edit on](#)
[GitHub](#)

Based on the XML Schema and CSS file Oxygen XML Author can help the content author in loading, editing, and validating the test reports. An XML file template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xmlstylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran. Each test suite
is ran at 20:00h each
    day. Please <important>check</important> the failed ones!</line>
  </description>
  <results>
    <entry>
      <test_name>Database connection test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>XSLT Transformation test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>DTD validation test</test_name>
      <passed>false</passed>
    </entry>
  </results>
</report>
```

The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In our case the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xmlstylesheet type="text/css"
  href="http://www.mysite.com/reports/test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation=
  "http://www.mysite.com/reports/test_report.xsd">
  <title>Test report title</title>
  <description>
  ....
```

The alternative is to create an archive containing the `test_report.xml`, `test_report.css` and `test_report.xsd` and send it to the content authors.

Advanced Customization Tutorial - Document Type Associations

[Edit on GitHub](#)

Oxygen XML Author supports individual document types and classes of document types through frameworks. A framework associates a document type or a class of documents with CSS stylesheets, validation schemas, catalog files, new files templates, transformation scenarios and custom actions.

In this tutorial, we create a framework for a set of documents. As an example, we create a light documentation framework (similar to DocBook), then we set up a complete customization of the **Author** mode.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

[Predefined Document Types \(Frameworks\)](#) on page 1000

Adding or Editing a Document Type Association (Framework)

[Edit on GitHub](#)

To add or edit a *Document Type Association*, open the *Preferences* dialog box (*Options > Preferences*) and go to **Document Type Association**. From this *Document Type Association preferences page* you can use the **New**, **Edit**, **Duplicate**, or **Extend** buttons to open a *Document Type configuration dialog box* that allows you to customize a new or existing document type (framework).

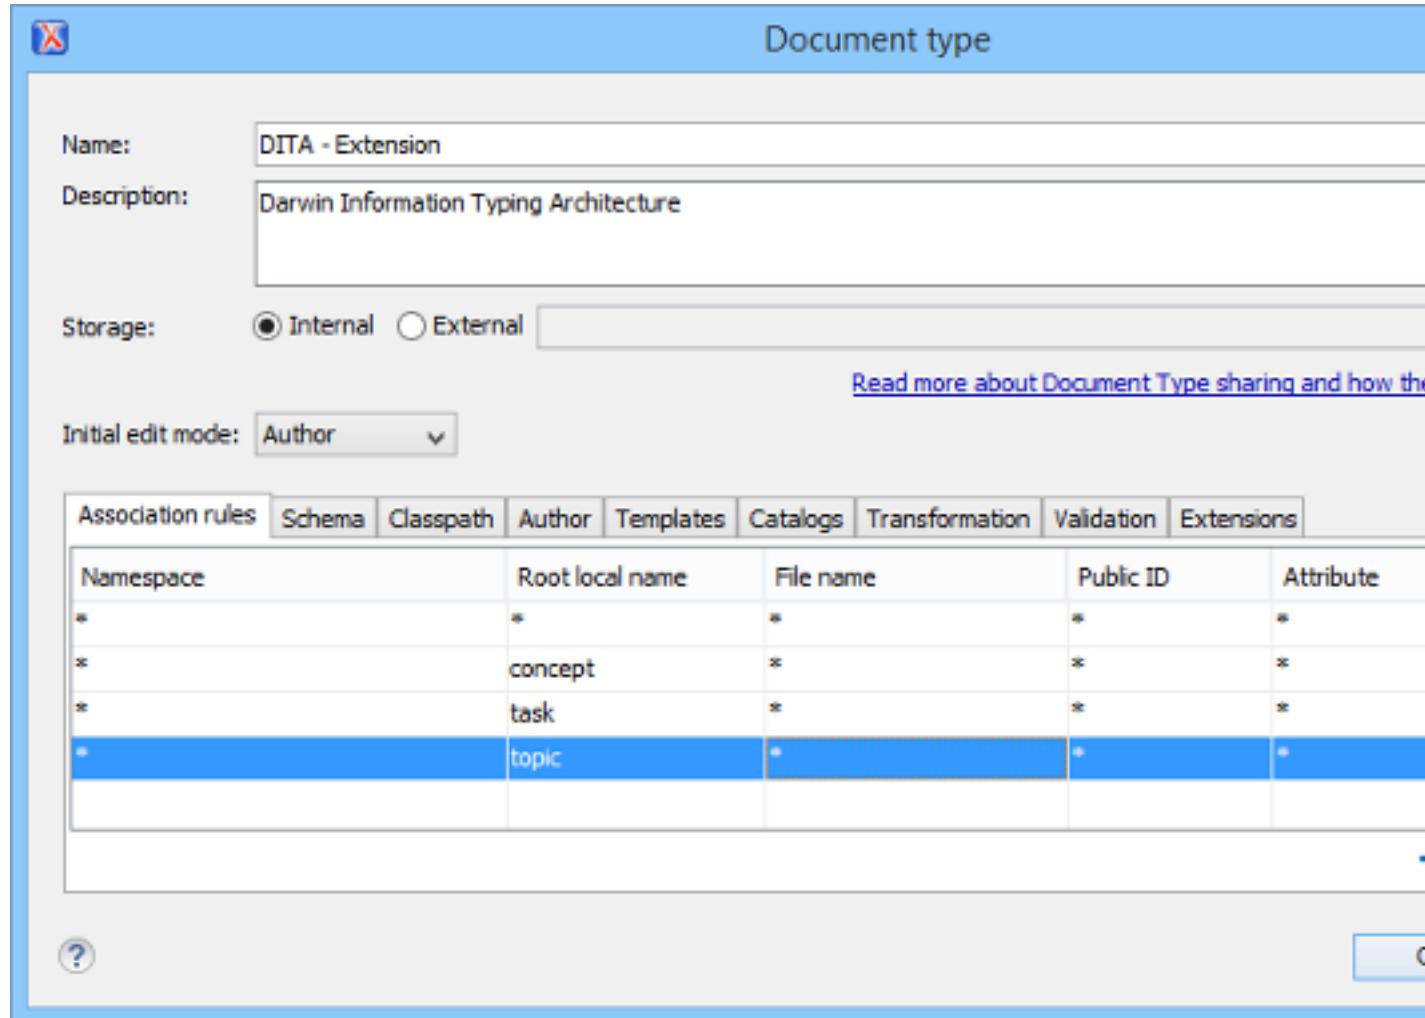

Figure 332: Document Type Configuration Dialog Box

You can specify the following properties for a document type:

- **Name** - The name of the document type.

- **Priority** - When multiple document types match the same document, the priority determines the order in which they are applied. It can be one of the following: Lowest, Low, Normal, High, Highest. The predefined document types that are already configured when the application is installed on the computer have the default Low priority.
- **Note:** Frameworks that have the same priority are sorted alphabetically.
- **Description** - The document type description displayed as a tool tip in the [Document Type Association preferences page](#).
- **Storage** - The location where the document type is saved. If you select the **External** storage option, the document type is saved in the specified file with a mandatory framework extension, located in a subdirectory of the current frameworks directory. If you select the **Internal** storage option, the document type data is saved in the current .xpr Oxygen XML Author project file (for Project-level Document Type Association options) or in the Oxygen XML Author internal options (for Global-level Document Type Association Options). You can change the Document Type Association options level in the [Document Type Association preferences page](#).
- **Initial edit mode** - Allows you to select the initial editing mode for this document type: **Editor specific**, **Text**, **Author**, **Grid** and **Design** (available only for the W3C XML Schema editor). If the **Editor specific** option is selected, the initial editing mode is determined based upon the editor type. You can find the mapping between editors and edit modes in the [Edit modes preferences page](#). You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the **Author** mode you can set it in the **Initial edit mode** combo box.

Note: You can also customize the initial mode for a document type in the **Edit modes** preferences page. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes**.

You can specify the **Association rules** used for determining a document type for an opened XML document. A rule can define one or more conditions. All conditions need to be fulfilled for a specific rule to be chosen. Conditions can specify:

- **Namespace** - The namespace of the document that matches the document type.
- **Root local name of document** - The local name of the document that matches the document type.
- **File name** - The file name (including the extension) of the document that matches the document type.
- **Public ID** (for DTDs) - The PUBLIC identifier of the document that matches the document type.
- **Attribute** - This field allows you to associate a document type depending on a certain value of the attribute in the root.
- **Java class** - Name of the Java class that is called to determine if the document type should be used for an XML document. Java class must either implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface or extend the `ro.sync.ecss.extensions.api.DocumentTypeAdvancedCustomRuleMatcher` abstract class from the [Author API](#).

In the **Schema** tab, you can specify the type and URI of schema used for validation and content completion of all documents from the document type, when there is no schema detected in the document.

You can choose one of the following schema types:

- DTD
- Relax NG schema (XML syntax)
- Relax NG schema (XML syntax) + Schematron
- Relax NG schema (compact syntax)
- XML Schema
- XML Schema + Schematron rules
- NVDL schema

[Selecting and Combining Multiple CSS Styles](#) on page 1222

Configure Actions, Menus, and Toolbars for a Framework

[Edit on](#)[GitHub](#)

You can configure actions, menus, and toolbars that are specific to a document type in the **Author** mode to gain a productive editing experience, by using the *Document Type configuration dialog box*.

To add or configure actions, menus, or toolbars follow this procedure:

1. *Open the Preferences dialog box (Options > Preferences)*, go to **Document Types Association**, and click the framework for which you want to create an action.
2. Click **Edit** and in the *Document Type configuration dialog box* go to the **Author** tab, then go to **Actions**.
3. Click the  **New** button and use the *Action dialog box* to create an action.

Configure the Insert Section Action for a Framework

[Edit on GitHub](#)

This section presents all the steps that you need to follow, to define the **Insert Section** action. It is assumed that the icon files,  (Section16.gif) for the menu item and  (Section20.gif) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in the frameworks/sdf directory.

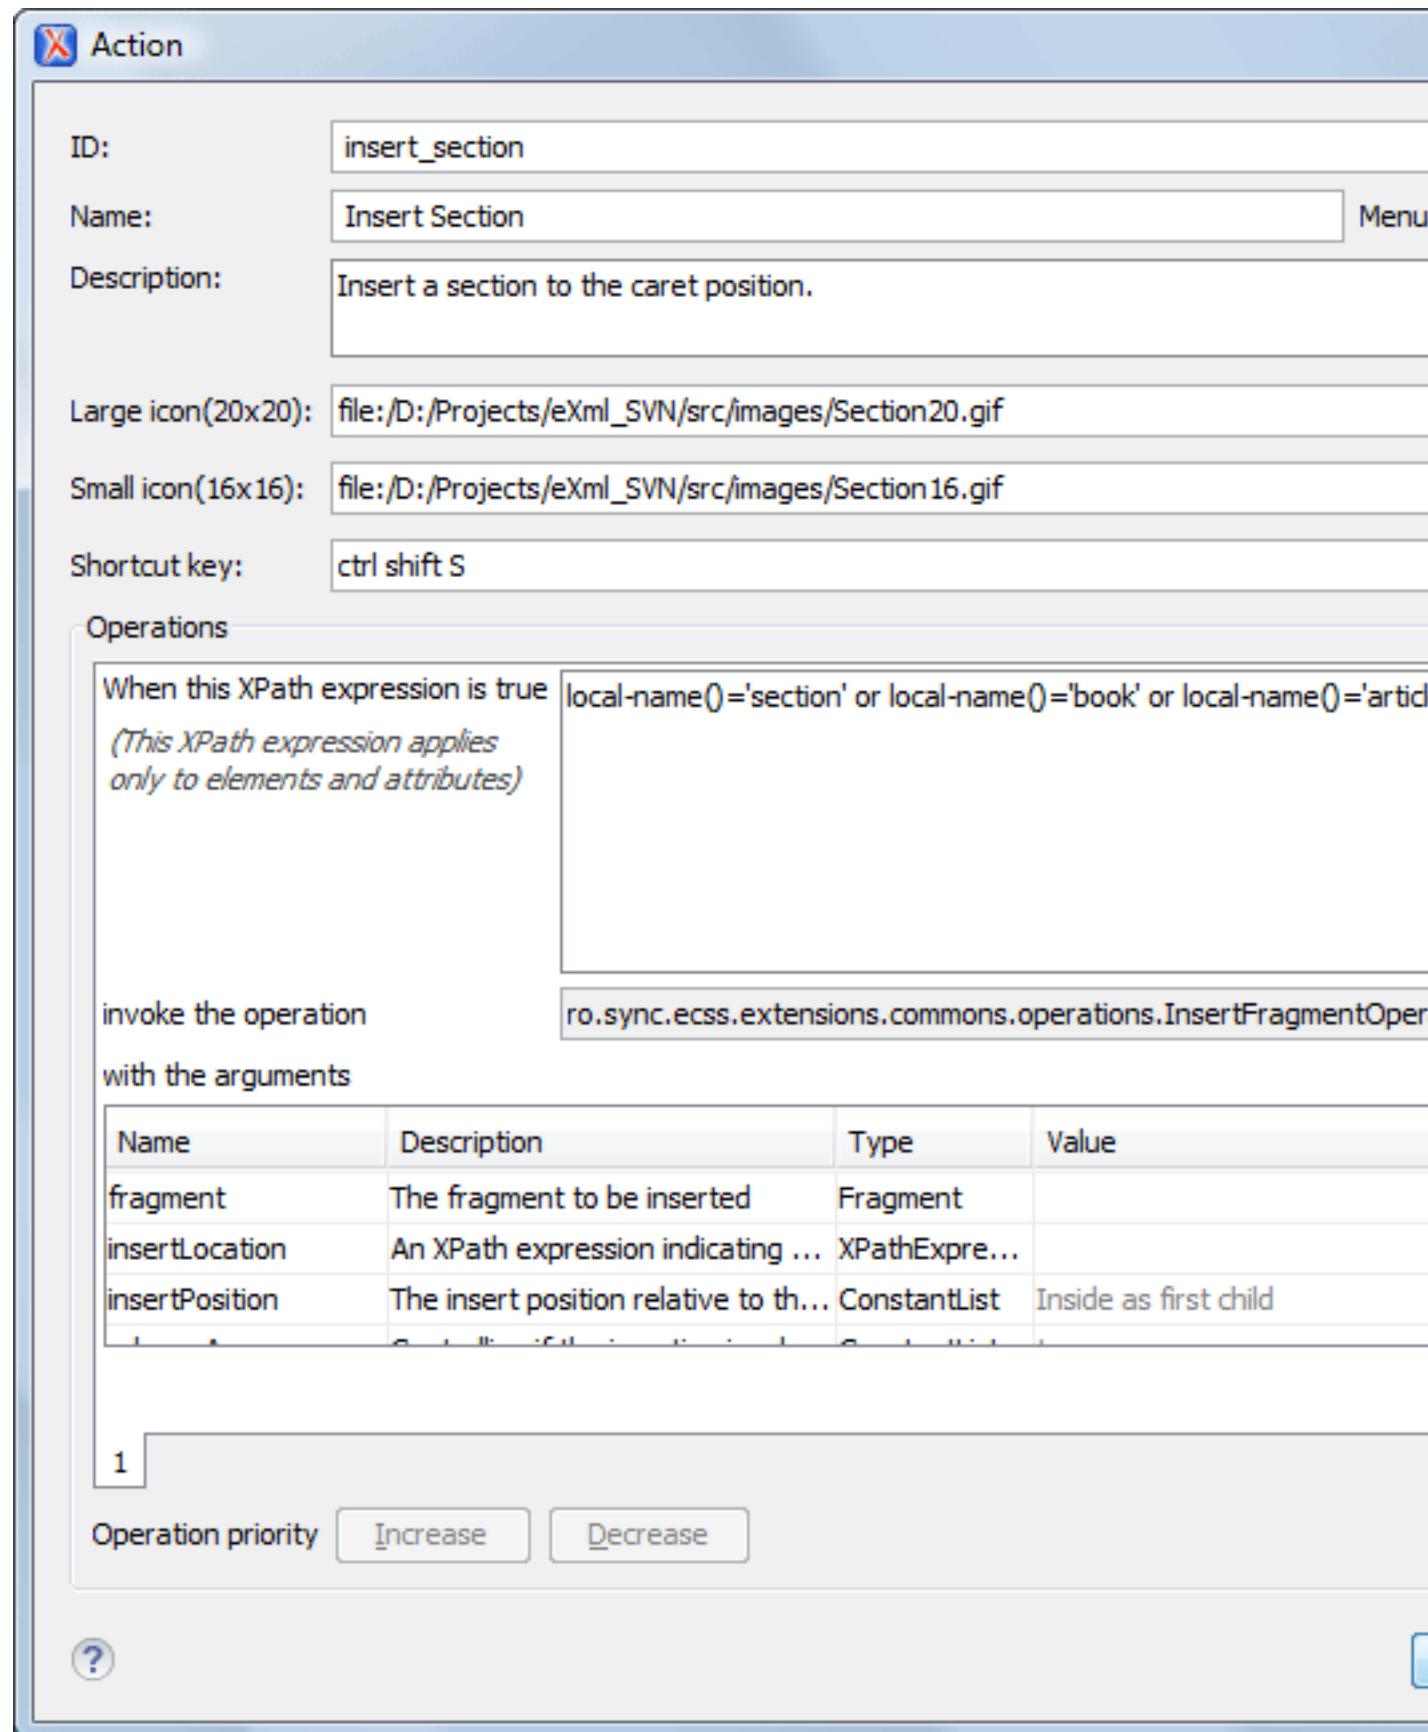

Figure 333: Action Dialog Box

1. Set the **ID** field to **insert_section**. This is a unique action identifier.
2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.
3. Set the **Menu access key** to **i**. On Windows, the menu items can be accessed using **ALT+letter** keys combination, when the menu is visible. The letter is visually represented by underlining the first letter from the menu item name having the same value.
4. Set the **Description** field to **Insert a section at cursor position**.
5. Set the **Large icon (20x20)** field to `$(frameworks)/sdf/Section20.gif`. A good practice is to store the image files inside the framework directory and use *editor variable* `$(framework)` to make the image relative to the framework location.

If the images are bundled in a jar archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

If the image file `Section20.gif` is located in the **images** directory inside the jar archive, you can reference it by using `/images/Section20.gif`. The jar file must be added into the **Classpath** list.

6. Set the **Small icon (16x16)** field to `$(frameworks)/sdf/Section16.gif`.
7. Click the text field next to **Shortcut key** and set it to **Ctrl (Meta on Mac OS)+Shift+S**. This will be the key combination to trigger the action using the keyboard only.

The shortcut is enabled only by *adding the action to the main menu of Author mode*, which contains all the actions that the author will have in a menu for the current document type.

8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The Xpath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example we'll suppose you want allow the action to add a section only if the current element is either a book, article or another section.

- a) Set the XPath expression field to:

```
local-name()='section' or local-name()='book' or
local-name()='article'
```

- b) Set the **invoke operation** field to `InsertFragmentOperation` built-in operation, designed to insert an XML fragment at cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the *Author Default Operations* section. This set can be expanded with your own Java operation implementations.
- c) Configure the arguments section as follows:

```
<section xmlns=
"http://www.oxygenxml.com/sample/documentation">
<title/>
</section>
```

`insertLocation` - leave it empty. This means the location will be at the cursor position.

`insertPosition` - select "**Inside**".

Configure the Insert Table Action for a Framework

[Edit on GitHub](#)

The procedure described below will create an action that inserts a table with three rows and three columns into a document. The first row is the table header. As with *the insert section action*, you will use the `InsertFragmentOperation` built-in operation.

Place the icon files for the menu item, and for the toolbar, in the `frameworks/sdf` directory.

1. Set **ID** field to **insert_table**.
2. Set **Name** field to **Insert table**.
3. Set **Menu access key** field to **t**.
4. Set **Description** field to **Adds a table element**.
5. Set **Toolbar icon** to \${framework} / toolbarIcon.png.
6. Set **Menu icon** to \${framework} / menuIcon.png.
7. Set **Shortcut key** to **Ctrl + Shift + T (Command + Shift + T on OS X)**.
8. Set up the action's functionality:
 - a) Set **XPath expression** field to **true()**.
true() is equivalent with leaving this field empty.
 - b) Set **Invoke operation** to use **InsertFragmentOperation** built-in operation that inserts an XML fragment to the cursor position.
 - c) Configure operation's arguments as follows:

fragment - set it to:

```
<table xmlns=
"http://www.oxygenxml.com/sample/documentation">
<header><td/><td/><td/></header>
<tr><td/><td/><td/></tr>
<tr><td/><td/><td/></tr>
</table>
```

insertLocation - to add tables at the end of the section use the following code:

```
ancestor::section/*[last()]
```

insertPosition - Select **After**.

Configure the Main Menu for a Framework

[Edit on GitHub](#)

Defined actions can be grouped into customized menus in the Oxygen XML Author menu bar.

1. Open the **Document Type configuration dialog box** for the **SDF framework** and go to the **Author** tab.
2. Go to the **Menu** subtab. In the left side you have the list of actions and some special entries:
 - **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
 - **Separator** - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the menu tree with **Menu** entry as root. To change its name, click this label to select it, then press the **Edit** button. Enter **SD Framework** as name, and **D** as menu access key.
4. Select the **Submenu** label in the left panel section and the **SD Framework** label in the right panel section, then press the **Add as child** button. Change the submenu name to **Table**, using the **Edit** button.
5. Select the **Insert section** action in the left panel section and the **Table** label in the right panel section, then press the **Add as sibling** button.
6. Now select the **Insert table** action in the left panel section and the **Table** in the right panel section. Press the **Add as child** button.

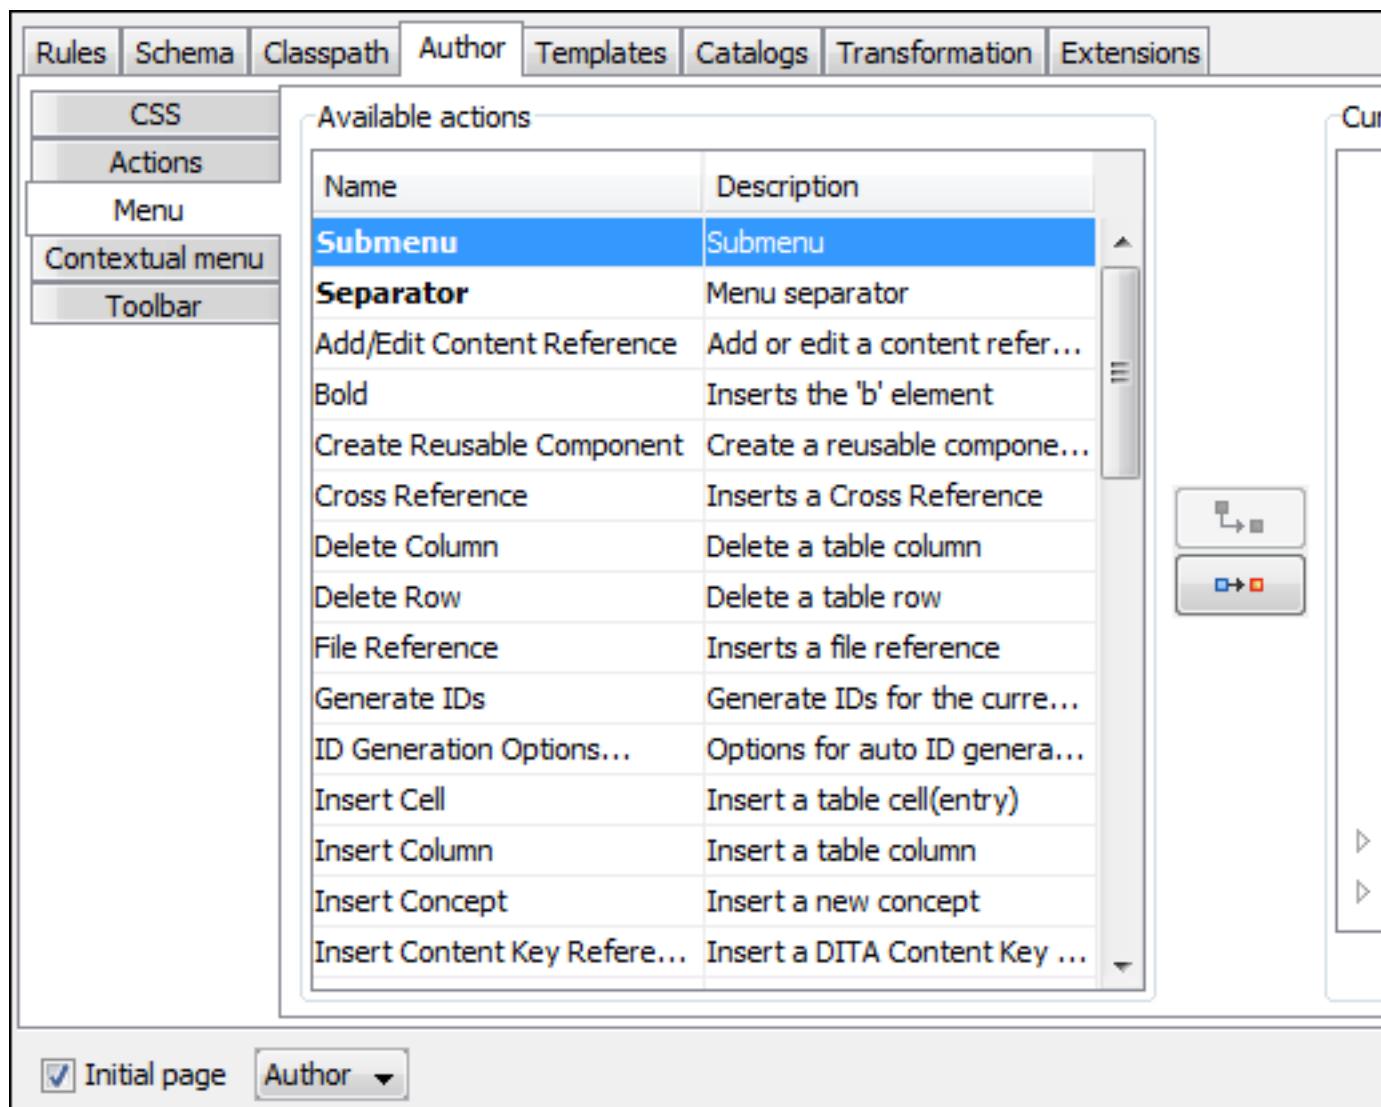

Figure 334: Configuring the Menu

When opening a custom framework test document in **Author** mode, the menu you created is displayed in the editor menu bar, between the **Tools** and the **Document** menus. The upper part of the menu contains generic **Author** mode actions (common to all document types) and the two actions created previously (with **Insert table** under the **Table** submenu).

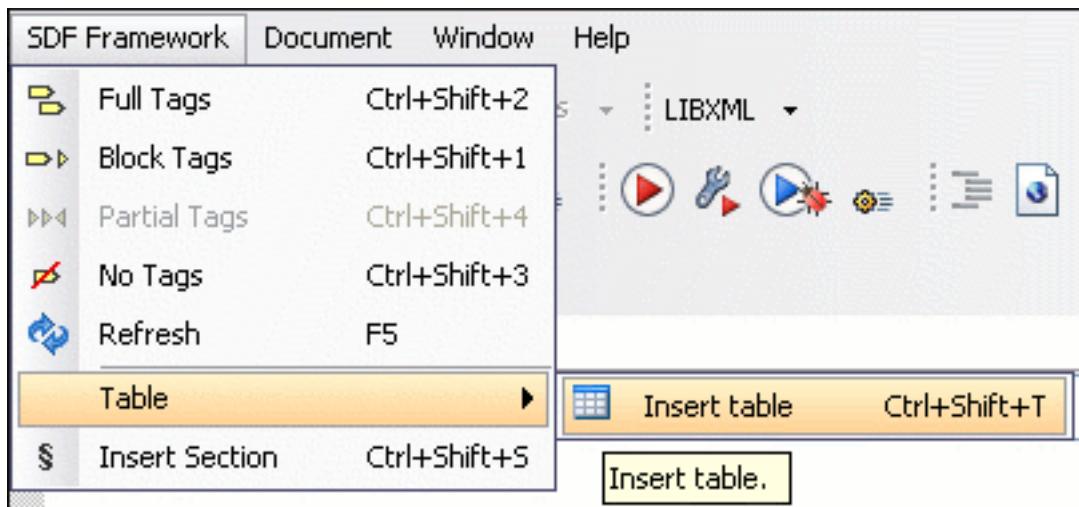

Figure 335: Author Mode Menu

Configure the Contextual Menu for a Framework

[Edit on GitHub](#)

The contextual menu is displayed when you right-click in the **Author** editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the [Document Type configuration dialog box](#) for the particular framework and go to the **Author** tab. Next, go to the **Contextual Menu** subtab.
2. Follow the same steps as explained in the [Configuring the Main Menu](#), except changing the menu name because the contextual menu does not have a name.

Note: You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and document type-specific ones) are grouped together under the same submenu.

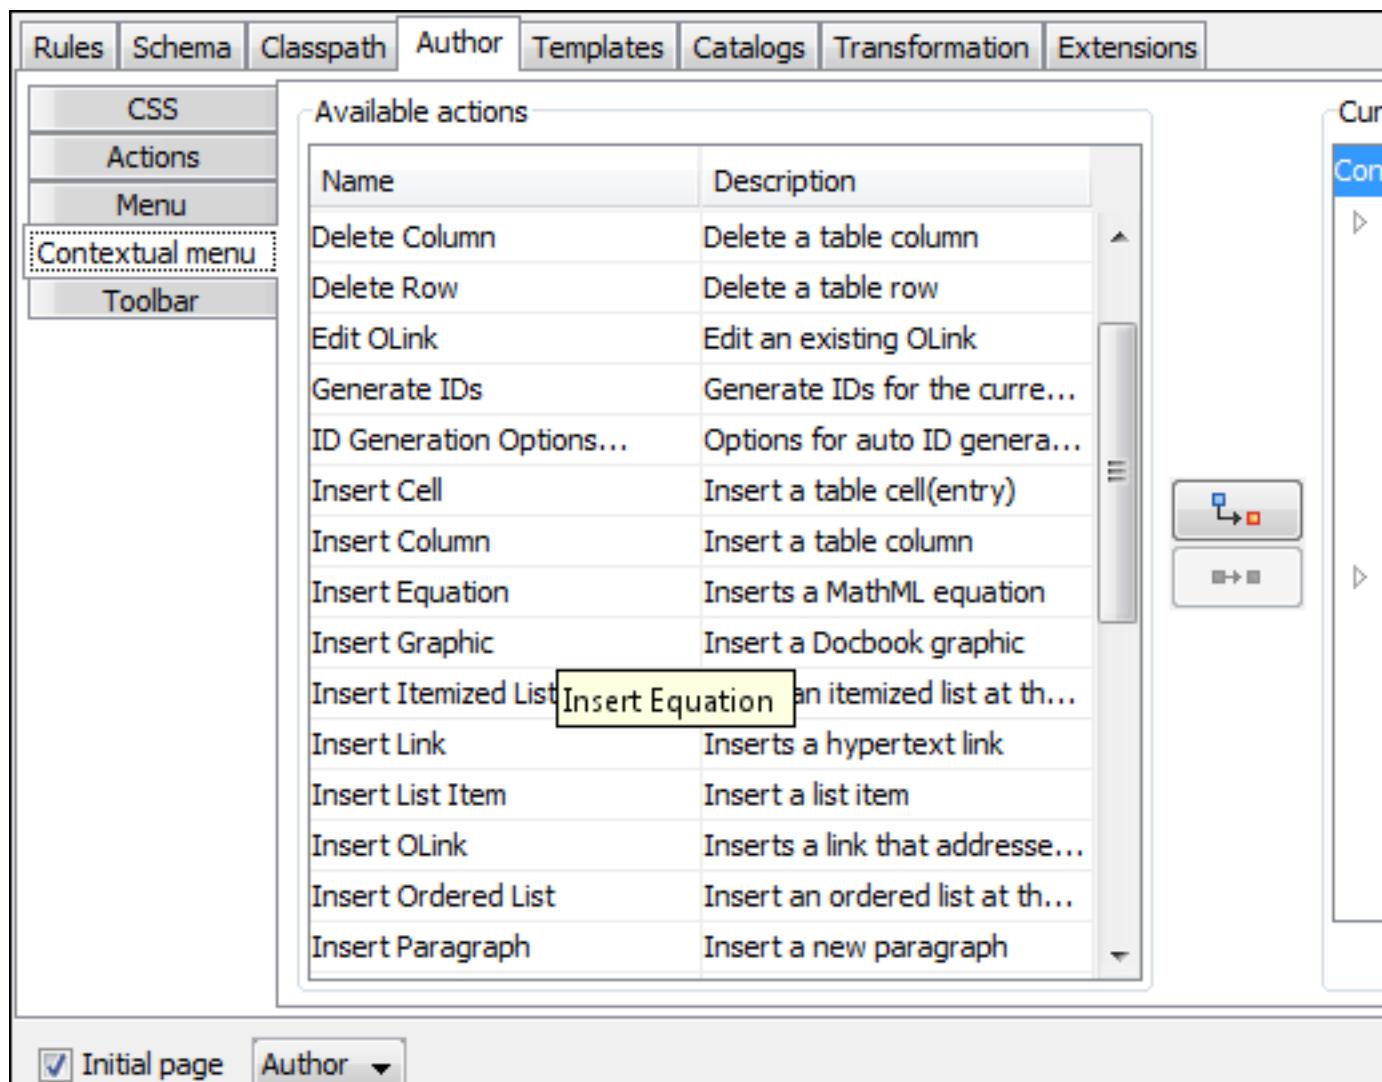

Figure 336: Configuring the Contextual Menu

To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** sub-menu and the **Insert section** action.

Configure the Toolbars for a Framework

[Edit on GitHub](#)

The procedure below describes how to add defined actions to a toolbar. These steps use examples from the two previous help topics that described how to define the **Insert Section** and **Insert Table** actions. You can also configure additional toolbars to add other custom actions.

1. Open the **Document Type configuration dialog box** for the **SDF framework** and select the **Author** tab. Next, go to the **Toolbar** subtab.

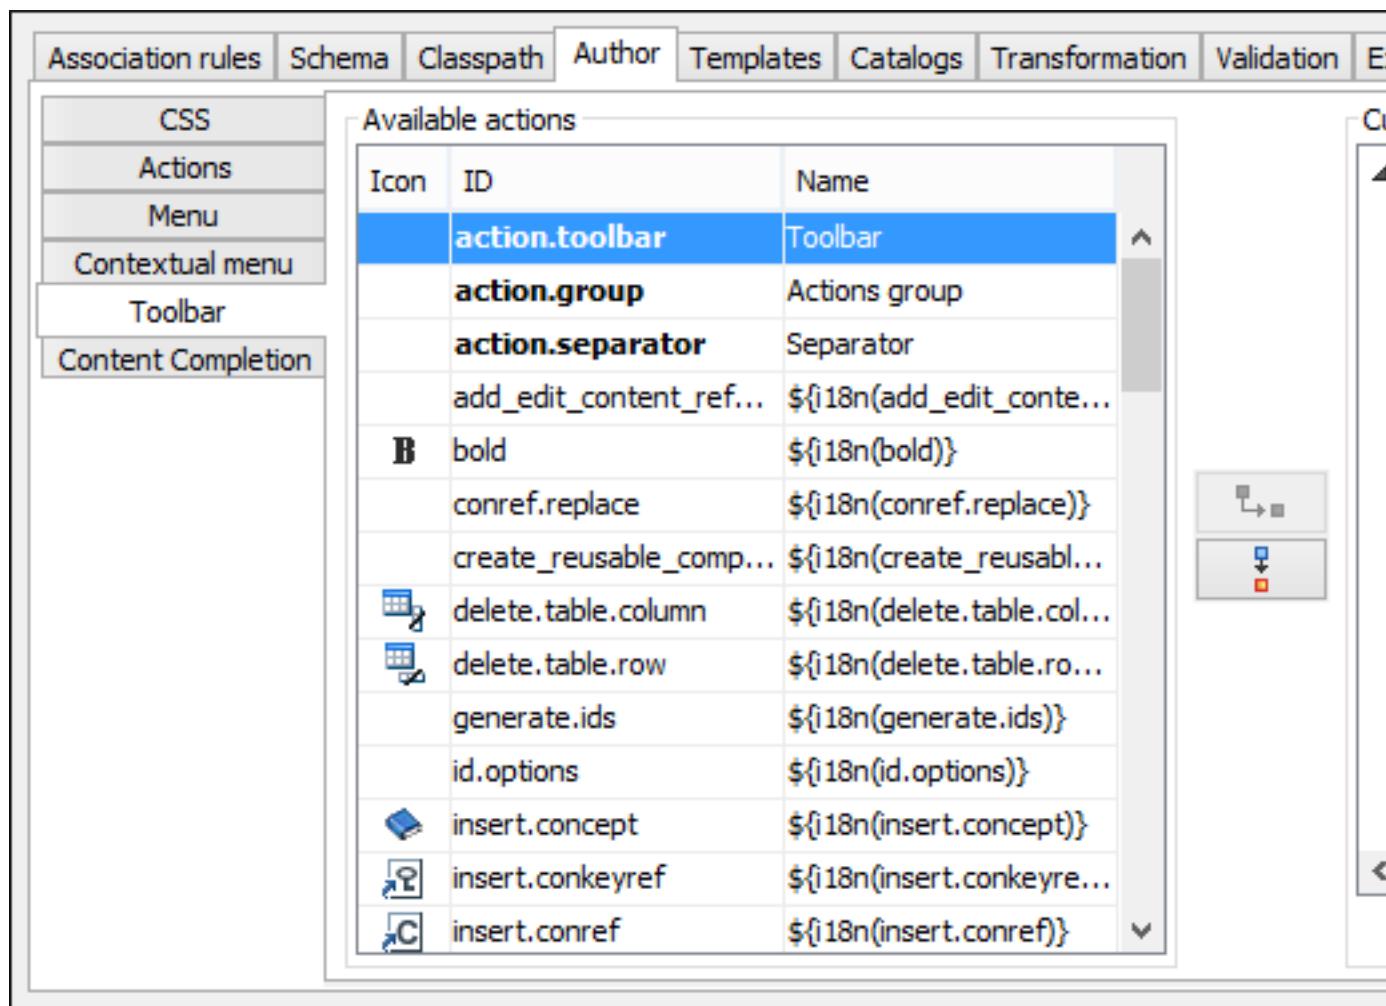

Figure 337: Configuring the Toolbar

The panel is divided in two sections: the left side contains a list of actions, while the right one contains an action tree, displaying the list of actions added in the toolbar. The special entry called *Separator* allows you to visually separate the actions in the toolbar.

2. Select the **Insert section** action in the left panel section and the **Toolbar** label in the right panel section, then press the **Add as child** button.
3. Select the **Insert table** action in the left panel section and the **Insert section** in the right panel section. Press the **Add as sibling** button.

When opening a document of the particular framework in **Author** mode, the toolbar with the new buttons will be displayed in the toolbar area.

Tip: If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the **Author** mode, right-click the main toolbar, select **Configure Toolbars**, and make sure the appropriate toolbar (such as the **Author Custom Actions** toolbar) is enabled.

Configure Content Completion for a Framework

[Edit on GitHub](#)

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- **Content Completion** window

- **Elements view**
- **Element Insert** menus (from the **Outline** view or breadcrumb contextual menus)

You can use the content completion customization support in a custom framework by following this procedure:

1. Open the *Document type configuration dialog box* for the *SDF framework* and select the **Author** tab. Next, go to the **Content Completion** tab.

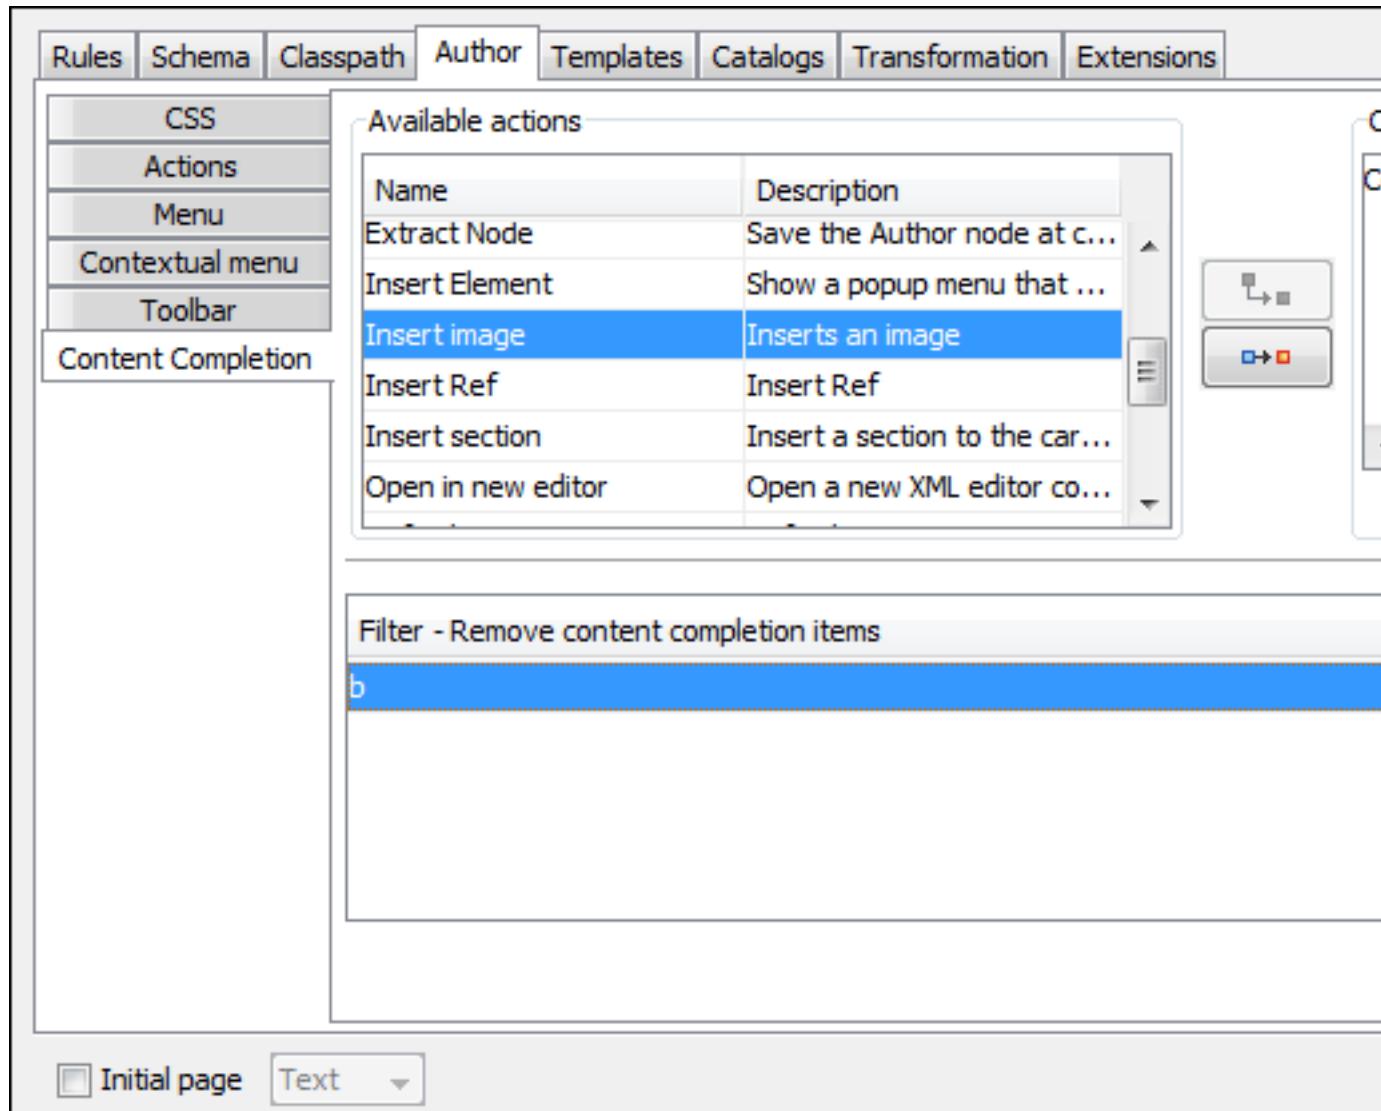

Figure 338: Customize Content Completion

The top side of the **Content Completion** section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the **Content Completion Assistant** list of proposals. The bottom side contains the list with all the items that you decided to remove from the **Content Completion Assistant** list of proposals.

2. If you want to add a custom action to the list of current **Content Completion** items, select the action item from the **Available actions** list and press the **Add as child** or **Add as sibling** button to include it in the **Current actions** list. An **Insert Action** dialog box appears, giving you the possibility to select where to provide the selected action.

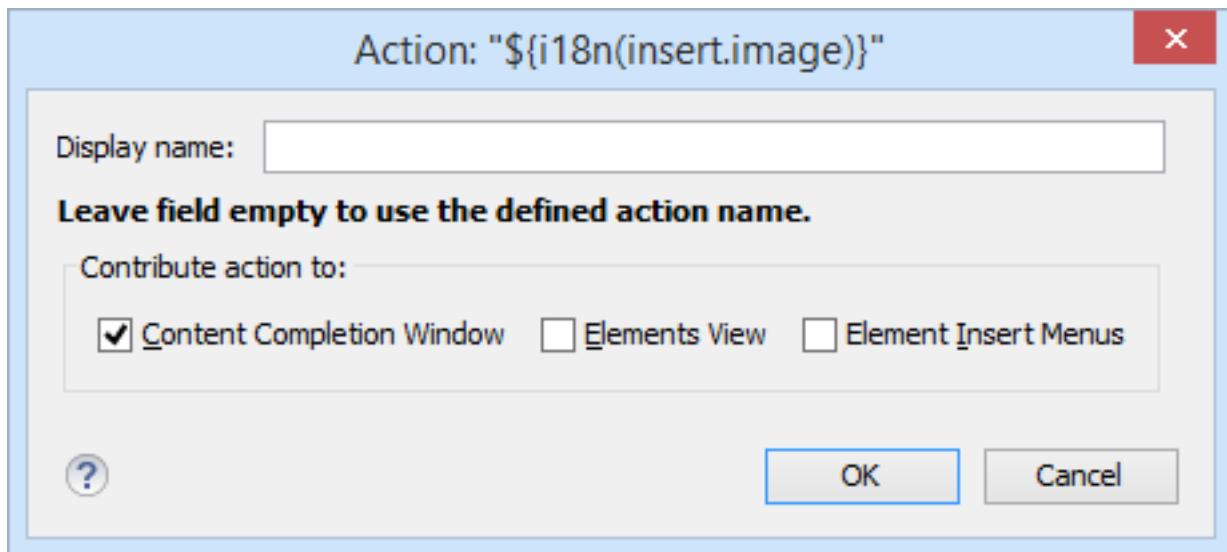

Figure 339: Insert Action Dialog Box

3. If you want to exclude a certain item from the **Content Completion** items list, you can use the **+ Add** button from the **Filter - Remove content completion items** list. The **Remove item** dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

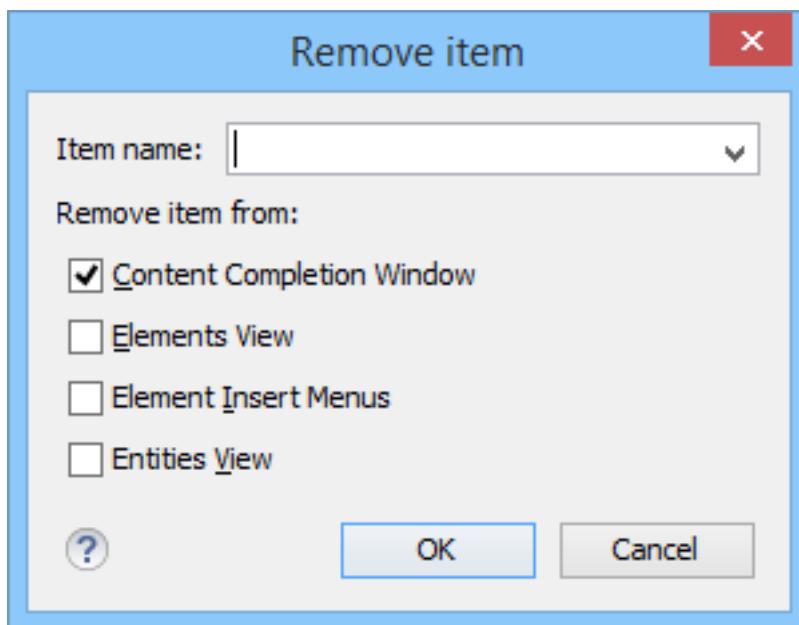

Figure 340: Remove Item Dialog Box

Author Mode Default Operations

[Edit on GitHub](#)

The default operations for the **Author** mode, along with their arguments are as follows:

- **InsertFragmentOperation**

Inserts an XML fragment at the current cursor position. The selection - if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The

namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see [Arguments of InsertFragmentOperation Operation](#) on page 1136.

- **InsertOrReplaceFragmentOperation**

Similar to **InsertFragmentOperation**, except it removes the selected content before inserting the fragment. For more details about its list of parameters, see [Arguments of InsertFragmentOperation Operation](#) on page 1136.

- **InsertOrReplaceTextOperation**

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

- **text** - The text section to insert.
- **SurroundWithFragmentOperation**

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to [Arguments of SurroundWithFragmentOperation](#) on page 1138.

- **SurroundWithTextOperation**

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header** - The text that is placed before the selection.
- **footer** - The text that is placed after the selection.

- **InsertEquationOperation**

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

- **fragment** - The XML fragment containing the MathML content that should be inserted.

- **OpenInSystemAppOperation**

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation is:

- **resourcePath** - An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables are expanded in the value of this parameter, before the expression is executed.
- **isUnparsedEntity** - Possible values are **true** or **false**. If the value is **true**, the value of the **resourcePath** argument is treated as the name of an unparsed entity.

- **ChangeAttributeOperation**

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom **Author** mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

- **name** - The attribute local name.
- **namespace** - The attribute namespace.
- **elementLocation** - The XPath location that identifies the element.
- **value** - The new value for the attribute. If empty or null the attribute will be removed.
- **editAttribute** - If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.
- **removeIfEmpty** - The possible values are **true** and **false**. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

- **UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is

- **unwrapElementLocation** - An XPath expression indicating the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.
- **ToggleSurroundWithElementOperation**

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

- **element** - The element to wrap or unwrap content.
- **schemaAware** - This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

- **RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName** - The new element name
- **elementLocation** - The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

- **ExecuteTransformationScenariosOperation**

This operation allows running one or more transformation scenarios defined in the current document type association. It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

- **scenarioNames** - The list of scenario names that will be executed, separated by new lines.
- **XSLTOperation** and **XQueryOperation**

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

Notice: For the Oxygen XML Web Author Component, these operations cannot be invoked using the [JavaScript API](#).

These operations have the following parameters:

- **sourceLocation**

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations in which you want to look at an ancestor of the current element and take decisions in the script based on this. To do this, you can set the **sourceLocation** to point to an ancestor node then declare a parameter called **currentElementLocation** in your script and use it to re-position in the current element, as in the following example:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:saxon="http://saxon.sf.net/" exclude-result-prefixes="saxon">

    <!-- This is an XPath location which will be sent by the operation
        to the script --&gt;
    &lt;xsl:param name="currentElementLocation"/&gt;

    &lt;xsl:template match="/"&gt;
        <!-- Evaluate the XPath of the current element location --&gt;
        &lt;xsl:apply-templates&gt;</pre>

```

```

        select="saxon:eval(saxon:expression($currentElementLocation))" />
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element,
        but we can use information from the entire XML -->
        <xsl:variable
            name="keyImage" select="//imagedata[@fileref='images/
lake.jpeg']"
            /ancestor::inlinemediaobject/@xml:id/string()"/>
        <xref linkend="${keyImage}" role="key_include"
            xmlns="http://docbook.org/ns/docbook">
            <xsl:value-of
                select="$currentElementLocation"></xsl:value-
of>
        </xref>
    </xsl:template>
</xsl:stylesheet>

```

- **targetLocation**

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

- **script**

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported `xslt_operation.xsl` needs to be located in the current framework directory.

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="1.0">
    <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>

```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The `${framework}` editor variable can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, `http://www.oxygenxml.com/fr/testy.xsl`) and map it in the `catalog.xml` file from the framework directory to a resource from the framework.

- **action**

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

- **caretPosition**

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the `${caret}` editor variable in the inserted content.

- **expandEditorVariables**

Parameter controlling the expansion of editor variables returned by the script processing. Expansion is enabled by default.

- **XQueryUpdateOperation**

Allows you to execute an XQuery Update script directly over content in **Author** mode.

Notice: This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author Component.

It has one argument:

- **script**

The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the \${framework} or \${frameworkDir} editor variables to refer the scripts from the framework directory.

The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

```
declare variable $oxyxq:selection external;
```

An example of an XQuery Update Script that converts paragraphs to list items:

```
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";
(: This variable will be linked to the selected nodes assuming that there
are
actually fully selected nodes. For example this selection will
returnnull:
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.
:)
declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
    (.)
else
    ($oxyxq:selection)

returnif (not(empty($toProcess))) then
(
    (: Create the list :)
    let $ul :=
        <ul>
            {
                for $sel in $toProcess
                return
                    <li>{$sel}</li>
            }
        </ul>

    return
    (
        (: Delete the processed nodes :)
        for $sel in $toProcess
        return
            delete node $sel,
        (: Inserts the constructed list :)
        insert node $ul
            before $toProcess[1]
    )
)
else
()
```

- **JSOperation**

Allows you to call the Java API from custom JavaScript content.

Notice: For the Oxygen XML Web Author Component, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

- **script**

The JavaScript content to execute. It must have a function called `doOperation()`, which can use the predefined `authorAccess` variable. The `authorAccess` variable has access to the entire `ro.sync.ecss.extensions.api.AuthorAccess` Java API.

The following example is a script that retrieves the current value of the `type` attribute on the current element, allows the end user to edit its new value and sets the new value in the document:

```
function doOperation(){
    //The current node is either entirely selected...
    currentNode =
        authorAccess.getEditorAccess().getFullySelectedNode();
    if(currentNode == null){
        //or the cursor is placed in it
        caretOffset =
            authorAccess.getEditorAccess().getCaretOffset();
        currentNode =
            authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    }
    //Get current value of the @type attribute
    currentTypeValue = "";
    currentTypeValueAttr = currentNode.getAttribute("type");
    if(currentTypeValueAttr != null){
        currentTypeValue = currentTypeValueAttr.getValue();
    }
    //Ask user for new value for attribute.
    newTypeValue = javax.swing.JOptionPane.showInputDialog("Input
@type value", currentTypeValue);
    if(newTypeValue != null){
        //Create and set the new attribute value for the @type
        //attribute.
        attrValue = new
        Packages.ro.sync.ecss.extensions.api.node.AttrValue(newTypeValue);
        authorAccess.getDocumentController().setAttribute("type",
        attrValue, currentNode);
    }
}
```

Note: If you have a script called `commons.js` in the framework directory, you can call functions defined inside it from your custom script content so that you can use that external script file as a library of functions.

- **ExecuteMultipleActionsOperation**

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Author.

- **actionIDs** - The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by new lines.

- **MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

- **sourceLocation** - XPath expression that identifies the content to be moved.
- **deleteLocation** - XPath expression that identifies the node to be removed. This parameter is optional. If missing, the **sourceLocation** parameter will also identify the node to be deleted.
- **surroundFragment** - A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.
- **targetLocation** - XPath expression that identifies the location where the node must be moved to.
- **insertPosition** - Argument that indicates the insert position.
- **moveOnlySourceContentNodes** - When `true`, only the content of the source element is moved.
- **processTrackedChangesForXpathLocations** - When nodes are located via an XPath expression and the nodes are deleted with change tracking enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to `true` and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).

- **ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations** - An XPath expression indicating a list of nodes for which the specified list of pseudo-classes will be set. If it is not defined, then the element at the cursor position will be used.
- **setPseudoClassNames** - A space-separated list of pseudo-class names that will be set on the matched nodes.
- **removeLocations** - An XPath expression indicating a list of nodes from which the specified list of pseudo-classes will be removed. If it is not defined, then the element at the cursor position will be used.
- **removePseudoClassNames** - A space-separated list of pseudo-class names that will be removed from the matched nodes.

- **SetPseudoClassOperation**

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation** - An XPath expression indicating the element for which the pseudo-class will be set. If it is not defined, then the element at cursor position will be used.
- **name** - The pseudo-class local name.

- **ShowElementDocumentationOperation**

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

- **RemovePseudoClassOperation**

An operation that removes a pseudo-class from an element. Accepts the following parameters:

- **name** - Name of the pseudo-class to be removed.
- **elementLocation** - The XPath location that identifies the element. Leave it empty for the current element.

Let's consider that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```
paragraph:myClass{
    font-size:2em;
    color:red;
}
paragraph{
    color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the paragraph is rebuilt by matching the other rules (in this case, the foreground color of the paragraph element will become blue).

- **TogglePseudoClassOperation**

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

- **name** - Name of the pseudo-class to be toggled on/off.
- **elementLocation** - The XPath location that identifies the element. Leave it empty for the current element.

```
paragraph:myClass{
    color:red;
}
paragraph{
    color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that we have a TogglePseudoClassOperation configured for the myClass pseudo-class. Invoking it the first time will set the myClass pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered paragraph element.

- **ExecuteMultipleWebappCompatibleActionsOperation**

An implementation of an operation that runs a sequence of Oxygen XML Web Author Component-compatible actions, defined as a list of IDs.

- **DeleteElementsOperation**

Deletes the nodes indicated by the elementLocations parameter XPath expression. If missing, the operation will delete the node at the cursor location.

- **DeleteElementOperation**

Deletes the node indicated by the elementLocation parameter XPath expression. If missing, the operation will delete the node at the cursor location.

- **InsertXIncludeOperation**

Insert an **XInclude** element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

Author mode operations can include parameters that contain the following editor variables:

- **\${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- **\${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- **\${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}** - To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:
 - **'message'** - The displayed message. Note the quotes that enclose the message.
 - **type** - Optional parameter, with one of the following values:

Parameter	
url	Format: \${ask('message' , url , 'default_value')}

Parameter	
	<p>Description: Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Input URL', url)}</code> - The displayed dialog box has the name Input URL. The expected input type is URL. • <code> \${ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value <code>http://www.example.com</code>.
password	<p>Format: <code> \${ask('message', password, 'default')}</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Input password', password)}</code> - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. • <code> \${ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
generic	<p>Format: <code> \${ask('message', generic, 'default')}</code></p> <p>Description: The input is considered to be generic text that requires no special handling.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Hello world!')}</code> - The dialog box has a Hello world! message displayed. • <code> \${ask('Hello world!', generic, 'Hello again!')}</code> - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
relative_url	<p>Format: <code> \${ask('message', relative_url, 'default')}</code></p> <p>Description: Input is considered a URL. Oxygen XML Author tries to make the URL relative to that of the document you are editing.</p> <p>Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Author will transform it into an absolute URL.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('File location', relative_url, 'C:/example.txt')}</code> - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.
combobox	<p>Format: <code> \${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))}</code></p>

Parameter	
	<p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated value (<code>real_value</code>).</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} </code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <p>Note: In this example, the default value is indicated by the <code>osx</code> key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')} </code></p> <ul style="list-style-type: none"> • <code> \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')} </code>
editable_combobox	<p>Format: <code> \${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))} </code></p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated real value (<code>real_value</code>) or the value inserted when you edit a list entry.</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} </code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
radio	<p>Format: <code> \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))} </code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a '<code>rendered_value</code>' and will return an associated '<code>real_value</code>'.</p> <p>Note: The '<code>default</code>' parameter specifies the default selected value and can match either a key or a value.</p>

Parameter	
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems. <p>Note: In this example Mac OS X is the default selected value and if selected it would return osx for the output.</p>

- 'default-value' - optional parameter. Provides a default value.
- `${timeStamp}` - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- `${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java **UUID** class.
- `${id}` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `${cfn}` - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- `${cfne}` - Current file name with extension. The current file is the one currently opened and selected.
- `${cf}` - Current file as file path, that is the absolute file path of the current edited document.
- `${cfdf}` - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- `${frameworksDir}` - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${pd}` - Current project folder as file path. Usually the current folder selected in the **Project View**.
- `${oxygenInstallDir}` - Oxygen XML Author installation folder as file path.
- `${homeDir}` - The path (as file path) of the user home folder.
- `${pn}` - Current project name.
- `${env(VAR_NAME)}` - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `${system(var.name)}` editor variable.
- `${system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `${env(VAR_NAME)}` editor variable instead.
- `${date(pattern)}` - Current date. The allowed patterns are equivalent to the ones in the **Java SimpleDateFormat class**. **Example:** `yyyy-MM-dd`;

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about xs:datetime, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

[Arguments of SurroundWithFragmentOperation](#) on page 1138

Arguments of `InsertFragmentOperation` Operation

[Edit on GitHub](#)

fragment

This argument has a textual value. This value is parsed by Oxygen XML Author as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

1. Prefixes that are not bound explicitly

For instance, the fragment:

```
<x:item id="dty2"/>
&ent;
<x:item id="dty3"/>
```

Can be correctly inserted in the document: ('|' marks the insertion point):

```
<?xml version="1.0"
encoding="UTF-8"?>
<!DOCTYPE x:root [
    <!ENTITY ent "entity">
]>

<x:root xmlns:x="nsp">
|
</x:root>
```

Result:

```
<?xml version="1.0"
encoding="UTF-8"?>
<!DOCTYPE x:root [
    <!ENTITY ent "entity">
]>
<x:root xmlns:x="nsp">
    <x:item id="dty2"/>
    &ent;
    <x:item id="dty3"/>
</x:root>
```

2. Default namespaces

If there is a default namespace declared in the document and the document fragment does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

For instance, the fragment:

```
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```
<?xml version="1.0"
encoding="UTF-8"?>
<root xmlns="nsp">
|
</root>
```

Gives the result document:

```
<?xml version="1.0"
encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

`insertLocation`

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

`insertPosition`

Specifies where the insertion is made relative to the reference node selected by the `insertLocation`. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

`goToNextEditablePosition`

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `cursorEditor` variable. The possible values of this action are `true` and `false`.

`schemaAware`

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Arguments of `SurroundWithFragmentOperation`

[Edit on GitHub](#)

The **Author** mode operation `SurroundWithFragmentOperation` has only one argument:

- `fragment`

The XML fragment that will surround the selection. For example, consider the fragment:

```
<F>
  <A></A>
  <B>
    <C></C>
  </B>
</F>
```

and the document:

```
<doc>
  <X></X>
  <Y></Y>
  <Z></Z>
<doc>
```

Considering the selected content to be surrounded is the sequence of elements X and Y, then the result is:

```
<doc>
  <F>
    <A>
      <X></X>
      <Y></Y>
    </A>
    <B>
      <C></C>
    </B>
  </F>
  <Z></Z>
<doc>
```

Since the element A was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

Add a Custom Operation to an Existing Framework

[Edit on GitHub](#)

This task explains how to add a custom **Author** mode operation to an existing document type.

1. Setup a sample project by following the [instructions for installing the SDK](#). The framework project is `oxygen-sample-framework`.
2. A number of classes in the `simple.documentation.framework.operations` package implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java `jar` library.
4. Copy the `jar` library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. [Open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, and edit the document type (you need write access to the `[OXYGEN_INSTALL_DIR]`) to open the **Document Type configuration dialog box**.
 - a) In the **Classpath** tab, add a new entry similar to: `${framework}/customAction.jar`.
 - b) In the **Author** tab, add a new action that uses your custom operation.
 - c) Mount the action to the toolbars or menus.
6. Share the modifications with your colleagues. The files that should be shared are your `customAction.jar` library and the `.framework` configuration file from the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.

Using Retina/HiDPI Images in Author Mode

[Edit on GitHub](#)

Oxygen XML Author provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include @2x in the name (for example, myImage@2x.png).

You can reference an image to style an element in a CSS by using the `url` function in the `content` property, as in the following example:

```
listItem:before{
    content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the `myImage.png` file just before the `listItem` element.

However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Author interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Author will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Author would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Author also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Author:

Color Theme	Referred Image File	Double Density Image File	Triple Density Image File
normal	./img/myImage.png	./img/myImage@2x.png	./img/myImage@3x.png
dark	./img/myImage_dark.png	./img/myImage_dark@2x.png	./img/myImage_dark@3x.png

Adding Retina/HiDPI Icons in a Framework

Higher resolution icons can also be included in customized frameworks for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type customization (from the [Action dialog box](#)) or from an API (`ro.sync.xml.workspace.api.node.customizer.XMLNodeRendererCustomizer`).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include @2x in the name (for example, myIcon@2x.png).

Developers should not specify the path of the alternate icons (@2x or @3x) in the [Action dialog box](#) or the [XMLNodeRendererCustomizer API](#). When using a Retina or HiDPI display, Oxygen XML Author automatically searches the folder of the *normal* icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the *normal* icon is scaled and used instead.

Java API - Extending Author Functionality through Java

[Edit on GitHub](#)

Oxygen XML Author **Author** mode has a built-in set of operations covering the insertion of text and XML fragments (see the [Author Default Operations](#)) and the execution of XPath expressions on the current document edited in **Author** mode. However, there are situations in which you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Author **Author** mode functionality through Java, you will need the [Oxygen SDK](#) available [on the Oxygen XML Author website](#). It includes the source code of the **Author** mode operations in the predefined document types and the full documentation (in Javadoc format) of the public API available for **Author** mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Author XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

Attention: Make sure the Java classes of your custom **Author** mode operations are compiled with the same Java version used by Oxygen XML Author. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Author with a Java 1.6 virtual machine but the Java classes of your custom **Author** mode operations are compiled with a Java 1.7 virtual machine then the custom operations cannot be loaded and used by the Java 1.6 virtual machine.

Example 1- Simple Use of a Dialog Box from an Author Mode Operation

[Edit on GitHub](#)

In this example, we start adding functionality for inserting images in the **Simple Documentation Framework**. The images are represented by the `image` element. The location of the image file is represented by the value of the `href` attribute. In the Java implementation, a dialog box will be displayed with a text field, in which the user can enter a full URL or browse for a local file.

1. Setup a sample project following [this set of instructions](#). The framework project is **oxygen-sample-framework**.
2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the [ro.sync.ecss.extensions.api.AuthorOperation](#) interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this methods can be one of the following combinations:
 - an object of type [ro.sync.ecss.extensions.api.AuthorAccess](#) and a map
 - argument names and values
- The `getArguments` method is used by Oxygen XML Author when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
- The `getDescription` method is used by Oxygen XML Author when the operation is configured. It returns a description of the operation.

Here is the implementation of these three methods:

```
/**
```

```

 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
throws IllegalArgumentException,
    AuthorOperationException {

JFrame oxygenFrame = (JFrame)
authorAccess.getWorkspaceAccess().getParentFrame();
String href = displayURLDialog(oxygenFrame);
if (href.length() != 0) {
    // Creates the image XML fragment.
    String imageFragment =
        "<image xmlns='http://www.oxygenxml.com/sample/documentation'
href='"
        + href + "'/>";

    // Inserts this fragment at the cursor position.
    int caretPosition =
authorAccess.getEditorAccess().getCareOffset();

authorAccess.getDocumentController().insertXMLFragment(imageFragment,
caretPosition);
}

/**
 * Has no arguments.
 *
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}

```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype [on the Oxygen XML Author website](#).

Important:

Make sure you always specify the namespace of the inserted fragments.

```
<image xmlns='http://www.oxygenxml.com/sample/documentation'
href='path/to/image.png'>
```

3. Package the compiled class into a jar file. An example of an Ant script that packages the `classes` folder content into a jar archive named `sdf.jar` is listed below:

```

<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
    <target name="dist">
        <jar destfile="sdf.jar" basedir="classes">
            <fileset dir="classes">
                <include name="**/**"/>

```

```

</fileset>
</jar>
</target>
</project>

```

4. Copy the sdf.jar file into the frameworks/sdf folder.
5. Add the sdf.jar to the class path. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, select SDF, and press the **Edit** button.
6. Select the **Classpath** tab in the lower part of the [Document Type configuration dialog box](#) and press the  **Add** button. In the displayed dialog box, enter the location of the jar file, relative to the Oxygen XML Author frameworks folder.
7. We now create the action that will use the defined operation. Go to the **Actions** subtab. Copy the icon files for the menu item and for the toolbar in the frameworks/sdf folder.
8. Define the action's properties:
 - Set **ID** to **insert_image**.
 - Set **Name** to **Insert image**.
 - Set **Menu access key** to letter **i**.
 - Set **Toolbar action** to \${framework}/toolbarImage.png.
 - Set **Menu icon** to \${framework}/menuImage.png.
 - Set **Shortcut key** to **Ctrl (Meta on Mac OS)+Shift+i**.
9. Next, we set up the operation. You want to add images only if the current element is a section, book or article.
 - Set the value of **XPath expression** to

```
local-name()='section' or local-name()='book'
          or local-name()='article'
```
 - Set the **Invoke operation** field to simple.documentation.framework.InsertImageOperation.

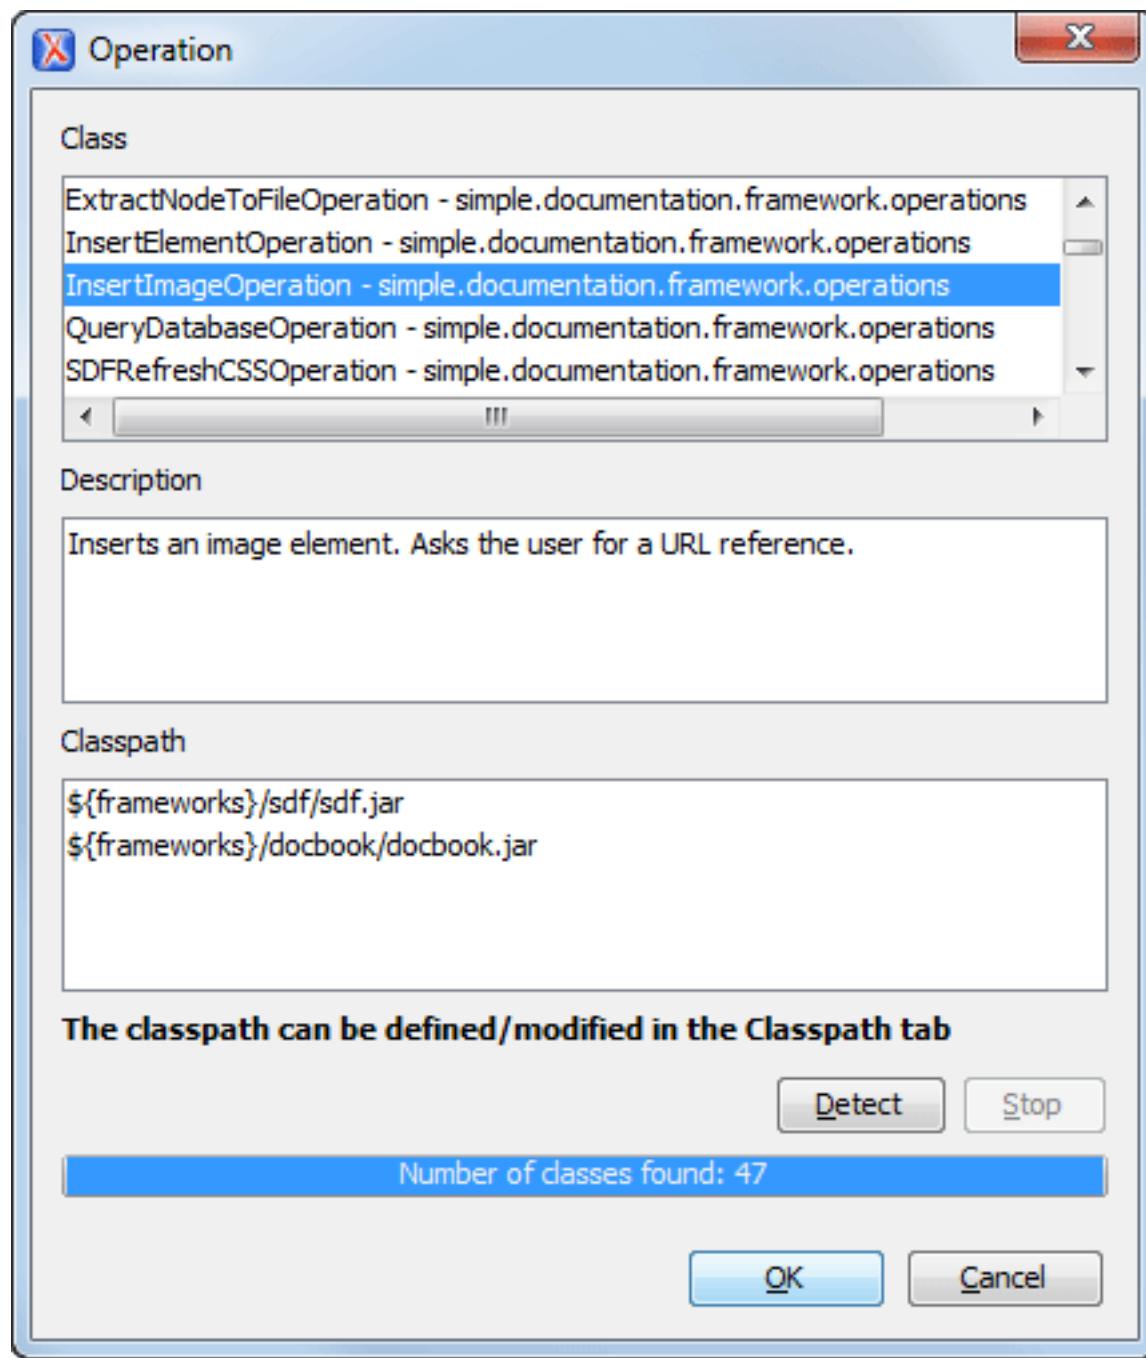

Figure 341: Selecting the Operation

10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, you can open the `sdf_sample.xml` sample, then place the cursor inside a section between two para elements (for instance). Press the button associated with the action from the toolbar. In the dialog box, select an image URL and press **OK**. The image is inserted into the document.

Example 2- Operations with Arguments. Report from Database Operation

[Edit on GitHub](#)

In this example you will create an operation that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the *database connection string*, the *user name*, the *password* and the *SQL expression*.

1. Setup a sample project following [this set of instructions](#). The framework project is **oxygen-sample-framework**.
2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface.

```
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation{
```

3. Now define the operation's arguments. For each of them you will use a String constant representing the argument name:

```
private static final String ARG_JDBC_DRIVER ="jdbc_driver";
private static final String ARG_USER ="user";
private static final String ARG_PASSWORD ="password";
private static final String ARG_SQL ="sql";
private static final String ARG_CONNECTION ="connection";
```

4. You must describe each of the argument name and type. To do this, implement the `getArguments` method that will return an array of argument descriptors:

```
public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] {
        new ArgumentDescriptor(
            ARG_JDBC_DRIVER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the Java class that is the JDBC driver."),
        new ArgumentDescriptor(
            ARG_CONNECTION,
            ArgumentDescriptor.TYPE_STRING,
            "The database URL connection string."),
        new ArgumentDescriptor(
            ARG_USER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the database user."),
        new ArgumentDescriptor(
            ARG_PASSWORD,
            ArgumentDescriptor.TYPE_STRING,
            "The database password."),
        new ArgumentDescriptor(
            ARG_SQL,
            ArgumentDescriptor.TYPE_STRING,
            "The SQL statement to be executed.")
    };
    return args;
}
```

These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

5. When the operation is invoked, the implementation of the `doOperation` method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
    throws IllegalArgumentException, AuthorOperationException {

    // Collects the arguments.
    String jdbcDriver =
```

```

        (String)map.getArgumentValue(ARG_JDBC_DRIVER);
        String connection =
            (String)map.getArgumentValue(ARG_CONNECTION);
        String user =
            (String)map.getArgumentValue(ARG_USER);
        String password =
            (String)map.getArgumentValue(ARG_PASSWORD);
        String sql =
            (String)map.getArgumentValue(ARG_SQL);

        int caretPosition = authorAccess.getCaretOffset();
        try {
            authorAccess.getDocumentController().insertXMLFragment(
                getFragment(jdbcDriver, connection, user, password, sql),
                caretPosition);
        } catch (SQLException e) {
            throw new AuthorOperationException(
                "The operation failed due to the following database error: "
                + e.getMessage(), e);
        } catch (ClassNotFoundException e) {
            throw new AuthorOperationException(
                "The JDBC database driver was not found. Tried to load '"
                + jdbcDriver + "'", e);
        }
    }
}

```

6. The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `table` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `header` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '`<`' and '`&`' characters are replaced with the '`<`' and '`&`' character entities to ensure the fragment is well-formed.

```

private String getFragment(
    String jdbcDriver,
    String connectionURL,
    String user,
    String password,
    String sql) throws
    SQLException,
    ClassNotFoundException {

    Properties pr = new Properties();
    pr.put("characterEncoding", "UTF8");
    pr.put("useUnicode", "TRUE");
    pr.put("user", user);
    pr.put("password", password);

    // Loads the database driver.
    Class.forName(jdbcDriver);
    // Opens the connection
    Connection connection =
        DriverManager.getConnection(connectionURL, pr);
    java.sql.Statement statement =
        connection.createStatement();
    ResultSet resultSet =
        statement.executeQuery(sql);

    StringBuffer fragmentBuffer = new StringBuffer();
    fragmentBuffer.append(
        "<table xmlns=" +
        "'http://www.oxygenxml.com/sample/documentation'>");
    //
```

```

// Creates the table header.
//
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
    fragmentBuffer.append("<td>");
    fragmentBuffer.append(
        xmlEscape(metaData.getColumnName(i)));
    fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(
            xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}

fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();
}

```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

7. Package the compiled class into a jar file.
8. Copy the jar file and the JDBC driver files into the frameworks/sdf directory.
9. Add the jars to the class path. To do this, open the *Document Type Association preferences page*, select SDF and press the **Edit** button. Select the **Classpath** tab in the lower part of the *Document Type configuration dialog box* and press the  **Add** button. In the displayed dialog box, enter the location of the jar file, relative to the Oxygen XML Author frameworks folder.

10. Go to the **Actions** subtab. The action properties are:

- Set **ID** to **clients_report**.
- Set **Name** to **Clients Report**.
- Set **Menu access key** to letter r.
- Set **Description** to **Connects to the database and collects the list of clients**.
- Set **Toolbar icon** to \${framework}/TableDB20.png (image  TableDB20.png is already stored in the frameworks / sdf folder).
- Leave empty the **Menu icon**.
- Set **shortcut key** to **Ctrl + Shift + C (Command + Shift + C on OS X)**.

11. The action will work only if the current element is a **section**. Set up the operation as follows:

- Set **XPath expression** to:

```
local-name()='section'
```

- Use the Java operation defined earlier to set the **Invoke operation** field. Press the **Choose** button, then select `simple.documentation.framework.QueryDatabaseOperation`. Once selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax :`jdbc://<database_host>:<database_port>/<database_name>`.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

The screenshot shows the 'Operations' section of the Toolbar panel. It includes fields for the XPath expression ('local-name()='section') and the Java operation ('simple.documentation.framework.operations.QueryDatabaseOperation'). A table lists arguments: jdbc_driver, connection, user, and password, all of type String. At the bottom, there's an 'Operation priority' dropdown set to 1, and 'Increase' and 'Decrease' buttons.

Name	Description	Type	Value
<code>jdbc_driver</code>	The name of the Java class tha...	String	
<code>connection</code>	The database URL connection s...	String	
<code>user</code>	The name of the database user.	String	
<code>password</code>	The database password.	String	

Figure 342: Java Operation Arguments Setup

To test the action, you can open the `sdf_sample.xml` sample and place the cursor inside a `section` between two para elements (for instance). Press the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

The screenshot shows the Oxygen XML Author interface with the 'Author' mode selected. At the top, there's a header with tabs: '#document', 'article', and 'section'. Below the header, a text area contains the message: 'Here I have the list of clients that are using the XML documenta... framework Author c... book:'. A table is displayed below this text. The table has two columns: 'userID' and 'email'. The data is as follows:

userID	email
204473	michael@test-oxy.ro
204477	mary@test-oxy.ro
204478	adrian@test-oxy.ro
204479	will@test-oxy.ro

At the bottom of the interface, there are three tabs: 'Text', 'Grid', and 'Author'. The 'Author' tab is currently active.

Figure 343: Table Content Extracted from the Database

Localizing Frameworks

[Edit on GitHub](#)

Oxygen XML Author supports framework localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Author in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```

<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>
  .....

```

```
</translation>
```

Oxygen XML Author matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `languagelist` tag for the corresponding framework is used.

Add the directory where this file is located to the **Classpath** list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Framework actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Use the **New** or **Edit** button to open the [Document type configuration dialog box](#), go to **Author > Actions**, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. `translation_key` corresponds to the key from the `translation.xml` file.

Now open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the `translation.xml` file:

```
<key value="translation_key">
    <comment>Bold action name.</comment>
    <val lang="en_US">Bold</val>
    <val lang="de_DE">Bold</val>
    <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the `translation.xml` file in the Java code used by your custom framework, use the new `ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()` API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```
title:before{
    content: "${i18n(title.key)} : ";
```

Note: You can enter any language you want in the `languagelist` tag and any number of keys.

The `translation.xml` file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the **Classpath** list corresponding to the DocBook document type the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association > Author > Actions**. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the [Oxygen SDK](#) Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Packing and Deploying Plugins or Frameworks as Add-ons

[Edit on GitHub](#)

Packing a Plugin or Framework as an Add-on

This procedure is suitable for developers who want a better control over the add-on package or those who want to automate some of the steps:

1. Pack the plugin or framework as a ZIP file or a Java Archive (JAR). Note that you should pack the entire root directory not just its contents.
2. Digitally sign the package. Note that you can perform this step only if you have created a JAR at the previous step. You will need a certificate signed by a trusted authority. To sign the jar you can either use the jarsigner command line tool inside Oracle's Java Development Kit. ([JDK_DIR]/bin/jarsigner.exe) or, if you are working with Apache Ant, you can use the signjar task (a front for the jarsigner command line tool).

Note: The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the keytool command line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Author provides. To use this template, go to **File > New** and select the **Oxygen add-ons update site** template. Once deployed, this descriptor file is referenced as *update site*.

Alternatively, you can use the **Add-ons Packager** plugin by following this procedure:

1. Install the **Add-ons Packager** plugin from <http://www.oxygenxml.com/InstData/Addons/optional/updateSite.xml> as described in the *Installing Add-ons procedure*.
2. Restart Oxygen XML Author. If the add-on is correctly installed, the **Add-ons packager** toolbar action is available.
3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.
4. Press **OK** to complete the packaging process.

Deploying an Add-on

To deploy an add-on, copy the ZIP/JAR file and the descriptor file to an HTTP server. The URL to this location serves as the *Update Site URL*.

Creating the Basic Association

[Edit on GitHub](#)

Let us go through an example of creating a custom document type (framework) and editing an XML document of this type. We will call our document type **Simple Documentation Framework**.

First Step - XML Schema

[Edit on GitHub](#)

Our sample custom framework is very simple. The documents are either articles or books, both composed of sections. The sections may contain titles, paragraphs, figures, tables, and other sections. To complete the picture, each section includes a def element from another namespace.

The first schema file:

```
<?xml version="1.0" encoding="UTF-8"?>
<xss:schema xmlns:xss="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.oxygenxml.com/sample/documentation"
  xmlns:doc="http://www.oxygenxml.com/sample/documentation"
  xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
  elementFormDefault="qualified">

  <xss:import namespace=
```

```
"http://www.oxygenxml.com/sample/documentation/abstracts"
  schemaLocation=
"abs.xsd"/>
```

The namespace of the documents will be `http://www.oxygenxml.com/sample/documentation`. The namespace of the `def` element is `http://www.oxygenxml.com/sample/documentation/abstracts`.

Next, we define the structure of the sections. They all start with a title, then have the optional `def` element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
  <xs:sequence>
    <xs:element name="title" type="xs:string"/>
    <xs:element ref="abs:def" minOccurs="0"/>
    <xs:choice>
      <xs:sequence>
        <xs:element ref="doc:section" maxOccurs="unbounded"/>
      </xs:sequence>
      <xs:choice maxOccurs="unbounded">
        <xs:element ref="doc:para"/>
        <xs:element ref="doc:image"/>
        <xs:element ref="doc:table"/>
      </xs:choice>
    </xs:choice>
  </xs:sequence>
</xs:complexType>
```

The paragraph contains text and other styling markup, such as bold (`b`) and italic (`i`) elements.

```
<xs:element name="para" type="doc:paragraphType"/>

<xs:complexType name="paragraphType" mixed="true">
  <xs:choice minOccurs="0" maxOccurs="unbounded">
    <xs:element name="b"/>
    <xs:element name="i"/>
  </xs:choice>
</xs:complexType>
```

The `image` element has an attribute with a reference to the file containing image data.

```
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The `table` contains a header row and then a sequence of rows (`tr` elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```
<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded"
              type="doc:paragraphType"/>
```

```

        </xs:sequence>
    </xs:complexType>
</xs:element>
<xs:element name="tr" maxOccurs="unbounded">
    <xs:complexType>
        <xs:sequence>
            <xs:element name="td" type="doc:tdType"
                maxOccurs="unbounded"/>

            </xs:sequence>
        </xs:complexType>
    </xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>

<xs:complexType name="tdType">
    <xs:complexContent>
        <xs:extension base="doc:paragraphType">
            <xs:attribute name="row_span" type="xs:integer"/>
            <xs:attribute name="column_span" type="xs:integer"/>
        </xs:extension>
    </xs:complexContent>
</xs:complexType>

```

The def element is defined as a text only element in the imported schema abs.xsd:

```

<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace=
        "http://www.oxygenxml.com/sample/documentation/abstracts">
    <xs:element name="def" type="xs:string"/>
</xs:schema>

```

Now the XML data structure will be styled.

Schema Settings

[Edit on GitHub](#)

In the bottom section of the *Document Type configuration dialog box*, there are a series of tabs. The first one refers to the schema that is used for validation of the documents that match the defined **Association Rules**.

Important: If the document refers a schema using a DOCTYPE declaration or a `xsi:schemaLocation` attribute, the schema from the document type association will not be used when validating.

Schema Type

Select from the combo box the value **XML Schema**.

Schema URI

Enter the value of the schema location (for example, `${frameworks} /sdf/schema/sdf.xsd`). Use the `${frameworks}` editor variable in the schema URI path instead of a full path to be valid for multiple Oxygen XML Author installations.

Important: The `${frameworks}` variable is expanded at the validation time into the absolute location of the directory containing the frameworks.

Second Step - CSS

[Edit on GitHub](#)

If you read the [Simple Customization Tutorial](#) then you already have some basic notions about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the **Author** mode layout engine) to associate specific properties with that element.

Defining the General Layout

[Edit on GitHub](#)

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
    display:block;
}

/* Horizontal flow */
b,i {
    display:inline;
}
```

Important: Having block display children in an inline display parent results in Oxygen XML Author changing the style of the parent to block display.

Styling the section Element

[Edit on GitHub](#)

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```
title{
    font-size: 2.4em;
    font-weight:bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It's useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo elements will be used, plus the CSS counters.

First declare a counter named `sect` for each book or article. The counter is set to zero at the beginning of each such element:

```
book,
article{
    counter-reset:sect;
}
```

The `sect` counter is incremented with each `section`, that is a direct child of a `book` or an `article` element.

```
book > section,
article > section{
    counter-increment:sect;
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```
book > section > title:before,
article > section > title:before{
    content: "Section " counter(sect) ". ";
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```
section{
    margin-left:1em;
    margin-top:1em;
}
```

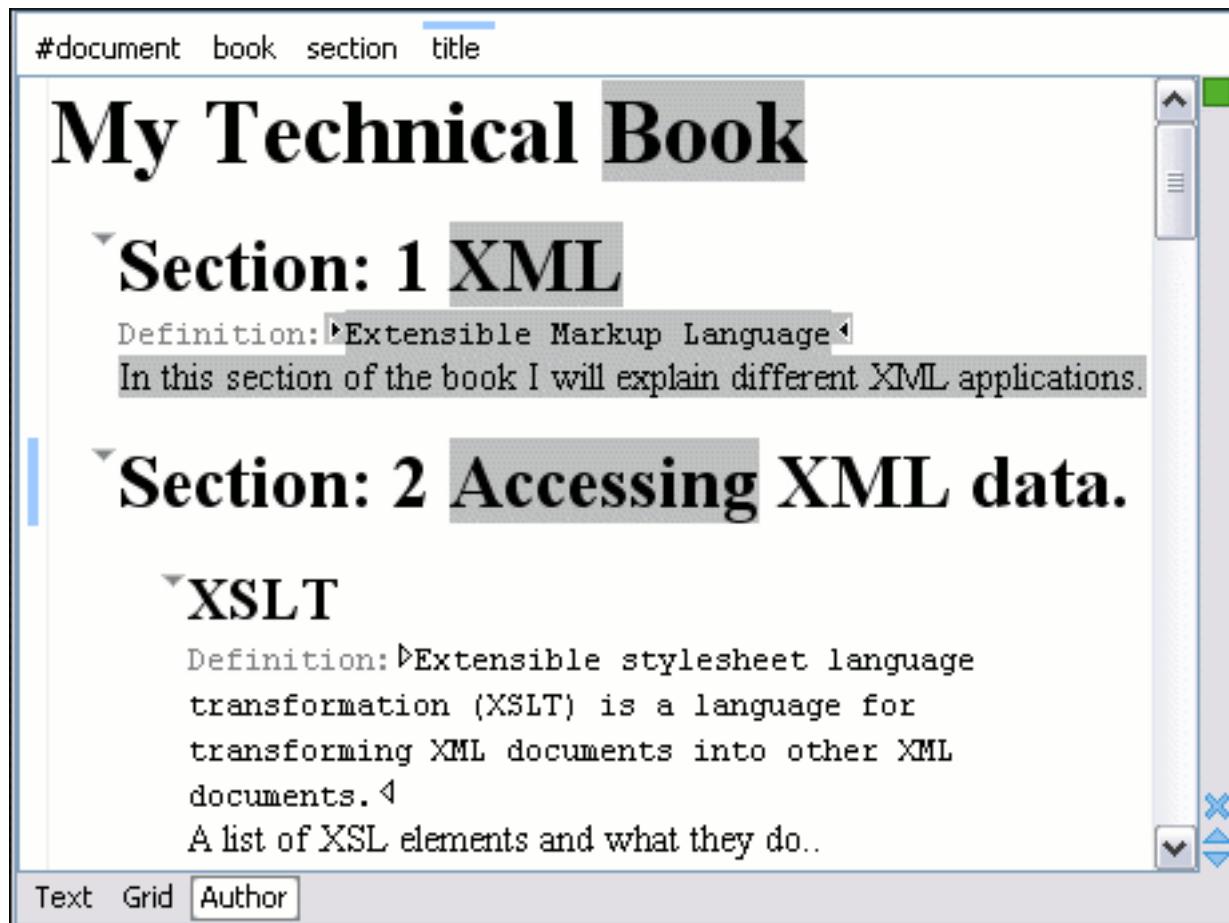

Figure 344: A sample of nested sections and their titles.

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

Styling the Inline Elements

[Edit on GitHub](#)

The "bold" style is obtained by using the `font-weight:bold` CSS property, while the "italic" style is specified by the `font-style:italic` property:

```
b {
    font-weight:bold;
}

i {
    font-style:italic;
}
```

Styling Images

[Edit on GitHub](#)

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Author supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Author.

```
image{
    display:block;
    content: attr(href, url);
    margin-left: 2em;
}
```

Our `image` element has the required attribute `href` of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Author identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Author handles both absolute and relative specified URLs. If the image has an *absolute* URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is *relative* specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
    <imageobject>
        <imagedata entityref="graphic" scale="50"/>
    </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the **Author** mode:

```
imagedata[entityref]{
    content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
    width:attr(width, length);}
```

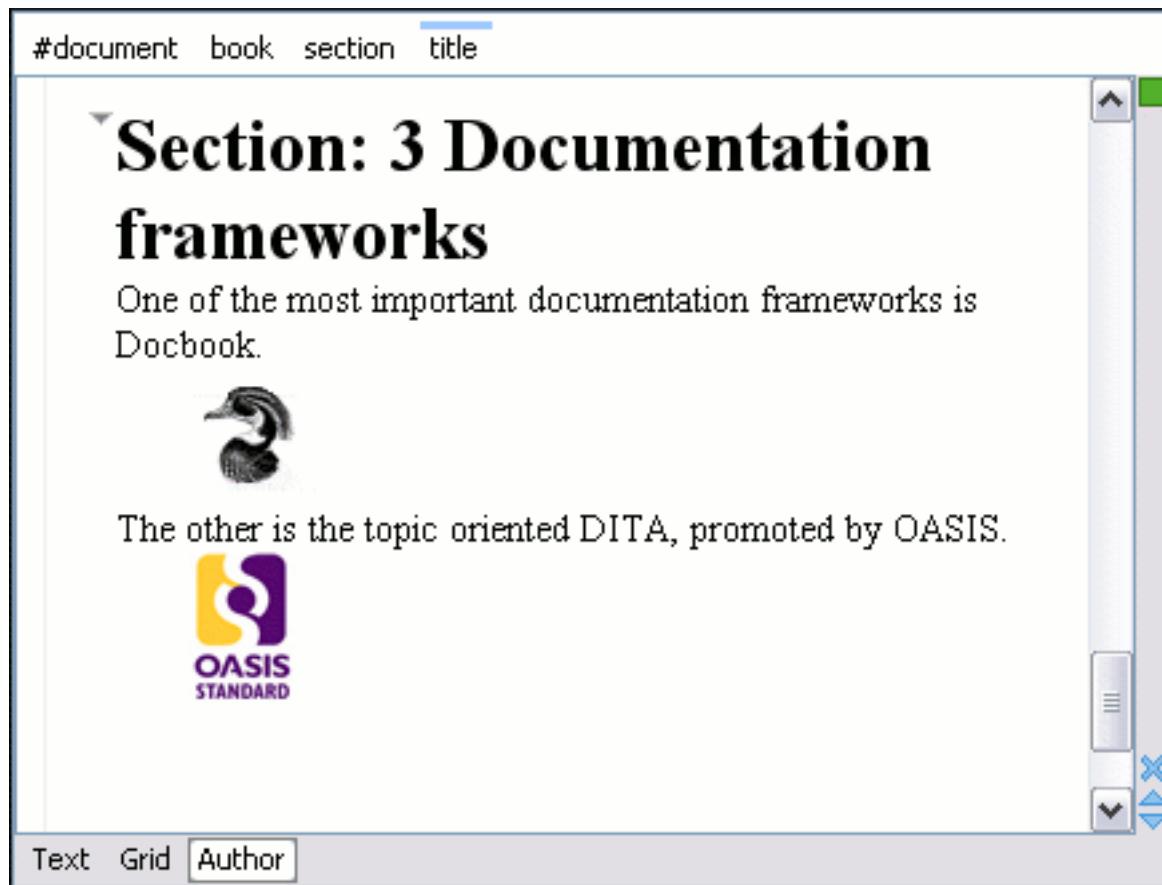

Figure 345: Samples of images in Author

Testing the Document Type Association

[Edit on GitHub](#)

To test the new Document Type create an XML instance that is conforming with the *Simple Documentation Framework* association rules. You will not specify an XML Schema location directly in the document, using an `xsi:schemaLocation` attribute; Oxygen XML Author will detect instead its associated document type and use the specified schema.

```
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">

    <title>My Technical Book</title>
    <section>
        <title>XML</title>
        <abs:def>Extensible Markup Language</abs:def>
        <para>In this section of the book I will
              explain different XML applications.</para>
    </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the `title` to `title2`. Validate again. This time there should be one error:

```
cvc-complex-type.2.4.a: Invalid content was found starting with element
'title2'. One of '{"http://www.oxygenxml.com/sample/
documentation":title}'
```

is expected.

Undo the tag name change. Press on the **Author** button at the bottom of the editing area. Oxygen XML Author should load the CSS from the document type association and create a layout similar to this:

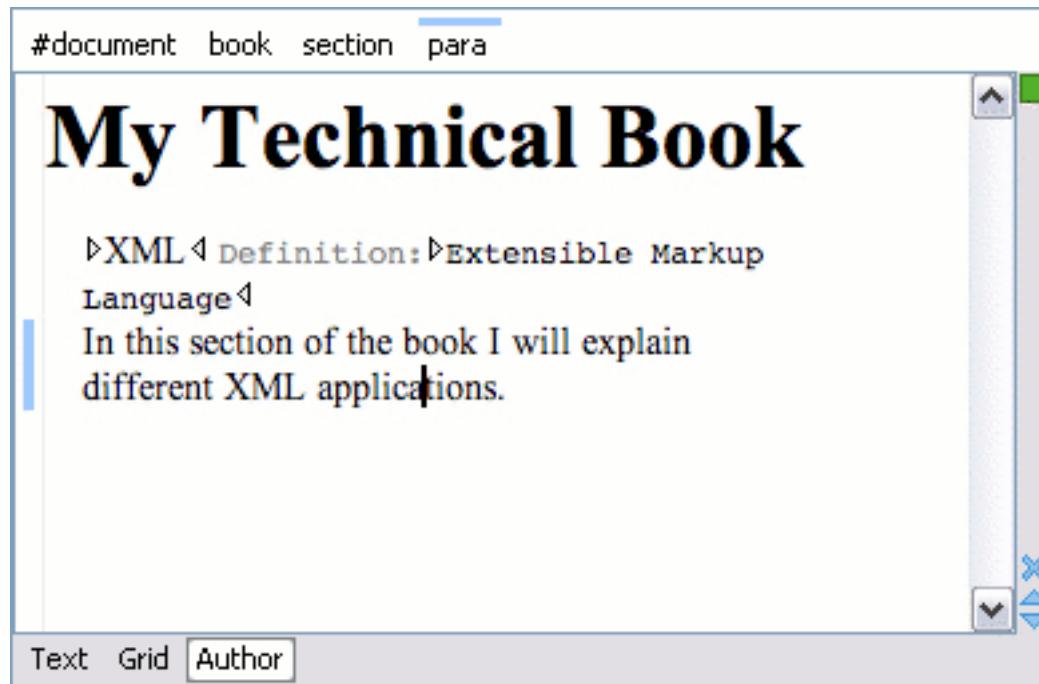

Figure 346: Example: Document Type Association

Organizing the Framework Files

[Edit on GitHub](#)

First, create a new folder called `sdf` (for "Simple Documentation Framework") in `[OXYGEN_INSTALL_DIR]/frameworks`. This folder will be used to store all files related to the documentation framework. The following folder structure will be created:

```

oxygen
  frameworks
    sdf
      schema
      css
  
```

The `frameworks` directory is the container where all the Oxygen XML Author framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folder inside the Oxygen XML Author installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop. You can download the "all platforms" distribution from the Oxygen XML Author website and extract it in the chosen folder.

To test your framework distribution, copy it in the `frameworks` directory of the newly installed application and start Oxygen XML Author by running the provided start-up script files.

You should copy the created schema files `abs.xsd` and `sdf.xsd`, `sdf.xsd` being the master schema, to the `schema` directory and the CSS file `sdf.css` to the `css` directory.

Packaging and Deploying

[Edit on GitHub](#)

Using a file explorer, go to the Oxygen XML Author `[OXYGEN_INSTALL_DIR]/frameworks` directory. Select the `sdf` directory and make an archive from it. Move it to another Oxygen XML Author installation (eventually on another computer). Extract it in the `[OXYGEN_INSTALL_DIR]/frameworks` directory. Start Oxygen XML Author and test the association as explained above.

If you create multiple document type associations and you have a complex directory structure it might be easy from the deployment point of view to use an Oxygen XML Author All Platforms distribution. Add your framework files to it, repackage it and send it to the content authors.

Attention: When deploying your customized `sdf` directory, make sure that your `sdf` directory contains the `sdf.framework` file (that is the file defined as External Storage in the [Document Type Association preferences page](#) shall always be stored inside the `sdf` directory). If your external storage points somewhere else Oxygen XML Author will not be able to update the Document Type Association options automatically on the deployed computers.

Configuring New File Templates

[Edit on GitHub](#)

Describes how to create a set of document templates that the content authors will use as a starting point for creating books and articles.

Each Document Type Association can point to a directory, usually named `templates`, that contains the file templates. All files found here are considered templates for the respective document type. The template name is taken from the file name, and the template type is detected from the file extension.

1. Go to your custom framework directory (`[OXYGEN_INSTALL_DIR]\frameworks\[\CUSTOM_FRAMEWORK_DIR]`) and create a directory named `templates`.
The directory tree of the documentation framework should be something like this:

```
[OXYGEN_INSTALL_DIR]
  frameworks
    [\CUSTOM_FRAMEWORK_DIR]
      schema
      css
      templates
```

2. In the `templates` directory, create two files. A file for the `book` template and another one for the `article` template.

An example for the `Book.xml` file:

```
<?xml version="1.0" encoding="UTF-8"?>
<book xmlns="http://www.oxygenxml.com/sample/documentation"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
  <title>Book Template Title</title>
  <section>
    <title>Section Title</title>
    <abs:def/>
    <para>This content is copyrighted:</para>
    <table>
      <header>
        <td>Company</td>
        <td>Date</td>
      </header>
      <tr>
        <td></td>
        <td></td>
      </tr>
    </table>
  </section>
</book>
```

```

</table>
</section>
</book>
```

An example for the Article.xml file:

```

<?xml version="1.0" encoding="UTF-8"?>
<article
    xmlns="http://www.oxygenxml.com/sample/documentation"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <title></title>
    <section>
        <title></title>
        <para></para>
        <para></para>
    </section>
</article>
```

You can also use *editor variables* in the content of the template files and they will be expanded when the files are opened.

Note: You should avoid using the \${cf}, \${cf}, \${currentFileURL}, and \${cfdu} editor variables when you save your documents in a data base.

3. Open the **Document Type configuration dialog box** for your custom framework and click the **Templates** tab. In the **Templates directory** text field, introduce the \${frameworkDir}/templates path. It is recommended that all the file references made from a Document Type Association to be relative to the \${frameworkDir} directory. Binding a Document Type Association to an absolute file (e. g.: C:\some_dir\templates) makes the association difficult to share between users.
4. To test the templates settings, go to **File > New** to display the **New document** dialog box. You should see the new templates in the folder for your custom framework (in the **Framework templates** section). The names of the two templates are prefixed with the name of the framework. Selecting one of them should create a new XML file with the content specified in the template file.

[Custom Editor Variables](#) on page 230

Configuring XML Catalogs

[Edit on GitHub](#)

In the XML sample file for **SDF** you did not use a xsi:schemaLocation attribute, but instead you let the editor use the schema from the association. However, there are cases in which you must reference the location of a schema file from a remote web location and an Internet connection may not be available. In such cases an XML catalog may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalogs, by modifying our sdf.xsd XML Schema file from the [Example Files Listings](#).

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

Create a new XML file called catalog.xml and save it into the [OXYGEN_INSTALL_DIR]/frameworks/sdf directory. The content of the file should be:

```

<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
    <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
         uri="schema/abs.xsd"/>
    <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
         uri="schema/abs.xsd"/>
</catalog>
```

- Add catalog files to your Document Type Association using the *Catalogs tab* from the *Document Type configuration dialog box*.

To test the catalog settings, restart Oxygen XML Author and try to validate a new sample custom framework document. There should be no errors.

The sdf .xsd schema that validates the document refers the other file abs .xsd through an import element:

```
<xs:import namespace=
  "http://www.oxygenxml.com/sample/documentation/abstracts"
  schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The schemaLocation attribute references the abs .xsd file:

```
xsi:schemaLocation="http://www.oxygenxml.com/sample/
documentation/abstracts"
http://www.oxygenxml.com/SDF/abs.xsd" />
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to http://www.oxygenxml.com/SDF/abs.xsd must be resolved to the abs .xsd file located in the schema directory. The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Configuring Transformation Scenarios for a Framework

[Edit on GitHub](#)

When distributing a framework to the users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. Being contained in the **Document Type Association**, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

- Create an xsl folder inside the frameworks/sdf folder.

The folder structure for the documentation framework should be:

```
oxygen
  frameworks
    sdf
      schema
      css
      templates
      xsl
```

- Create the sdf .xsl file in the xsl folder. The complete content of the sdf .xsl file is found in the [Example Files Listings](#).
- Open the *Preferences dialog box (Options > Preferences)* and go to **Document Type Associations**. Open the

Document Type dialog for the **SDF** framework then choose the **Transformation** tab. Click the  **New** button and choose the appropriate type of transformation (for example, **XML transformation with XSLT**).

In the **New scenario** dialog box, fill in the following fields:

- Fill in the **Name** field with **SDF to HTML**. This will be the name of your transformation scenario.
- Set the **XSL URL** field to \${framework}/xsl/sdf.xsl.

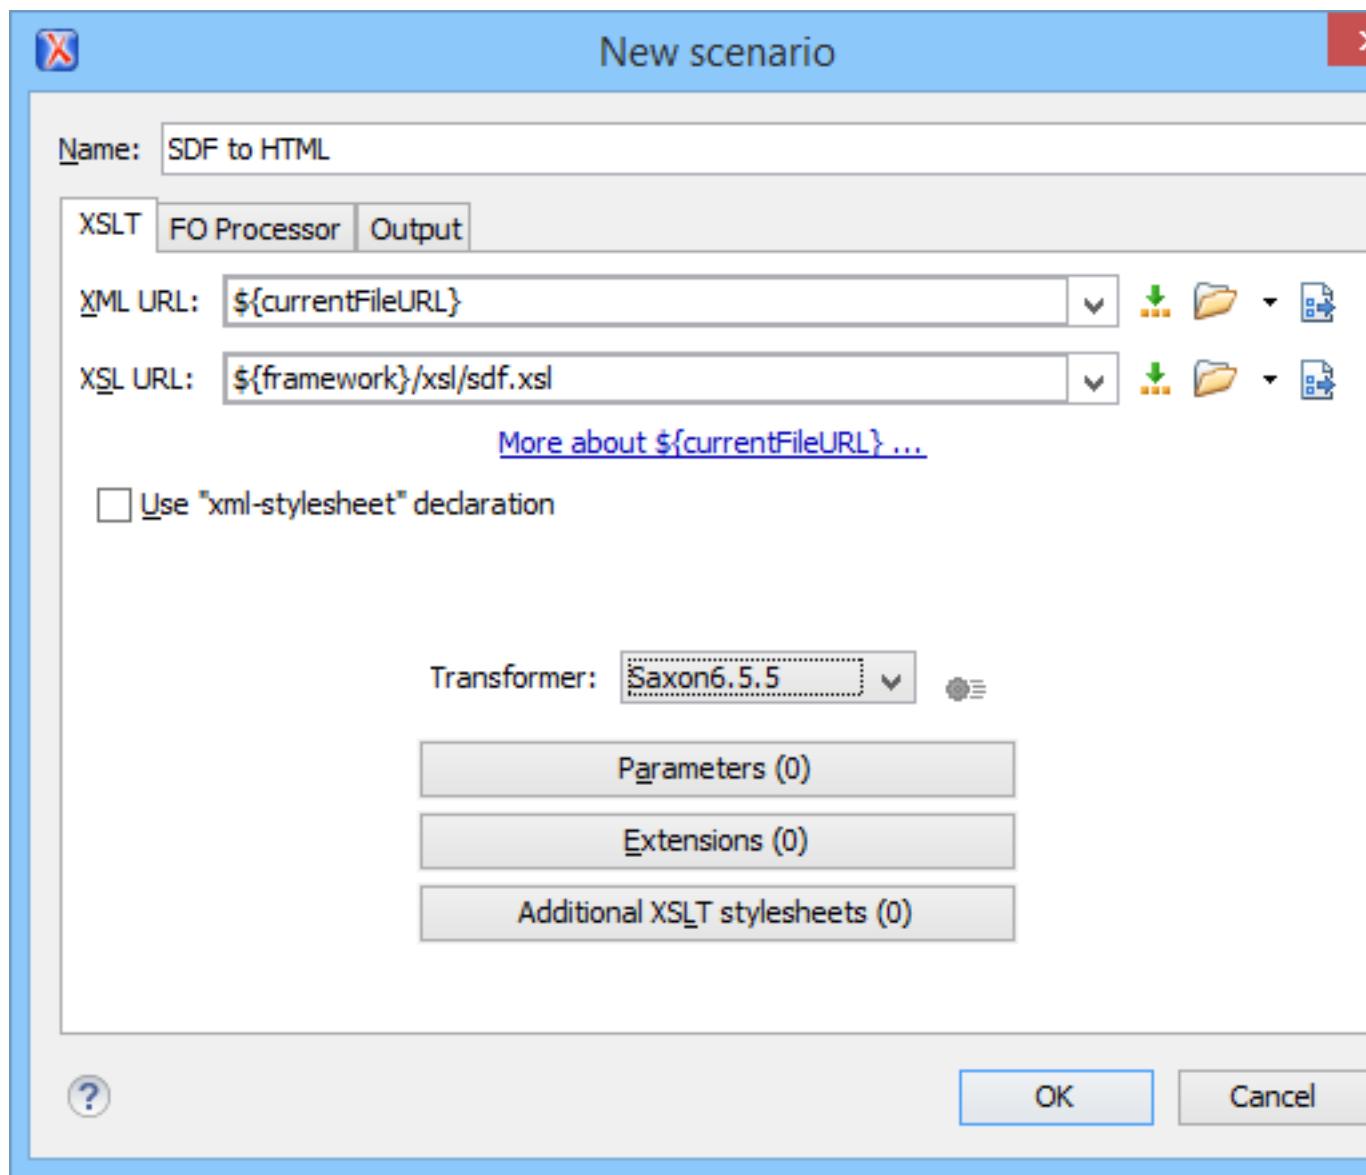

Figure 347: Configuring a New XSLT Transformation Scenario

4. Change to the **Output** tab. Configure the fields as follows:

- Set the **Save as** field to \${cfid}/\${cfn}.html. This means the transformation output file will have the name of the XML file and the *html* extension and will be stored in the same folder.
- Enable the **Open in Browser/System Application** option.

Note: To set the browser or system application that will be used, *open the Preferences dialog box (Options > Preferences)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- Enable the **Saved file** option.
5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:

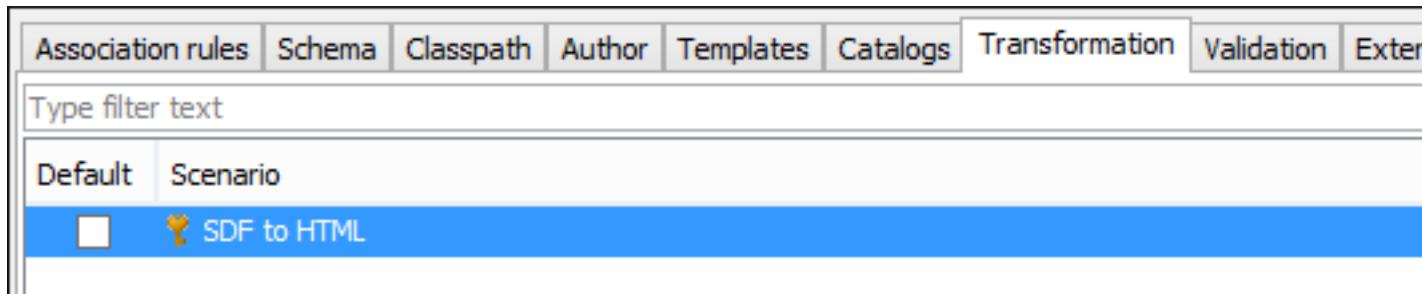

Figure 348: Transformation Tab

To test the transformation scenario that you just created, open the **SDF** XML sample from the [Example Files Listings](#).

Click the **Apply Transformation Scenario(s)** button to display the **Transform with** dialog box. The scenario list contains the scenario you defined earlier. Select the *SDF to HTML* scenario that you just defined and click the **Apply associated** button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

[Edit on GitHub](#)

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Defining Master Files at Project Level](#) on page 360 or [Working with Modular XML Files in the Master Files Context](#) on page 606.

To associate a validation scenario with a specific framework, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.
2. Select the document type and click the **Edit** button to open the **Document Type configuration dialog box**, then choose the **Validation** tab. This tab displays a list of document types in which you can define validation scenarios. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the **Default** box for that specific document type.
3. To add a new scenario, press the **New** button.
The **New scenarios** dialog box is displayed. It lists all the validation units for the scenario.

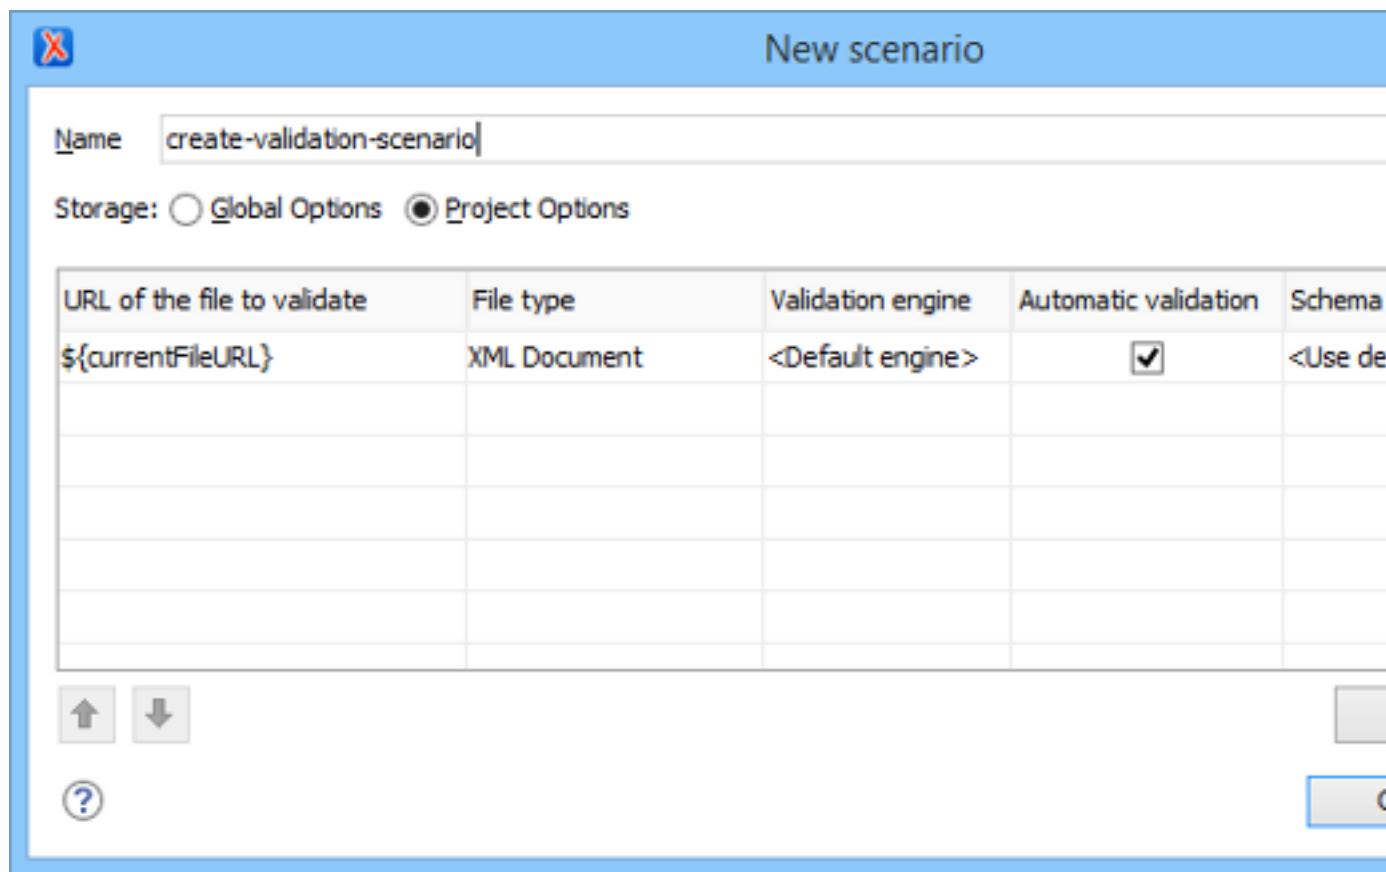

Figure 349: Create New Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

You can choose between storing the scenario in the **Global Options** or **Project Options**.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

<code> \${Desktop} - My Desktop</code>
<code> \${start-dir} - Start directory of custom validator</code>
<code> \${standard-params} - List of standard params for validation</code>
<code> \${cfn} - The current file name without extension</code>
<code> \${currentFileURL} - The path of the currently edited file</code>
<code> \${cfdu} - The path of current file directory (URL)</code>
<code> \${frameworks} - Oxygen frameworks directory (URL)</code>
<code> \${pdu} - Project directory (URL)</code>
<code> \${oxygenHome} - Oxygen installation directory (URL)</code>
<code> \${home} - The path to user home directory (URL)</code>
<code> \${pn} - Project name</code>
<code> \${env(VAR_NAME)} - Value of environment variable VAR_NAME</code>
<code> \${system(var.name)} - Value of system variable var.name</code>

Figure 350: Insert an Editor Variable

File type

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map  [Validate and Check for Completeness action](#), but for a local file rather than an entire DITA map).

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#)).

Automatic validation

If this option is checked, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences](#)

	<i>page</i> , then this option is ignored, as the preference setting has a higher priority.
Schema	This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.
 Settings	Opens the Specify Schema dialog box that allows you to set a schema for validating XML documents, or a list of extensions for validating XSL or XQuery documents. You can also set a default phase for validation with a Schematron schema.
 Move Up	Moves the selected scenario up one spot in the list.
 Move Down	Moves the selected scenario down one spot in the list.
Add	Adds a new validation unit to the list.
Remove	Removes an existing validation unit from the list.
4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the <i>validation phase</i> .	
5. Press Ok .	The newly created validation scenario is now included in the list of scenarios in the Validation tab . You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

Customizing Smart Paste Support

[Edit on
GitHub](#)

The *Smart Paste* feature preserves certain style and structure information when copying content from some of the most common applications and pasting into *document types that support Smart Paste* in Oxygen XML Author. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named `resources` in the following path structure:

`[OXYGEN_INSTALL_DIR]/frameworks/[Document Type]/resources`

2. Create an XSLT file named `xhtml2content.xsl` and save it in the `resources` folder for the particular framework.

For example: `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/xhtml2content.xsl`.

3. Add your customized styling in the XSLT file.
4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Author.

Result: When you paste content from external applications (such as a web browser or and Office document) to a document that is opened in **Author** mode, and that matches the particular framework, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

Related information

[Smart Paste Support](#) on page 436

[oXygen XML Blog: How Special Paste Works in oXygen](#)

Configuring Extensions

[Edit on GitHub](#)

You can add extensions to your frameworks (Document Type Association) by using the **Extensions** tab from the [Document Type configuration dialog box](#).

Note: It is possible for a plugin to share the same classes with a framework. For further details, go to [How to Share the Classloader Between a Framework and a Plugin](#).

Configuring an Extensions Bundle

[Edit on GitHub](#)

All extensions that are provided by Oxygen XML Author are includes in a single bundle.

Note: The individual extensions can still be set ([open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the `ro.sync.ecss.extensions.api.ExtensionsBundle` class. The provided implementation of the `ExtensionsBundle` is instantiated when the rules of the *Document Type Association* defined for the custom framework matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another `ExtensionsBundle` instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a `lib` folder in the Java project folder and copy in it the `oxygen.jar` file from the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Create the class (for example, `simple.documentation.framework.SDFExtensionsBundle`) to extend the abstract class `ro.sync.ecss.extensions.api.ExtensionsBundle`.

For example:

```
public class SDFExtensionsBundle extends ExtensionsBundle {
```

3. A **Document Type ID** and a short description should be defined first by implementing the methods `getDocumentTypeID` and `getDescription`. The **Document Type ID** is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.

For example:

```
public String getDocumentTypeID() {
    return "Simple.Document.Framework.document.type";
}

public String getDescription() {
    return "A custom extensions bundle used for the Simple Document" +
        "Framework document type";
}
```

4. To be notified about the activation of the custom *Author Extension* in relation with an opened document, `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` should be implemented. The **activation** and **deactivation** events received by this listener should be used to perform custom initializations and to register or remove listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`. The custom *Author Extension* state listener should be provided by implementing the `createAuthorExtensionStateListener` method.

For example:

```
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
{
    return new SDFAuthorExtensionStateListener();
}
```

The `AuthorExtensionStateListener` is instantiated and notified about the activation of the framework when the rules of the *Document Type Association* match a document opened in the **Author** editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in [Implementing an Author Extension State Listener](#).

If *Schema Aware mode* is active in Oxygen XML Author, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

See [Implementing a Schema-Aware Editing Handler Adapter](#) on page 1171 for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the *Document Type Association* that contains the filter declaration.

For example:

```
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSschemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the [Configuring a Content Completion Handler](#) section.

6. The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the [Configuring a Link Target Element Finder](#) section.

7. The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Author Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Author Eclipse plugin. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

```
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the **Author** mode drag and drop listeners, see the [Configuring a custom Drag and Drop Listener](#) section.

8. Another extension that can be included in the bundle is the reference resolver. In our example, the references are represented by the `ref` element and the attribute indicating the referenced resource is `location`. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another Document Type is activated as result of the detection process.

For example:

```
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the [Configuring a References Resolver](#) section.

9. To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of `ro.sync.ecss.extensions.api.StylesFilter` can be provided. The extensions bundle method responsible for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another Document Type is activated as a result of the detection process.

For example:

```
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the [Configuring CSS Styles Filter](#) section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the ExtensionsBundle specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`.

For example:

```
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}
```

```
public AuthorTableColumnWidthProvider
    createAuthorTableColumnWidthProvider() {
        return new TableColumnWidthProvider();
}
```

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in [Configuring a Table Cell Span Provider](#) and [Configuring a Table Column Width Provider](#) sections.

If the functionality related to one of the previous extension point does not need to be modified, then the developed `ro.sync.ecss.extensions.api.ExtensionsBundle` should not override the corresponding method and leave the default base implementation to return `null`.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.LinkTextResolver` interface should be returned by the `createLinkTextResolver` method. This implementation is used each time `the oxy_link-text()` function is encountered in the CSS styles associated with an element.

For example:

```
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

Oxygen XML Author offers built-in implementations for DITA and DocBook:

`ro.sync.ecss.extensions.dita.link.DitaLinkTextResolver` and
`ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` respectively.

12. Pack the compiled class into a jar file.
13. Copy the jar file into your custom framework directory (for example, `frameworks/sdf`).
14. Add the jar file to the class path. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, select the document type (for example, *SDF*), press the **Edit** button, select the **Classpath** tab, and press the **+ Add** button. In the displayed dialog box, enter the location of the jar file relative to the Oxygen XML Author `frameworks` folder.
15. Register the Java class by going to the **Extensions** tab. Press the **Choose** button and select the name of the class (for example, `SDFExtensionsBundle`).

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Author website](#).

Customize Profiling Conditions

[Edit on GitHub](#)

For each document type, you can configure the phrase-type elements that wrap the profiled content by setting a custom `ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider`. This configuration is set by default for DITA and DocBook frameworks.

Implementing a Schema-Aware Editing Handler Adapter

[Edit on GitHub](#)

The `AuthorSchemaAwareEditingHandlerAdapter` extension point allows you to handle certain **Author** mode actions in various ways. For example, implementing the

`AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Author when pasting content (through the use of *some specific methods*).

How to Implement an `AuthorSchemaAwareEditingHandlerAdapter`

For this handler to be called, the *Schema Aware Editing option* must be set to **On** or **Custom** in the *Schema-Aware preferences page*. The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `InvalidEditException`.

To implement your own `AuthorSchemaAwareEditingHandlerAdapter`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter` extension.
2. To instruct Oxygen XML Author to use this newly created implementation, *configure an extensions bundle* and return the `AuthorSchemaAwareEditingHandlerAdapter` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter` method.

Example

Typing events can be handled using the `handleTyping` method. For example, the `AuthorSchemaAwareEditingHandler` checks if the schema is not a learned one, was loaded successfully, and if the *Smart paste and drag and drop option* is enabled. If these conditions are met, the event will be handled.

```
public class AuthorSchemaAwareEditingHandlerAdapter extends
    AuthorSchemaAwareEditingHandler {

    /**
     * @see
     * ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler#handleTyping(int,
     * char, ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
        throws InvalidEditException {
        boolean handleTyping = false;
        AuthorSchemaManager authorSchemaManager =
            authorAccess.getDocumentController().getAuthorSchemaManager();
        if (!authorSchemaManager.isLearnSchema() &&
            !authorSchemaManager.hasLoadingErrors() &&

            authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
            try {
                AuthorDocumentFragment characterFragment =
                    authorAccess.getDocumentController().createNewDocumentTextFragment(String.valueOf(ch))

                handleTyping = handleInsertionEvent(offset, new
                    AuthorDocumentFragment[] {characterFragment}, authorAccess);
            } catch (AuthorOperationException e) {
                throw new InvalidEditException(e.getMessage(), "Invalid typing event:
" + e.getMessage(), e, false);
            }
        }
        return handleTyping;
    }
}
```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

Methods for Improving the Paste Mechanism

`getAncestorDetectionOptions`

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Author will propose solutions to make it valid. As a possible solution, Oxygen XML Author might surround the pasted content in a sequence of ancestor elements. This `getAncestorDetectionOptions` method allows you to choose which parent elements might be a possible solution.

`canBeReplaced`

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Author. For example, when pasting an element inside an empty element with the same name, this `canBeReplaced` method allows Oxygen XML Author to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

Implementing an Edit Properties Handler for Author Mode

[Edit on GitHub](#)

The `EditPropertiesHandler` extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in **Author** mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an `EditPropertiesHandler`

To implement your own `EditPropertiesHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.EditPropertiesHandler` interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
 - a. If you have [configured an extensions bundle](#), you can return the `EditPropertiesHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()` method.
 - b. Specify the `EditPropertiesHandler` in the **Author edit properties handler** individual extension in the [Extensions tab](#) of the **Document Type** configuration dialog box for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `image` tag in **Author** mode (with tags displayed from the  **Tags display mode** drop-down menu):

```
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
```

```

        return "A sample implementation that handles the properties for a table
element.";
    }

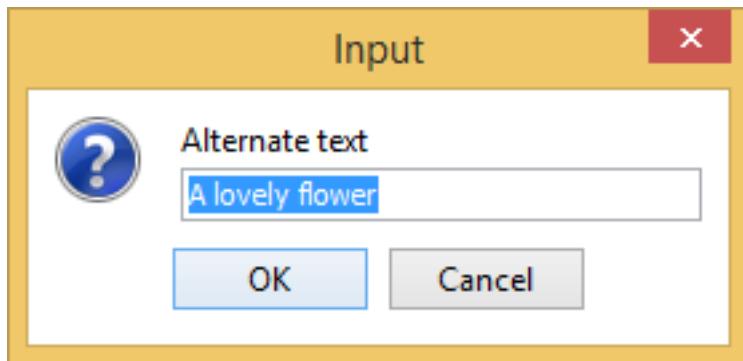

/**
 * @see
ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties(ro.sync.ecss.exten
*/
@Override
public boolean canEditProperties(AuthorNode authorNode) {
    // If this node is an image element we can edit its properties.
    return "image".equals(authorNode.getDisplayName());
}

/**
 * @see
ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties(ro.sync.ecss.extension
ro.sync.ecss.extensions.api.AuthorAccess)
*/
@Override
public void editProperties(AuthorNode authorNode, AuthorAccess
authorAccess) {
    // If we receive this call then it surely an image.
    AuthorElement imageElement = (AuthorElement) authorNode;
    String currentValue = "";
    AttrValue altValue = imageElement.getAttribute("alt");
    if (altValue != null) {
        currentValue = altValue.getValue();
    }
    String newValue = JOptionPane.showInputDialog(
        (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
        "Alternate text",
        currentValue);

    if (newValue != null) {
        authorAccess.getDocumentController().setAttribute("alt", new
AttrValue(newValue), imageElement);
    }
}
}

```

Example result: If a user were to double-click an image tag icon (in **Author** mode, the following dialog box would be displayed that allows the user to edit the *alternate text* property for the image:

Implementing an Author Mode Action Event Handler

[Edit on](#)
[GitHub](#)

The `AuthorActionEventHandler` extension point allows you to handle certain **Author** mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press **Enter** instead of it opening the **Content Completion Assistant**.

How to Implement an `AuthorActionEventHandler`

To implement your own `AuthorActionEventHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
 - a. If you have *configured an extensions bundle*, you can return the `AuthorActionEventHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
 - b. Specify the `AuthorActionEventHandler` in the **Author action event handler** individual extension in the *Extensions tab* of the **Document Type** configuration dialog box for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses **Enter** in **Author** mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the new-line character. Then the `handleEvent` method inserts the new line at the current cursor position.

```
public class CustomAuthorActionEventHandler implements
AuthorActionEventHandler {

    /**
     * @see
     ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent(AuthorAccess,
AuthorEventType)
    */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess,
AuthorEventType type) {
        boolean canHandle = false;

        if (type == AuthorEventType.ENTER) {
            AuthorDocumentController documentController =
authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretoffset();
            try {
                AuthorNode nodeAtOffset =
documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
                    AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                    AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                    if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                        canHandle = true;
                    }
                }
            } catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    logger.error(ex.getMessage(), ex);
                }
            }
        }
    }
}
```

```

        return canHandle;
    }

    /**
     * @see
     ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent(ro.sync.ecss.extensions.
     ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
    */
    @Override
    public boolean handleEvent(AuthorAccess authorAccess,
    AuthorActionEventType eventType) {
        int caretOffset = authorAccess.getEditorAccess().getCaretoffset();
        // Insert a new line
        authorAccess.getDocumentController().insertText(caretOffset, "\n");
        return true;
    }

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "Insert a new line";
    }
}

```

Implementing an Image Decorator for Author Mode

[Edit on
GitHub](#)

The `AuthorImageDecorator` extension point allows you to add a custom decorator over images in **Author** mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

How to Implement an `AuthorImageDecorator`

To implement your own `AuthorImageDecorator`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorImageDecorator` interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
 - a. If you have *configured an extensions bundle*, you can return the `AuthorImageDecorator` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()` method.
 - b. Specify the `AuthorImageDecorator` in the **Author image decorator** individual extension in the *Extensions tab* of the **Document Type** configuration dialog box for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```

/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see
     ro.sync.ecss.extensions.api.AuthorImageDecorator#paint(ro.sync.exml.view.graphics.Graphic,
     int, int, int, int, ro.sync.exml.view.graphics.Rectangle,

```

```

    ro.sync.ecss.extensions.api.node.AuthorNode,
    ro.sync.ecss.extensions.api.AuthorAccess, boolean)
  */
@Override
public void paint(Graphics g, int x, int y, int imageWidth, int
imageHeight,
    Rectangle originalSize, AuthorNode element, AuthorAccess
authorAccess, boolean wasAnnotated) {
  if
  ("image".equals(CommonsOperationsUtil.getLocalName(element.getName())))
  {
    g.drawString(
      "[Double-click to edit image]",
      // Draw near the top-left corner
      x + 15,
      y + 15);
  }
}

```

Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Implementing a State Listener for Author Mode

[Edit on GitHub](#)

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the **Author** mode extension (where the listener is defined) is activated or deactivated in the Document Type detection process.

```

import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements
AuthorExtensionStateListener {
private AuthorListener sdfAuthorDocumentListener;
private AuthorMouseListener sdfMouseListener;
private AuthorCaretListener sdfCaretListener;
private OptionListener sdfOptionListener;

```

When the rules of the *Document Type Association* match a document opened in the **Author** editing mode, the *activation* event received by this listener should be used to perform custom initializations and to register listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`.

```

public void activated(AuthorAccess authorAccess) {
  // Get the value of the option.
  String option = authorAccess.getOptionsStorage().getOption(
    "sdf.custom.option.key", "");
  // Use the option for some initializations...

  // Add an OptionListener.
  authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

  // Add author DocumentListeners.
  sdfAuthorDocumentListener = new SDFAuthorListener();
  authorAccess.getDocumentController().addAuthorListener(
    sdfAuthorDocumentListener);

  // Add MouseListener.
  sdfMouseListener = new SDFAuthorMouseListener();
  authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);
}

```

```

// Add CaretListener.
sdfCaretListener = new SDFAuthorCaretListener();
authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

// Other custom initializations...

}

```

The authorAccess parameter received by the activated method can be used to gain access to specific **Author** mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed *Author Extension* need to be stored or retrieved, a reference to the *ro.sync.ecss.extensions.api.OptionsStorage* can be obtained by calling the *getOptionsStorage* method from the authorAccess. The same object can be used to register *ro.sync.ecss.extensions.api.OptionListener* listeners. An option listener is registered in relation with an option **key** and will be notified about the value changes of that option.

An *AuthorListener* can be used if events related to the **Author** mode document modifications are of interest. The listener can be added to the *ro.sync.ecss.extensions.api.AuthorDocumentController*. A reference to the document controller is returned by the *getDocumentController* method from the authorAccess. The document controller can also be used to perform operations involving document modifications.

To provide access to the **Author** mode component-related functionality and information, the authorAccess has a reference to the *ro.sync.ecss.extensions.api.access.AuthorEditorAccess* that can be obtained when calling the *getEditorAccess* method. At this level, *AuthorMouseListener* and *AuthorCaretListener* can be added to provide notification of mouse and cursor events that occur in the **Author** editor mode.

The *deactivation* event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The deactivate method is typically used to unregister the listeners previously added on the activate method and to perform other actions. For example, options related to the deactivated *Author Extension* can be saved at this point.

```

public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption(
        "sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(
        sdfAuthorDocumentListener);

    // Remove MouseListener.

    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.

    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}

```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

Configuring a Content Completion Handler

[Edit on GitHub](#)

You can filter or contribute to items offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.

```
import java.util.List;

import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {
```

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Author or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the `filterAttributes` method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAttribute` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```
/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
    WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the
    // attribute named 'frame' to the list of default content completion
    // proposals
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAttribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
    return attributes;
}
```

The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```
public List<CIElement> filterElements(List<CIElement> elements,
    WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove
    // the
```

```

// 'td' element from the list of content completion proposals and add the
// 'th' element.
if (context != null) {
    Stack<ContextElement> elementStack = context.getElementStack();
    if (elementStack != null) {
        ContextElement contextElement = context.getElementStack().peek();
        if ("header".equals(contextElement.getQName())) {
            if (elements != null) {
                for (Iterator<CIElement> iterator = elements.iterator();
                     iterator.hasNext();) {
                    CIElement element = iterator.next();
                    // Remove the 'td' element
                    if ("td".equals(element.getQName())) {
                        elements.remove(element);
                        break;
                    }
                }
            } else {
                elements = new ArrayList<CIElement>();
            }
            // Insert the 'th' element in the list of content completion
            // proposals
            CIElement thElement = new SDFElement();
            thElement.setName("th");
            elements.add(thElement);
        }
    }
} else {
    // If the given context is null then the given list of content
    // completion elements contains
    // global elements.
}
return elements;
}

```

The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

Configuring a Link Target Element Finder

[Edit on GitHub](#)

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the `DefaultElementLocatorProvider` implementation will be used by default. The interface that should be implemented for a custom link target reference finder is `ro.sync.ecss.extensions.api.link.ElementLocatorProvider`. As an alternative, the `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider` implementation can also be extended.

The used `ElementLocatorProvider` will be queried for an `ElementLocator` when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained `ElementLocator` will be queried for each element from the document.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

DefaultElementLocatorProvider Implementation[Edit on GitHub](#)

The DefaultElementLocatorProvider implementation offers support for the most common types of links:

- Links based on ID attribute values.
- XPointer element() scheme.

The method `getElementLocator` determines what ElementLocator should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null `IDTypeVerifier` will always be provided if a schema is associated with the document type.

The link string argument is the "anchor" part of the URL that is composed from the value of the link property specified for the link element in the CSS.

```
public ElementLocator getElementLocator(IDTypeVerifier idVerifier,
                                         String link) {
    ElementLocator elementLocator = null;
    try {
        if(link.startsWith("element(")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    } catch (ElementLocatorException e) {
        logger.warn("Exception when create element locator for link: "
                   + link + ". Cause: " + e, e);
    }
    return elementLocator;
}
```

XPointerElementLocator Implementation[Edit on GitHub](#)

XPointerElementLocator is an implementation of the abstract class `ro.sync.ecss.extensions.api.link.ElementLocator` for links that have one of the following XPointer element() scheme patterns:

element (elementID)

Locate the element with the specified id.

element (/1/2/3)

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

element (elementID/3/4)

A child sequence appearing after a *NCName* identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the id/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```
public XPointerElementLocator(IDTypeVerifier idVerifier, String link)
    throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element(".length(), link.length() - 1);
```

```

 StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
 xpointerPath = new String[stringTokenizer.countTokens()];
 int i = 0;
 while (stringTokenizer.hasMoreTokens()) {
     xpointerPath[i] = stringTokenizer.nextToken();
     boolean invalidFormat = false;

     // Empty xpointer component is not supported
     if(xpointerPath[i].length() == 0){
         invalidFormat = true;
     }

     if(i > 0){
         try {
             Integer.parseInt(xpointerPath[i]);
         } catch (NumberFormatException e) {
             invalidFormat = true;
         }
     }

     if(invalidFormat){
         throw new ElementLocatorException(
             "Only the element() scheme is supported when locating XPointer
links."
             + "Supported formats: element(elementID), element(/1/2/3),
element(elemID/2/3/4).");
     }
     i++;
 }

 if(Character.isDigit(xpointerPath[0].charAt(0))){
     // This is the case when xpointer have the following pattern /1/5/7
     xpointerPathDepth = xpointerPath.length;
 } else {
     // This is the case when xpointer starts with an element ID
     xpointerPathDepth = -1;
     startWithElementID = true;
 }
}

```

The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are

uri

The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

localName

Local name of the element.

qName

Qualified name of the element.

atts

Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```

public boolean startElement(String uri, String localName,
    String name, Attr[] attrs) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < attrs.length; i++) {
            if(xpointerElement.equals(attrs[i].getValue())){
                if(idVerifier.hasIDType(
                    localName, uri, attrs[i].getQName(), attrs[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }
    }

    if (xpointerPathDepth == startElementDepth){
        // check if xpointer path matches with the current element path
        linkLocated = true;
        try {
            int xpointerIdx = xpointerPath.length - 1;
            int stackIdx = currentElementIndexStack.size() - 1;
            int stopIdx = startWithElementID ? 1 : 0;
            while (xpointerIdx >= stopIdx && stackIdx >= 0) {
                int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
                int currentElementIndex =
                    ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
                if(xpointerIndex != currentElementIndex) {
                    linkLocated = false;
                    break;
                }

                xpointerIdx--;
                stackIdx--;
            }
        } catch (NumberFormatException e) {
            logger.warn(e,e);
        }
    }
    return linkLocated;
}

```

The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The XPointerElementLocator implementation of the endElement updates the depth of the current element path and the index of the element in its parent.

```
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth--;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

IDEElementLocator Implementation

[Edit on GitHub](#)

The IDEElementLocator is an implementation of the abstract class `ro.sync.ecss.extensions.api.link.ElementLocator` for links that use an **id**.

The constructor only assigns field values and the method `endElement` is empty for this implementation.

The method `startElement` checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- the qualified name of the attribute is `xml:id`
- the attribute type is ID

The attribute type is checked with the help of the method `IDTypeVerifier.hasIDType`.

```
public boolean startElement(String uri, String localName,
                            String name, Attr[] attrs) {
    boolean elementFound = false;
    for (int i = 0; i < attrs.length; i++) {
        if (link.equals(attrs[i].getValue())) {
            if ("xml:id".equals(attrs[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName =
                    ExtensionUtil.getLocalName(attrs[i].getQName());
                String attrUri = attrs[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }
    return elementFound;
}
```

Creating a Customized Link Target Reference Finder

[Edit on GitHub](#)

If you need to create a custom link target reference finder you can do so by creating the class that will implement the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface. As an alternative, your class could extend `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`, the default implementation.

Note: The complete source code of the

`ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`,

`ro.sync.ecss.extensions.commons.IDEElementLocator` or

`ro.sync.ecss.extensions.commons.XPointerElementLocator` can be found in the **oxygen-sample-framework** project.

Configuring a Custom Drag and Drop Listener

[Edit on](#)
[GitHub](#)

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the framework with the Eclipse plugin or the standalone version of the application or if you want to add the handler for the **Text** or **Author** modes.

Table 10: Interfaces for the Drag and Drop listener

Interface	Description
<code>ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener</code>	Receives callbacks from the mode.
<code>com.oxygenxml.editor.editors.author.AuthorDnDListener</code>	Receives callbacks from the
<code>com.oxygenxml.editor.editors.TextDnDListener</code>	Receives callbacks from the

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

Configuring a References Resolver

[Edit on](#)
[GitHub](#)

You need to provide a handler for resolving references and obtain the content they reference. In our case the element that has references is **ref** and the attribute indicating the referenced resource is **location**. You will have to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

```
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
    implements AuthorReferenceResolver {
```

2. The `hasReferences` method verifies if the handler considers the node to have references. It takes as argument an `AuthorNode` that represents the node that will be verified. The method will return `true` if the node is considered to have references. In our case, to be a reference the node must be an element with the name `ref` and it must have an attribute named `location`.

```
public boolean hasReferences(AuthorNode node) {
    boolean hasReferences = false;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            hasReferences = attrValue != null;
        }
    }
    return hasReferences;
}
```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes as argument an `AuthorNode` that represents the node for which the display name is needed. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In our case, the display name is the value of the `location` attribute from the `ref` element.

```
public String getDisplayName(AuthorNode node) {
    String displayName = "ref-fragment";
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                displayName = attrValue.getValue();
            }
        }
    }
    return displayName;
}
```

4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes as arguments an `AuthorNode` that represents the node for which the reference needs resolving, the `systemID` of the node, the `AuthorAccess` with access methods to the **Author** mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the XML catalog. In the implementation you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));

                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if (inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                }

                XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                xmlReader.setEntityResolver(entityResolver);

                saxSource = new SAXSource(xmlReader, inputSource);
            } catch (MalformedURLException e) {
                logger.error(e, e);
            } catch (SAXException e) {
                logger.error(e, e);
            } catch (IOException e) {
                logger.error(e, e);
            }
        }
    }
}
```

```

        }
    }

    return saxSource;
}

```

5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes as argument an `AuthorNode` that represents the node with the reference. In the implementation the unique identifier is the value of the `location` attribute from the `ref` element.

```

public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}

```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes as arguments an `AuthorNode` that represents the node with the reference and the `AuthorAccess` with access methods to the **Author** mode data model. In the implementation you use the value of the `location` attribute from the `ref` element and resolve it relatively to the XML base URL of the node.

```

public String getReferenceSystemID(AuthorNode node,
                                   AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                                              authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                }
            }
        }
    }
    return systemID;
}

```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

In the listing below, the XML document contains the `ref` element:

```
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

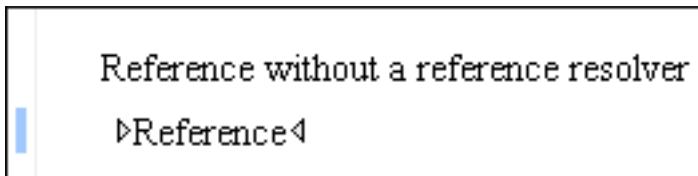

Figure 351: Reference with no specified reference resolver

When the above implementation is configured, the reference has the expected layout:

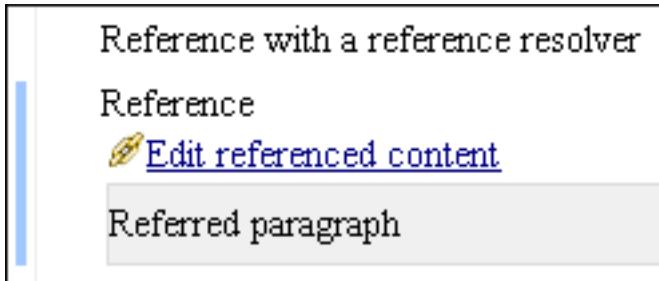

Figure 352: Reference with reference resolver

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

Configuring CSS Styles Filter

[Edit on GitHub](#)

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the **Author** mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Author or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in our simple document example the filter can change the value of the `KEY_FONT` property for the `table` element:

```
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType()
            && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD,
12));
        }
        return styles;
    }
}
```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

Configuring Tables

[Edit on GitHub](#)

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Author offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```
table{
    display:table;
    border:1px solid navy;
    margin:1em;
    max-width:1000px;
    min-width:150px;
}

table[width]{
    width:attr(width, length);
}

tr, header{
    display:table-row;
}

header{
    background-color: silver;
    color:inherit
}

td{
    display:table-cell;
    border:1px solid navy;
    padding:1em;
}
```

Since in the *schema*, the `td` tag has the attributes **row_span** and **column_span** that are not automatically recognized by Oxygen XML Author, a Java extension will be implemented that will provide information about the cell spanning. See the section *Configuring a Table Cell Span Provider*.

The column widths are specified by the attributes **width** of the elements `customcol` that are not automatically recognized by Oxygen XML Author. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see *Configuring a Table Column Width Provider*.

The table from our example does not make use of the attributes `colsep` and `rowsep` (which are automatically recognized) but we still want the rows to be separated by horizontal lines. It is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see *Configuring a Table Cell Row and Column Separator Provider* on page 1197.

Configuring a Table Column Width Provider

[Edit on GitHub](#)

In a custom framework, the `table` element as well as the table columns can have specified widths. For these widths to be considered by **Author** mode we need to provide the means to determine them. As explained in *Configuring Tables* on page 1189, if you use the `table` element attribute **width** Oxygen XML Author can determine the table width automatically. In this example the table has `col` elements with **width** attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

- Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interface.

```
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider
    implements AuthorTableColumnWidthProvider {
```

- Method `init` is taking as argument an `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML table element. In our case the column widths are specified in `col` elements from the `table` element. In such cases you must collect the span information by analyzing the `table` element.

```
public void init(AuthorElement tableElement) {
    this.tableElement = tableElement;
    AuthorElement[] colChildren =
    tableElement.getElementsByLocalName("customcol");
    if (colChildren != null && colChildren.length > 0) {
        for (int i = 0; i < colChildren.length; i++) {
            AuthorElement colChild = colChildren[i];
            if (i == 0) {
                colsStartOffset = colChild.getStartOffset();
            }
            if (i == colChildren.length - 1) {
                colsEndOffset = colChild.getEndOffset();
            }
            // Determine the 'width' for this col.
            AttrValue colWidthAttribute = colChild.getAttribute("width");
            String colWidth = null;
            if (colWidthAttribute != null) {
                colWidth = colWidthAttribute.getValue();
                // Add WidthRepresentation objects for the columns this 'customcol'
                // specification
                // spans over.
                colWidthSpecs.add(new WidthRepresentation(colWidth, true));
            }
        }
    }
}
```

- The method `isTableAcceptingWidth` should check if the table cells are `td`.

```
public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

- The method `isTableAndColumnsResizable` should check if the table cells are `td`. This method determines if the table and its columns can be resized by dragging the edge of a column.

```
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

- Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is

simple and just parses the value of the **width** attribute. The methods must return null for the tables / cells that do not have a specified width.

```
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}
```

```
public List<WidthRepresentation> getCellWidth(AuthorElement
cellElement, int colNumberStart,
int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}
```

- Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```
public void commitTableWidthModification(AuthorDocumentController
authorDocumentController,
int newTableWidth, String tableCellsTagName) throws
AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (newTableWidth > 0) {
            if (tableElement != null) {
                String newWidth = String.valueOf(newTableWidth);

                authorDocumentController.setAttribute(
                    "width",
                    new AttrValue(newWidth),
                    tableElement);
            } else {
                throw new AuthorOperationException("Cannot find the element
representing the table.");
            }
        }
    }
}
```

```
public void commitColumnWidthModifications(AuthorDocumentController
authorDocumentController,
WidthRepresentation[] colWidths, String tableCellsTagName) throws
AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
```

```

    if (colWidths != null && tableElement != null) {
        if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset <
        colsEndOffset) {
            authorDocumentController.delete(colsStartOffset,
                colsEndOffset);
        }
        String xmlFragment = createXMLFragment(colWidths);
        int offset = -1;
        AuthorElement[] header =
        tableElement.getElementsByLocalName("header");
        if (header != null && header.length > 0) {
            // Insert the cols elements before the 'header' element
            offset = header[0].getStartOffset();
        }
        if (offset == -1) {
            throw new AuthorOperationException("No valid offset to insert the
            columns width specification.");
        }
        authorDocumentController.insertXMLFragment(xmlFragment, offset);
    }
}

private String createXMLFragment(WidthRepresentation[ ]
widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol");
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=\"" + width.getWidthRepresentation() + "\"");
        }
        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=\"" + ns + "\"");
        }
        fragment.append("/>");
    }
    return fragment.toString();
}

```

- The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

```

public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingPercentageColumnWidths(String
tableCellsTagName) {
    return true;
}

public boolean isAcceptingProportionalColumnWidths(String
tableCellsTagName) {
    return true;
}

```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

In the listing below, the XML document contains the table element:

```

```

When no table column width provider is specified, the table has the following layout:

C1	C2	C3	C4
cs=1, rs=1	cs=1, rs=1	cs=1, rs=2	cs=1, rs=3
cs=1, rs=1	cs=1, rs=1		
cs=3, rs=1			

Figure 353: Table layout when no column width provider is specified

When the above implementation is configured, the table has the correct layout:

C1	C2	C3	C4
cs=1, rs=1	cs=1, rs=1	cs=1, rs=2	cs=1, rs=3
cs=1, rs=1	cs=1, rs=1		
cs=3, rs=1			

Figure 354: Columns with custom widths

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

Configuring a Table Cell Span Provider

[Edit on GitHub](#)

In a custom framework, the `table` element can have cells that span over multiple columns and rows. As explained in [Configuring Tables](#) on page 1189, you need to indicate Oxygen XML Author a method to determine the cell spanning. If you use the cell element attributes `rowspan` and `colspan` or `rows` and `cols`, Oxygen XML Author can determine the cell spanning automatically. In our example the `td` element uses the attributes `row_span` and `column_span` that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
    implements AuthorTableCellSpanProvider {
```

2. The `init` method is taking as argument the `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `table` element. In our case the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `table` element. In such cases, you must collect the span information by analyzing the `table` element.

```
public void init(AuthorElement table) {
}
```

3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The

implementation is simple and just parses the value of **column_span** attribute. The method must return null for all the cells that do not change the span specification.

```
public Integer getColSpan(AuthorElement cell) {
    Integer colSpan = null;

    AttrValue attrValue = cell.getAttribute("column_span");
    if(attrValue != null) {
        // The attribute was found.
        String cs = attrValue.getValue();
        if(cs != null) {
            try {
                colSpan = new Integer(cs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return colSpan;
}
```

4. The row span is determined in a similar manner:

```
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;

    AttrValue attrValue = cell.getAttribute("row_span");
    if(attrValue != null) {
        // The attribute was found.
        String rs = attrValue.getValue();
        if(rs != null) {
            try {
                rowSpan = new Integer(rs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return rowSpan;
}
```

5. The method `hasColumnSpecifications` always returns true considering column specifications always available.

```
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype [on the Oxygen XML Author website](#).

6. In the listing below, the XML document contains the table element:

```
<table>
  <header>
    <td>C1</td>
    <td>C2</td>
    <td>C3</td>
    <td>C4</td>
  </header>
  <tr>
    <td>cs=1, rs=1</td>
```

```
<td column_span="2" row_span="2">cs=2, rs=2</td>
<td row_span="3">cs=1, rs=3</td>
</tr>
<tr>
    <td>cs=1, rs=1</td>
</tr>
<tr>
    <td column_span="3">cs=3, rs=1</td>
</tr>
</table>
```

When no table cell span provider is specified, the table has the following layout:

The screenshot shows the Oxygen XML Author interface with the 'Author' tab selected. A table is displayed with the following structure and cell values:

C1	C2	C3	C4
cs=1, rs=1	cs=2, rs=2	cs=1, rs=3	
cs=1, rs=1			
cs=3, rs=1			

The table has four columns labeled C1 through C4. The first row contains three cells with spans: the first cell spans both columns (cs=2) and two rows (rs=2), the second cell spans all three columns (cs=3) and one row (rs=1), and the third cell spans one column (cs=1) and three rows (rs=3). The fourth column is empty. The second and third rows each contain a single cell with a span: the second row's cell spans both columns (cs=2) and two rows (rs=2), and the third row's cell spans all three columns (cs=3) and one row (rs=1). The fourth column is empty in these rows as well.

Figure 355: Table layout when no cell span provider is specified

When the above implementation is configured, the table has the correct layout:

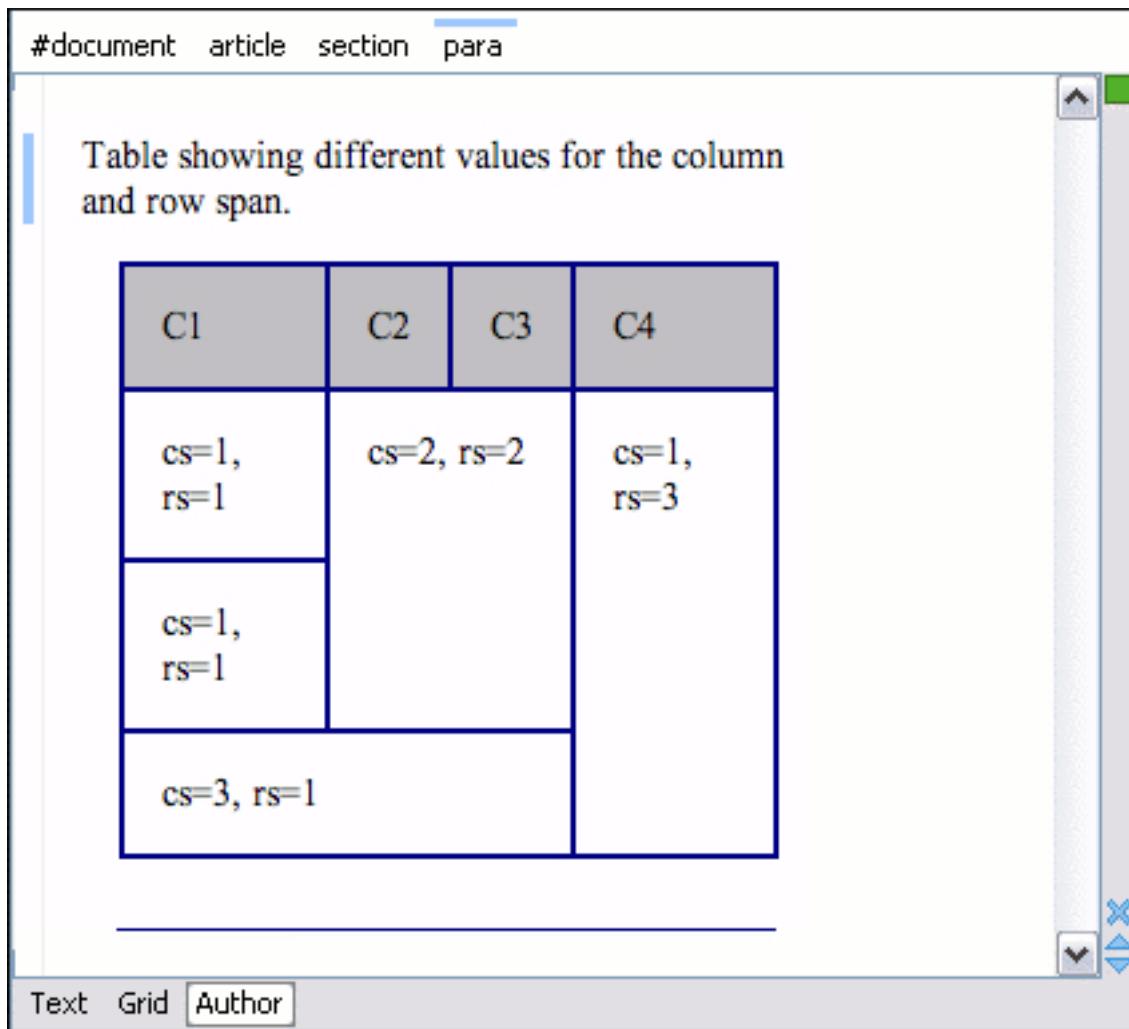

Figure 356: Cells spanning multiple rows and columns.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

Configuring a Table Cell Row and Column Separator Provider

[Edit on GitHub](#)

In a custom framework, the `table` element has separators between rows. As explained in [Configuring Tables](#) on page 1189, you need to indicate a method to determine the way rows and columns are separated. If you use the `rowsep` and `colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Author can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider{
```

2. The `init` method is taking as argument the `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `table` element. In our case the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when

the cell separators are specified in the `table` element. In such cases, you should initialize your provider based on the given argument.

```
public void init(AuthorElement table) {  
}
```

3. The `getColSep` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. In our case we choose to return `false` since we do not need column separators.

```
/**  
 * @return false - No column separator at the right of the cell.  
 */  
@Override  
public boolean getColSep(AuthorElement cellElement, int columnIndex) {  
    return false;  
}
```

4. The row separators are determined in a similar manner. This time the method returns `true`, forcing a separator between the rows.

```
/**  
 * @return true - A row separator below each cell.  
 */  
@Override  
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {  
    return true;  
}
```

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the `oxygen-sample-framework` module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

5. In the example below, the XML document contains the `table` element:

```
<table>  
    <header>  
        <td>H1</td>  
        <td>H2</td>  
        <td>H3</td>  
        <td>H4</td>  
    </header>  
    <tr>  
        <td>C11</td>  
        <td>C12</td>  
        <td>C13</td>  
        <td>C14</td>  
    </tr>  
    <tr>  
        <td>C21</td>  
        <td>C22</td>  
        <td>C23</td>  
        <td>C24</td>  
    </tr>  
    <tr>  
        <td>C31</td>  
        <td>C32</td>  
        <td>C33</td>  
        <td>C34</td>  
    </tr>  
</table>
```

When the borders for the `td` element are removed from the CSS, the row separators become visible:

H1	H2	H3	H4
C11	C12	C13	C14
C21	C22	C23	C24
C31	C32	C33	C34

Figure 357: Row separators provided by the Java implementation.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

Configuring a Unique Attributes Recognizer

[Edit on GitHub](#)

The `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` interface can be implemented if you want to provide for your framework the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks. The following methods can be implemented to accomplish this: `assignUniqueIDs(int startOffset, int endOffset)`, `isAutoIDGenerationActive()`
- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

Tip: The `ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer` class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework. You can also check out the DITA and DocBook implementations of `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` to see how they were implemented and connected to the extensions bundle.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Author website*.

Configuring an XML Node Renderer Customizer

[Edit on GitHub](#)

You can use this API extension to customize the way an XML node is rendered in the **Author Outline** view, **Author** breadcrumb navigation bar, **Text** mode **Outline** view, content completion assistant window or **DITA Maps Manager** view.

Note: Oxygen XML Author uses `XMLNodeRendererCustomizer` implementations for the following frameworks: DITA, DITA Map, DocBook 4, DocBook 5, TEI P4, TEI P5, XHTML, XSLT, and XML Schema.

There are two methods to provide an implementation of

`ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer`:

- As a part of a bundle, returning it from the `createXMLNodeCustomizer()` method of the `ExtensionsBundle` associated with your document type in the *Document type configuration dialog box* (**Extensions bundle** field in the **Extensions** tab).
- As an individual extension, associated with your document type in the *Document type configuration dialog box* (**XML node renderer customizer** field in the **Individual extensions** section of the **Extensions** tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the `XMLNodeRendererCustomizer` should be backed up by a copy of larger size using the proper *Retina/HiDPI naming convention*.

For example, for the `title` element, if the `XMLNodeRendererCustomizer` returns the path `${framework} /images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file `(myImg@2x.png)` should be added to the same images directory (`${framework} /images/myImg@2x.png`). If the higher resolution icon (the `@2x` file) does not exist, the *normal* icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the *Using Retina/HiDPI Images in Author Mode* section.

Note: The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype *on the Oxygen XML Author website*.

Customizing the Rendering of Elements on page 1211

Adding Custom Persistent Highlights

[Edit on GitHub](#)

The *Author API* includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the `AuthorPersistentHighlighter` class that is accessible through the `AuthorEditorAccess#getPersistentHighlighter()` method.

For more information, see the JavaDoc details for this class at <http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html>.

Customizing the Main CSS of a Document Type

[Edit on GitHub](#)

The easiest way to customize the *main* CSS stylesheet of a document type is to create a new CSS stylesheet, save it as an *alternate* CSS file that will be applied as an additional layer to the *main* CSS, and then select it from the **Styles** drop-down menu in **Author** mode.

For example, suppose that you want to customize the *main* CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/edit` folder (where the default *main* stylesheet named `style-basic.css` is located).
2. Edit the DITA framework and go to its **CSS** subtab:
 - a) [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.
 - b) Select the DITA document type and press the **Edit** button.
 - c) Go to the **CSS** subtab of the **Author** tab.

	URI	Title
CSS	<code>#{framework}/css/edit/style-basic.css</code>	Basic
Actions	<code>#{framework}/css/edit/style-century.css</code>	Century
Menu	<code>#{framework}/css_classed/dita.css</code>	<Old - Compatibility M
Contextual menu	<code>#{framework}/css/edit/alternate-full-width-layout.css</code>	+ Full width
Toolbar	<code>#{framework}/css/edit/alternate-map-print-preview-layout.css</code>	+ Print ready
Content Completion	<code>#{framework}/css/edit/alternate-coloured-revisions.css</code>	+ Colored revision ch
	<code>#{framework}/css/edit/alternate-syntax-highlight.css</code>	+ Codeblock syntax h
	<code>#{framework}/css/edit/alternate-table-show-colspec.css</code>	+ Show table column

Enable multiple selection of alternate CSSs

If there are CSSs specified in the document then

ignore CSSs from the associated document type

merge them with CSSs from the associated document type

Figure 358: CSS Subtab of the Document Type Association Author Tab

3. Add the new stylesheet as an *alternate* CSS stylesheet:
 - a) Click the **Add** button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
 - b) Check the **Alternate** option to define it as an *alternate* stylesheet that will be applied as an additional layer to the *main* CSS.

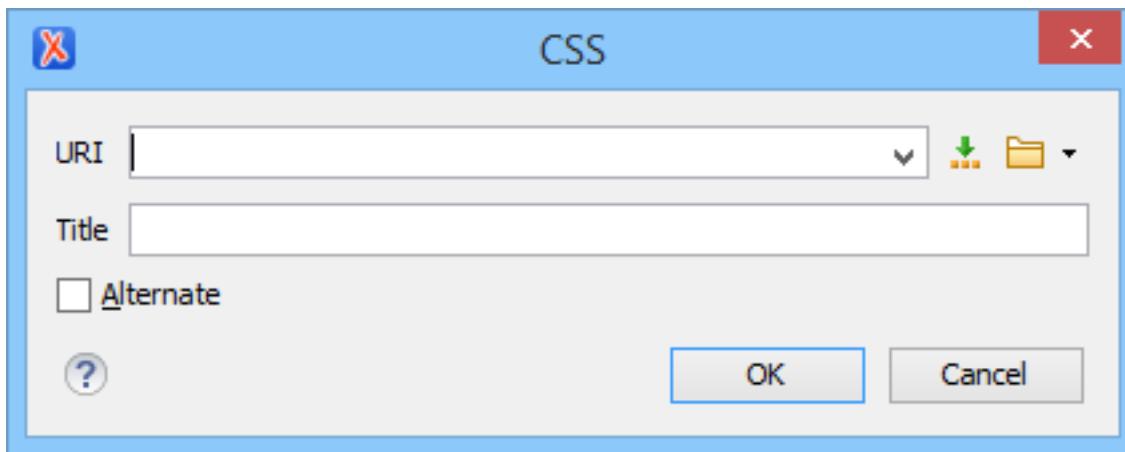

Figure 359: Add CSS Stylesheet Dialog Box

4. Press **OK** in all the dialog boxes to validate the changes.
5. Select your newly created CSS stylesheet from the **Styles** drop-down menu on the toolbar in **Author** mode. You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the **Author** mode by using the **Refresh** action that is available on the **Author** toolbar and in the **DITA** menu.

[Selecting and Combining Multiple CSS Styles](#) on page 1222

Sharing a Document Type (Framework)

[Edit on GitHub](#)

Oxygen XML Author allows you to share customizations of a specific XML type by creating your own [Document Type \(framework\)](#) in the [Document Type Association preferences page](#).

A document type (framework) can be shared with other authors by using any of the following methods:

Save it in a Custom Folder

To share your customized framework with other members of your team, you can save it to a separate folder inside the `[OXYGEN_INSTALL_DIR]/frameworks` directory by following these steps:

Important: For this approach to work, the application must be installed in a folder with full write access.

1. Go to `[OXYGEN_INSTALL_DIR]/frameworks` and create a directory for your new framework (for example, `custom_framework`). This directory will contain the resources for your customized framework. See the **DocBook** framework structure from `[OXYGEN_INSTALL_DIR]/frameworks/docbook` as an example.
2. Create your custom document type (framework) and specify the `custom_framework` directory for the **External** storage option.
3. Configure the custom document type according to your needs. Take special care to make all file references relative to the `[OXYGEN_INSTALL_DIR]/frameworks` directory by using the `$(frameworks)` editor variable. See the [Author Mode Customization](#) section for more details on creating and configuring a new document type (framework).
4. Add any additional resources (CSS files, new file templates, schemas used for validation, catalogs, etc.) to the directory you created in step 1.
5. After completing your customizations in the [Document Type Association preferences page](#), you should have a new configuration file saved in: `[OXYGEN_INSTALL_DIR]/frameworks/custom_framework/custom.framework`.

6. To share the new framework directory with other users, have them copy it to their `[OXYGEN_INSTALL_DIR]/frameworks` directory. The new framework will be available in the list of Document Types when Oxygen XML Author starts.

Note: If you have a `frameworks` directory stored on your local drive, you can also go to the [Document Type Association > Locations preferences page](#) and add your `frameworks` directory in the **Additional frameworks directories** list.

Save it at Project Level

You can also share customized frameworks by saving it at project level in the [Document Type Association preferences page](#). To do so, follow these steps:

1. On your local drive, create a directory with full write access. This directory will contain the resources for your customized framework and the project file.
2. Start Oxygen XML Author, go to the [Project view](#) and create a project. Save it in the newly created directory.
3. In the [Document Type Association preferences page](#), select **Project Options** at the bottom of the page.
4. Create your custom document type (framework) and use the default **Internal** storage option. It will actually be saved in the project file (`.xpr`).
5. Configure the custom document type according to your needs. Take special care to make all file references relative to the project directory by using the `$(pd)` editor variable. See the [Author Mode Customization](#) section for more details on creating and configuring a new document type (framework).
6. Add any additional resources (CSS files, new file templates, schemas used for validation, catalogs, etc.) to your project.
7. You can then share the new project directory with other team members. When they open the customized project file in the [Project view](#), the new framework becomes available in the list of Document Types.

Deploy it as an Add-on

You can also share your customized framework by deploying it as an add-on. To do so, follow the procedures in [Packing and Deploying Plugins or Frameworks as Add-ons](#) on page 1150.

Related information

[Sharing an Extended Document Type \(Framework\)](#) on page 1203

Sharing an Extended Document Type (Framework)

[Edit on GitHub](#)

You can extend a predefined, built-in document type (such as **DITA** or **DocBook**) using the [Document Type Association preferences page](#), make modifications to it, and then share the extension with your team.

Extending a Framework to be Shared

For the purpose of providing specific instructions for sharing an extended framework, suppose that you want to share an extension of the **DITA** framework in which you have removed certain elements from the content completion list. The following steps describe how you can create an extended framework that can be shared with others:

1. In a location where you have full write access, create a folder structure similar to this: `custom_frameworks/dita-extension`.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [Document Type Association > Locations](#). In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list.
3. Go to the [Document Type Association preferences page](#) and select the **DITA** document type configuration and use the **Extend** button to create an extension for it.
4. Give the extension an appropriate name (for example, **DITA - Custom**), select **External** for the **Storage** option, and specify an appropriate path (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).

5. Make your changes to the extension. For example, you could go to the **Content Completion** subtab of the **Author** tab and in the **Filter - Remove content completion items** list, add elements that you do not want to be presented to the end users.
6. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association preferences page**.

Results

After you perform these steps you will have a fully functional framework in the `dita-extension` folder and it can be shared with others.

Sharing the Extended Framework

There are several ways that you can share the extended framework with others:

- Copy it to their `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- Create a `custom_frameworks` folder (anywhere on disk) and copy the extended framework into it. Then add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list in the **Document Type Association > Locations preferences page**.
- Distribute the extended framework along with a project by following these steps:
 1. On your local drive, create a directory (with full write access) that contains the project files and a `custom_frameworks` folder with your extended framework inside.
 2. Start Oxygen XML Author, go to the **Project view** and create a project. Save it in the newly created directory.
 3. In the the **Document Type Association > Locations preferences page**, select **Project Options** at the bottom of the page.
 4. In the **Additional frameworks directories** list, add an entry like this: `${pd} /custom_frameworks`.
 5. Add other resources to your project (for example, you can have all your DITA content located inside the project folder).
 6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in the **Project view**, the new framework becomes available in the list of Document Types.
- Deploy the extended framework configuration *as an add-on*.

After your team members install the framework they can check the list of Document Types in the **Document Type Association preferences page** to see if the framework is present and if it appears before the bundled **DITA** framework (meaning that it has higher priority).

Customizing the Content Completion Assistant

[Edit on GitHub](#)

Oxygen XML Author gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the **Content Completion Assistant**. Oxygen XML Author also includes support that allows you to customize the **Content Completion Assistant** to suit your specific needs.

There are two ways to customize the **Content Completion Assistant** in Oxygen XML Author:

- You can add, modify, or remove actions that are proposed for each particular document type (framework) by using the **Content Completion subtab in the Document Type Association configuration dialog box**. To access this subtab, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend button**, click on the **Author** tab, and then the **Content Completion** subtab.
- You can use a `cc_config.xml` configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Configuring the Proposals for Attribute and Element Values

[Edit on](#)
[GitHub](#)

Oxygen XML Author includes support for configuring the proposed values that appear in the **Content Completion Assistant**. To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the **Content Completion Assistant**.

For an example of a specific use-case, suppose that you want the **Content Completion Assistant** to propose several possible values for the language code when you use an `xml:lang` attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the **Content Completion Assistant**, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. *Open the Preferences dialog box (Options > Preferences)* and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the *Classpath tab* add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
 - a. To easily create a new configuration file, you can use the *Content Completion Configuration* file template that is included in Oxygen XML Author (**File > New > Framework templates > Oxygen Extensions > Content Completion Configuration**). The file template includes details about how each element and attribute is used in the configuration file.
 - b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: `cc_config.xml` (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/`cc_config.xml`).
6. Restart the application and open an XML document. In the **Content Completion Assistant** you should see your customizations.

Tip: In some cases, you can simply use the  **Refresh (F5)** action to test your customizations, without having to restart the application.

Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (`cc_config.xml`) includes a series of `match` instructions that will either match an element or attribute name. A new value is specified inside one or more `item` elements, which are grouped inside an `items` element. The behavior of the `items` element is specified with the help of the `action` attribute, which can have any of the following values:

- `append` - Adds new values to appear in the proposals list (default value).
- `addIfEmpty` - Adds new values to the proposals list only if no other values are contributed by the schema.
- `replace` - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

Other Important Notes About the Configuration File

Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```
<!-- Replaces the values for an element with the local name "lg", from the
given namespace -->
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>

<!-- Adds two values for an attribute with the local name "type", from any
namespace -->
<match attributeName="type">
  <items>
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>
```

Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```
<xslt href="../xsl/
get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

Note: A comprehensive XSLT sample is included in the **Content Completion Configuration** file template.

Configuring Proposed Values in the Context that the Content Completion was Invoked

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element in which the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, `color`) and other values for another property (for example, `shape`). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value="" />
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value="" />
</sampleArticle>
```

The content completion configuration file:

```
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <match elementName="property" attributeName="value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </match>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```

<xsl:stylesheet
    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:saxon="http://saxon.sf.net/"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:param name="documentSystemID" as="xs:string"></xsl:param>
    <xsl:param name="contextElementXPathExpression" as="xs:string"></
    xsl:param>

    <xsl:template name="start">
        <xsl:apply-templates select="doc($documentSystemID)" />
    </xsl:template>

    <xsl:template match="/">
        <xsl:variable name="propertyElement"

            select="saxon:eval(saxon:expression($contextElementXPathExpression, ./
            *))" />

        <items>
            <xsl:if test="$propertyElement/@name = 'color'">
                <item value='red' />
                <item value='blue' />
            </xsl:if>
            <xsl:if test="$propertyElement/@name = 'shape'">
                <item value='rectangle' />
                <item value='square' />
            </xsl:if>
        </items>
    </xsl:template>
</xsl:stylesheet>
```

The contextElementXPathExpression parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

[Customizing the Rendering of Elements](#) on page 1211

Configuring the Proposals for Elements

[Edit on
GitHub](#)

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (`li`) accepts more than 60 child elements. Oxygen XML Author includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want restrict DITA list item elements (`li`) to only accept paragraph elements (`p`). In this case, the **Content Completion Assistant** should not offer any other element other than a paragraph (`p`) when a list item (`li`) is inserted into a document. It would also be helpful if the required child element (`p`) was automatically inserted whenever a list item (`li`) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Author offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the **Content Completion Assistant**, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. *Open the Preferences dialog box (Options > Preferences)* and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath tab** add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
 - a. To easily create a new configuration file, you can use the *Content Completion Configuration* file template that is included in Oxygen XML Author (**File > New > Framework templates > Oxygen Extensions > Content Completion Configuration**). The file template includes details about how each element and attribute is used in the configuration file.
 - b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the **Content Completion Assistant** you should see your customizations.

Tip: In some cases, you can simply use the  Refresh (F5) action to test your customizations, without having to restart the application.

Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (cc_config.xml) uses elementProposals elements. This element allows you to customize or filter the child elements and attributes for an element.

Elements:

To control the **elements** that are proposed for an element, you can use the following attributes for the elementProposals element:

- path - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the title elements in the document, while "chapter/title" matches only the title elements that are direct children of the chapter element.

Note: If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use *possibleElements* or *rejectElements* to specify or restrict elements for an entire framework.

For example, suppose that in your DITA documents, you want to restrict your users from using image elements (image) because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image" />
```

Since the path attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- insertElements - A space-separated sequence of child element names. Each time the element specified in the path attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, *insertElements="b i"* will insert exactly one b element, followed by an i element. An empty value (" ") means that no child elements should be inserted.

Note: If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- **possibleElements** - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the `path` attribute. For example, "bold italic codeph ph" means that the **Content Completion Assistant** will contain these four elements when invoked on the element specified in the `path` attribute. The following other possible values are also supported:
 - **NONE** - There will be no proposals in the content completion list.
 - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
 - **INSERTED** - The proposals will be the same list of elements that are defined in the `insertElements` attribute.
- **rejectElements** - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `path` attribute is inserted into the document, the list of proposals in the **Content Completion Assistant** will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

Attributes:

To control the **attributes** that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- `path` - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `title` elements in the document, while "chapter/title" matches only the `title` elements that are direct children of the `chapter` element.

Note: If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleAttributes` or `rejectAttributes` to specify or restrict attributes for an entire framework.

For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```
<elementProposals possibleAttributes="  
    id domains href scope format type conref  
    props keyref class"/>
```

Since the `path` attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- `insertAttributes` - A space-separated sequence of attribute names that will be inserted along with the element.
- `possibleAttributes` - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `path` attribute.
- `rejectAttributes` - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `path` attribute is inserted into the document, the list of proposals in the **Content Completion Assistant** will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

Other Important Notes About the Configuration File

Important:

- By default, the element names that do not have a namespace prefix are considered from *no-namespace*. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the `elementPath` and `model` attributes.
- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the  Refresh (**F5**) action to test your customizations.

- When an XML element from the document is matched against a list of configured `elementProposals`, the first one in sequence takes precedence. Therefore, make sure you place the more specific `elementProposals` (those with a longer path) first in your configuration file.
- Regular expression patterns can be used in the following attributes: `possibleElements`, `rejectElements`, `possibleAttributes`, and `rejectAttributes`. For example, `code*`, `*block`, `con*ref`, `_*`.
- Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex `elementProposals` patterns are defined, you should avoid *infinite recursions*.

Examples: Configuring the Element Proposals

- Example 1: Automatically Insert Elements**

Suppose that you want to automatically insert a paragraph element (`p`) whenever a DITA ordered list item element (`ol/li`) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```
<elementProposals path="ol/li" insertElements="p"
    possibleElements="_INSERTED_"/>
```

- Example 2: Insert Complex Element Structure**

For a more complex example, suppose that you want to insert a complex structure whenever a DITA `prolog` element is inserted.

For instance, if you need to insert the following structure inside `prolog` elements:

```
<prolog>
    <author></author>
    <metadata>
        <keywords>
            <keyword></keyword>
            <keyword></keyword>
        </keywords>
    </metadata>
</prolog>
```

The configuration file should include the following:

```
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/
    keywords" insertElements="keyword, keyword"/>
```

- Example 3: Limit Possible Elements**

Suppose that you also want to limit the proposals for the `keywords` element to only allow the user to insert `audience` or `keyword` elements. The configuration file should include the following:

```
<elementProposals path="prolog/
    metadata" insertElements="keywords" possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting `image` elements inside DITA list item elements (`li`), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="li" rejectElements="image" />
```

Examples: Configuring the Attributes Proposals

- Example 1: Automatically Insert Attributes**

Suppose that you want to insert an `id` attribute (with an empty value) whenever a DITA list item element (`li`) is inserted. The configuration file should include the following:

```
<elementProposals path="li" insertAttributes="id"/>
```

- **Example 2: Limit Possible Attributes**

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (`li`) is inserted. The configuration file should look like this:

```
<elementProposals path="li" insertAttributes="id" possibleAttributes="id product platform audience"/>
```

Suppose that you want to simply restrict your users from inserting `conref` attributes inside DITA topics (`topic` element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="topic" rejectAttributes="conref" />
```

Customizing the Rendering of Elements

[Edit on GitHub](#)

In addition to the support for configuring the proposals that appear in the **Content Completion Assistant**, Oxygen XML Author also includes support for customizing how the elements are rendered. You can do this by using the [XMLNodeRendererCustomizer API extension](#), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`p`) to be rendered as "Paragraph" instead of "p" in the various components in **Author** mode (such as in the **Outline** view, **Elements** view, **Attributes** view, and the breadcrumb navigation bar). To achieve this, you can use the `elementRenderings` element in the configuration file.

Setting up the Content Completion Configuration File

To customize the configuration file for the **Content Completion Assistant**, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath tab** add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
 - a. To easily create a new configuration file, you can use the *Content Completion Configuration* file template that is included in Oxygen XML Author (**File > New > Framework templates > Oxygen Extensions > Content Completion Configuration**). The file template includes details about how each element and attribute is used in the configuration file.
 - b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).

- Restart the application and open an XML document. In the **Content Completion Assistant** you should see your customizations.

Tip: In some cases, you can simply use the  Refresh (F5) action to test your customizations, without having to restart the application.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the `render` element inside a `elementRenderings` element to specify how element names, their annotations, and their icons are rendered.

You can use the following attributes for the `render` element:

- `element` - Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from `noNamespace`.
- `as` - Provides the name (label) that will be displayed for the element in various components in **Author** mode (such as in the **Content Completion Assistant**, the breadcrumb navigation bar, the **Full Tags** display mode, and the **Outline**, **Elements**, and **Attributes** views). This attribute is optional. If it is missing, the name of the element is used.
- `iconPath` - Optional attribute that specifies the icon for the element. This is shown in the **Content Completion Assistant** and the **Outline** view in **Author** mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Author to load "frameworks/\$ {framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Author classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Author JAR file resources).
- `xml:lang` - Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple `render` elements for the same `element` attribute (element name) and the `xml:lang` attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

Note: The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (`p`) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the `render` element also accepts the following element to change the tooltip annotations for an element (in both **Author** mode and **Text** mode):

- `annotation` - This element can be used within the `render` element to customize the tooltip annotations that are displayed for the element in various components in **Author** mode (such as tooltips shown in the **Content Completion Assistant** documentation window, the breadcrumb navigation bar, the **Full Tags** display mode, and the **Outline**, **Elements**, and **Attributes** views), as well as the tooltips that are displayed when you hover over elements in **Text** mode. You can use HTML content to style the annotations (see the *example below*).

Note: If this element is missing, the *styling for the annotations for that element is collected from the associated schema*.

Other Important Notes About the Configuration File for Rendering Elements

Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the Refresh (F5) action to test your customizations.
- If the framework has an associated *styleguide*, then the annotations defined in the configuration file will take precedence over those defined in the *styleguide*. To check to see if your framework uses a *styleguide*, look for the following folder: \${oxygenInstallDir}frameworks/\${framework}/styleguide/. If that folder exists, it is recommended that you make your annotation changes directly in the *styleguide*, rather than in the configuration file.
- If an *XMLNodeRendererCustomizer API extension* has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the *XMLNodeRendererCustomizer* implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also applies to aspects of the Oxygen XML Web Author Component interface.

Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA *title* element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in **Author** mode. The configuration file should look like this:

```
<elementRenderings>
    <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
        <annotation>
            <html xmlns="http://www.w3.org/1999/xhtml">
                <head>
                    <title>Documentation for the Title Element</title>
                </head>
                <body>
                    <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
                </body>
            </html>
        </annotation>
    </render>
</elementRenderings>
```

Annotations for XML Elements and Attributes in Content Completion Assistant

[Edit on GitHub](#)

Oxygen XML Author gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the **Content Completion Assistant** for a

recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the **Elements** view. If you hover over attributes in the **Attributes** view you also see information about each attribute, gathered from the same schema.

If you have a document type configuration set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to specification web pages for certain elements and attributes.

To provide this additional information in the **Content Completion Assistant**, follow these steps:

1. Create a new folder in the configuration directory for the document type.
OXYGEN_INSTALL_DIR/frameworks/dita/styleguide
2. Use the **New** document wizard to create a file using the Oxygen content completion styleguide file template.
3. Save the file in the folder created in step 1, using the fixed name: contentCompletionElementsMap.xml.
4. *Open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Author will locate your mapping file by doing one of the following:
 - In the **Classpath** tab add a link to the newly created folder.
 - In the **Catalogs** tab *add a new catalog file*. The selected file needs to contain the following:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN" "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:catalog">
  <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
</catalog>
```

where *{processed_dt_name}* is the name of the document type in lower case and with spaces replaced by underscores.

Note: If Oxygen XML Author finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.
You can look at how the DITA mapping file is configured: OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml
The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.
6. Re-open the application and open an XML document.

In the **Content Completion Assistant** you should see the additional annotations for each element.

CSS Support in Author Mode

[Edit on GitHub](#)

Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language. Also, some custom functions and properties that extend the W3C CSS specification, and are useful for URL and string manipulation, are available to developers who create **Author** editing frameworks.

Selecting and Combining Multiple CSS Styles

[Edit on GitHub](#)

Oxygen XML Author provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate)* CSS style and multiple *alternate* CSS styles. This makes it easy to change the look of the document.

An example of a common use case is when content authors want to use custom styling within a document. You can select a *main* CSS stylesheet that styles the whole document and then apply *alternate* styles, as layers, to specific parts of the document.

Managing the CSS Styles

The *main* and *alternate* styles that are listed in the **Styles** drop-down menu can be controlled in the [Document Type configuration dialog box](#). To access it, follow these steps:

1. [Open the Preferences dialog box](#).
2. Go to **Document Type Association**.
3. Select the appropriate document type and press the **Edit** button.

The CSS styles (CSS files) associated with the particular document type are listed in the **CSS** subtab of the **Author** tab.

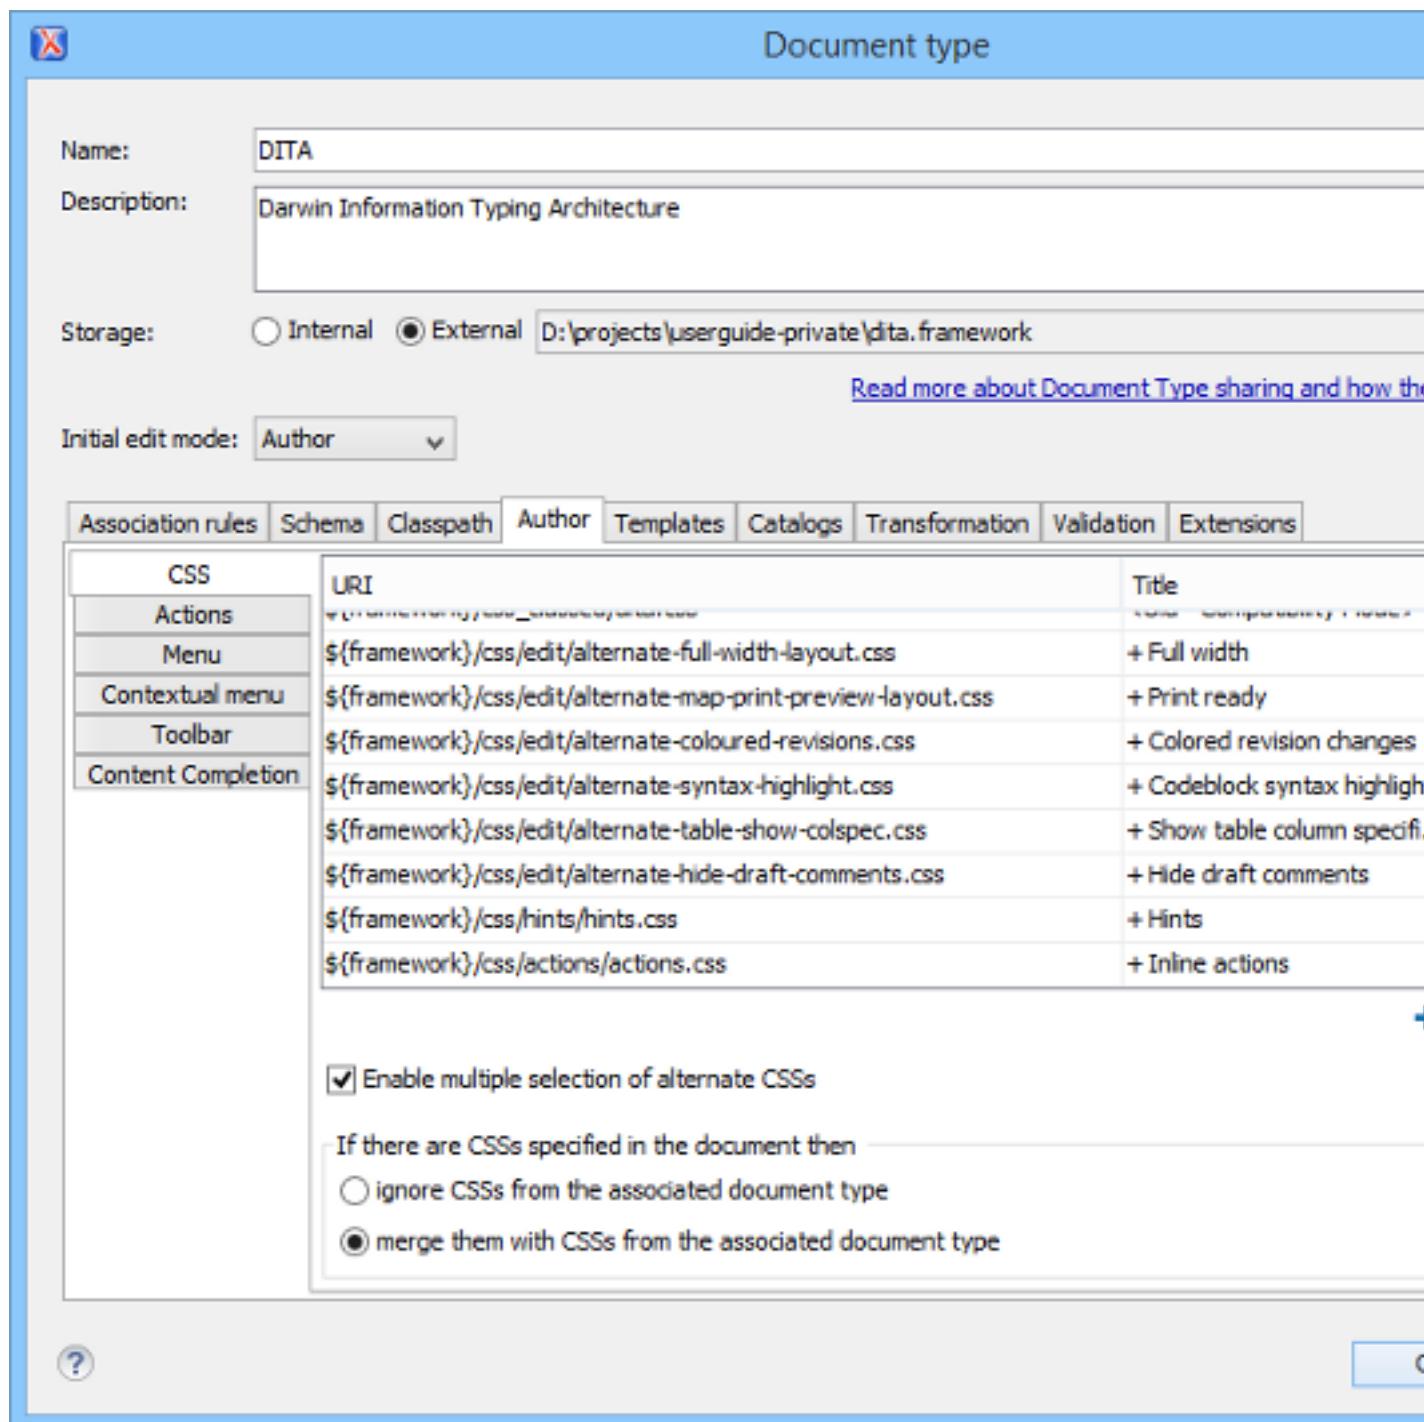

Figure 360: Main and Alternate CSS Styles in the Document Type Association Dialog Box

You can **Add**, **Edit**, or **Delete** styles from this dialog box to manage the *main* and *alternate* styles associated to the particular document type. You can also change the order of the styles by using the **Move Up** and **Move Down** buttons. This will also change the order that they appear in the **Styles** drop-down menu. The *alternate* styles are combined with the *main* CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last *alternate* style in this list will take precedence, since it is the last one to be combined (applied as a layer).

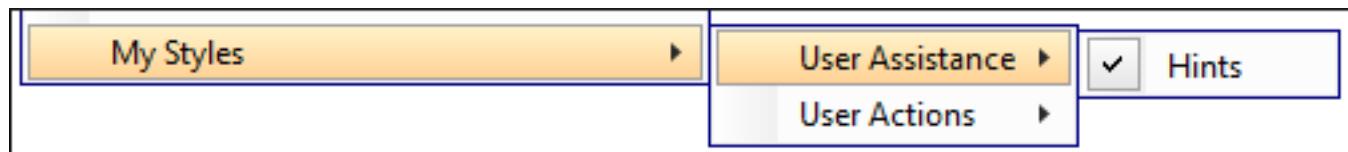

The **URI** column shows the path of each CSS file. The names listed in the **Styles** drop-down menu match the values in the **Title** column. The value in the **Alternate** column determines whether it is a *main* or *alternate* CSS. If the value is *no* it is a *main* CSS. If the value is *yes* it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the **Styles** drop-down menu.

Note: To group alternate styles into categories (submenus), use a vertical bar character (|) in the **Title** column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the **Styles** drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.

Example: Suppose that you want to add two alternate stylesheets in separate submenus, with the **Title** column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.

URI	Title	Alternate
<code> \${framework}/css/hints/hints.css</code>	My Styles User Assistance Hints	yes
<code> \${framework}/css/actions/actions.css</code>	My Styles User Actions Inline actions	yes

Oxygen XML Author will add a My Styles submenu with two submenus (User Assistance that contains the Hints style, and User Actions that contains the Inline Actions style) in the **Styles** drop-down menu.

The **Enable multiple selection of alternate CSSs** box at the bottom of the pane must be checked for the *alternate* styles to be combined. They are applied like layers and you can activate any number of them. If this option is disabled, the *alternate* styles are treated like *main* CSS styles and you can only select one at a time. By default, this option is enabled for DITA documents. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to *ignore* or *merge* them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

Using the Styles Drop-Down Menu

You can use the **Styles** drop-down menu to select a *main* style that applies to the whole document and then select one or more *alternate* styles that behave like layers and are merged sequentially with the *main* style. The *main* styles are listed in the top section, while the *alternate* styles are listed in the bottom section.

The selections from the **Styles** drop-down menu are persistent, meaning that Oxygen XML Author will remember the selections when subsequent documents are opened.

EXAMPLE: CSS Styles in DITA

Oxygen XML Author comes with a set of predefined CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps). In the subsequent figure, a DITA document has the **Century** style selected for the *main* CSS and the *alternate* styles **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

Tip: The **Hints** style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The **Inline actions** style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

The screenshot shows the Oxygen XML Author interface with a DITA document titled "care.dita". The document structure is visible in the top navigation bar: "topic" and "body". The main content area contains several paragraphs and a table.

Content Snippets:

- Use a generic DITA topic only if the content cannot be placed into one of the other types like **task**, **concept**, **reference**, etc.
- The topic title must clearly convey the content found in the topic.

Section Header:

Care and Preparation

Buttons:

[Title Alternatives] [Short Description] OR [Abstract] [Prolog]

Text Content:

When caring for your flower garden you want to feed your plants properly. Proper nutrition is key to successful gardening, landscaping, and healthy flowers. You have to balance the soil structure with nutrients and regulate the pH to cover your needs. It's important to remember that many flower gardens fail because they just don't get enough of you.

Table:

A DITA table that can encode any complex table structure.

Table Headers:

Flowers

name	number	width	align
------	--------	-------	-------

Table Data:

- name c1 number 1 width 171.0pt align
- name c2 number 2 width 99.0pt align
- name newCol3 number 3 width 200px align

Table:

Flower	Type	Soil
Chrysanthemum	perennial	well drained
Gardenia	perennial	acidic

Handling CSS Imports

[Edit on GitHub](#)

When a CSS document contains imports to other CSS documents, the references are also passed through the XML catalog URI mappings to determine an indirect CSS referenced location.

For example, if you can have a CSS import, such as:

```
@import "http://host/path/to/location/custom.css";
```

and then add your own XML catalog file that maps the location to a custom CSS in the [XML Catalog preferences page](#):

```
<uri name="http://host/path/to/location/custom.css" uri="path/to/custom.css"/>
```

Add a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog file that looks like this:

```
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css" uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

For example, the following editor variable:

```
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework folder where the `custom.css` is placed.

oxygen Media Type

[Edit on GitHub](#)

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.). You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Author **Author** mode and ignored in other media types. This can be accomplished by using the `oxygen` media type.

```
b{  
    font-weight:bold;  
}
```

```

    display:inline;
}

@media oxygen{
b{
    text-decoration:underline;
}
}

```

This example results in the text being bold if the document is opened in a web browser that does not recognize @media oxygen, while the text is bold and underlined when opened in Oxygen XML Author **Author** mode.

You can also use the oxygen media type to specify CSS selectors to be applied in certain operating systems or platforms by using the os and platform properties. For example, you can specify one set of style rules for displaying Oxygen XML Author in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
- **platform** - The possible values are: standalone, eclipse, or webapp.

```

@media oxygen AND (os:"win") AND (platform:"standalone") {
p{
    content:"PPP";
}
}

```

Related information

[@media Rule](#) on page 1227

CSS At-Rules

[Edit on GitHub](#)

Oxygen XML Author supports some of the standard at-rules specified by CSS Level 2.1 and 3. The @media rule also include support for some style rules that are specific to Oxygen XML Author.

@font-face At-Rule

[Edit on GitHub](#)

Oxygen XML Author allows you to use custom fonts in the **Author** mode by specifying them in the CSS using the @font-face media type. Only the src and font-family CSS properties can be used for this media type.

```

@font-face{
    font-family:"Baroque Script";
    /*The location of the loaded TTF font must be relative to
the CSS*/
    src:url("BaroqueScript.ttf");
}

```

@media Rule

[Edit on GitHub](#)

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Author supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author **Author** mode. For more information, see [oxygen Media Type](#) on page 1226.
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author **Author** mode when a dark theme is used (for example, *Graphite*).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author **Author** mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author **Author** mode on a Windows High Contrast Theme with a white background.

```
@media oxygen{
  b{
    text-decoration:underline;
  }
}
@media oxygen-high-contrast-white{
  b{
    font-weight:bold;
  }
}
```

Supported Properties

Oxygen XML Author also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.
- **max-width** - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

```
@media (min-width:500px){
  p{
    content:'xxx';
  }
}
@media (max-width:700px){
  p:after{
    content:'yyy';
  }
}
```

Standard W3C CSS Supported Features
[Edit on GitHub](#)

Oxygen XML Author supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors
[Edit on GitHub](#)

The following table lists the CSS selectors that are supported in Oxygen XML Author:

Expression	Name	CSS Level	Description / Example
*	Universal selector	CSS Level 2	Matches any element
E	Type selector	CSS Level 2	Matches any E element (i. e. an element with the local name E)
E F	Descendant selector	CSS Level 2	Matches any F element that is a descendant of an E element.
E > F	Child selectors	CSS Level 2	Matches any F element that is a child of an element E.
E:lang(c)	Language pseudo-class	CSS Level 2	Matches element of type E if it is in (human) language c (the document language specifies how language is determined).
E + F	Adjacent selector	CSS Level 2	Matches any F element immediately preceded by a sibling element E.
E ~ F	General sibling selector	CSS Level 3	Matches any F element preceded by a sibling element E.
E[foo]	Attribute selector	CSS Level 2	Matches any E element with the "foo" attribute set (whatever the value).
E[foo="warning"]	Attribute selector with value	CSS Level 2	Matches any E element whose "foo" attribute value is exactly equal to "warning".
E[foo~= "warning"]	Attribute selector containing value	CSS Level 2	Matches any E element whose "foo" attribute value is a list of space-separated values, one of which is exactly equal to "warning".
E[lang = "en"]	Attribute selector containing hyphen separated values	CSS Level 2	Matches any E element whose "lang" attribute has a hyphen-separated list of values beginning (from the left) with "en".
E:before and E:after	Pseudo elements	CSS Level 2	The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.
E:before(n) and E:after(n)	Pseudo elements	CSS Level 3	Multiple ':before(n)' and ':after(n)' pseudo-elements can

Expression	Name	CSS Level	Description / Example
			<p>be used to insert content before or after the content of an element (or other pseudo-element).</p> <p>For more information, see the W3C CSS3 pseudo elements site.</p>
E:first-child	The first-child pseudo-class	CSS Level 2	Matches element E when E is the first child of its parent.
E:not(s)	Negation pseudo-class	CSS Level 2	An E element that does not match simple selector s.
E:has	Relational pseudo-class	CSS Level 4	<p>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument.</p> <p>For more information, see :has Relational Pseudo-Class on page 1234.</p>
E:hover	The hover pseudo-class	CSS Level 2	The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.
E:focus	The focus pseudo-class	CSS Level 2	The :focus pseudo-class applies while an element has the focus (accepts keyboard input).
E:focus-within	The generalized input focus pseudo-class	CSS Level 4	The :focus-within pseudo-class applies to elements for which the :focus pseudo-class applies. Additionally, the ancestors of an element that matches :focus-within also match.
E#myid	The ID selector	CSS Level 2	<p>Matches any E element with ID equal to "myid".</p> <p>Important: Limitation: In Oxygen XML Author the match is performed only taking into account the attributes with the exact name: "id".</p>
E[att^="val"]	Substring matching attribute selector	CSS Level 3	An E element whose att attribute value begins exactly with the string val.
E[att\$="val"]	Substring matching attribute selector	CSS Level 3	An E element whose att attribute value ends exactly with the string val.
E[att*="val"]	Substring matching attribute selector	CSS Level 3	An E element whose att attribute value contains the substring val.

Expression	Name	CSS Level	Description / Example
E:root	Root pseudo-class	CSS Level 3	Matches the root element of the document. In HTML, the root element is always the HTML element.
E:empty	Empty pseudo-class	CSS Level 3	An E element that has no text or child elements.
E:nth-child(n)	The nth-child pseudo-class	CSS Level 3	An E element, the nth child of its parent.
E:nth-last-child(n)	The nth-last-child pseudo-class	CSS Level 3	An E element, the nth child of its parent, counting from the last one.
E:nth-of-type(n)	The nth-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type.
E:nth-last-of-type(n)	The nth-last-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type, counting from the last one.
E:last-child	The last-child pseudo-class	CSS Level 3	An E element, last child of its parent.
E:first-of-type	The first-of-type pseudo-class	CSS Level 3	An E element, first sibling of its type.
E:last-of-type	The last-of-type pseudo-class	CSS Level 3	An E element, last sibling of its type.
E:only-child	The only-child pseudo-class	CSS Level 3	An E element, only child of its parent.
E:only-of-type	The only-of-type pseudo-class	CSS Level 3	An E element, only sibling of its type.
ns E	Element namespace selector	CSS Level 3	An element that has the local name E and the namespace given by the prefix ns. The namespace prefix can be bound to a URI by the at-rule: <pre>@namespace ns "http://some_namespace_uri";</pre> See Namespace Selector on page 1231.
E !>F	The subject selector	CSS Level 4 (experimental)	An element that has the local name E and has a child F. See Subject Selector on page 1233.

Namespace Selector

[Edit on GitHub](#)

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Author uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1 the name tokens from selectors are matching all elements from ANY namespace that have the same local name. Example:

```
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3 you can create selectors that are namespace aware.

Defining both prefixed namespaces and the default namespace

Given the namespace declarations:

```
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

In a context where the default namespace applies:

A

represents the name A in the http://sync.example.org namespace.

B

represents the name B that belongs to NO NAMESPACE.

***C**

represents the name C in ANY namespace, including NO NAMESPACE.

D

represents the name D in the http://example.com/foo namespace.

Defining only prefixed namespaces

Given the namespace declaration:

```
@namespace sync "http://sync.example.org";
```

Then:

A

represents the name A in the http://sync.example.org namespace.

B

represents the name B that belongs to NO NAMESPACE.

***C**

represents the name C in ANY namespace, including NO NAMESPACE.

D

represents the name D in ANY namespace, including NO NAMESPACE.

Defining prefixed namespaces combined with pseudo-elements

To match the `def` element its namespace will be declared, bind it to the `abs` prefix, and then write a CSS rule:

```
@namespace abs "http://www.oxygenxml.com/sample/documentation/
abstracts";
```

Then:

abs|def

represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

abs|def:before

represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

Subject Selector

[Edit on GitHub](#)

Oxygen XML Author supports the subject selector described in CSS Level 4 (currently a working draft at W3C <http://www.w3.org/TR/selectors4/>). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!" instead of the last element from the path).

The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.

```
table! > caption {
    border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```
table > caption {
    border: 1px solid red;
}
```

This draws a border around the caption.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
chapter! > oxy|processing-instruction[important][level="high"]{
    color:red;
```

```
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

Descendant Selectors Limitation

Important: The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a! b c
```

and:

```
a! > b > c
```

:has Relational Pseudo-Class

[Edit on GitHub](#)

Oxygen XML Author supports the CSS Level 4 subject selector (currently a working draft at W3C <http://www.w3.org/TR/selectors4/>), as described in [Subject Selector](#) on page 1233. Oxygen XML Author also supports the `:has` relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see <https://drafts.csswg.org/selectors-4/#relational>.

You can create conditions that take into account the structure of the matching element.

For example:

```
table:has( tbody > thead){
  border: 1px solid red;
}
```

This will result in a border being drawn for the table elements that contain at least a `thead` element in the `tbody` element.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
  <title>A title</title>
```

```
<?important level='high'?>
</chapter>
```

Descendant Selectors Limitation

Important: The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a! b c
```

and:

```
a! > b > c
```

Supported CSS Properties

[Edit on GitHub](#)

Oxygen XML Author validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Author-specific (extension) CSS properties, see [Oxygen XML Author CSS Extensions](#) on page 1243.

Name	Rendered Values	Ignored Values

Transparent Colors

[Edit on GitHub](#)

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a *real* number between 0 and 1, or a percent.

RGBA color

```
personnel:before {
    display:block;
    padding: 1em;
    font-size: 1.8em;
    content: "Employees";
    font-weight: bold;
    color:#EEEEEE;
    background-color: rgba(50, 50, 50, 0.6);
```

```
}
```

attr() Function: Properties Values Collected from the Edited Document
[Edit on
GitHub](#)

In CSS Level 2.1 you may collect attribute values and use them as content *only* for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
  content: "Title id=(\" attr(id) \")";
}
```

If the title element from the XML document is:

```
<title id="title12">My title.</title>
```

Then the title will be displayed as:

```
Title id=(title12) My title.
```

In Oxygen XML Author, the use of attr() function is available not only for the content property, but also for any other property. This is similar to the CSS Level 3 working draft: <http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional>. The arguments of the function are:

```
attr( attribute_name , attribute_type , default_value )
```

attribute_name

The attribute name. This argument is required.

attribute_type

The attribute type. This argument is optional. If it is missing, argument's type is considered string. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Author accepts one of the following types:

color

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Author supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FFEEFF.

url

The value is a URL pointing to a media object. Oxygen XML Author supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

integer	The value must be interpreted as an integer.
number	The value must be interpreted as a float number.
length	The value must be interpreted as an integer.
percentage	The value must be interpreted relative to another value (length, size) expressed in percents.
em	The value must be interpreted as a size. 1 em is equal to the <i>font-size</i> of the relevant font.
ex	The value must be interpreted as a size. 1 ex is equal to the <i>height</i> of the x character of the relevant font.
px	The value must be interpreted as a size expressed in pixels relative to the viewing device.
mm	The value must be interpreted as a size expressed in millimeters.
cm	The value must be interpreted as a size expressed in centimeters.
in	The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.
pt	The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.
pc	The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

default_value

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

Usage samples for the attr() function

Consider the following XML instance:

```
<sample>
    <para bg_color="#AAAAFF">Blue paragraph.</para>
    <para bg_color="red">Red paragraph.</para>
    <para bg_color="red" font_size="2">Red paragraph with large
font.</para>
    <para bg_color="#00AA00" font_size="0.8" space="4">
        Green paragraph with small font and margin.</para>
</sample>
```

The para elements have bg_color attributes with RGB color values (such as #AAAAFF). You can use the attr() function to change the elements appearance in the editor based on the value of this attribute:

```
background-color:attr(bg_color, color);
```

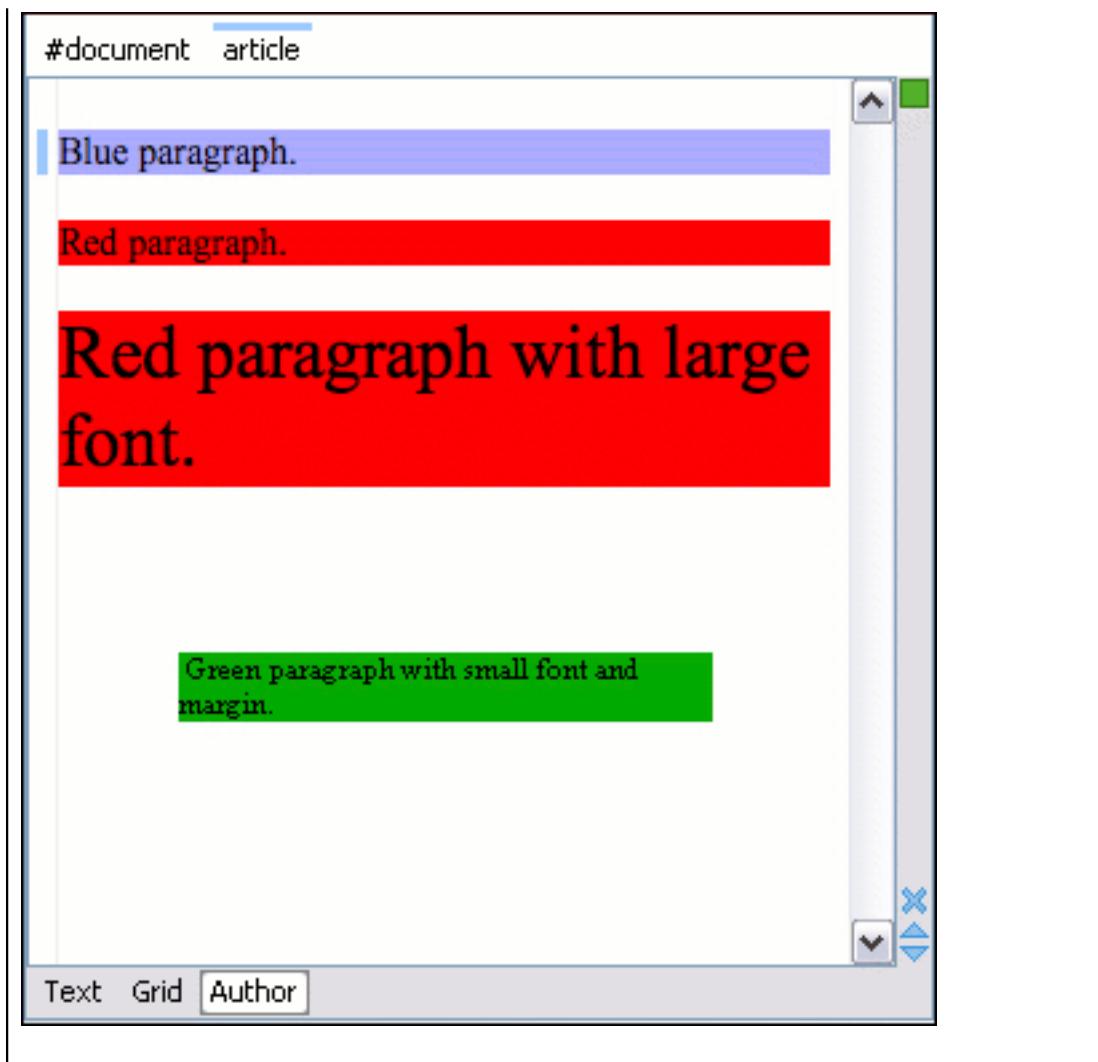

The attribute font_size represents the font size in *em* units. You can use this value to change the style of the element:

```
font-size:attr(font_size, em);
```

The complete CSS rule is:

```
para{
    display:block;
    background-color:attr(bg_color, color);
    font-size:attr(font_size, em);
    margin:attr(space, em);
}
```

The document is rendered as:

Oxygen XML Author CSS Extensions

[Edit on GitHub](#)

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Author CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.

Built-in CSS Selectors

[Edit on GitHub](#)

When Oxygen XML Author renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

List of CSS Selector Contributed by Oxygen XML Author

*[dir='lro'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{
    xi|include:before,
    xi|include:after{
        color:#808080 !important;
    }
}

```

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```
oxy|entity {
    background-color: inherit !important;
}
```

Additional CSS Selectors

[Edit on GitHub](#)

Oxygen XML Author provides support for selecting additional types of nodes. These custom selectors apply to: *document*, *doctype sections*, *processing-instructions*, *comments*, *CDATA sections*, *reference sections*, and *entities*. *Processing-instructions* are not displayed by default. To display them, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Author**, and select **Show processing instructions**.

Note: The custom selectors are presented in the default CSS for **Author** mode and all of their properties are marked with an *!important* flag. For this reason, you have to set the *!important* flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the **Author** mode extensions namespace at the beginning of the stylesheet documents:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- The oxy|document selector matches the entire document:

```
oxy|document {
    display:block !important;
}
```

- The following example changes the rendering of doctype sections:

```
oxy|doctype {
    display:block !important;
    color:blue !important;
    background-color:transparent !important;
}
```

- To match the processing instructions, you can use the oxy|processing-instruction selector:

```
oxy|processing-instruction {
    display:block !important;
    color:purple !important;
    background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the construct:

```
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```
oxy|processing-instruction[target_name][data="b"]
```

- The XML comments display in **Author** mode can be changed using the oxy|comment selector:

```
oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
}
```

- The oxy|cdata selector matches CDATA sections:

```
oxy|cdata{
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
}
```

- The oxy|entity selector matches the entities content:

```
oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
    background-color:transparent !important;
```

```
}
```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
oxy|entity[name='apos'],
oxy|entity[name^='#']{
    -oxy-display-tags: none;
}
```

- The *references to entities*, *XInclude*, and *DITA conrefs* and *conkeyrefs* are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that refers to them.
- You can use the `reference` property to customize the way these references are rendered in **Author** mode:

```
oxy|reference {
    border: 1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains *comments* and changes (if *Track Changes* was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of this comments and changes you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

Note: Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and track changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```
oxy|reference[comments]:before {
    content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain change tracking inside, use the `oxy|reference[changeTracking]` selector.

```
oxy|reference[changeTracking]:before {
    content: "Change tracking: " attr(changeTracking) !important;
}
```

- Here is an example of how you can set a custom color to the reference containing both track changes and comments:

```
oxy|reference[changeTracking][comments]:before {
    content: "Change tracking: " attr(changeTracking) " and comments: "
        attr(comments) !important;
}
```

The screenshot shows the Oxygen XML Author interface. On the left, a tree view displays the XML structure of a sample document. The root node contains DTD declarations, an entity declaration, and a CSS link. Below these are sections for "Some Text", "Some entity", "Comment", and "CDATA section". A section titled "sample1.xml reffered" contains the text "Reffered text.". This section has a "Comments: 2" link below it. Another section titled "sample1.xml reffered-with-comment" also contains "Reffered text with comments." and a "Change tracking: 2" link. A third section titled "sample1.xml reffered-with-track-changes" contains "Reffered text with changes." and a "Change tracking: 1 and comments: 1" link. The bottom section, "sample1.xml reffered-with-comment-and-track-changes", contains "Reffered text with comments and changes." and both links.

```
<!DOCTYPE SAMPLE [<!ENTITY ent "Some entity"><!ENTITY % xinclude SYSTEM "http://www.docbook.org/xml/4.4/xinclude.mod"%xinclude;>]><xmlstylesheet type="text/css" href="sample.css"/>Some Text>Some entity<comment>Comment</comment><![CDATA section]>&sample1.xml reffered;Reffered text.&sample1.xml reffered-with-comment;Comments: 2Reffered text with comments.&sample1.xml reffered-with-track-changes;Change tracking: 2Reffered text with changes.&sample1.xml reffered-with-comment-and-track-changes;Change tracking: 1 and comments: 1Reffered text with comments and changes.
```

Figure 362: Example: A Document Rendered Using these Rules

Additional CSS Properties

[Edit on GitHub](#)

Oxygen XML Author offers an extension of the standard CSS properties suited for content editing.

Folding Elements

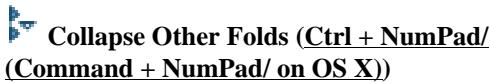

[Edit on](#)
[GitHub](#)

Oxygen XML Author allows you to declare some elements to be *foldable* (collapsible). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Author marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the **Folding** submenu of the contextual menu:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

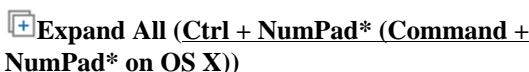

Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: `-oxy-foldable:true;`. To define the elements that are folded by default, use the `-oxy-folded:true` property.

Note: The `-oxy-folded` property works in conjunction with the `-oxy-foldable` property. Thus, the `folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property `-oxy-not-foldable-child` is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma separated element names. The first child element from the XML document that appears in the list of element names will be identified as the not foldable child and displayed. If the element is marked as *foldable* (`-oxy-foldable:true;`) but it doesn't have the property `-oxy-not-foldable-child` or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the `before` pseudo-element.

Note: Deprecated properties `foldable`, `not-foldable-child`, and `folded` are also supported.

Folding DocBook Elements

All the elements below can have a `title` child element and are considered to be logical sections. You mark them as being *foldable* leaving the `title` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
example,
table {
```

```

        -oxy-foldable:true;
        -oxy-not-foldable-child: title;
    }
}

```

Placeholders for Empty Elements

[Edit on GitHub](#)

Oxygen XML Author displays the element name as pseudo-content for empty elements if the [Show placeholders for empty elements option](#) is enabled in the **Author** preferences page and there is no *before* or *after* content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

-oxy-placeholder-content CSS Property

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `keyword` element to be displayed as `key`:

```

keyword{
    -oxy-placeholder-content: "key";
}

```

-oxy-show-placeholder CSS Property

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:

- `always` - Always display placeholders.
- `default` - Always display placeholders if *before* or *after* content are not set in CSS.
- `inherit` - The placeholders are displayed according to the [Show placeholders for empty elements option](#) (if *before* and *after* content is not declared).

Note: Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

Read-only elements: `-oxy-editable` property

[Edit on GitHub](#)

If you want to inhibit editing a certain element content, you can set the `-oxy-editable` (deprecated property `editable` is also supported) CSS property to `false`.

Display Elements: `-oxy-morph` Value

[Edit on GitHub](#)

Oxygen XML Author allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is inline if all its children are inline.

For example, suppose we have a `wrapper` XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline or block behavior, depending on the behavior of its child elements:

```

wrapper{
    display:-oxy-morph;
}

```

whitespace Property: -oxy-trim-when-ws-only Value[Edit on](#)[GitHub](#)

Oxygen XML Author allows you to set the whitespace property to `-oxy-trim-when-ws-only`, meaning that the leading and trailing whitespaces are removed.

visibility Property: -oxy-collapse-text[Edit on](#)[GitHub](#)

Oxygen XML Author allows you to set the value of the visibility property to `-oxy-collapse-text`, meaning that the text content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

The text value of an XML element will be edited using a text field form control. In this case, we want the text content not to be directly present in the **Author** visual editing mode:

```
title{
    content: oxy_textfield(edit, '#text', columns, 40);
    visibility:-oxy-collapse-text;
}
```

Cyrillic Counters: list-style-type Values (-oxy-lower-cyrillic)[Edit on](#)[GitHub](#)

Oxygen XML Author allows you to set the value of the `list-style-type` property to `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

Counting list items with Cyrillic symbols:

```
li{
    display:list-item;
    list-style-type:-oxy-lower-cyrillic-ru;
}
```

link Property[Edit on](#)[GitHub](#)

Oxygen XML Author allows you to declare some elements to be *links*. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the `link` property on the `before` or `after` pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`

DocBook Link Elements

The following elements are defined to be links on the `before` pseudo element and their values are defined by the value of an attribute.

```
*[href]:before{
    link:attr(href);
    content: "Click " attr(href) " for opening" ;
}
```

```

ulink[url]:before{
    link:attr(url);
    content: "Click to open: " attr(url);
}

olink[targetdoc]:before{
    -oxy-link: attr(targetdoc);
    content: "Click to open: " attr(targetdoc);
}

```

Display Tag Markers: `-oxy-display-tags`

[Edit on GitHub](#)

Oxygen XML Author allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- *none* - Tags markers must not be presented regardless of the current *display mode*..
- *default* - The tag markers will be created depending on the current *display mode*..
- *inherit* - The value of the property is inherited from an ancestor element.

```

-oxy-display-tags
    Value: none | default | inherit
    Initial: default
    Applies to: all nodes(comments, elements, CDATA, etc.)
    Inherited: false
    Media: all

```

DocBook Para elements

In this example, the `para` element from DocBook uses a :before and :after element and its tag markers will not be visible.

```

para:before{
    content: "{";
}

para:after{
    content: "}";
}

para{
    -oxy-display-tags: none;
    display:block;
    margin: 0.5em 0;
}

```

Append Content Properties: `-oxy-append-content / -oxy-prepend-content`

[Edit on GitHub](#)

`-oxy-append-content` Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account,

the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

-oxy-append-content

```
element:before{
    content: "Hello";
}
element:before{
    -oxy-append-content: " World!";
}
```

The content shown before the element will be Hello World!.

-oxy-prepend-content Property

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

-oxy-prepend-content

```
element:before{
    content: "Hello!";
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the element will be I said: Hello!.

Custom Colors for Element Tags

[Edit on GitHub](#)

By default, Oxygen XML Author does not display element tags. You can use the  **Partial Tags** button from the **Author** tool bar to control the amount of *displayed markup*.

To configure the default background and foreground colors of the tags, go to **Editor > Edit modes > Author**. The `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.

```
para {
    -oxy-tags-color:white;
    -oxy-tags-background-color:green;
}
title {
    -oxy-tags-color:yellow;
    -oxy-tags-background-color:black;
}
```

Custom CSS Functions

[Edit on GitHub](#)

The visual **Author** editing mode supports also a wide range of custom CSS extension functions.

oxy_local-name() Function

[Edit on GitHub](#)

The `oxy_local-name()` function evaluates the local name of the current node.

It does not have any arguments.

To insert as static text content before each element its local name, use this CSS selector:

```
* :before{
    content: oxy_local-name() " : ";
}
```

oxy_name() Function

[Edit on GitHub](#)

The `oxy_name()` function evaluates the qualified name of the current node.

It does not have any arguments.

To insert as static text content before each element its qualified name, use this CSS selector:

```
* :before{
    content: oxy_name() " : ";
}
```

oxy_url() Function

[Edit on GitHub](#)

The `oxy_url()` function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Author uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (built-in or custom).

`oxy_url(base_location , loc_1 , loc_2)`

base_location

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

loc_1 ... loc_n (optional)

Strings representing relative location path components.

The following function receives String objects as input parameters:

```
oxy_url('http://www.oxygenxml.com/css/test.css' , '../dir1/ ,
'dir2/dir3/' , '....dir4/dir5/test.xml')
```

and returns:

```
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
```

The following function receives the result of the evaluation of two other functions as parameters:

```
image[href]{
  content:oxy_url(oxy_base-uri(),
    oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

You can use the above example when you have image references and you want to see thumbnail images stored in the same folder.

The following function uses an editor variable as the first parameter to point to the Oxygen XML Author installation location:

```
image[href] {
  content: oxy_url('${oxygenHome}', 'logo.png');
}
```

Related information

[Editor Variables](#) on page 226

`oxy_base-uri()` Function

[Edit on GitHub](#)

The `oxy_base-uri()` function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the [XML Base specification](#) for more details.

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
  content:oxy_url(oxy_base-uri(),
    oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

`oxy_parent-url()` Function

[Edit on GitHub](#)

The `oxy_parent-url()` function evaluates the parent URL of a URL received as string.

`oxy_parent-url(URL)`

URL

The URL as string.

`oxy_capitalize()` Function

[Edit on GitHub](#)

The `oxy_capitalize` function capitalizes the first letter of the text received as argument.

`oxy_capitalize(text)`

text

The text in which the first letter will be capitalized.

To insert as static text content before each element its capitalized qualified name, use this CSS selector:

```
* :before{
    content: oxy_capitalize(oxy_name() ) " : ";
}
```

oxy_uppercase() Function

[Edit on GitHub](#)

The `oxy_uppercase()` function transforms to upper case the text received as argument.

`oxy_uppercase(text)`

text

The text to be capitalized.

To insert as static text content before each element its upper-cased qualified name, use this CSS selector:

```
* :before{
    content: oxy_uppercase(oxy_name() ) " : ";
}
```

oxy_lowercase() Function

[Edit on GitHub](#)

The `oxy_lowercase()` function transforms to lower case the text received as argument.

`oxy_lowercase(text)`

text

The text to be lower cased.

To insert as static text content before each element its lower-cased qualified name, use this CSS selector:

```
* :before{
    content: oxy_lowercase(oxy_name() ) " : ";
}
```

oxy_concat() Function

[Edit on GitHub](#)

The `oxy_concat()` function concatenates the received string arguments.

`oxy_concat(str_1 , str_2)`

str_1 ... str_n

The string arguments to be concatenated.

If an XML element has an attribute called **padding-left**:

```
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```
* [padding-left] {
```

```
padding-left:oxy_concat(attr(padding-left), "px");
}
```

oxy_replace() Function

[Edit on GitHub](#)

The `oxy_replace` function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

- `oxy_replace(text , target , replacement)`

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

text	The text in which the replace will occur.
-------------	---

target	The target string to be replaced.
---------------	-----------------------------------

replacement	The string replacement.
--------------------	-------------------------

- `oxy_replace(text , target , replacement , isRegExp)`

This function replaces each substring of the text that matches the target string with the specified replacement string.

text	The text in which the replace will occur.
-------------	---

target	The target string to be replaced.
---------------	-----------------------------------

replacement	The string replacement.
--------------------	-------------------------

isRegExp	If <i>true</i> the target and replacement arguments are considered regular expressions, if <i>false</i> they are considered literal strings.
-----------------	--

Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
  content:oxy_url(oxy_base-uri(),
    oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

oxy_unparsed-entity-uri() Function

[Edit on GitHub](#)

The `oxy_unparsed-entity-uri()` function returns the URI value of an unparsed entity name.

`oxy_unparsed-entity-uri(unparsedEntityName)`

unparsedEntityName	The name of an unparsed entity defined in the DTD.
---------------------------	--

This function can be useful to display images that are referenced with unparsed entity names.

CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity

```
imagedata[entityref]{
  content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

}

oxy_attributes() Function

[Edit on
GitHub](#)

The `oxy_attributes()` function concatenates the attributes for an element and returns the serialization.

oxy_attributes ()

oxy_attributes()

For the following XML fragment:<element att1="x" xmlns:a="2" x="" />
the CSS selector

```
element{  
    content:oxy_attributes();  
}
```

will display `att1="x" xmlns:a="2" x=""`.

oxy_substring() Function

[Edit on
GitHub](#)

The `oxy_substring()` function is used to return a string of text.

The `oxy_substring()` function has two signatures:

- `oxy_substring(text , startOffset)`

Returns a new string that is a substring of the original **text** string. It begins with the character at the specified index and extends to the end of **text** string.

text

The original string.

startOffset

The beginning index, inclusive

- `substring(text , startOffset , endOffset)`

Returns a new string that is a substring of the original **text** string. The substring begins at the specified **startOffset** and extends to the character at index **endOffset** - 1.

text

The original string.

startOffset

The beginning index, inclusive

endOffset

The ending index, exclusive.

`oxy_substring('abcd', 1)` returns the string 'bcd'.

`oxy_substring('abcd' , 4)` returns an empty string.

`oxy_substring('abcd', 1, 3)` returns the string 'bc'.

If we only want to display part of an attribute value, the part that comes before an **Appendix** string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
    oxy_indexof(attr(longdesc), "Appendix"));
}
```

oxy_getSomeText(text, length) Function[Edit on GitHub](#)

The `oxy_getSomeText(text, length)` function allows you to truncate a long string and to set a maximum number of displayed characters.

The following properties are supported:

- **text** - Displays the actual text.
- **length** - Sets the maximum number of characters that are displayed.
- **endsWithPoints** - Specifies if the truncated text ends with ellipsis.

If an attribute value is very large, we can trim its content before it is displayed as static content:

```
*[longdesc]:before{
    content: oxy_getSomeText(attr(longdesc), 200);
}
```

oxy_indexof() Function[Edit on GitHub](#)

The `oxy_indexof()` function is used to define searches.

The `oxy_indexof()` function has two signatures:

- `oxy_indexof(text , toFind)`
Returns the index within **text** string of the first occurrence of the **toFind** substring.

text Text to search in.

toFind The searched substring.

- `oxy_indexof(text , toFind , fromOffset)`
Returns the index within **text** string of the first occurrence of the **toFind** substring. The search starts from **fromOffset** index.

text Text to search in.

toFind The searched substring.

fromOffset The index to start the search from.

```
oxy_indexof('abcd', 'bc') returns 1.  
oxy_indexof('abcdabc', 'bc', 2) returns 4.
```

If we only want to display part of an attribute value, the part that comes before an **Appendix** string:

```
image[longdesc]{
    content: oxy_substring(attr(longdesc), 0,
        oxy_indexof(attr(longdesc), "Appendix"));
}
```

oxy_lastindexof() Function[Edit on GitHub](#)

The `oxy_lastindexof()` function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

- `oxy_lastindexof(text , toFind)`

Returns the index within **text** string of the rightmost occurrence of the **toFind** substring.

text	Text to search in.
toFind	The searched substring.
• <code>oxy_lastindexof(text , toFind , fromOffset)</code>	
The search starts from fromOffset index. Returns the index within text string of the last occurrence of the toFind substring, searching backwards starting from the fromOffset index.	
text	Text to search in.
toFind	The searched substring.
fromOffset	The index to start the search backwards from.

```
oxy_lastindexof('abcdabc', 'bc') returns 4.  
oxy_lastindexof('abcdbccdbc', 'bc', 2) returns 1.
```

If we only want to display part of an attribute value, the part that comes before an **Appendix** string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
    oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

oxy_xpath() Function

[Edit on GitHub](#)

The `oxy_xpath()` function is used to evaluate XPath expressions.

The `oxy_xpath()` function has the following signature:

- `oxy_xpath(XPathExpression [, processChangeMarkers , value] [, evaluate , value])`

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced **xi:include** section or inside artificially referenced content (for example, DITA `conref` or `topicref` references).

The parameters of the function are as follows:

- A required expression parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (`delete` changes are removed and `insert` changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
 - `dynamic` - Evaluates the XPath each time there are changes in the document.
 - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
 - `static` - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

Note: When XPath expressions are evaluated, the entities and `xi:include` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```
<section>
  <p>Referenced content</p>
</section>
```

The latter will be the actual content in which the XPath expression is executed.

An Example of the `oxy_xpath()` Function

The following example counts the number of words from a paragraph (including tracked changes) and displays the result in front of it:

```
para:before{
  content:
    concat("/Number of words:",
           oxy_xpath(
             "count(tokenize(normalize-space(string-
join(text(), '')), ' '))",
             processChangeMarkers,
             true),
             "/ ");
}
```

`oxy_action()` Function

[Edit on GitHub](#)

The `oxy_action()` function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from [the `oxy_button\(\)` function](#).

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- `name` - The name of the action. It will be displayed as the label for the button or menu item.
- `description` (optional) - A short description with details about the result of the action.
- `icon` (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (`oxygen.jar`) by starting its value with / (for example, / images/Remove16.png). It can also be expressed as [editor variables](#).
- `operation` - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of [predefined operations](#) that can be used.

Note: If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- `arg-<string>` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).

- ID - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

```

oxy_button(
    action, oxy_action(
        name, 'Insert',
        description, 'Insert an element after the current one',
        icon, url('insert.png'),
        operation,
        'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
        arg-fragment, '<element>${caret}</element>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'),
        showIcon, true)

```

You can also create a button form control directly from an oxy_action function:

```

oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation,
    'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After')

```

Tip: A code template is available to make it easy to add the oxy_action function with the **Content Completion Assistant** by pressing Ctrl + Space (Command + Space on OS X) and select the  oxy_action code template..

Related information

[Button Form Control](#) on page 1275

The oxy_button built-in form control is used for graphical user interface objects that invokes a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

oxy_action_list() Function

[Edit on GitHub](#)

The oxy_action_list() function allows you to define a list of actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action_list() function is used from [the oxy_buttonGroup\(\) function](#).

The arguments received by the oxy_action_list() function are a list of actions that are defined with [the oxy_action\(\) function](#). The following properties are supported in the oxy_action_list() function:

- name - The name of the action. It will be displayed as the label for the button or menu item.
- description (optional) - A short description with details about the result of the action.
- icon (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (oxygen.jar) by starting its value with / (for example, / images/Remove16.png). It can also be expressed as [editor variables](#).
- operation - The name of the Java class implementing the [ro.sync.ecss.extensions.api.AuthorOperation](#) interface. There is also a variety of [predefined operations](#) that can be used.

Note: If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- `arg-<string>` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- `ID` - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

```

oxy_action_list(
    oxy_action(
        name, 'Insert',
        description,
        'Insert an element after the current one',
        operation, InsertFragmentOperation,
        arg-fragment, '<element></element>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
    ),
    oxy_action(
        name, 'Delete',
        description, 'Deletes the current element',
        operation, DeleteElementOperation
    )
)
)

```

Tip: A code template is available to make it easy to add the `oxy_action_list` function with the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_action_list` code template.

Related concepts

[oxy_action\(\) Function](#) on page 1263

The `oxy_action()` function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

Related information

[Button Group Form Control](#) on page 1276

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

oxy_label() Function

[Edit on GitHub](#)

The `oxy_label()` function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are *property name - property value* pairs. The following properties are supported:

- `text` - This property specifies the built-in form control you are using.
- `width` - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `background-color` - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element in which it is inserted.

- **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
 - `font-weight`, `font-size`, `font-style`, `font`
 - `text-align`, `text-decoration`
 - `width`
 - `color`, `background-color`
 - `link` - For more information about this property see [the link property section](#).

```
element{
    content: oxy_label(text, "Label Text", styles,
        "font-size:2em;color:red;link:attr(href);");
}
```

Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```
* {
    width: 40%;
    text-align:center;
}
```

Then refer that file with an `import` directive, as follows:

```
elem {
    content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")
```

CAUTION: Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\nLINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

Note: The text is split after \A, which represents a new line character.

You can use the `oxy_label()` function together with a [built-in form control](#) function to create a form control based layouts.

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```
person:before {
    content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
    "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```
person:before {
    content: oxy_label(text, "Name:*", styles, "font-
weight:bold;width:200px") oxy_textfield(edit, '@name', columns,
20) "\A "
        oxy_label(text, "Address:", styles, "width:200px")
        oxy_textfield(edit, '@address', columns, 20)
}
```

Tip: A code template is available to make it easy to add the `oxy_label` function with the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_label` code template..

oxy_link-text() Function

[Edit on GitHub](#)

You can use the `oxy_link-text()` function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks, go to [Configuring an Extensions Bundle](#).

DITA Support

For DITA, the `oxy_link-text()` function resolves the `xref` element and the elements that have a `keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `topicref` element that has the `navtitle` and `locktitle` attributes set, the function returns the value of the `navtitle` attribute.

DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `xref` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `xreflabel` attribute.

```
<para><code id="para.id" xreflabel="The reference label">my
  code</code></para>
<para><xref linkend="para.id"/></para>

xref {
  content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `href` is not valid), you can use an optional argument to display fallback text.

```
*[class~="map/topicref"]::before{
  content: oxy_link-text("Cannot find the topic reference");
  link:attr(href);
}
```

oxy_unescapeURLValue(string) Function

[Edit on GitHub](#)

The `oxy_unescapeURLValue()` function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

```
oxy_unescapeURLValue( "http://www.example.com/a%20simple
%20example.html" ) returns the http://www.example.com/a simple
example.html value.
```

Arithmetic Functions

[Edit on GitHub](#)

Arithmetic Functions are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class (<http://download.oracle.com/javase/6/docs/api/java/lang/Math.html>).

In addition to that, the following functions are available:

Syntax	Details
<code>oxy_add(param1, ..., paramN, 'returnType')</code>	Adds the values of all parameters from param1 to paramN.
<code>oxy_subtract(param1, param2, ..., paramN, 'returnType')</code>	Subtracts the values of parameters param2 to paramN from param1.
<code>oxy_multiply(param1, ..., paramN, 'returnType')</code>	Multiplies the values of parameters from param1 to paramN.
<code>oxy_divide(param1, param2, 'returnType')</code>	Performs the division of param1 to param2.
<code>oxy_modulo(param1, param2, 'returnType')</code>	Returns the remainder of the division of param1 to param2.

Note: The `returnType` can be '`integer`', '`number`', or any of the supported CSS measuring types.

If we have an image with `width` and `height` specified on it we can compute the number of pixels on it:

```
image:before{
  content: "Number of pixels: " oxy_multiply(attr(width),
    attr(height), "px");
}
```

Form Controls

[Edit on GitHub](#)

Oxygen XML Author provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects.

Oxygen XML Author provides the following built-in form controls:

- **[Text Field](#)** - A graphical user interface box that allows you to enter a single line of text.
- **[Combo Box](#)** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **[Checkbox](#)** - A graphical user interface box that you can click to select or deselect a value.
- **[Pop-up](#)** - A contextual menu that provides quick access to various actions.
- **[Button](#)** - A graphical user interface object that performs a specific action.
- **[Button Group](#)** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **[Text Area](#)** - A box that allows you to enter multiple lines of text.
- **[URL Chooser](#)** - A dialog box that allows you to select the location of local or remote resources.
- **[Date Picker](#)** - A form control object that allows you to select a date in a specified format.

- **HTML Content** - A graphical user interface box that is used for rendering HTML content.

For customization purposes, Oxygen XML Author also supports *custom form controls in Java*.

To watch our video demonstration in regards to form controls, go to http://oxygentools.com/demo/Form_Controls.html.

[Dynamically Add Form Controls Using a Styles Filter](#) on page 1305

Text Field Form Control

[Edit on GitHub](#)

The oxy_textfield built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The oxy_textfield form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.
- **Note:** You can set the value of the **visibility** property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The **width** property takes precedence over the **columns** property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that populate the content completion list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
- **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **color** - Specifies the foreground color of the form control. If the value of the **color** property is `inherit`, the form control has the same color as the element in which it is inserted.
- **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

Note: If the value is `false`, the **Content Completion Assistant** considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: `value a`, `value b`, and other values. If the **hasMultipleValues** property is set to `true` and the user enters "value " (notice the space character after 'value') in the text field, the **Content Completion Assistant** will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the **hasMultipleValues** property was set to `false` for our example, the **Content Completion Assistant** would only suggest `value a` and `value b` because the space is considered part of the prefix.

- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Text Field Form Control

```
element {
    content: "Label: "
    oxy_textfield(
        edit, "@my_attr",
        values, "value1, value2",
        color, "red",
        columns, 40);
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_textfield` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_textfield` code template.

Combo Box Form Control

[Edit on GitHub](#)

The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
 - `#text` - Specifies that the presented/edited value is the simple text value of an element.
- `Note:` You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `columns` - Controls the width of the form control. The unit size is the width of the `w` character.
- `width` - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `editable` - This property accepts the `true` and `false` values. In addition to a drop-down menu, the `true` value also generates an editable text field box that allows you to insert other values than the proposed ones. The `false` value generates a drop-down menu that only accepts the proposed values.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.

- **values** - Specifies the values that populate the content completion list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema..
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `#{i18n()} editor variable`.

Note: This property is only available for read-only combo boxes (the `editable` property is set to `false`).

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

- **canRemoveValue** - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

Combo Box Form Control

```
comboBox:before {
    content: "A combo box that edits an attribute value. The
possible values are provided from CSS:"
    oxy_combobox(
        edit, "@attribute",
        editable, true,
        values, "value1, value2, value3",
        labels, "Value no1, Value no2, Value no3");
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_combobox` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_combobox` code template.

Checkbox Form Control

[Edit on GitHub](#)

The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple check-boxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.

- **#text** - Specifies that the presented/edited value is the simple text value of an element.
- Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `oxy_combobox(values, '1\\\", 2\\\", 3, 4, edit, false)` will display a combo box having the first value `1, 2, 3` and the second value `4`.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.
- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `${i18n() } editor variable`. If this property is not specified, the `values` property is used as the label.
- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Single Checkbox Form Control

```
checkBox[attribute]:before {
    content: "A check box editor that edits a two valued
attribute (On/Off).
The values are specified in the CSS:"
    oxy_checkbox(
        edit, "@attribute",
        values, "On",
        uncheckedValues, "Off",
        labels, "On/Off");
}
```

Multiple Check-boxes Form Control

```
multipleCheckBox[attribute]:before {
    content: "Multiple checkboxes editor that edits an attribute
value."
```

```

Depending whether the check-box is selected a different value is committed:
oxy_checkbox(
    edit, "@attribute",
    values, "true, yes, on",
    uncheckedValues, "false, no, off",
    resultSeparator, ",",
    labels, "Present, Working, Started");
}

```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_checkbox` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_checkbox` code template.

Pop-up Form Control

[Edit on GitHub](#)

The `oxy_popup` built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The `oxy_popup` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:

- `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
- `#text` - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- `rows` - This property specifies the number of rows that the form control presents.

Note: If the value of the `rows` property is not specified, the default value of `12` is used.

- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

Note: This property is used for rendering in the **Author** mode.

- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.

Example:

```

link:before{
    content: oxy_popup(
        edit, '@href',
        values, "Spring Flowers, Summer Flowers, Autumn Flowers, Winter
Flowers",
        tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
Chrysanthemum${comma}Salvia, Gerbera",
        selectionMode, single);
}

```

- `values` - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `oxy_combobox(values, '1\\, 2\\, 3, 4, edit, false)` will display a combo box having the first value 1, 2, 3 and the second value 4.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.
- Note:** The value of the `resultSeparator` property cannot exceed one character.
- **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.
 - **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.
 - **columns** - Controls the width of the form control. The unit size is the width of the `w` character. This property is used for the visual representation of the form control.
 - **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
 - **rendererSort** - Allows you to sort the values rendered on the form control label. The possible values of this property are `ascending` and `descending`.
 - **editorSort** - Allows you to sort the values rendered on the form control. The possible values of this property are `ascending` and `descending`.
 - **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.
 - **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
 - **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Pop-up Form Control

```
popupWithMultipleSelection:before {
    content: " This editor edits an attribute value. The
possible values are specified
inside the CSS: "
    oxy_popup(
        edit, "@attribute",
        values, "value1, value2, value3, value4, value5",
        labels, "Value no1, Value no2, Value no3, Value no4,
Value no5",
        resultSeparator, "/",
        columns, 10,
        selectionMode, "multiple",
        color, "blue",
        fontInherit, true);
    font-size:30px;
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_popup` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_popup` code template.

Button Form Control

[Edit on GitHub](#)

The `oxy_button` built-in form control is used for graphical user interface objects that invokes a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_button` form control supports the following properties:

- `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `actionID` - The ID of the action, specified in the associated *document type framework*, that is invoked when you click the button.

Note: The element that contains the form control represents the context where the action is invoked.

- `action` - Defines an action directly, rather than using the `actionID` parameter to reference an action from the associated *document type framework*. This property is defined using the `oxy_action` function.

```
oxy_button(action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
))
```

Tip: You can also create a button form control *directly from an oxy_action function*.

- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `transparent` - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).
- `showText` - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```
element {
    content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

- `showIcon` - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```
element {
    content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

- `enableInReadOnlyContext` - To enable *button form controls* or *groups of buttons form controls* this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_button(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Button Form Control

```
button:before {
    content: "Label:" oxy_button(
        /* This action is declared in the document type
        associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection");
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_button` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_button` code template. Also, an  `oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an `action` parameter.

Button Group Form Control

[Edit on GitHub](#)

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- `actionIDs` - The IDs of the actions that will be presented in the group of buttons.
- `actionID` - The ID of the action, specified in the associated *document type framework*, that is invoked when you click the button.

Note: The element that contains the form control represents the context where the action is invoked.

- `action_list` - Defines a list of actions directly, rather than using the `actionID` parameter to reference actions from the associated *document type framework*. This property is defined using the *oxy_action_list function*.

```

oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            arg-fragment, '<element></element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Delete',
            description, 'Deletes the current element',
            operation, 'ro.sync.ecss.extensions.commons.operations.DeleteElementOperation'
        )
    )
)

```

Tip: A code template is available to make it easy to add the `oxy_action_list` function.

- `label` - Specifies the label to be displayed on the button. This label can be translated using the `$(i18n())` editor variable.
 - `icon` - The path to the icon to be displayed on the button.
 - `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
 - `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
 - `actionStyle` - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or both.
 - `tooltip` - Specifies a tooltip to be displayed when you hover over the form control.
 - `transparent` - Makes the button transparent without any borders or background colors. The values of this property can be `true` or `false`.
 - `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
 - `enableInReadOnlyContext` - To enable `button form controls` or `groups of buttons form controls` this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
 - `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p::before {  
    content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')  
}  
p:showBorder {  
    border: 1px solid red;  
}
```

Button Group Form Control

```
buttongroup:before {
    content:
        oxy_label(text, "Button Group:", width, 150px, text-align, left)
        oxy_buttonGroup(
            label, 'A group of actions',
            /* The action IDs are declared in the document type
            associated with the XML document. */
            actionIDs, "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
            actionStyle, "both");
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_buttonGroup` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_buttonGroup` code template. Also, an  `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

Text Area Form Control

[Edit on GitHub](#)

The `oxy_textArea` built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
 - `#text` - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- `#content` - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</
ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
    content:
        oxy_textArea(
            edit, '#content',
            contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

Note: When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
  content:
    oxy_textArea(
      edit, '#content',
      contentType, 'text/xml' );
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

Note: When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- `columns` - Controls the width of the form control. The unit size is the width of the `w` character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `rows` - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- `contentType` - Specifies the type of content for which the form control offers syntax highlighting. The following values are supported: `text/css`; `text/shell`; `text/cc`; `text/xquery`; `text/xml`; `text/python`; `text/xsd`; `text/c`; `text>xpath`; `text/javascript`; `text/xsl`; `text/wsdl`; `text/html`; `text/xproc`; `text/properties`; `text/sql`; `text/rng`; `text/sch`; `text/json`; `text/perl`; `text/php`; `text/java`; `text/batch`; `text/rnc`; `text/dtd`; `text/nvdl`; `text/plain`.
- `indentOnTab` - Specifies the behavior of the **Tab** key. If the value of this property is set to `true` (default value), the **Tab** key inserts characters. If it is set to `false`, **Tab** is used for navigation, jumping to the next editable position in the document.
- The `white-space` CSS property influences the value that you edit, as well as the form control size:
 - `pre` - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specified, the form control calculates its size on its own so that all the text is visible.
 - `pre-wrap` - The long lines are wrapped to avoid horizontal scrolling.

Note: The `rows` and `columns` properties must be specified. If these are not specified, the form control considers the value to be `pre`.

- `normal` - The white spaces and new lines are normalized.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```
textArea {
    visibility: -oxy-collapse-text;
    white-space: pre;
}

textArea[language="CSS"]::before {
    content: oxy_textArea(
        edit, '#text',
        contentType, 'text/css');
}

textArea[language="XML"]::before {
    content: oxy_textArea(
        edit, '#text',
        contentType, 'text/xml',
        rows, 10,
        columns, 30);
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_textArea` form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_textArea` code template.

URL Chooser Form Control

[Edit on GitHub](#)

The `oxy_urlChooser` built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.

The `oxy_urlChooser` editor supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
 - `#text` - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- `columns` - Controls the width of the form control. The unit size is the width of the `w` character.

- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "`jpg, png, gif`" is mapped to a single filter that will display all `jpg`, `png`, and `gif` files.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

URL Chooser Form Control

```
urlChooser[file]:before {
    content: "A URL chooser editor that allows browsing for a
            URL. The selected URL is made relative to the currently edited
            file:";
    oxy_urlChooser(
        edit, "@file",
        columns 25);
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_urlChooser` form control, invoke the **Content Completion Assistant** by pressing Ctrl + Space (Command + Space on OS X) and select the  `oxy_urlChooser` code template.

Date Picker Form Control

[Edit on GitHub](#)

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- `columns` - Controls the width of the form control. The unit size is the width of the `w` character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `format` - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If missing, the type of the date is determined from the associated schema.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `validateInput` - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_datePicker(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Date Picker Form Control

```
date {
    content:
        oxy_label(text, "Date time attribute with format defined
in CSS: ", width, 300px)
        oxy_datePicker(
            columns, 16,
            edit, "@attribute",
            format, "yyyy-MM-dd" );
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the `oxy_datePicker` form control, invoke the **Content Completion Assistant** by pressing Ctrl + Space (Command + Space on OS X) and select the  `oxy_datePicker` code template.

HTML Content Form Control

[Edit on GitHub](#)

The `oxy_htmlContent` built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The `oxy_htmlContent` form control supports the following properties:

- `href` - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- `id` - The unique identifier of an item. This is a `div` element that has a unique `id` and is a child of the `body` element. The `div` element is the container of the HTML content to be rendered by the form control.
- `content` - An alternative to the `href` and `id` pair of elements. It provides the HTML content that will be displayed in the form control.

- width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the href property or is defined in-line. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

In the following example, the form control collects the content from the *p_description* div element found in the *descriptions.html* file. The box is 400 pixels wide and is displayed before a paragraph identified by the intro_id attribute value.

```
p#intro_id:before {
    content:
        oxy_htmlContent(
            href, "descriptions.html",
            id, "p_description",
            width, 400px);
}
```

An alternative example, using the content property:

```
p#intro_id:before {
    content:
        oxy_htmlContent(
            content, "<div style='font-weight:bold;'>My
content</div>",
            width, 400px);
}
```

Note: You can use the **Content Completion Assistant** in the CSS or LESS editor to easily insert a sample of the form control by selecting the corresponding code template. The form control code templates are displayed with a  symbol in the content complete list.

Tip: To insert a sample of the oxy_htmlContent form control, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  oxy_htmlContent code template.

Implementing Custom Form Controls

[Edit on GitHub](#)

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of `ro.sync.ecss.extensions.api.editor.InplaceRenderer`. The renderer has to be a **SWING** implementation and can be used both in the standalone and Eclipse distributions.
- **swingEditorClassName** - You can use this property for the standalone (**Swing**-based) distribution to specify the name of the class used for editing. It is a **Swing** implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.
- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a **SWT** implementation of the `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

Note: If the custom form control is intended to work in the Oxygen XML Author standalone distribution, the declaration of **swtEditorClassName** is not required. The *renderer* (the class that draws the value) has different properties from the *editor* (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.
- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Author will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment( "<custom/>" , offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```

The custom form controls can use any of the predefined properties of the *built-in form controls*, as well as specified custom properties.

This following is an example of how to specify a custom form control in the CSS:

```
myElement {
    content: oxy_editor(
        rendererClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
        swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    )
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Author SDK at http://oxygenxml.com/oxygen_sdk_maven.html.
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR library.
4. Copy the JAR library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Author, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, edit the appropriate framework, and add the JAR library in the **Classpath** tab.
6. Specify the custom form control in your CSS, as described above.

Editing Processing Instructions Using Form Controls

[Edit on GitHub](#)

Oxygen XML Author allows you to edit *processing instructions*, *comments*, and *CDATA* by using the built-in editors.

Oxygen XML Author allows you to edit *processing instructions*, *comments*, and *CDATA* by using the built-in editors.

Note: You can edit both the content and the attribute value from a *processing instruction*.

Editing an Attribute from a Processing Instruction

PI content

```
<?pi_target attr="val"?>
```

CSS

```
oxy|processing-instruction:before {
    display:inline;
    content:
        "EDIT attribute: " oxy_textfield(edit, '@attr', columns,
15);
    visibility:visible;
}
oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

Custom CSS Pseudo-classes

[Edit on](#)

[GitHub](#)

You can set your custom CSS pseudo-classes on the nodes from the `AuthorDocument` model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them the document does not create undo and redo edits - the document is considered unmodified. You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Author they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/cals_table.css` (Search for `-oxy-visible-colspecs`)
2. The definition of action `table.toggle.colspec` from the DocBook 4 framework makes use of the pre-defined `TogglePseudoClassOperation` Author mode operation.

Here are some examples:

Controlling the visibility of a section using a pseudo-class

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```
section {
    display:none;
}

section:access-control-user {
    display:block;
}
```

By setting the pseudo-class `access-control-user`, the element `section` will become visible by matching the second CSS selector.

Coloring the elements at the current cursor location

```
*:caret-visited {
    color:red;
}
```

You could create an `AuthorCaretListener` that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

The API that you can use from the `CaretListener`:

```
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String)
ro.sync.ecss.extensions.api.node.AuthorElement)
ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String)
ro.sync.ecss.extensions.api.node.AuthorElement)
```

Pre-defined `Author mode operations` can be used directly in your framework to work with custom pseudo-classes:

1. `TogglePseudoClassOperation`
2. `SetPseudoClassOperation`
3. `RemovePseudoClassOperation`

Debugging CSS Stylesheets

[Edit on GitHub](#)

To assist you with debugging and customizing CSS stylesheets the **Author** mode includes a `CSS Inspector view` to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

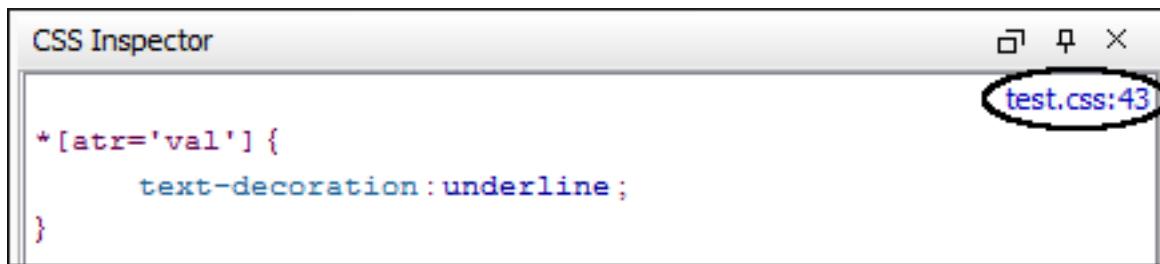

Figure 363: CSS Inspector View

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

Creating and Running Automated Tests

[Edit on GitHub](#)

If you have developed complex custom plugins or document types, the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Author standalone installation includes a main `oxygen.jar` library located in the `[OXYGEN_INSTALL_DIR]`. That JAR library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop JUnit tests for your customizations using the **Eclipse** workbench, follow these steps:

1. Create a new Eclipse Java project and copy to it the entire contents of the `[OXYGEN_INSTALL_DIR]`.
2. Add all JAR libraries present in the `[OXYGEN_INSTALL_DIR]/lib` directory to the **Java Build Path -> Libraries** tab. Make sure that the main JAR library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the **Order and Export** tab.
3. Click **Add Library** and add the `JUnit` and `JFCUnit` libraries.
4. Create a new Java class that extends `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.
5. Pass the following parameters on to the constructor of the super class:
 - `File installationFolder` - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.
 - `File frameworksFolder` - The file path to the frameworks directory. It can point to a custom frameworks directory where the custom framework resides.
 - `File pluginsFolder` - The file path to the plugins directory. It can point to a custom plugins directory where the custom plugins resides.
 - `File optionsFolder` - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
 - `String licenseKey` - The license key used to license the test class.
 - `int productId` - The ID of the product and should be one of the following: `PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT`, `PluginWorkspaceTCBase.XML_EDITOR_PRODUCT`, or `PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT`.

6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```

public class MyTestClass extends PluginWorkspaceTCBase {

    /**
     * Constructor.
     */
    public MyTestClass() throws Exception {
        super(null, new File("frameworks"), new File("plugins"), null,
              "-----START-LICENSE-KEY-----\n" +
              "\n" +
              "Registration_Name=Developer\n" +
              "\n" +
              "Company=\n" +
              "\n" +
              "Category=Enterprise\n" +
              "\n" +
              "Component=XML-Editor, XSLT-Debugger, Saxon-SA\n" +
              "\n" +
              "Version=14\n" +
              "\n" +
              "Number_of_Licenses=1\n" +
              "\n" +
              "Date=09-04-2012\n" +
              "\n" +
              "Trial=31\n" +
              "\n" +
              "SGN=MCwCFGNoEGJSeiC3XYIyalvjjzHhGhqAhRNRDpEu8RIWb8icCJ07HqfVP4++A\ \ =
\\=\n" +
              "\n" +
              "-----END-LICENSE-KEY-----",
              PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);
    }

    /**
     * <p><b>Description:</b> TC for opening a file and using the bold
     * operation</p>
     * <p><b>Bug ID:</b> EXM-20417</p>
     *
     * @author radu_coravu
     *
     * @throws Exception
     */
    public void testOpenFileAndBoldEXM_20417() throws Exception {
        WSEditor ed = open(new File("D:/projects/eXml/test/authorExtensions/
dita/sampleSmall.xml").toURL());
        //Move caret
        moveCaretRelativeTo("Context", 1, false);

        //Insert <b>
        invokeAuthorExtensionActionForID("bold");
        assertEquals("<?xml version='1.0' encoding='utf-8'?>\n" +
                    "<!DOCTYPE task PUBLIC '-//OASIS//DTD DITA Task//EN' '\
http://docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd'>\n" +
                    "<task id='taskId'>\n" +
                    "    <title>Task <b>title</b></title>\n" +
                    "    <prolog/>\n" +
                    "    <taskbody>\n" +
                    "        <context>\n" +
                    "            <p>Context for the current task</p>\n" +
                    "        </context>\n" +
                    "        <steps>\n"

```

```

        "      <step>\n" +
        "      <cmd>Task step.</cmd>\n" +
        "      </step>\n" +
        "      </steps>\n" +
        "      </taskbody>\n" +
    "</task>\n" +
    "", getCurrentEditorXMLContent() );
}
}

```

API Frequently Asked Questions (API FAQ)

[Edit on GitHub](#)

This section contains answers to common questions regarding the Oxygen XML Author customizations using the *oXygen SDK*, *Author Component*, or *Plugins*.

For additional questions, [contact us](#). The preferred approach is via email because API questions must be analyzed thoroughly. We also provide code snippets, if they are required.

To stay up-to-date with the latest API changes, discuss issues and ask for solutions from other developers working with the *oXygen SDK*, register on the [oXygen-SDK mailing list](#).

Add Custom Actions to the Contextual Menu?

[Edit on GitHub](#)

Question

How do I add my own custom actions to the contextual menu using an API?

Answer

The API methods `WSAuthorEditorPageBase.addPopUpMenuCustomizer` and `WSTextEditorPage.addPopUpMenuCustomizer` allow you to customize the contextual menu shown either in the **Author** or **Text** modes. The API is available both in the standalone application and in the Eclipse plugin.

Here is an elegant way to add actions to the **Author** page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

```

import org.eclipse.jface.action.ContributionManager;
import org.eclipse.ui.PlatformUI;
import org.eclipse.ui.menus.IMenuService;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;
/**
 * This class is used to create the possibility to attach certain
 * menuContributions to the {@link ContributionManager}, which is used for
 * the
 * popup menu in the Author Page of the Oxygen Editor.<br />
 * You just need to use the org.eclipse.ui.menus extension and add a
 * menuContribution with the locationURI: <b>menu:oxygen.authorpage</b>
 */
public class OxygenAuthorPagePopupMenuCustomizer implements
    AuthorPopupMenuCustomizer {

    @Override
    public void customizePopUpMenu(Object menuManagerObj,
        AuthorAccess authoraccess) {
        if (menuManagerObj instanceof ContributionManager) {

```

```
        ContributionManager contributionManager =
(ContributionManager) menuManagerObj;
        IMenuService menuService = (IMenuService)
PlatformUI.getWorkbench()
.getActiveWorkbenchWindow().getService(IMenuService.class);

        menuService.populateContributionManager(contributionManager,
                "menu:oxygen.authorpage");
        contributionManager.update(true);
    }
}
```

2. Add a workbench listener and add the pop-up customizer when an editor is opened in the **Author** page:

```
Workbench.getInstance().getActiveWorkbenchWindow().getPartService().addPartListener(  
    new IPartListener() {  
        @Override  
        public void partOpened(IWorkbenchPart part) {  
            if(part instanceof ro.sync.exml.workspace.api.editor.WSEditor) {  
                WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();  
                if(currentPage instanceof WSAuthorEditorPage) {  
                    ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer(new  
OxygenAuthorPagePopupMenuCustomizer());  
                }  
            }  
        }  
        .....  
    });
```

3. Implement the extension point in your `plugin.xml`:

```
<extension  
    point="org.eclipse.ui.menus">  
    <menuContribution  
        allPopups="false"  
        locationURI="menu:oxygen.authorpage">  
        <command  
            commandId="eu.doccenter.kgu.client.tagging.removeTaggingFromOxygen"  
            style="push">  
            </command>  
        </menuContribution>  
    </extension>
```

Add Custom Callouts

[Edit on GitHub](#)

Question

I want to highlight validation errors, instead of underlining them (for example, changing the text background color to light red or yellow). Also, I want to let Oxygen XML Author write a note about the error type into the **Author** mode directly at the error position (for example, " [value "text" not allowed for attribute "type"] "). Is this possible using the API?

Answer

The Plugins API allows you to set a `ValidationProblemsFilter` that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the **Author** mode using the API `WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)`. For each of those

offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

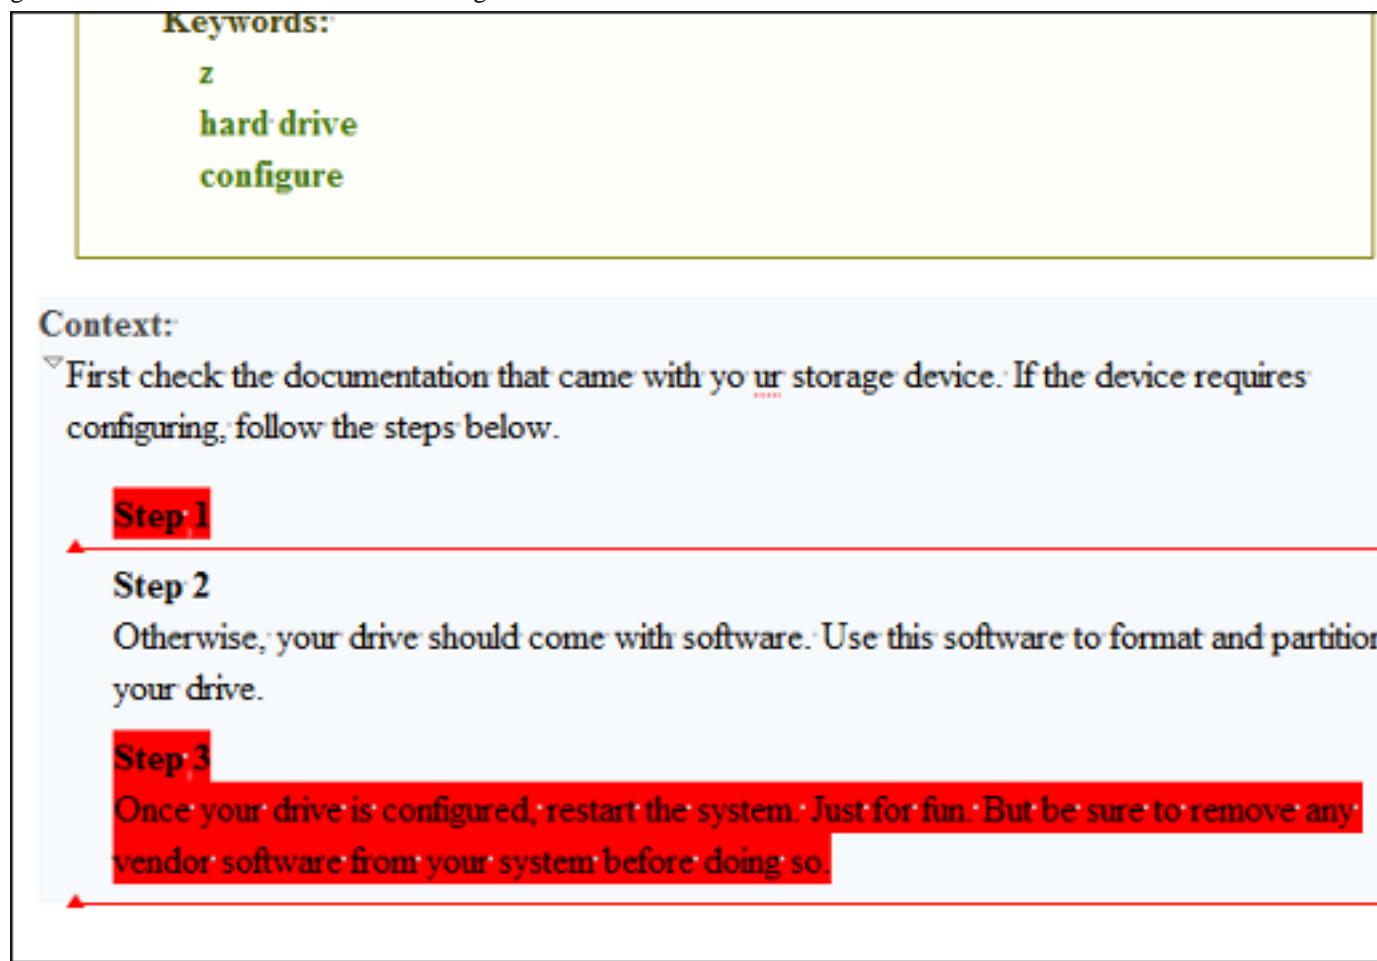

Figure 364: Custom Callouts with Persistent Highlights

Here is a working example:

```
/**
 * Plugin extension - workspace access extension.
 */
public class CustomWorkspaceAccessPluginExtension
    implements WorkspaceAccessPluginExtension {

    /**
     * @see ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension

    #applicationStarted(ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
    */
    public void applicationStarted(final StandalonePluginWorkspace
pluginWorkspaceAccess) {
        pluginWorkspaceAccess.addEditorChangeListener(new
WSEditorChangeListener() {
            /**
             * @see
ro.sync.exml.workspace.api.listeners.WSEditorChangeListener#editorOpened(java.net.URL)
            */
            @Override
            public void editorOpened(URL editorLocation) {

```

```

        final WSEditor currentEditor =
pluginWorkspaceAccess.getEditorAccess(editorLocation,
StandalonePluginWorkspace.MAIN_EDITING_AREA);
        WSEditorPage currentPage = currentEditor.getCurrentPage();
        if(currentPage instanceof WSAuthorEditorPage) {
            final WSAuthorEditorPage currentAuthorPage =
(WSAuthorEditorPage)currentPage;

currentAuthorPage.getPersistentHighlighter().setHighlightRenderer(new
PersistentHighlightRenderer() {
    @Override
    public String getTooltip(AuthorPersistentHighlight
highlight) {
        return highlight.getClonedProperties().get("message");
    }
    @Override
    public HighlightPainter
getHighlightPainter(AuthorPersistentHighlight highlight) {
        //Depending on severity could have different color.
        ColorHighlightPainter painter = new
ColorHighlightPainter(Color.COLOR_RED, -1, -1);
        painter.setBgColor(Color.COLOR_RED);
        return painter;
    }
});
        currentAuthorPage.getReviewController()

        .getAuthorCalloutsController().setCalloutsRenderingInformationProvider(
            new CalloutsRenderingInformationProvider() {
                @Override
                public boolean
shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
                    //All custom highlights are ours
                    return true;
                }
                @Override
                public AuthorCalloutRenderingInformation
getCalloutRenderingInformation(
                    final AuthorPersistentHighlight highlight) {
                    return new AuthorCalloutRenderingInformation() {
                        @Override
                        public long getTimestamp() {
                            //Not interesting
                            return -1;
                        }
                        @Override
                        public String getContentFromTarget(int limit) {
                            return "";
                        }

public boolean applicationClosing() {
    return true;
}
}

```

Add Custom Highlights to Content

[Edit on GitHub](#)

Question

How can we add custom highlights to the document content in **Author** mode?

Answer

There are two types of highlights you can add:

1. **Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

You can use the following API method:

```
ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()
```

to obtain an *AuthorHighlighter* that allows you to add a highlight between certain offsets with a specified painter.

For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.

2. **Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

You can use the following API method:

```
ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHig
```

to obtain an *AuthorPersistentHighlighter* class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

For example, you can use this support to implement your own way of adding review comments.

Auto-Generate an ID When a Document is Opened or Created

[Edit on GitHub](#)

Question

Is it possible to configure how the application generates ids? For project compliance we need ids having a certain format for each created topic.

Answer

This could be done implementing a plugin for Oxygen XML Author using the Plugins SDK:

http://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

There is a type of plugin called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented plugin would intercept the opened editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```

pluginWorkspaceAccess.addEditorChangeListener(new
WSEditorChangeListener() {
    /**
     * @see
ro.sync.exml.workspace.api.listeners.WSEditorChangeListener#editorOpened(java.net.URL)
    */
@Override
public void editorOpened(URL editorLocation) {
    WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation,
PluginWorkspace.MAIN_EDITING_AREA);
    generateID(ed);
}
/**
 * @see
ro.sync.exml.workspace.api.listeners.WSEditorChangeListener#editorPageChanged(java.net.URL)
    */
@Override
public void editorPageChanged(URL editorLocation) {
    WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation,
PluginWorkspace.MAIN_EDITING_AREA);
    generateID(ed);
}

private void generateID(WSEditor ed) {
    if(ed.getCurrentPage() instanceof WSAuthorEditorPage) {
        WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage)
ed.getCurrentPage();
        AuthorDocumentController ctrl =
authorEditPage.getDocumentController();
        AuthorElement root =
ctrl.getAuthorDocumentNode().getRootElement();
        if(root.getAttribute("id") == null || !
root.getAttribute("id").getValue().startsWith("generated_")) {
            ctrl.setAttribute("id", new AttrValue("generated_" +
Math.random()), root);
        }
    }
}

}, PluginWorkspace.MAIN_EDITING_AREA);

```

Change the Default Track Changes (Review) Author Name

[Edit on GitHub](#)

Question

How can we change the default author name used for Track Changes in the *Author Component*?

Answer

The Track Changes (Review) author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:

```
ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
```

2. **Options** - If the author name was not imposed from the API, it is determined from the [*Author option set in the Review preferences page*](#).
3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:

```
System.getProperty("user.name")
```

So, to impose the Track Changes author, use one of the following approaches:

1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method:
[http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro-sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName\(java.lang.String\)](http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro-sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName(java.lang.String))
2. Customize the default options and set a specific value for the [*Author name option set in the Review preferences page*](#).
3. Set the value of `user.name` system property when the applet is initializing and before any document is loaded.

Change the DOCTYPE of an Opened XML Document

[Edit on GitHub](#)

Question

How to change the DOCTYPE of a document opened in the **Author** mode?

Answer

The following API:

```
ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype()
```

allows you to get the DOCTYPE of the current XML file opened in the **Author** mode.

There is also an API method available that would allow you to set the DOCTYPE back to the XML:

```
ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDOCTYPE)
```

Here is an example of how this solution would work:

```
AuthorDOCTYPE dt = new
AuthorDOCTYPE("article", "testSystemID", "testPublicID",
             "<!DOCTYPE article PUBLIC \"testPublicID\" \"testSystemID\">"); 
docController.setDoctype(dt);
```

Basically you could take the entire content from the existing DOCTYPE,

```
ro.sync.ecss.extensions.api.AuthorDocumentType.getContent()
```

modify it to your needs, and create another `AuthorDocumentType` object with the new content and with the same public, system IDs.

For example, you could use this API if you want to add unparsed entities in the XML DOCTYPE.

Control XML Serialization in the Oxygen XML Author Component

[Edit on GitHub](#)

Question

How can I force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside block-level elements?

Answer

Usually, in a standalone version of Oxygen XML Author, the **Editor > Format** and **Editor > Format > XML** preferences pages allow you to control the way the XML is saved on the disk after you edit it in the **Author** mode.

In the editor application (Standalone or Eclipse-based), you can either bundle a *default set of options* or use the `PluginWorkspace.setGlobalObjectProperty(String, Object)` API:

```
//For not breaking the line
//Long line
pluginWorkspace.setObjectProperty("editor.line.width", new Integer(100000));
//Do not break before inline elements
pluginWorkspace.setObjectProperty("editor.format.indent.inline.elements",
    false);

//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty("editor.detect.indent.on.open", false);
//Zero indent size
pluginWorkspace.setObjectProperty("editor.indent.size.v9.2", 0);
```

In the Oxygen XML Author Component, you can either bundle a *fixed set of options*, or use our Java API to set properties that overwrite the default options:

```
//For not breaking the line
//Long line
AuthorComponentFactory.getInstance().setObjectProperty("editor.line.width", new
    Integer(100000));
//Do not break before inline elements
AuthorComponentFactory.getInstance().setObjectProperty("editor.format.indent.inline.ele
    false);

//For forcing zero indent
//Force indent settings to be controlled by us
AuthorComponentFactory.getInstance().setObjectProperty("editor.detect.indent.on.open",
    false);
//Zero indent size
AuthorComponentFactory.getInstance().setObjectProperty("editor.indent.size.v9.2",
    0);
```

Customize the Default Icons for Toolbars/Menus

[Edit on GitHub](#)

Question

How can we change the default icons used for the application built-in actions?

Answer

If you look inside the main JAR library `[OXYGEN_INSTALL_DIR]\lib\oxygen.jar` or `[OXYGEN_INSTALL_DIR]\lib\author.jar`, it contains an `images` folder that contains all the images that we use for our buttons, menus, and toolbars.

To overwrite them with your own creations, follow these steps:

1. In the `[OXYGEN_INSTALL_DIR]\lib` directory create a folder called `endorsed`.
2. In the `endorsed` folder create another folder called `images`.
3. Add your own images in the `images` folder.

You can use this mechanism to overwrite any kind of resource located in the main *oXygen JAR library*. The folder structure in the `endorsed` directory and in the main *oXygen JAR* must be identical.

Customize the Outline View in Text Mode?

[Edit on GitHub](#)

Question

How do I customize the **Outline** view in **Text** mode?

Answer

Suppose that you have the following XML document:

```
<doc startnumber="15">
  <sec counter="no">
    <info/>
    <title>Introduction</title>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
    <sec>
      <title>Section title</title>
      <para>Content</para>
    </sec>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
</doc>
```

and you want to display the XML content in a simplified Outline view like this:

```
doc "15"
sec Introduction
sec 15 Section title
sec 15.1 Section title
sec 16 Section title
```

Usually an Outline should have the following characteristics:

1. Double clicking in the Outline the corresponding XML content would get selected.
2. When the cursor moves in the opened XML document the Outline would select the proper entry.
3. When modifications occur in the document, the Outline would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```
/*
 * Simple Outline for the Text mode based on executing XPaths over the text
content.
*/
public class CustomWorkspaceAccessPluginExtension implements
WorkspaceAccessPluginExtension {
    /**
     * The custom outline list.
     */
    private JList customOutlineList;

    /**
     * Maps outline nodes to ranges in document
     */
    private WSXMLTextNodeRange[] currentOutlineRanges;

    /**
     * The current text page
     */
    private WSXMLTextEditorPage currentTextPage;

    /**
     * Disable CaretListener when we select from the CaretListener.
     */
    private boolean enableCaretListener = true;

    /**
     * @see
ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension#applicationStarted(ro.sync.
     */
    @Override
    public void applicationStarted(final StandalonePluginWorkspace
pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addViewComponentCustomizer(new
ViewComponentCustomizer() {
        /**
         * @see
ro.sync.exml.workspace.api.standalone.ViewComponentCustomizer#customizeView(ro.sync.exm
         */
        @Override
        public void customizeView(ViewInfo viewInfo) {
            if(
                //The view ID defined in the "plugin.xml"
                "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
                customOutlineList = new JList();
                //Render the content in the Outline.
                customOutlineList.setCellRenderer(new DefaultListCellRenderer() {
                    /**
                     * @see
javax.swing.DefaultListCellRenderer#getListCellRendererComponent(javax.swing.JList,
java.lang.Object, int, boolean, boolean)
                     */
                    @Override
                    public Component getListCellRendererComponent(JList<?> list,
Object value, int index,
                        boolean isSelected, boolean cellHasFocus) {

```

```

JLabel label =
(JLabel) super.getListCellRendererComponent(list, value, index, isSelected,
cellHasFocus);
    String val = null;
    if(value instanceof Element) {
        Element element = ((Element)value);
        val = element.getNodeName();
        if(!"".equals(element.getAttribute("startnumber"))) {
            val += " " + "" + element.getAttribute("startnumber")
+ " ";
        }
        NodeList titles = element.getElementsByTagName("title");
        if(titles.getLength() > 0) {
            val += " \\" + titles.item(0).getTextContent() + "\\";
        }
    }
    label.setText(val);
    return label;
}
});
//When we click a node, select it in the text page.
customOutlineList.addMouseListener(new MouseAdapter() {
@Override
public void mouseClicked(MouseEvent e) {
    if(SwingUtilities.isLeftMouseButton(e) && e.getClickCount() ==
2) {
        int sel = customOutlineList.getSelectedIndex();
        enableCaretListener = false;
        try {
currentTextPage.select(currentTextPage.getOffsetOfLineStart(currentOutlineRanges[sel].
+ currentOutlineRanges[sel].getStartColumn() - 1,
currentTextPage.getOffsetOfLineStart(currentOutlineRanges[sel].getEndLine())
+ currentOutlineRanges[sel].getEndColumn());
        } catch (BadLocationException e1) {
            e1.printStackTrace();
        }
        enableCaretListener = true;
    }
}
});
viewInfo.setComponent(new JScrollPane(customOutlineList));
viewInfo.setTitle("Custom Outline");
}
}
};

pluginWorkspaceAccess.addEditorChangeListener(new
WSEditorChangeListener() {
/**
 * @see
ro.sync.exml.workspace.api.listeners.WSEditorChangeListener#editorOpened(java.net.URL)
*/
@Override
public void editorOpened(URL editorLocation) {
//An editor was opened
WSEditor editorAccess =
pluginWorkspaceAccess.getEditorAccess(editorLocation,
StandalonePluginWorkspace.MAIN_EDITING_AREA);
if(editorAccess != null) {
    WSEditorPage currentPage = editorAccess.getCurrentPage();
    if(currentPage instanceof WSXMLTextEditorPage) {
        //User editing in Text mode an opened XML document
    }
}
}
}
);

```

```

    final WSXMLTextEditorPage xmlTP = (WSXMLTextEditorPage) currentPage;
    //Reconfigure outline on each change.
    xmlTP.getDocument().addDocumentListener(new DocumentListener() {
        @Override
        public void removeUpdate(DocumentEvent e) {
            reconfigureOutline(xmlTP);
        }
        @Override
        public void insertUpdate(DocumentEvent e) {
            reconfigureOutline(xmlTP);
        }
        @Override
        public void changedUpdate(DocumentEvent e) {
            reconfigureOutline(xmlTP);
        }
    });
    JTextArea textComponent = (JTextArea) xmlTP.getTextComponent();
    textComponent.addCaretListener(new CaretListener() {
        @Override
        public void caretUpdate(CaretEvent e) {
            if(currentOutlineRanges != null && currentTextPage != null
            && enableCaretListener) {
                enableCaretListener = false;
                //Find the node to select in the outline.
                try {
                    int line = xmlTP.getLineOfOffset(e.getDot());
                    for (int i = currentOutlineRanges.length - 1; i >= 0;
                    i--) {
                        if(line > currentOutlineRanges[i].getStartLine() &&
                        line < currentOutlineRanges[i].getEndLine()) {
                            customOutlineList.setSelectedIndex(i);
                            break;
                        }
                    }
                } catch (BadLocationException e1) {
                    e1.printStackTrace();
                }
                enableCaretListener = true;
            }
        }
    });
}
/***
 * @see
ro.sync.exml.workspace.api.listeners.WSEditorChangeListener#editorActivated(java.net.URL)
 */

Difference Between a Document Type (Framework) and a Plugin Extension

[Edit on GitHub](#)

Question

What is the difference between a Document Type (Framework) and a Plugin Extension?

Answer

Two ways of customizing the application are possible:

1. Implement a plugin.

A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Author.

For the Oxygen XML AuthorPlugins API, Javadoc, samples, and documentation, go to http://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. *Create or modify the document type* that is associated to your specific XML vocabulary.

This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

For example, if the end users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA Document Type. If you look in the *Document Type Association preferences page* there is a

DITA document type. If you edit that document type you will see that it has an **Author** tab in the [Document Type configuration dialog box](#). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

For information about developing your own document types (frameworks), see [Author Mode Customization Guide](#) on page 1106.

If you look on disk in the `[OXYGEN_INSTALL_DIR]\frameworks\dita` folder, there is a file called `dita.framework`. That file gets updated when you edit a document type from the [Document Type Association preferences page](#). Then you can share that updated file with all users.

The same folder contains some JAR libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

We have an *oXygen SDK* that contains the Java sources from all the DITA Java customizations:

http://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

Important: It is possible for a plugin to share the same classes with a framework. For further details, go to [How to Share the Classloader Between a Framework and a Plugin](#).

Disable Context-Sensitive Menu Items for Custom Author Actions

[Edit on GitHub](#)

Question

Is there a way to disable menu items for custom **Author** mode actions depending on the cursor context?

Answer

By default, Oxygen XML Author does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain **Author** mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own `ro.sync.ecss.extensions.api.ExtensionsBundle` implementation you can overwrite the method:

```
ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()
```

and when the extension state listener gets activated, you can use the API like this:

```
/**
 * @see
 ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated(ro.sync.ecss.extensions.api.AuthorAccess)
 */
public void activated(final AuthorAccess authorAccess) {

    //Add a caret listener to enable/disable extension actions:
    authorAccess.getEditorAccess().addAuthorCaretListener(new
    AuthorCaretListener() {
        @Override
        public void caretMoved(AuthorCaretEvent caretEvent) {
            try {
                Map<String, Object> authorExtensionActions =
                authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();
                //Get the action used to insert a paragraph. Its ID is "paragraph"
                AbstractAction insertParagraph = (AbstractAction)
                authorExtensionActions.get("paragraph");
            }
        }
    });
}
```

```
//Evaluate an XPath expression in the context of the current node in  
which the cursor is located  
Object[] evaluateXPath =  
authorAccess.getDocumentController().evaluateXPath(".[ancestor-or-  
self::p]", false, false, false, false);  
if(evaluateXPath != null && evaluateXPath.length > 0 &&  
evaluateXPath[0] != null) {  
    //We are inside a paragraph, disable the action.  
    insertParagraph.setEnabled(false);  
} else {  
    //Enable the action  
    insertParagraph.setEnabled(true);  
}  
} catch (AuthorOperationException e) {  
    e.printStackTrace();  
}  
}  
});
```

When the extension is deactivated, you should remove the `CaretListener` to avoid adding multiple listeners that perform the same functionality.

Dynamically Add Form Controls Using a Styles Filter

[Edit on GitHub](#)

Question

How do I add form controls using an API?

Answer

Usually, a form control is added from the CSS using one of the [built-in form controls](#). However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically `ro.sync.ecss.extensions.api.StylesFilter`.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```
public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if(authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
            && "before".equals(authorNode.getName())) {
            authorNode = authorNode.getParent();
            if ("country".equals(authorNode.getName())) {
                // This is the BEFORE pseudo element of the "country" element.
                // Read the supported countries from the configuration file.
                Map<String, Object> formControlArgs = new HashMap<String, Object>();

                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE,
InplaceEditorArgumentKeys.TYPE_COMBOBOX);
                    // This will be a comma separated enumeration: France, Spain, Great
                    Britain
                String countries = readCountriesFromFile();
                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES,
countries);

                formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");

                // We also add a label in form of the form control.
                Map<String, Object> labelProps = new HashMap<String, Object>();
```

```

        labelProps.put("text", "Country: ");
        labelProps.put("styles", "* {width: 100px; color: gray;}");
        StaticContent[] mixedContent = new StaticContent[] {new
        LabelContent(labelProps), new EditorContent(formControlArgs)};
        styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
    }

    // The previously added form control is the only way the element can be
    edited.
    if ("country".equals(authorNode.getName())) {
        styles.setProperty(Styles.KEY_VISIBILITY, "-oxy-collapse-text");
    }

    return styles;
}
}

```

If the execution of the `formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);` line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called *lazy evaluation* and can be implemented as follows:

```

formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, new
LazyValue<List<CIValue>>() {
    public java.util.List<CIValue> get() {
        // We avoid reading the possible values until they are actually
        requested.
        // This will be a List with CIValues created over countries: France,
        Spain, Great Britain
        return readCountriesFromFile();
    }
});

```

The lazy evaluation approach can be used for the following form controls properties:

- `InplaceEditorArgumentKeys.PROPERTY_VALUES`
- `InplaceEditorArgumentKeys.PROPERTY_LABELS`
- `InplaceEditorArgumentKeys.PROPERTY_TOOLTIPS`

The full source code for this example is available inside the [oXygen SDK](#).

Dynamically Modify the Content Inserted by the Author

[Edit on GitHub](#)

Question

Is there a way to insert typographic quotation marks instead of double quotes?

Answer

By using the API you can set a document filter to change the text that is inserted in the document in **Author** mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```

authorAccess.getDocumentController().setDocumentFilter(new
AuthorDocumentFilter() {
    /**

```

```
* @see
ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText(ro.sync.ecss.extensions.ap
int, java.lang.String)
*/
@Override
public void insertText(AuthorDocumentFilterBypass filterBypass, int
offset, String toInsert) {
    if(toInsert.length() == 1 && "\"".equals(toInsert)) {
        //User typed a quote but he actually needs a smart quote.
        //So we either have to add \u201E (start smart quote)
        //Or we add \u201C (end smart quote)
        //Depending on whether we already have a start smart quote inserted in
the current paragraph.

        try {
            AuthorNode currentNode =
authorAccess.getDocumentController().getNodeAtOffset(offset);
            int startofTextInCurrentNode = currentNode.getStartOffset();
            if(offset > startofTextInCurrentNode) {
                Segment seg = new Segment();

                authorAccess.getDocumentController().getChars(startofTextInCurrentNode,
offset - startofTextInCurrentNode, seg);
                String previosTextInNode = seg.toString();
                boolean insertStartQuote = true;
                for (int i = previosTextInNode.length() - 1; i >= 0; i--) {
                    char ch = previosTextInNode.charAt(i);
                    if('\u201C' == ch) {
                        //Found end of smart quote, so yes, we should insert a start
one
                        break;
                    } else if('\u201E' == ch) {
                        //Found start quote, so we should insert an end one.
                        insertStartQuote = false;
                        break;
                    }
                }

                if(insertStartQuote) {
                    toInsert = "\u201E";
                } else {
                    toInsert = "\u201C";
                }
            }
        } catch (BadLocationException e) {
            e.printStackTrace();
        }
    }
    System.err.println("INSERT TEXT /" + toInsert + "/");
    super.insertText(filterBypass, offset, toInsert);
}
});
```

You can find the online Javadoc for AuthorDocumentFilter API here: <http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro.sync.ecss.extensions/api/AuthorDocumentFilter.html>

An alternative to using a document filtering is the use of a `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter`, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

Dynamically Open File in Oxygen XML Author Distributed via JavaWebStart

[Edit on GitHub](#)

Question

How can we dynamically open a file in an Oxygen XML Author distributed via JWS?

Answer

The JWS packager Ant build file that is included with Oxygen XML Author signs by default the JNLP file (this means that a copy of it is included in the main JAR library) in this step:

```
<copy file="${outputDir}/${packageName}/
${productName}.jnlp" tofile="${home}/JNLP-INF/APPLICATION.JNLP"/>
```

Siging the JNLP file is required by newer Java versions and means that it is impossible to automatically generate a JNLP file containing some dynamic arguments. The solution is to use the signed JNLP template feature of Java 7, bundle inside the JAR library a signed APPLICATION_TEMPLATE.JNLP instead of an APPLICATION.JNLP with a wildcard command line argument:

```
<application-desc main-class="ro.sync.jws.JwsDeployer">
  <argument>*</argument>
</application-desc>
```

Then you can replace the wildcard in the external placed JNLP to the actual, dynamic command line arguments value.

A different, more complicated approach would be to have the JNLP file signed and always referenced as a URL argument a location like this:

```
http://path/to/server/redirectEditedURL.php
```

When the URL gets clicked on the client side you would also call a PHP script on the server side that would update the redirect location for redirectEditedURL.php to point to the clicked XML resource. Then the opened Oxygen XML Author would try to connect to the redirect PHP and be redirected to open the XML.

Extend the Java Functionality of an Existing Framework (Document Type)

[Edit on GitHub](#)

Question

How can I change the way a DocBook 4 `xref` displays in **Author** mode based on what element is at the `linkend`?

Answer

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Author classes:

```
<dependency>
  <groupId>com.oxygenxml</groupId>
  <artifactId>oxygen-sdk</artifactId>
  <version>${oxygen.version}</version>
</dependency>
```

where `${oxygen.version}` is the version of Oxygen XML Author.

Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the `[OXYGEN_INSTALL_DIR]\frameworks\docbook\docbook.jar` to the class path of the project.
3. Create a class that extends `ro.sync.ecss.extensions.docbook.DocBook4ExtensionsBundle` and overwrites the method:
`ro.sync.ecss.extensions.api.ExtensionsBundle#createLinkTextResolver()`
4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the *Oxygen SDK*).
5. Pack your extension classes in a JAR file. Copy the JAR to: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\custom.jar`.
6. Start Oxygen XML Author.
7. *Open the Preferences dialog box (Options > Preferences)* and go to **Document Type Association**. Edit the DocBook 4 document type. In the **Classpath** list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.
8. You can rename the document type and the docbook framework folder to something else (such as `custom_docbook`) and share it with others. A document type can also be installed using our [add-on support](#).

Impose Custom Options for Authors

[Edit on GitHub](#)

Question

How to enable **Track Changes** at startup?

Answer

There are two ways to enable **Track Changes** for every document that you open:

1. You could *customize the default options* that are used by your authors and set the **Track Changes - Initial State option** to **Always On**.
2. Use an API to toggle the **Track Changes** state after a document is opened in **Author mode**:

```
// Check the current state of Track Changes
boolean trackChangesOn =
    authorAccess.getReviewController().isTrackingChanges();
if (!trackChangesOn) {
    // Set Track Changes state to On
    authorAccess.getReviewController().toggleTrackChanges();
}
```

Insert an Element with all the Required Content

[Edit on GitHub](#)

Question

I am inserting a DITA *image* XML element using the API that points to a certain resource and has required content. Can the required content be automatically inserted by the application?

Answer

The API `ro.sync.ecss.extensions.api.AuthorSchemaManager` can propose valid elements that can be inserted at the specific offset. Using the method `AuthorSchemaManager.createAuthorDocumentFragment(CIElement)`, you can convert the

proposed elements to document fragments (which have all the required content filled in) that can then be inserted in the document.

```

AuthorSchemaManager schemaManager
= this.authorAccess.getDocumentController().getAuthorSchemaManager();
WhatElementsCanGoHereContext context =
schemaManager.createWhatElementsCanGoHereContext(this.authorAccess.getEditorAccess());
List<CIElement> possibleElementsAtCaretPosition =
schemaManager.whatElementsCanGoHere(context);
loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
    CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
    List<CIAttribute> attrs = possibleElement.getAttributes();
    if(attrs != null) {
        for (int j = 0; j < attrs.size(); j++) {
            CIAttribute ciAttribute = attrs.get(j);
            if (ciAttribute.getName().equals("class")) {
                if (ciAttribute.getDefaultValue() != null
                    && ciAttribute.getDefaultValue().contains(" topic/image ")) {
                    //Found a CIElement for image
                    //Create a fragment for it. The fragment contains all required
                    child elements already built.
                    AuthorDocumentFragment frag =
schemaManager.createAuthorDocumentFragment(possibleElement);
                    //Now set the @href to it.
                    //Ask the user and obtain a value for the @href
                    //Then:

                    String href = "test.png";
                    List<AuthorNode> nodes = frag.getContentNodes();
                    if(!nodes.isEmpty()) {
                        AuthorElement imageEl = (AuthorElement) nodes.get(0);
                        imageEl.setAttribute("href", new AttrValue(href));
                    }
                    //And insert the fragment.

this.authorAccess.getDocumentController().insertFragment(this.authorAccess.getEditorA
frag);
                    break loop;
                }
            }
        }
    }
}

```

AuthorDocumentFragment Class

Modify the XML Content on Open

[Edit on GitHub](#)

Question

I have a bunch of DITA documents that have a fixed path the image `src` attributes. These paths are not valid and I am trying to move away from this practice by converting it in to relative paths. When an XML document is opened, can I trigger the Java API to change the fixed path to a relative path?

Answer

The Plugins SDK: http://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins contains a sample Plugin Type called *WorkspaceAccess*. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:

- Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use our *Author API* to change attributes:

```

        pluginWorkspaceAccess.addEditorChangeListener(new
        WSEditorChangeListener() {
            /**
             * @see
             ro.sync.exml.workspace.api.listeners.WSEditorChangeListener#editorOpened(java.net.URL)
             */
            @Override
            public void editorOpened(URL editorLocation) {
                WSEditor openedEditor =
                    pluginWorkspaceAccess.getCurrentEditorAccess(StandalonePluginWorkspace.MAIN_EDITING_AREA);
                if(openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {

                    WSAuthorEditorPage authPage = (WSAuthorEditorPage)
                    openedEditor.getCurrentPage();
                    AuthorDocumentController docController =
                        authPage.getDocumentController();
                    try {
                        //All changes will be undone by pressing Undo once.
                        docController.beginCompoundEdit();
                        fixupImageRefs(docController,
                            docController.getAuthorDocumentNode());
                    } finally {
                        docController.endCompoundEdit();
                    }
                }
            }

            private void fixupImageRefs(AuthorDocumentController docController,
            AuthorNode authorNode) {
                if(authorNode instanceof AuthorParentNode) {
                    //Recurse
                    List<AuthorNode> contentNodes =
                    ((AuthorParentNode)authorNode).getContentNodes();
                    if(contentNodes != null) {
                        for (int i = 0; i < contentNodes.size(); i++) {
                            fixupImageRefs(docController, contentNodes.get(i));
                        }
                    }
                    if(authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
                        AuthorElement elem = (AuthorElement) authorNode;
                        if("image".equals(elem.getLocalName())) {
                            if(elem.getAttribute("href") != null) {
                                String originalHref =
                                elem.getAttribute("href").getValue();
                                URL currentLocation =
                                docController.getAuthorDocumentNode().getXMLBaseURL();
                                //TODO here you compute the new href.
                                String newHref = null;
                                docController.setAttribute("href", new AttrValue(newHref),
                                elem);
                            }
                        }
                    }
                },
                StandalonePluginWorkspace.MAIN_EDITING_AREA);
            }
        });
    }
}

```

2. An API to open XML documents in the application:

```
ro.sync.exml.workspace.api.Workspace.open(URL)
```

So you can create up a plugin that automatically opens one by one XML documents from a certain folder in the application, makes modifications to them, saves the content by calling:

```
ro.sync.exml.workspace.api.editor.WSEditorBase.save()
```

and then closes the editor:

```
ro.sync.exml.workspace.api.Workspace.close(URL)
```

Modify the XML Content on Save

[Edit on GitHub](#)

Question

Is it possible to get Oxygen XML Author to update the revised date on a DITA document when it's saved?

Answer

The Plugins SDK: http://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins contains a sample Plugin Type called *WorkspaceAccess*. Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use our *Author API* to change attributes before the save takes place:

```
@Override
public void applicationStarted(final StandalonePluginWorkspace
pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(new
WSEditorChangeListener() {
    //An editor was opened
    @Override
    public void editorOpened(URL editorLocation) {
        final WSEditor editorAccess =
pluginWorkspaceAccess.getEditorAccess(editorLocation,
PluginWorkspace.MAIN_EDITING_AREA);
        if(editorAccess != null){
            editorAccess.addEditorListener(new
ro.sync.exml.workspace.api.listeners.WSEditorListener() {
                //Editor is about to be saved
                @Override
                public boolean editorAboutToBeSavedVeto(int operationType) {

                    if(EditorPageConstants.PAGE_AUTHOR.equals(editorAccess.getCurrentPageID())){
                        WSAuthorEditorPage authorPage = (WSAuthorEditorPage)
editorAccess.getCurrentPage();
                        AuthorDocumentController controller =
authorPage.getDocumentController();
                        try {
                            //Find the revised element
                            AuthorNode[] nodes = controller.findNodesByXPath("//
revised", true, true, true);
                            if(nodes != null && nodes.length > 0){
                                AuthorElement revised = (AuthorElement) nodes[0];
                                //Set the modified attribute to it...
                            }
                        }
                    }
                }
            });
        }
    }
}
```

```
        controller.setAttribute("modified", new AttrValue(new Date().toString()), revised);
    }
} catch (AuthorOperationException e) {
    e.printStackTrace();
}
}
//And let the save continue..
return true;
}
});
}
}
}, PluginWorkspace.MAIN_EDITING_AREA);
}
```

Multiple Rendering Modes for the Same Document in Author Mode

[Edit on GitHub](#)

Question

How can we add multiple buttons, each showing a different visualization mode of the same document in **Author** mode?

Answer

In the toolbar of the **Author** mode there is a **Styles** drop-down menu that contains alternative CSS styles for the same document. To add an alternative CSS stylesheet, [open the **Preferences** dialog box \(**Options > Preferences**\)](#), go to **Document Type Association**, select the document type associated with your documents and press **Edit**. In the [**Document Type configuration dialog box**](#) that appears, go to the **Author** tab, and in the **CSS** subtab add references to alternate CSS stylesheets.

For example, one of the alternate CSS stylesheets that we offer for the DITA document type is located here:

[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css

If you open it, you will see that it imports the main CSS and then adds selectors of its own.

Obtain a DOM Element from `AuthorNode` or `AuthorElement`

[Edit on GitHub](#)

Question

Can a DOM Element be obtained from an AuthorNode or an AuthorElement?

Answer

No, a DOM Element cannot be obtained from an AuthorNode or an AuthorElement. The AuthorNode structure is also hierarchical but the difference is that all the text content is kept in a single text buffer instead of having individual text nodes.

We have an image in the Javadoc documentation that explains this situation: <http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html>

Obtain the Currently Selected Element Using the Author API

[Edit on GitHub](#)

Question

In **Author** mode, if an element is fully selected, I want to perform an action on it. If not, I want to perform an action on the node that is located at the cursor position. Is this possible via the API?

Answer

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using `AuthorDocumentController.getNodeAtOffset` will actually return the parent of the selected node. We have some special API that makes it easier for you to determine this situation: `WSAuthorEditorPageBase.getFullySelectedNode()`.

```
AuthorDocumentController controller =
    authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretnOffset();

AuthorElement nodeAtCaret = (AuthorElement)
    authorAccess.getEditorAccess().getFullySelectedNode();
if (nodeAtCaret == null) {
    //We have no fully selected node. We can look at the cursor offset.
    nodeAtCaret = (AuthorElement)
        authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    //Or we could look at the selection start and end, see which node is the
    parent of each offset and get the closest common ancestor.
}
```

Run XSLT or XQuery Transformations

[Edit on GitHub](#)

Question

Can I run XSL 2.0 / 3.0 transformation with Saxon EE using the *oXygen SDK*?

Answer

The API class `ro.sync.exml.workspace.api.util.XMLUtilAccess` allows you to create an XSLT Transformer that implements the JAXP interface `javax.xml.transform.Transformer`. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an `AuthorAccess` API available:

```
InputSource is = new org.xml.sax.InputSource(URLUtil.correct(new
File("test/personal.xsl")).toString());
xslSrc = new SAXSource(is);
javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer(xslSrc, null,
AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);
transformer.transform(new StreamSource(new File("test/personal.xml")), new
StreamResult(new File("test/personal.html")));
```

If you want to create the transformer from the plugins side, you can use this method instead:
`ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess()`.

Save a New Document with a Predefined File Name Pattern

[Edit on GitHub](#)

Question

Is it possible to get Oxygen XML Author to automatically generate a file name comprising a UUID plus file extension using the SDK?

Answer

This could be done implementing a plugin for Oxygen XML Author using the Plugins SDK:

http://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

There is a type of plugin called *Workspace Access* that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```

private static class CustomEdListener extends WSEditorListener{
    private final WSEditor editor;
    private final StandalonePluginWorkspace
        pluginWorkspaceAccess;
    private boolean saving = false;
    public CustomEdListener(StandalonePluginWorkspace pluginWorkspaceAccess,
WSEditor editor) {
        this.pluginWorkspaceAccess = pluginWorkspaceAccess;
        this.editor = editor;
    }
    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
        if(! saving &&
            editor.getEditorLocation().toString().contains("Untitled")) {
            File chosenDir = pluginWorkspaceAccess.chooseDirectory();
            if(chosenDir != null) {
                final File chosenFile = new File(chosenDir,
UUID.randomUUID().toString() + ".dita");
                SwingUtilities.invokeLater(new Runnable() {
                    @Override
                    public void run() {
                        try {
                            saving = true;
                            editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
                        } catch (MalformedURLException e) {
                            e.printStackTrace();
                        } finally {
                            saving = false;
                        }
                    }
                });
            }
        }
        //Reject the original save request.
        return false;
    }
    return true;
}
@Override
public void applicationStarted(final StandalonePluginWorkspace
pluginWorkspaceAccess) {

```

```

        pluginWorkspaceAccess.addEditorChangeListener(new
WSEditorChangeListener() {
    @Override
    public void editorOpened(URL editorLocation) {
        final WSEditor editor =
pluginWorkspaceAccess.getEditorAccess(editorLocation,
PluginWorkspace.MAIN_EDITING_AREA);
        if(editor != null &&
editor.getEditorLocation().toString().contains("Untitled")) {

            //Untitled editor
            editor.addEditorListener(new
CustomEdListener(pluginWorkspaceAccess, editor));
        }
    }
},
PluginWorkspace.MAIN_EDITING_AREA);
.....

```

Split Paragraph on Enter (Instead of Showing Content Completion List) [Edit on GitHub](#)

Question

How to split the paragraph on Enter instead of showing the content completion list?

Answer

To obtain this behavior, edit your document type and in the *Document Type configuration dialog box* go to the **Author** tab, then **Actions** subtab, and add your own split action. This action must have the **Enter** shortcut key associated and must trigger your own custom operation that handles the split.

So, when you press **Enter**, your Java operation is invoked and it will be your responsibility to split the paragraph using the current API (probably creating a document fragment from the cursor offset to the end of the paragraph, removing the content and then inserting the created fragment after the paragraph).

This solution has as a drawback. Oxygen XML Author hides the *Content Completion Assistant* when you press **Enter**. If you want to show allowed child elements at that certain offset, implement your own content proposals window using the `ro.sync.ecss.extensions.api.AuthorSchemaManager` API to use information from the associated schema.

Use Custom Rendering Styles for Entity References, Comments, or PIs [Edit on GitHub](#)

Problem

Is there a way to display entity references in the **Author** mode without the distinct gray background and tag markers?

Solution

There is a built-in CSS stylesheet in the Oxygen XML Author libraries that is used when styling content in the **Author** mode, no matter what CSS you use. This CSS has the following content:

```

@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {

```

```
    display:block !important;
}

oxy|cdata {
    display:morph !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|processing-instruction {
    display:block !important;
    color: rgb(139, 38, 201) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|comment {
    display:morph !important;
    color: rgb(0, 100, 0) !important;
    background-color:rgb(255, 255, 210) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
    link: attr(href) !important;
    text-decoration: underline !important;
    color: navy !important;

    margin: 2px !important;
    padding: 0px !important;
}

oxy|reference:before {
    display: morph !important;
    content: url(..../images/editContent.gif) !important;
}

oxy|entity[href]:before{
    display: morph !important;
    content: url(..../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
    editable:false !important;
    background-color: rgb(240, 240, 240) !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|reference {
    display:morph !important;
}

oxy|entity {
    display:morph !important;
```

```
}

oxy|entity[href] {
    border: 1px solid rgb(175, 175, 175) !important;
    padding: 0.2em !important;
}

xi|include {
    display:block !important;
    margin-bottom: 0.5em !important;
    padding: 2px !important;
}
xi|include:before,
xi|include:after{
    display:inline !important;
    background-color:inherit !important;
    color:#444444 !important;
    font-weight:bold !important;
}

xi|include:before {
    content:url(..../images/link.gif) attr(href) !important;
    link: attr(href) !important;
}
xi|xpointer:before {
    content:url(..../images/link.gif) attr(href) " " attr(xpointer) !important;
    link: oxy_concat(attr(href), "#", attr(xpointer)) !important;
}

xi|fallback {
    display:morph !important;
    margin: 2px !important;
    border: 1px solid #CB0039 !important;
}

xi|fallback:before {
    display:morph !important;
    content:"XInclude fallback: " !important;
    color:#CB0039 !important;
}

oxy|doctype {
    display:block !important;
    background-color: transparent !important;
    color:blue !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 2px !important;
}

oxy|error {
    display:morph !important;
    editable:false !important;
    white-space:pre !important;
    color: rgb(178, 0, 0) !important;
    font-weight:bold !important;
}

*[xlink|href]:before {
    content:url(..../images/link.gif);
    link: attr(xlink|href) !important;
}
```

```

/*No direct display of the MathML and SVG images.*/
svg|svg{
    display:inline !important;
    white-space: trim-when-ws-only;
}
svg|svg svg|*{
    display:none !important;
    white-space: normal;
}

mml|math{
    display:inline !important;
    white-space: trim-when-ws-only;
}
mml|math mml|*{
    display:none !important;
    white-space: normal;
}

```

In the CSS used for rendering the XML in **Author** mode, do the following:

1. Import the special **Author** mode namespace.
2. Use a special selector to customize the entity node.

Example:

```

@namespace oxy url('http://www.oxygenxml.com/extensions/author');
oxy|entity {
    background-color: inherit !important;
    margin:0px !important;
    padding: 0px !important;
    -oxy-display-tags:none;
}

```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and *CData* sections. You can also customize the way *xi:include* elements are rendered.

Chapter

Extending Oxygen XML Author Using the SDK

Topics:

- [*Extending Oxygen XML Author with Plugins*](#)
- [*Oxygen XML Author Component*](#)
- [*Oxygen XML Web Author Component*](#)

This chapter includes information about extending Oxygen XML Author with plugins and the *Author Component*.

Oxygen XML Author has an SDK that can be used as a base to develop frameworks and plugins. It can be also used to create projects that use the Oxygen XML Author Component. The SDK is available on our website at http://www.oxygenxml.com/oxygen_sdk.html.

This chapter includes information about extending Oxygen XML Author with plugins and the *Author Component*.

Extending Oxygen XML Author with Plugins

[Edit on GitHub](#)

A plugin is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a plugin for the standalone version of Oxygen XML Author. The [Plugins Development Kit](#) contains sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

If you want to customize the Oxygen XML Author Eclipse Plugin you can look at the [Eclipse IDE Integration Sample Project](#) to see how an Eclipse plugin can interact with the Oxygen XML Author APIs.

Introduction to Plugins

[Edit on GitHub](#)

A plugin can have multiple plugin extensions. The following plugin extensions are available (in the order of importance).

Plugins that are used in the entire workspace:

- [Workspace Access Plugin Extension](#) on page 1329
- [Workspace Access Plugin Extension \(JavaScript-Based\)](#) on page 1330
- [Components Validation Plugin Extension](#) on page 1324
- [Custom Protocol Plugin Extension](#) on page 1325
- [Resource Locking Custom Protocol Plugin Extension](#) on page 1327
- [Open Redirect Plugin Extension](#) on page 1326

Plugins that work only in the **Text** editing mode:

- [General Plugin Extension](#) on page 1333
- [Selection Plugin Extension](#) on page 1333
- [Document Plugin Extension](#) on page 1335

General Configuration of an Oxygen XML Author Plugin

[Edit on GitHub](#)

The Oxygen XML Author functionality can be extended with plugins that implement a clearly specified API.

On the Oxygen XML Author website there is an [SDK](#) with sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

The minimal implementation of a plugin must provide:

- A Java class that extends the `ro.sync.exml.plugin.Plugin` class.
- A Java class that implements the `ro.sync.exml.plugin.PluginExtension` interface.
- A plugin descriptor file called `plugin.xml`.

A `ro.sync.exml.plugin.PluginDescriptor` object is passed to the constructor of the subclass of the `ro.sync.exml.plugin.Plugin` class. It contains the following data items about the plugin:

- `basedir` (*File* object) - The base directory of the plugin.
- `description` (*String* object) - The description of the plugin.
- `name` (*String* object) - The name of the plugin.
- `vendor` (*String* object) - The vendor name of the plugin.
- `version` (*String* object) - The plugin version.
- `id` (*String* object) - A unique identifier.
- `classLoaderType` - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that

are referenced in the Oxygen XML Author lib directory will have precedence over those referenced in the plugin.xml configuration file, if they have the same package names. When choosing preferReferencedResources, the libraries that are referenced in the plugin.xml configuration file will have precedence over those found in the Oxygen XML Author lib directory, if they have the same package names.

The plugin descriptor is an XML file that defines how the plugin is integrated in Oxygen XML Author and what libraries are loaded. The structure of the plugin descriptor file is fully described in a DTD grammar located in [OXYGEN_INSTALL_DIR]/plugins/plugin.dtd. Here is a sample plugin descriptor used by the *Capitalize Lines* sample plugin:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="Capitalize Lines"
    description="Capitalize the first character on each line"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.caplines.CapLinesPlugin">
    <runtime>
        <library name="lib/caplines.jar"/>
    </runtime>
    <extension type="selectionProcessor"
        class="ro.sync.sample.plugin.caplines.CapLinesPluginExtension" keyboardShortcut="ctrl
        shift EQUALS"/>
</plugin>
```

If your plugin is of type *Selection*, *Document* or *General*, and thus contributes an action either to the contextual menu or to the main menu of the **Text** editing mode, then you can assign a keyboard shortcut for it. You can use the keyboardShortcut attribute for each extension element to specify the desired shortcut.

Tip: To compose string representations of the desired shortcut keys you can go to the Oxygen XML Author **Menu Shortcut Keys** preferences page, press **Edit** on any action, press the desired key sequence and use the representation that appears in the **Edit** dialog box.

Referencing libraries

To reference libraries, use either of the following elements:

- <library name="libraryName" scope="global" /> - To point to specific libraries.
Note: You can use the \${oxygenInstallDir} editor variable as part of the value of the name attribute. You can also use a system variable (\${system(var.name)}) or environment variable (\${env(VAR_NAME)}).
- <librariesFolder name="libraryFolderPath" scope="global" /> - To point to multiple libraries located in the specified folder.

Both elements support the scope attribute that defines the loading priority. It can have one of the following three values:

- *local* - The library is loaded in the plugin's own class loader. This is the default behavior.
- *global* - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application lib directory).
- *globalHighPriority* - The library is loaded in the main application class loader as the first library in the list (useful to patch certain resources located in other JARs of the application).

Installation

[Edit on GitHub](#)

To install a plugin in Oxygen XML Author, follow these steps:

1. Go to the Oxygen XML Author installation directory and locate the `plugins` directory.
The `plugins` directory contains all the plugins available to Oxygen XML Author.
2. In the `plugins` directory create a subfolder to store the plugin files.
3. In the new folder, place the plugin descriptor file (`plugin.xml`), the Java classes of the plugin and the other files that are referenced in the descriptor file.
4. Restart Oxygen XML Author.

Alternatively, you can go to **Help > Manage Addons** and use the **Manage Add-ons** dialog box. This dialog allows you to install available plugins and manage the ones that are currently in use.

Types of Plugin Extensions

[Edit on GitHub](#)

A plugin can have one or more defined plugin extensions that provide functionality to the application.

Author Stylesheet Plugin Extension

[Edit on GitHub](#)

This plugin type allows the developer to add a stylesheet that renders elements in **Author** mode.

This plugin type allows the developer to add a stylesheet (CSS or LESS) that renders elements in **Author** mode.

To specify additional stylesheets, edit the plugin descriptor and add `extension` elements that point to them, as in the following example:

```
<extension type="AuthorStylesheet" href="showTables.css"/>
<extension type="AuthorStylesheet" href="hideButtons.css"/>
```

Using this mechanism, you can add one or more CSS stylesheets to merge with the existing ones. Whenever you add a new stylesheet using this plugin, it will have priority over all other stylesheets applied on the file edited in **Author** mode.

If your implementation requires more flexibility (such as a dynamic change of the stylesheet), you should consider using the [*StylesFilter plugin extension*](#).

Components Validation Plugin Extension

[Edit on GitHub](#)

This plugin type allows the developer to customize the editor menus, toolbars, and other components by allowing or filtering them from the user interface.

This plugin provides the following API:

- The interface `ComponentsValidatorPluginExtension` - There is one method that must be implemented:
 - `getComponentsValidator()` - Returns a `ro.sync.exml.ComponentsValidator` implementation class used for validating the menus, toolbars, and their actions.
- The `ComponentsValidator` interface provides methods to filter various features from being added to the GUI of Oxygen XML Author:
 - `validateMenuOrTaggedAction(String[] menuOrActionPath)` - Checks if a menu or a tag action from a menu is allowed and returns a boolean value. A tag is used to uniquely identifying an action. The `String[]` argument is the tag of the menu / action and the tags of its parent menus if any.
 - `validateToolbarTaggedAction(String[] toolbarOrAction)` - Checks if an action from a toolbar is allowed and returns a boolean value. The `String[]` argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.

- `validateComponent(String key)` - Checks if the given component is allowed and returns a boolean value. The String argument is the tag identifying the component. You can remove toolbars entirely using this callback.
- `validateAccelAction(String category, String tag)` - Checks if the given accelerator action is allowed to appear in the GUI and returns a boolean value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.
- `validateContentType(String contentType)` - Checks if the given content type is allowed and returns a boolean value. The String argument represents the content type. You can instruct Oxygen XML Author to ignore content types such as `text / xsl` or `text / xquery`.
- `validateOptionPane(String optionPaneKey)` - Checks if the given options page can be added in the preferences option tree and returns a boolean value. The String argument is the option pane key.
- `validateOption(String optionKey)` - Checks if the given option can be added in the option page and returns a boolean value. The String argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.
- `validateLibrary(String library)` - Checks if the given library is allowed to appear listed in the **About** dialog box and returns a boolean value. The String argument is the library. This method is mostly for internal use.
- `validateNewEditorTemplate(EditorTemplate editorTemplate)` - Checks if the given template for a new editor is allowed and returns a boolean value. The EditorTemplate argument is the editor template. An EditorTemplate is used to create an editor for a given extension. You can thus filter what appears in the list of the **New** dialog box.
- `isDebuggerperspectiveAllowed()` - Check if the debugger perspective is allowed and returns a boolean value.
- `validateSHMarker(String marker)` - Checks if the given marker is allowed and returns a boolean value. The String argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.
- `validateToolbarComposite(String toolbarCompositeTag)` - Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

Tip: The best way to decide what to filter is to observe the values that Oxygen XML Author passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.

Custom Protocol Plugin Extension

[Edit on GitHub](#)

This type of plugin allows the developer to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

- The interface `URLStreamHandlerPluginExtension` - There is one method that must be implemented:
 - `getURLStreamHandler(String protocol)` - It takes as an argument the name of the protocol and returns a `URLStreamHandler` object, or null if there is no URL handler for the specified protocol.

This type of plugin extension can be usually combined with a [Workspace Access plugin extension](#) that can add a custom toolbar with custom actions for opening documents from a certain source.

As an alternative, two older plugin extensions can also be used to add a toolbar action for showing a custom URL chooser:

- With the help of the `URLChooserPluginExtension2` interface, it is possible to create your own dialog box that works with the custom protocol. This interface provides two methods:
 - `chooseURLs(StandalonePluginWorkspace workspaceAccess)` - Returns a `URL[]` object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser

dialog box here and then return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Author.

- `getMenuItemName()` - Returns a `String` object that is the name of the entry added in the **File** menu.
- With the help of the `URLChooserToolbarExtension` interface, it is possible to provide a toolbar entry that is used for launching the custom URLs chooser from the `URLChooserPluginExtension` implementation. This interface provides two methods:
 - `getToolbarIcon()` - Returns the `javax.swing.Icon` image used on the toolbar.
 - `getToolbarTooltip()` - Returns a `String` that is the tooltip used on the toolbar button.

Lock Handler Plugin Extension

[Edit on GitHub](#)

This type of extension is used for locking resources from a specific protocol.

It provides the following API:

- The interface `LockHandlerFactoryPluginExtension`.

You need to implement the following two methods:

- `LockHandler getLockHandler()`
Gets the lock handler for the current handled protocol. Might be `null` if not supported.
- `boolean isLockingSupported(String protocol)`
Checks if a lock handler can be provided for a specific protocol.

To use this type of extension in your plugin, create an extension of `LockHandlerFactory` type in your `plugin.xml` and specify the class implementing `LockHandlerFactoryPluginExtension`:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomLockHandler" .....
  <runtime>
    .....
  </runtime>

  <extension type="LockHandlerFactory"
    class="LockHandlerFactoryPluginExtensionImpl" />
  .....

</plugin>
```

Open Redirect Plugin Extension

[Edit on GitHub](#)

This type of plugin is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the **Archive Browser** view a plugin of this type can decide to open a file also from the archive in an XML editor panel. This file can be the `document.xml` main file from an OOXML file archive or a specific XML file from a zip archive.

The plugin must implement the interface `OpenRedirectExtension`. It only has one callback: `redirect(URL)` that receives the URL of the file opened by the Oxygen XML Author user. If the plugin decides to open also other files it must return an array of information objects (`OpenRedirectInformation[]`) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, `text/xml`). The content type is used for determining the type of editor panel. A `null` content type allows auto-detection of the file type.

Option Page Plugin Extension

[Edit on](#)[GitHub](#)

This extension type allows developers to add custom preference pages to the application **Preferences** dialog box.

The extension must implement the `ro.sync.exml.plugin.option.OptionPagePluginExtension` interface. The provided callbacks allow the developer to create the custom *Swing* component that will be added to the page and to react to various calls to persistently save the page settings using the `OptionsStorage` API.

All preferences pages that are contributed by a plugin appear listed in the **Preferences** dialog box in the **Plugins** category. The `plugin.xml` configuration file can specify one or more such extensions using constructs like this:

```
<extension type="OptionPage" class="my.package.CustomOptionPagePluginExtension"/>
```

Resource Locking Custom Protocol Plugin Extension

[Edit on](#)[GitHub](#)

This plugin type allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource on opening it in Oxygen XML Author.

This resource locking plugin extension allows you to work with a custom designed protocol for retrieving and storing files. It can lock a resource on opening it in Oxygen XML Author. This type of plugin extends the custom protocol plugin type with resource locking support.

Such a plugin provides the following API:

- The interface `URLStreamHandlerWithLockPluginExtension` - The plugin receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Author.

There are two additional methods that must be implemented:

- `getLockHandler()` - Returns a `LockHandler` implementation class with the implementation of the lock specific methods from the plugin.
- `isLockingSupported(String protocol)` - Returns a boolean that is `true` if the plugin accepts to manage locking for a certain URL protocol scheme (such as `ftp`, `http`, `https`, or `customName`).

Styles Filter Plugin Extension

[Edit on](#)[GitHub](#)

This plugin type allows the developer to dynamically modify the CSS styles used to render elements in the **Author** mode.

The plugin must extend the

`ro.sync.exml.plugin.author.css.filter.GeneralStylesFilterExtension` class. This class has a callback on which you can alter the styles for an **Author** mode element.

This extension point is similar with the Styles Filter that you set at the *Document Type* level. The only difference is that the plugin filters styles are used for any opened XML document, regardless of the document type. The changes made by this plugin are prioritised over the changes made by the Document Type level filter.

Note: Alternatively, you can use the [AuthorStylesheet plugin extension](#), which does not require any additional Java development and is compatible with Oxygen XML Web Author Component.

[Configuring CSS Styles Filter](#) on page 1188

Targeted URL Stream Handler Plugin Extension

[Edit on](#)[GitHub](#)

This type of plugin can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This plugin extension can handle the following protocols: `http`, `https`, `ftp` or `sftp`, for which Oxygen XML Author usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension will be asked to provide the URL stream handler for each opened connection of a URL having that protocol.

To use this type of plugin, you have to implement the `ro.sync.exml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension` interface, that provides the following methods:

- `boolean canHandleProtocol(String protocol)`

This method checks if the plugin can handle a specific protocol. If this method returns `true` for a specific protocol, the `getURLStreamHandler(URL)` method will be called for each opened connection of a URL having this protocol.

- `URLStreamHandler getURLStreamHandler(URL url)`

This method provides the URL handler for the specified URL and it is called for each opened connection of a URL with a protocol for which the `canHandleProtocol(String)` method returns `true`.

If this method returns `null`, the default Oxygen XML Author `URLStreamHandler` is used.

To use this type of extension in your plugin, create an extension of `TargetedURLHandler` type in your `plugin.xml` and specify the class that implements `TargetedURLStreamHandlerPluginExtension`:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomTargetedURLStreamHandlerPlugin" ....>
    <runtime>
        .....
    </runtime>

    <extension type="TargetedURLHandler"
        class="CustomTargetedURLStreamHandlerPluginExtension"/>
    .....
</plugin>
```

This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Author `HTTP URLStreamHandler` may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Author) to use the default SUN `URLStreamHandler`, since it is more compatible with sending and receiving SOAP requests.

```
public class CustomTargetedURLStreamHandlerPluginExtension
    implements TargetedURLStreamHandlerPluginExtension {

    @Override
    public boolean canHandleProtocol(String protocol) {
        boolean handleProtocol = false;
        if ("http".equals(protocol) || "https".equals(protocol)) {
            // This extension handles both HTTP and HTTPS protocols
            handleProtocol = true;
        }
        return handleProtocol;
    }

    @Override
    public URLStreamHandler getURLStreamHandler(URL url) {
        // This method is called only for the URLs with a protocol
        // for which the canHandleProtocol(String) method returns true (HTTP and
        // HTTPS)
    }
}
```

```

URLStreamHandler handler = null;

String host = url.getHost();
String protocol = url.getProtocol();
if ("some_host".equals(host)) {
    // When there are connections opened from some_host, the SUN HTTP(S)
    // handlers are used
    if ("http".equals(protocol)) {
        handler = new sun.net.www.protocol.http.Handler();
    } else {
        handler = new sun.net.www.protocol.https.Handler();
    }
}
return handler;
}
}

```

Workspace Access Plugin Extension

[Edit on
GitHub](#)

This plugin type allows you to contribute actions to the main menu and toolbars, create custom views and interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually requires access to some workspace resources such as toolbars, menus, views, and editors. This type of plugin is also useful because it allows you to make modifications to the XML content of an opened editor.

The plugin must implement the

`ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension` interface.

The callback method `applicationStarted` of this interface allows access to a parameter of the

`ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` type (allows for API access to the application workspace).

The `StandalonePluginWorkspace` interface has three methods that can be called to customize toolbars, menus, and views:

- `addToolbarComponentsCustomizer` - Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated `plugin.xml` descriptor using the following construct:

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM ".../plugin.dtd">
<plugin name="CustomWorkspaceAccess" .....>
    <runtime>
        .....
    </runtime>

    <extension type="WorkspaceAccess" .....>
        .....
        <toolbar id="SampleWorkspaceAccessToolbarID" initialSide="NORTH"
            initialRow="1"/>
    </plugin>

```

The `toolbar` element adds a toolbar in the Oxygen XML Author interface and allows you to contribute your own plugin-specific actions. The following attributes are supported:

- `id` - Unique identifier for the plugin toolbar.
- `initialSide` - Specifies the place where the toolbar is initially displayed. The allowed values are `NORTH` and `SOUTH`.
- `initialRow` - Specifies the initial row on the specified side where the toolbar is displayed. For example, the first toolbar has an initial row of 0 and the next toolbar has an initial row of 1.

The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified id will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

- `addViewComponentCustomizer` - Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated `plugin.xml` descriptor using the following construct:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" .....>
  <runtime>
    .....
  </runtime>

  <extension type="WorkspaceAccess" .....>
  .....
  <view id="SampleWorkspaceAccessID" initialSide="WEST" initialRow="0"/>
</plugin>
```

The `view` element adds a view in the Oxygen XML Author interface and allows you to contribute your own plugin-specific UI components. The following attributes are supported:

- `id` - Unique identifier of the view component.
- `initialSide` - Specifies the place where the view is initially displayed. The allowed values are: NORTH, SOUTH, EAST, and WEST.
- `initialRow` - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Author, the **Project** view has an initial row of 0 and the **Outline** view has an initial row of 1. Both views are in the WEST part of the workbench.
- `initialState` - Specifies the initial state of the view. The allowed values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.

The `ro.sync.exml.workspace.api.standalone.ViewInfo` view component information with the specified id will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

- `addMenuBarCustomizer` - Contributes to or modifies existing menu components.

Access to the opened editors can be done by first getting access to all URLs opened in the workspace using the `StandalonePluginWorkspace.getAllEditorLocations(int editingArea)` API method. There are two available editing areas: the **DITA Maps Manager** editing area and the main editing area. Using the URL of an opened resource, you can gain access to it using the `StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)` API method. A `ro.sync.exml.workspace.api.editor.WSEditor` then allows access to the current editing page.

A special editing API is supported for the **Text** mode

(`ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage`) and the **Author** mode (`ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPage`).

To be notified when editors are opened, selected, and closed, you can use the `StandalonePluginWorkspace.addEditorChangeListener` API method to add a listener.

Workspace Access Plugin Extension (JavaScript-Based)

[Edit on GitHub](#)

This is a JavaScript-based plugin extension that allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

This extension can use the same API as the [Workspace Access plugin extension](#), but the implementation is JavaScript-based and uses the bundled [Rhino](#) library to create and work with Java API from the JavaScript code.

The plugin descriptor file `plugin.xml` needs to point to a JavaScript file, as in the following example:

```
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
  id="unique.id.value"
  name="Add Action To DITA Maps Manager popup-menu"
  description="Plugin adds contextual menu action to DITA Maps Manager pop-up
menu."
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>
```

In the example above, the JavaScript file `wsAccess.js`, located in the plugin folder, will be called. This JavaScript file needs to have two JavaScript methods defined inside. Methods that will be called when the application starts and when it ends:

```
function applicationStarted(pluginWorkspaceAccess) {
.....
}

function applicationClosing(pluginWorkspaceAccess) {
.....
```

In regards to the `applicationStarted` callback, besides using the [ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace](#) API with the `pluginWorkspaceAccess`/`pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the **DITA Maps Manager** view. The action starts the `notepad.exe` application and passes the reference to the currently selected `topicref` to it.

```
function applicationStarted(pluginWorkspaceAccess) {
  Packages.java.lang.System.out.println("Application started " +
  pluginWorkspaceAccess);
  edChangedListener = {
    /*Called when a DITA Map is opened*/
    editorOpened: function (editorLocation) {
      Packages.java.lang.System.out.println("\nrunning " + editorLocation);
      /*Get the opened DITA Map*/
      editor = pluginWorkspaceAccess.getEditorAccess(editorLocation,
      Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
      ditaMapPage = editor.getCurrentPage();
      /*Add listener called when right-click is performed in the DITA Maps
      manager view*/
      customizerObj = {
        customizePopUpMenu: function (popUp, ditaMapDocumentController) {
          Packages.java.lang.System.out.println("RIGHT CLICK" + popUp);
          tree = ditaMapPage.getDITAMapTreeComponent();
          /*Selected tree path*/
          sel = tree.getSelectionPath();
          if (sel != null) {
            selectedElement = sel.getLastPathComponent();
            /*Reference attribute*/
            href = selectedElement.getAttribute("href");
          }
        }
      }
    }
  }
}
```

```

    if (href != null) {
        try {
            /*Create absolute reference*/
            absoluteRef = new
            Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
            Packages.java.lang.System.out.println("Computed absolute reference " +
+ absoluteRef);
            mi = new Packages.javax.swing.JMenuItem("Run notepad");
            popUp.add(mi);
            actionPerfObj = {
                actionPerformed: function (e) {
                    try {
                        Packages.java.lang.Runtime.getRuntime().exec("notepad.exe " +
pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
                    }
                    catch (e1) {
                        e1.printStackTrace();
                    }
                }
            }
            mi.addActionListener(new
JavaAdapter(Packages.java.awt.event.ActionListener, actionPerfObj));
        }
        catch (e1) {
            Packages.java.lang.System.out.println(e1);
        }
    }
}
ditaMapPage.setPopUpMenuCustomizer(new
Packages.ro.sync.exml.workspace.api.editor.ditamap.DITAMapPopupMenuCustomizer(cust
})
}
edChangedListener = new
JavaAdapter(Packages.ro.sync.exml.workspace.api.listeners.WSEditorChangeListener,
edChangedListener);
pluginWorkspaceAccess.addEditorChangeListener(
edChangedListener,
Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
}

function applicationClosing(pluginWorkspaceAccess) {
    Packages.java.lang.System.out.println("Application closing " +
pluginWorkspaceAccess);
}

```

XML Refactoring Operations Plugin Extension

[Edit on
GitHub](#)

This plugin type allows the developer to specify one or more directories from which the XML Refactoring operation resources are loaded.

The `RefactoringOperationsProvider` extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Author will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

Sample XML Refactoring Operations Plugin Extension

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">

<plugin
  id="refactoring.operations"
  name="Refactoring operations plugin"
  description="Contains operation descriptors and related
  scripts"
  version="1.0">
  <extension type="RefactoringOperationsProvider">
    <folder path="customDir"/>
    <folder path="customDir2"/>
  </extension>
</plugin>
```

Plugin Extensions Designed to Work only in the Text Editing Mode

[Edit on
GitHub](#)

These plugin extensions operate only when editing documents in the **Text** mode. They are mounted automatically by the application on the contextual menu in the **Plugins** submenu.

General Plugin Extension

[Edit on
GitHub](#)

This type of plugin allows you to invoke custom code to interact with the workspace in **Text** mode.

The *general* plugin type allows you to invoke custom code and to interact with the workspace of Oxygen XML Author.

This plugin is the most general plugin type and provides a limited API:

- The interface `GeneralPluginExtension` - Intended for general-purpose plugins, kind of external tools but triggered from the **Plugins** menu. The implementing classes must provide the method `process(GeneralPluginContext)`, which must provide the plugin processing. This method takes as a parameter a `GeneralPluginContext` object.
- The class `GeneralPluginContext` - Represents the context in which the general plugin extension does its processing. The `getPluginWorkspace()` method allows you access to the workspace of Oxygen XML Author.

Selection Plugin Extension

[Edit on
GitHub](#)

This type of plugin allows you to manage selections of text.

A *selection* plugin can be applied to both XML and non-XML documents. The plugin is started by making a selection in the editor, then selecting the corresponding menu item from the **Plugins** submenu in the contextual menu of **Text** mode.

This plugin type provides the following API:

- The interface `SelectionPluginExtension` - The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The `process(GeneralPluginContext)` method must return a `SelectionPluginResult` object that contains the result of the processing. The `String` value returned by the `SelectionPluginResult` object can include editor variables such as `$/caret` and `$/selection`.
- The `SelectionPluginContext` object represents the context. It provides four methods:
 - `getSelection()` - Returns a `String` that is the current selection of text.
 - `getFrame()` - Returns a `Frame` that is the editing frame.
 - `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Author.
 - `getDocumentURL()` - Returns the URL of the current edited document.

[Editor Variables](#) on page 226

Example - Uppercase Plugin

[Edit on GitHub](#)

The following plugin is called `UppercasePlugin` and is an example of a [Selection plugin](#). It is used in Oxygen XML Author for capitalizing the characters in the current selection. This example consists of two Java classes and the plugin descriptor:

- `UppercasePlugin.java`:

```
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.Plugin;
import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {
    /**
     * Plugin instance.
     */
    private static UppercasePlugin instance = null;

    /**
     * UppercasePlugin constructor.
     *
     * @param descriptor Plugin descriptor object.
     */
    public UppercasePlugin(PluginDescriptor descriptor) {
        super(descriptor);

        if (instance != null) {
            throw new IllegalStateException("Already instantiated !");
        }
        instance = this;
    }

    /**
     * Get the plugin instance.
     *
     * @return the shared plugin instance.
     */
    public static UppercasePlugin getInstance() {
        return instance;
    }
}
```

- `UppercasePluginExtension.java`:

```
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension
{
    /**
     * Convert the text to uppercase.
     *
```

```

    *@param context Selection context.
    *@return Uppercase plugin result.
    */
    public SelectionPluginResult process(SelectionPluginContext context) {
        return new SelectionPluginResultImpl(
            context.getSelection().toUpperCase());
    }
}

```

- plugin.xml:

```

<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="UpperCase"
    description="Convert the selection to uppercase"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.uppercase.UppercasePlugin">
    <runtime>
        <library name="lib/uppercase.jar"/>
    </runtime>
    <extension type="selectionProcessor"
        class="ro.sync.sample.plugin.uppercase.UppercasePluginExtension"/>
</plugin>

```

Document Plugin Extension

[Edit on GitHub](#)

This type of plugin allows you to manage the current document.

The *document* plugin type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The plugin is started by selecting the corresponding menu item from the **Plugins** submenu in the contextual menu of **Text** mode. It provides the following API:

- **Interface DocumentPluginExtension** - Receives the context object containing the current document. The `process(GeneralPluginContext)` method can return a `DocumentPluginResult` object containing a new document.
- **DocumentPluginContext object** - Represents the context and provides three methods:
 - `getDocument()` - Returns a `javax.swing.text.Document` object that represents the current document.
 - `getFrame()` - Returns a `java.awt.Frame` object that represents the editing frame.
 - `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Author.

Oxygen XML Author Plugin How to...

[Edit on GitHub](#)

This section includes information about how to implement complex plugins.

How to Write a CMS Integration Plugin

[Edit on GitHub](#)

To have a complete integration between Oxygen XML Author and a CMS, you usually have to write a plugin that combines the following two available plugin extensions:

- *Workspace Access*
- *Custom protocol*

The usual set of requirements for an integration between Oxygen XML Author and the CMS are as follows:

- Contribute to the Oxygen XML Author toolbars and main menu with your custom **Check Out** and **Check In** actions:

- **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
- **Check In** allows you to send the modified content back to the server.

You can use the **Workspace Access** plugin extension (and provided sample Java code) for all these operations.

- When **Check Out** is called, use the Oxygen XML Author API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a **Custom Protocol** extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Author. Your custom `java.net.URLStreamHandler` implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```
/*
 * Sample implementation for the "Check Out" method.
 *
 * @param pluginWorkspaceAccess The plugin workspace access (Workspace
 * Access plugin).
 * @throws MalformedURLException
 */
private void checkOut(StandalonePluginWorkspace
pluginWorkspaceAccess) throws MalformedURLException {
    //TODO Show the user a custom dialog box for browsing the CMS
    //TODO after the user selected the resource create a URL with a custom
    // which will uniquely map to the resource on the CMS using the
    URLHandler
    //something like:
    URL customURL = new URL("mycms://host/path/to/file.xml");
    //Ask Oxygen to open the URL
    pluginWorkspaceAccess.open(customURL);
    //Oxygen will then your custom protocol handler to provide the
    contents for the resource "mycms://host/path/to/file.xml"
    //Your custom protocol handler will check out the file in a temporary
    directory for example and provide the content from it.
    //Oxygen will also pass through your URLHandler if you have any
    relative references which need to be opened/obtained.
}
```

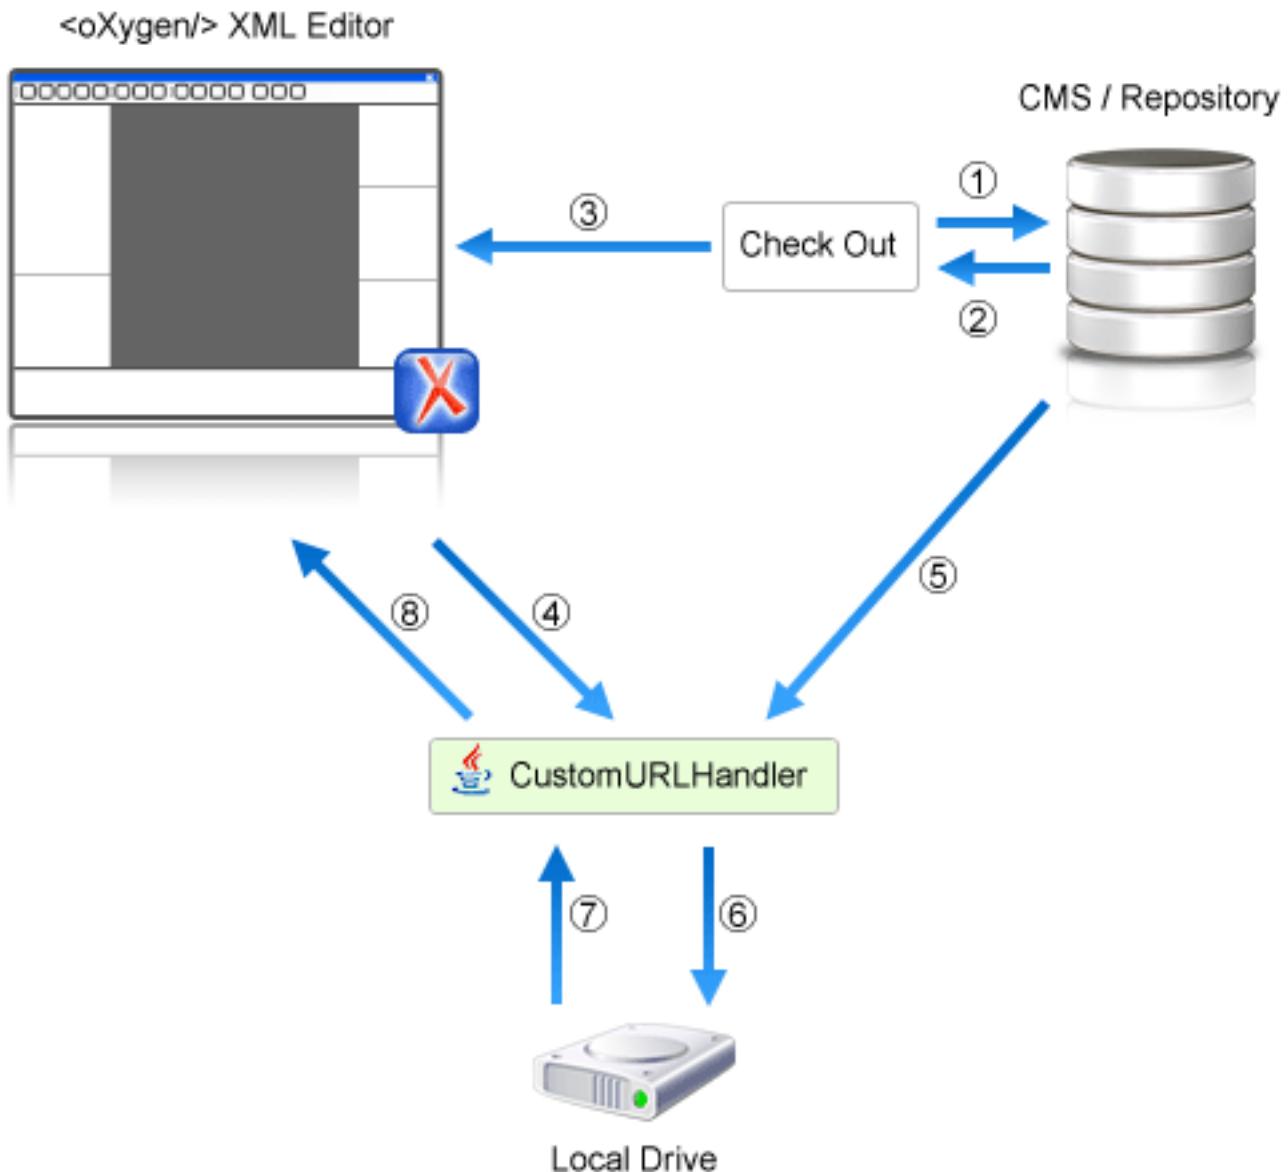

Figure 365: Check Out Process Diagram

Each phase is described below:

1. Browse CMS repository
 2. User chooses a resource
 3. Use API to open custom URL: mycms://path/to/file.xml
 4. Get content of URL: mycms://path/to/file.xml
 5. Get content of resource
 6. Store on disk for faster access
 7. Retrieve content from disk if already checked out
 8. Retrieved content
- Contribute a special **Browse CMS** action to every dialog box in Oxygen XML Author where a URL can be chosen to perform a special action (such as the **Reuse Content** or **Insert Image** action). Sample code:

```
//Add an additional browse action to all dialog boxes/places where
Oxygen allows selecting a URL.
```

```

        pluginWorkspaceAccess.addInputURLChooserCustomizer(new
InputURLChooserCustomizer() {
    public void customizeBrowseActions(List<Action>
existingBrowseActions, final InputURLChooser chooser) {
        //IMPORTANT, you also need to set a custom icon on the action
for situations when its text is not used for display.
        Action browseCMS = new AbstractAction("CMS") {
            public void actionPerformed(ActionEvent e) {
                URL chosenResource = browseCMSAndChooseResource();
                if (chosenResource != null) {
                    try {
                        //Set the chosen resource in the combo box chooser.
                        chooser.urlChosen(chosenResource);
                    } catch (MalformedURLException e1) {
                        //
                    }
                }
            }
        };
        existingBrowseActions.add(browseCMS);
    }
});

```

When inserting references to other resources using the actions already implemented in Oxygen XML Author, the reference to the resource is made by default relative to the absolute location of the edited XML file. You can gain control over the way in which the reference is made relative for a specific protocol like this:

```

//Add a custom relative reference resolver for your custom protocol.
//Usually when inserting references from one URL to another Oxygen
makes the inserted path relative.
//If your custom protocol needs special relativization techniques
then it should set up a custom relative
//references resolver to be notified when resolving needs to be
done.
pluginWorkspaceAccess.addRelativeReferencesResolver(
    //Your custom URL protocol for which you already have a custom
URLStreamHandlerPluginExtension set up.
    "mycms",
    //The relative references resolver
    new RelativeReferenceResolver() {
        public String makeRelative(URL baseURL, URL childURL) {
            //Return the referenced path as absolute for example.
            //return childURL.toString();
            //Or return null for the default behavior.
            return null;
        }
    });

```

- Write the `plugin.xml` descriptor. Your plugin combines the two extensions using a single set of libraries. The descriptor would look like this:

```

<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="CustomCMSAccess"
    description="Test"
    version="1.0.0"
    vendor="ACME"
    class="custom.cms.CMSAccessPlugin">
    <runtime>
        <library name="lib/cmsaccess.jar"/>
    </runtime>
    <!--Access to add actions to the main menu and toolbars or to add custom
views.-->

```

```

<!--See the
"ro.sync.sample.plugin.workspace.CustomWorkspaceAccessPluginExtension" Java
sample for more details-->
<extension type="WorkspaceAccess"
  class="custom.cms.CustomWorkspaceAccessPluginExtension"/>
<!--The custom URL handler that will communicate with the CMS
implementation-->
<!--See the
"ro.sync.sample.plugin.workspace.customprotocol.CustomProtocolURLHandlerExtension"
Java sample for more details-->
<extension type="URLHandler"
  class="custom.cms.CustomProtocolURLHandlerExtension"/>
</plugin>

```

- Create a `cmsaccess.jar` JAR archive containing your implementation classes.
- Copy your new plugin directory in the `plugins` subfolder of the Oxygen XML Author install folder and start Oxygen XML Author.

Class Loading Issues

[Edit on GitHub](#)

It is possible that the Java libraries you have specified in the plugin libraries list conflict with the ones already loaded by Oxygen XML Author. To instruct the plugin to prefer its libraries over the ones used by Oxygen XML Author, you can add the following attribute on the `<plugin>` root element: `classLoaderType="preferReferencedResources"` from the `plugin.xml` descriptor.

A **Late Delegation Class Loader** (the main class loader in Oxygen XML Author) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Author Class Loader uses as libraries all jars specified in the `[OXYGEN_INSTALL_DIR]\lib` directory. Its parent class loader is the default JVM Class loader. For each plugin instance, a separate class loader is created having as parent the Oxygen XML Author Class Loader.

The plugin class loader can be either a standard `java.net.URLClassLoader` or a `LateDelegationClassLoader` (depending on the attribute `classLoaderType` in the `plugin.xml`). Its parent class loader is always the Oxygen XML Author `LateDelegationClassLoader`.

If you experience additional problems, such as:

```

java.lang.LinkageError: ClassCastException:
attempting to cast
jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar!/
javax/xml/ws/spi/Provider.class
tojar:file:/D:/Program
  Files/Oxygen XML Editor
  12/plugins/wspcaccess/.../xdocs/lib/jaxws/
jaxws-api.jar!/javax/xml/ws/spi/Provider.class
  at javax.xml.ws.spi.Provider.provider(
Provider.java:94) at
  javax.xml.ws.Service.<init>(Service.java:56)
  .....

```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a `try/finally` statement:

```

ClassLoader oldClassLoader =
  Thread.currentThread().getContextClassLoader();
try {
  //This is the implementation of the
  //WorkspaceAccessPluginExtension plugin interface.
  Thread.currentThread().setContextClassLoader(
    CustomWorkspaceAccessPluginExtension.

```

```

    this.getClass().getClassLoader());
//WRITE YOUR CODE HERE
} finally {
    Thread.currentThread().
        setContextClassLoader(oldClassLoader);
}

```

How to Write A Custom Protocol Plugin

[Edit on
GitHub](#)

To create a custom protocol plugin, follow these steps:

1. Write the handler class for your protocol that implements the `java.net.URLStreamHandler` interface.
Be careful to provide ways to encode and decode the URLs of your files.
2. Write the plugin class by extending `ro.sync.exml.plugin.Plugin`.
3. Write the plugin extension class that implements the `ro.sync.exml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface.

It is necessary that the plugin extension for the custom protocol implements the `URLStreamHandlerPluginExtension` interface. Without it, you cannot use your plugin, because Oxygen XML Author is not able to find the protocol handler.

You can choose also to implement the `URLChooserPluginExtension` interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

An implementation of the extension `URLHandlerReadOnlyCheckerExtension` allows you to:

- Mark a resource as read-only when it is opened.
- Switch between marking the resource as read-only and read-write while it is edited.

It is useful when opening and editing CMS resources.

4. Write the `plugin.xml` descriptor.
Remember to set the name of the plugin class to the one from the second step and the plugin extension class name with the one you have chosen at step 3.
5. Create a .jar archive with all these files.
6. Install your new plugin in the `plugins` subfolder of the Oxygen XML Author install folder.

Packing and Deploying Plugins or Frameworks as Add-ons

[Edit on
GitHub](#)

Packing a Plugin or Framework as an Add-on

This procedure is suitable for developers who want a better control over the add-on package or those who want to automate some of the steps:

1. Pack the plugin or framework as a `ZIP` file or a `JAR`. Note that you should pack the entire root directory not just its contents.
2. Digitally sign the package. Note that you can perform this step only if you have created a `JAR` at the previous step. You will need a certificate signed by a trusted authority. To sign the jar you can either use the `jarsigner` command line tool inside Oracle's Java Development Kit. (`[JDK_DIR]/bin/jarsigner.exe`) or, if you are working with `Ant`, you can use the `signjar` task (a front for the `jarsigner` command line tool).

Note: The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the `keytool` command line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Author provides. To use this template, go to **File > New** and select the **Oxygen add-ons update site** template. Once deployed, this descriptor file is referenced as *update site*.

Alternatively, you can use the **Add-ons Packager** plugin by following this procedure:

1. Install the **Add-ons Packager** plugin from <http://www.oxygenxml.com/InstData/Addons/optional/updateSite.xml> as described in the *Installing Add-ons procedure*.
2. Restart Oxygen XML Author. If the add-on is correctly installed, the **Add-ons packager** toolbar action is available.
3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.
4. Press **OK** to complete the packaging process.

Deploying an Add-on

To deploy an add-on, copy the **ZIP/JAR** file and the descriptor file to an HTTP server. The URL to this location serves as the *Update Site URL*.

How to Share a Class Loader Between a Framework and Plugin

[Edit on GitHub](#)

In some cases you may need to extend the functionality of Oxygen XML Author both through a framework and through a plugin. Normally, a framework and a plugin both run in their own private classloader. If the framework and the plugin use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one *Class Loader* and they will both use the same static objects and have the ability to cast objects between one another.

To do this, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, select the document type, go to the **Classpath** tab, and in the **Use parent classloader from plugin with ID** fields introduce the ID of the plugin. This ID is declared in the *configuration file of the plugin*.

Important: The shared classed must be specified only in the configuration files of the plugin, and not in the configuration file and the document type class path at the same time.

Creating and Running Automated Tests

[Edit on GitHub](#)

If you have developed complex custom plugins or document types, the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Author standalone installation includes a main `oxygen.jar` library located in the `[OXYGEN_INSTALL_DIR]`. That JAR library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop JUnit tests for your customizations using the **Eclipse** workbench, follow these steps:

1. Create a new Eclipse Java project and copy to it the entire contents of the `[OXYGEN_INSTALL_DIR]`.
2. Add all JAR libraries present in the `[OXYGEN_INSTALL_DIR]/lib` directory to the **Java Build Path -> Libraries** tab. Make sure that the main JAR library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the **Order and Export** tab.
3. Click **Add Library** and add the `JUnit` and `JFCUnit` libraries.
4. Create a new Java class that extends `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.
5. Pass the following parameters on to the constructor of the super class:
 - `File installationFolder` - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.
 - `File frameworksFolder` - The file path to the frameworks directory. It can point to a custom frameworks directory where the custom framework resides.

- File pluginsFolder - The file path to the plugins directory. It can point to a custom plugins directory where the custom plugins resides.
 - File optionsFolder - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
 - String licenseKey - The license key used to license the test class.
 - int productId - The ID of the product and should be one of the following: PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT, PluginWorkspaceTCBase.XML_EDITOR_PRODUCT, or PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT.
6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```

public class MyTestClass extends PluginWorkspaceTCBase {

    /**
     * Constructor.
     */
    public MyTestClass() throws Exception {
        super(null, new File("frameworks"), new File("plugins"), null,
              "-----START-LICENSE-KEY-----\n" +
              "\n" +
              "Registration_Name=Developer\n" +
              "\n" +
              "Company=\n" +
              "\n" +
              "Category=Enterprise\n" +
              "\n" +
              "Component=XML-Editor, XSLT-Debugger, Saxon-SA\n" +
              "\n" +
              "Version=14\n" +
              "\n" +
              "Number_of_Licenses=1\n" +
              "\n" +
              "Date=09-04-2012\n" +
              "\n" +
              "Trial=31\n" +
              "\n" +
              "SGN=MCwCFGNoEGJSeiC3XYIyalvJzHhGhqAhRNRDpEu8RIWb8icCJO7HqfVP4++A\\ \\
\\=\n" +
              "\n" +
              "-----END-LICENSE-KEY-----",
              PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);
    }

    /**
     * <p><b>Description:</b> TC for opening a file and using the bold
     * operation</p>
     * <p><b>Bug ID:</b> EXM-20417</p>
     *
     * @author radu_coravu
     *
     * @throws Exception
     */
    public void testOpenFileAndBoldEXM_20417() throws Exception {
        WSEditor ed = open(new File("D:/projects/eXml/test/authorExtensions/
dita/sampleSmall.xml").toURL());
        //Move caret
        moveCaretRelativeTo("Context", 1, false);

        //Insert <b>
        invokeAuthorExtensionActionForID("bold");
    }
}

```

```

        assertEquals("<?xml version=\"1.0\" encoding=\"utf-8\"?>\n" +
        "<!DOCTYPE task PUBLIC \"-//OASIS//DTD DITA Task//EN\" \"http://
docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd\">\n" +
        "<task id=\"taskId\">\n" +
        "  <title>Task <b>title</b></title>\n" +
        "  <prolog/>\n" +
        "  <taskbody>\n" +
        "    <context>\n" +
        "      <p>Context for the current task</p>\n" +
        "    </context>\n" +
        "    <steps>\n" +
        "      <step>\n" +
        "        <cmd>Task step.</cmd>\n" +
        "      </step>\n" +
        "    </steps>\n" +
        "  </taskbody>\n" +
        "</task>\n" +
        "", getCurrentEditorXMLContent());
    }
}

```

Debugging a Plugin Using the Eclipse Workbench

[Edit on GitHub](#)

To debug problems in the code of the plugin without having to re-bundle the Java classes of the plugin in a JAR library, follow these steps:

1. Download and unpack an *all platforms standalone version* of Oxygen XML Author.
2. Set up the *oxygen SDK* following *this set of instructions*.
3. Create an Eclipse Java Project (for example, *MyPluginProject*) from one of the sample plugins (the Workspace Access plugin, for example).
4. In the *MyPluginProject* folder, create a folder called *myPlugin*. In this new folder copy the *plugin.xml* from the sample plugin. Modify the added *plugin.xml* to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the **Project** view), and go to **Build Path > Configure Build Path**. Then inspect the value of the **Default output folder** text box.

Example: If the compiled output folder is *classes*, then you need to add in the *plugin.xml* the following library reference:

```
<library name=". . . /classes" />
```

5. Copy the *plugin.dtd* from the *[OXYGEN_INSTALL_DIR]/plugins* folder in the root *MyPluginProject* folder.
6. In the *MyPluginProject* build path add external JAR references to all the JAR libraries in the *[OXYGEN_INSTALL_DIR]/lib* folder. Now your *MyPluginProject* should compile successfully.
7. In the Eclipse IDE, create a new *Java Application* configuration for debugging. Set the **Main class** box to *ro.sync.exml.Oxygen*. Click the **Arguments** tab and add the following code snippet in the **VM arguments** input box, making sure that the path to the *plugins* directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -
Xmx1024m
-XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects
\MyPluginProject
```

Note: If you need to configure the plugin for Oxygen XML Author, set the *com.oxygenxml.app.descriptor* to *ro.sync.exml.AuthorFrameDescriptor* or *ro.sync.exml.DeveloperFrameDescriptor*, respectively.

8. Add a break point in the source of one of your Java classes.

9. Debug the created configuration. When the code reaches your breakpoint, the debug perspective should take over.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

[Edit on GitHub](#)

To debug problems in the extension code without having to bundle the extension's Java classes in a JAR library, perform the following steps:

1. Download and unpack an *all platforms standalone version* of Oxygen XML Author to a folder on your hard drive.
2. Create an Eclipse Java Project (for example, `MySDKProject`) with the corresponding Java sources (for example, a custom implementation of the `ro.sync.ecss.extensions.api.StylesFilter` interface).
3. In the Project build path add external JAR references to all the JAR libraries in the `[OXYGEN_INSTALL_DIR]/lib` folder. Now your Project should compile successfully.
4. Start the standalone version of Oxygen XML Author from the `[OXYGEN_INSTALL_DIR]` and in the *Document Type Association preferences page*, edit the document type (for example, **DITA**) to open the *Document Type configuration dialog box*. In the **Classpath** tab, add a reference to your Project's `classes` directory and in the **Extensions** tab, select your custom `StylesFilter` extension as a value for the **CSS styles filter** property. Close the application to save the changes to the framework file.
5. Create a new Java Application configuration for debugging. The Main Class should be `ro.sync.exml.Oxygen`. The given VM Arguments should be

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -  
Xmx1024m -XX:MaxPermSize=384m
```

6. Add a break point in one of the source Java classes.
7. Debug the created configuration. When the code reaches your breakpoint, the debug perspective should take over.

Disabling a Plugin

[Edit on GitHub](#)

To disable a plugin, use one of the following two methods:

- *Open the Preferences dialog box (Options > Preferences)*, go to **Plugins**, and deselect the plugin that you want to disable.
- Create an empty file called `plugin.disable` next to the plugin configuration file (`plugin.xml`). The plugin will be disabled and will no longer be loaded by the application on startup.

Note: This is useful if you want to temporarily stop work on a plugin and use the application without it.

Oxygen XML Author Component

[Edit on GitHub](#)

The Oxygen XML Author Component was designed as a subset of Oxygen XML Author that can be integrated into another application under the terms of the Oxygen XML Author SDK agreement to provide functionality for editing and authoring XML documents. The component can be embedded in a third-party standalone Java application or customized as a Java Web Applet to provide WYSIWYG-like XML editing directly in your web browser.

The Oxygen XML Author Component startup project for *Java Swing* integrations is available online as a Maven archetype on the Oxygen XML Author website. More information about the setup can be found on the *[oxygen SDK page](#)*.

Licensing

[Edit on GitHub](#)

The licensing terms and conditions for the Oxygen XML Author Component are defined in the *[oxygen SDK License Agreement](#)*. To obtain the licensing terms and conditions and other licensing information as well, you can also contact our support team at support@oxygenxml.com. You may also obtain a free of charge evaluation license key for

development purposes, subject to registration. Any deployment of an application developed using the Oxygen XML Author Component is also subject to the terms of the SDK agreement.

There are two main categories of Oxygen XML Author Component integrations:

- 1. Integration for internal use.**

You develop an application that embeds the *Author Component* to be used internally (in your company or by you). You can buy and use previously purchased Oxygen XML Author floating licenses to enable the runtime usage of the Oxygen XML Author Component as it was integrated into the application.

- 2. Integration for external use.**

Using the Oxygen XML Author Component, you create an application that you distribute to other users outside your company (with a CMS for example). In this case you need to contact us to apply for a Value Added Reseller (VAR) partnership.

From a technical point of view, the Oxygen XML Author Component provides the Java API to:

- Inject floating license server details in the Java code. The following link provides details about how to configure an HTTP floating license server: http://www.oxygenxml.com/license_server.html#floating_license_servlet.

```
AuthorComponentFactory.getInstance().init(frameworkZips, optionsZipURL,
    codeBase, appletID,
    //The servlet URL
    "http://www.host.com/servlet",
    //The HTTP credentials user name
    "userName",
    //The HTTP credentials password
    "password");
```

- Inject the licensing information key (for example, the evaluation license key) directly in the component's Java code.

```
AuthorComponentFactory.getInstance().init(
    frameworkZips, optionsZipURL, codeBase, appletID,
    //The license key if it is a fixed license.
    licenseKey);
```

- Display the license registration dialog box. This is the default behavior if a null license key is set using the API, this transfers the licensing responsibility to the end-user. The user can license an Oxygen XML Author Component using standard Oxygen XML Author license keys. The license key will be saved to the local user's disk and on subsequent runs the user will not be asked anymore.

```
AuthorComponentFactory.getInstance().init(
    frameworkZips, optionsZipURL, codeBase, appletID,
    //Null license key, will ask the user.
    null);
```

[Edit on GitHub](#)

Installation Requirements

Running the Oxygen XML Author Component as a Java applet requires:

- Oracle (Sun) Java JRE version 1.6 update 10 or newer.
- At least 100 MB disk space and 100MB free memory.
- The applet needs to be signed with a valid certificate and will request full access to the user machine to store customization data (such as options and framework files).
- A table of supported browsers can be found in [Supported Browsers and Operating Systems](#) on page 1351.

Running the Oxygen XML Author Component embedded in a third-party Java/Swing application requires:

- Oracle (Sun) Java JRE version 1.6 or newer.
- At least 100 MB disk space and 100MB free memory.

Customization

[Edit on GitHub](#)

For a special type of XML, you can create a custom framework (which also works in a standalone version of Oxygen XML Author). Oxygen XML Author already has frameworks for editing DocBook, DITA, TEI, and so on. Their sources are available in [the Oxygen SDK](#). This custom framework is then packed in a zip archive and used to deploy the component.

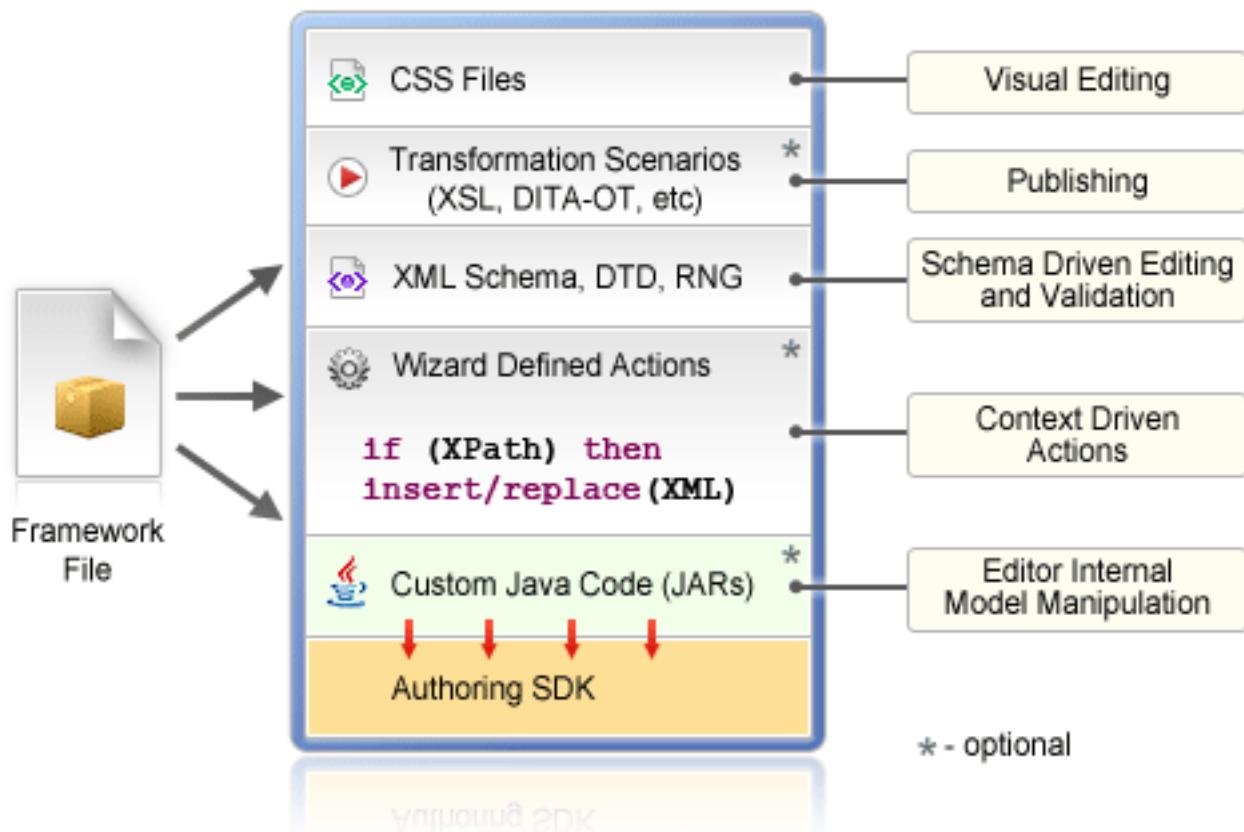

Figure 366: Components of a Custom Framework

Multiple frameworks can coexist in the same component and can be used at the same time for editing XML documents.

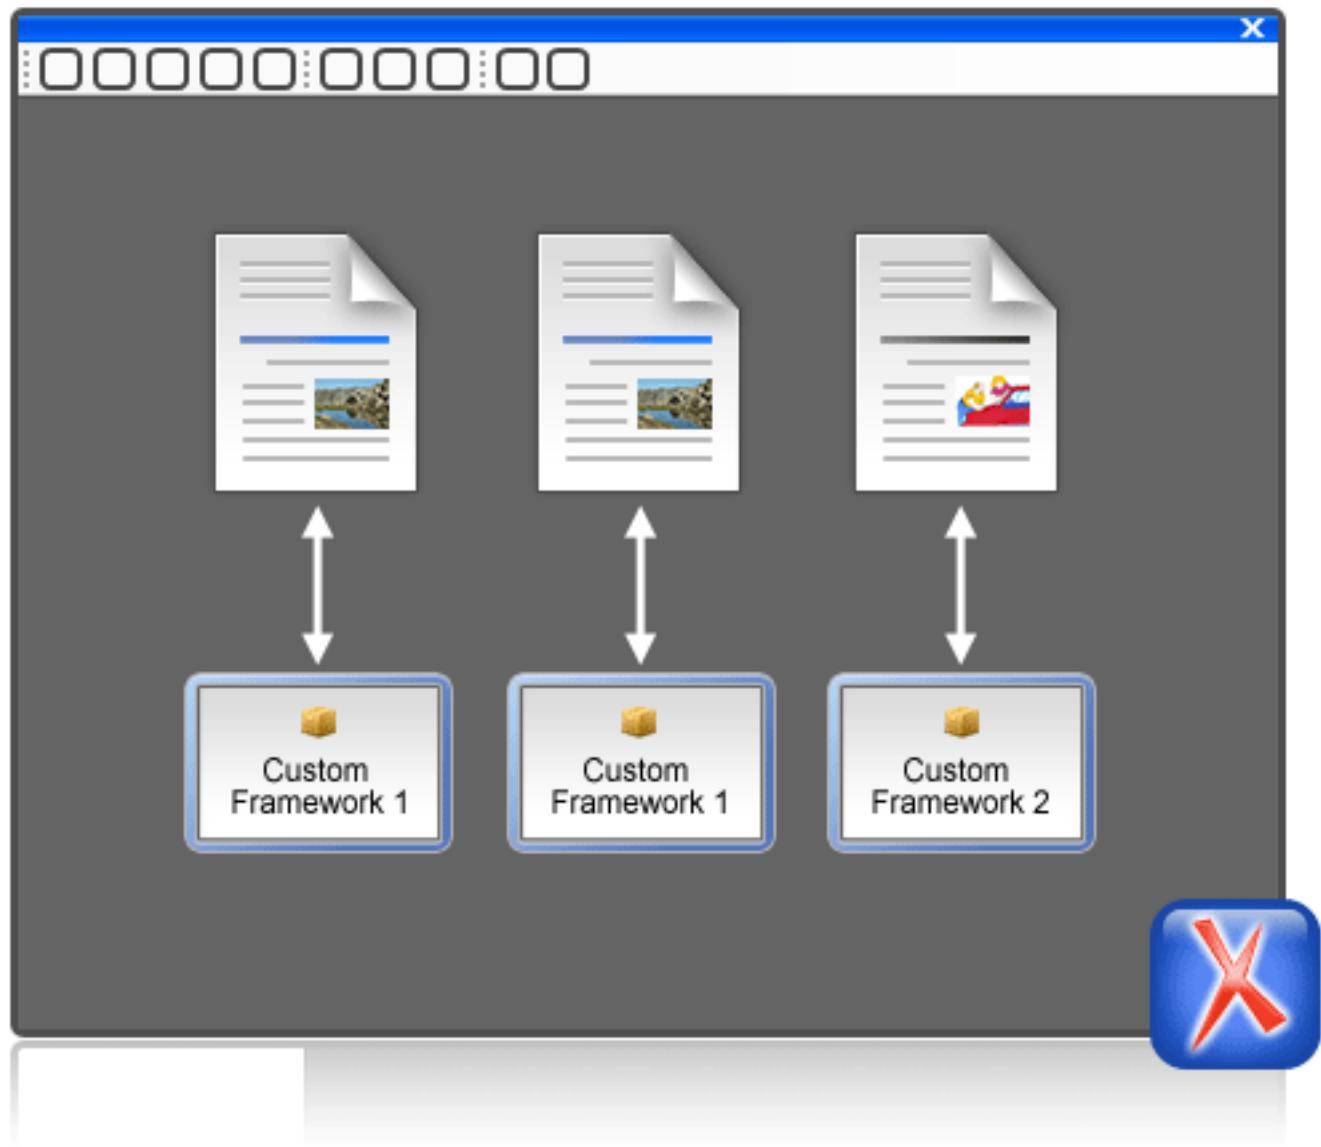

Figure 367: Multiple Frameworks

You can add on your custom toolbar all actions available in the standalone Oxygen XML Author application for editing in the **Author** mode. You can also add custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component can also provide the **Outline**, **Model**, **Elements**, and **Attributes** views, which can be added to your own developed containers.

The main entry point for the Oxygen XML Author Component Java API is the [*AuthorComponentFactory*](#) class.

Related information

[*Author Mode Customization Guide*](#) on page 1106

[*Oxygen XML Author Component*](#) on page 1344

[AuthorComponentFactory API](#)**Example - Customizing the DITA Framework**[Edit on GitHub](#)

If you look inside the `bundle-frameworks\oxygen-frameworks` folder distributed with the [Oxygen XML Author Component sample project](#), it contains a document type framework folder. Customizations that affect the framework/document type configuration for the component should first be done in a standalone installation of Oxygen XML Author.

An Oxygen XML Author standalone installation includes a frameworks folder that contains the `dita` framework located in `[OXYGEN_INSTALL_DIR]\frameworks\dita`. The `dita` framework contains a bundled **DITA-OT** distribution which contains the DTDs used for DITA editing. If your DTD specialization is a DITA OT plugin, it *should be installed* in the `DITA_OT_DIR\plugins` folder.

To make changes to the DITA document type configuration, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. These changes will affect the `[OXYGEN_INSTALL_DIR]\frameworks\dita\dita.framework` configuration file.

After you do this you can re-pack the Oxygen XML Author Component following the instructions from the `README.html` file located in the `oxygen-sample-applet` project. The *Author Component* sample project and the Oxygen XML Author standalone installation should be of the same version.

Related information

[Advanced Customization Tutorial - Document Type Associations](#) on page 1114

Packing a Fixed Set of Options[Edit on GitHub](#)

The Oxygen XML Author Component shares a common internal architecture with the standalone application, although it does not have **Preferences** dialog boxes. However, the *Author Component Applet* can be configured to use a fixed set of user options on startup.

The sample project contains a module called `bundle-options`. The module contains a file called `options.xml` in the `oxygen-options` folder. Such an XML file can be obtained by exporting the options to an XML format from an installation of Oxygen XML Author.

To create an *options file* in the Oxygen XML Author:

- Make sure the options that you want to set are not *stored at project level*.
- Set the values you want to impose as defaults in the [Preferences pages](#).
- Select **Options > Export Global Options**.

Deployment[Edit on GitHub](#)

The Oxygen XML Author Component Java API allows you to use it in your Java application or as a Java applet. The JavaDoc for the API can be found [here](#). The sample project found in the `oxygen-sample-applet` module includes Java sources (`ro.sync.ecss.samples.AuthorComponentSample.java`) demonstrating how the component is created, licensed and used in a Java application.

Important: You must obtain the appropriate deployment license (upon payment of a required deployment license fee) to deploy the Oxygen XML Author Component along with your application developed with the SDK.

Web Deployment[Edit on GitHub](#)

The Oxygen XML Author Component can be deployed as a Java Applet using the new Applet with JNLP Java technology, available in Oracle (Sun) Java JRE version 1.6 update 10 or newer.

The [sample project](#) demonstrates how the Oxygen XML Author Component can be distributed as an applet.

To deploy the Oxygen XML Author Component as a Java Applet, consider the following notes:

- Follow the instructions [here](#) to setup the sample project and look for Java sources of the sample Applet implementation in the sample project module (**oxygen-sample-applet**). They can be customized to fit your requirements.
- The `default.properties` configuration file must first be edited to specify your custom certificate information used to sign the applet libraries. You also have to specify the code base from where the applet will be downloaded.
- You can look inside the `web-resources/author-component-dita.html` and `web-resources/author-component-dita.js` sample Web resources to see how the applet is embedded in the page and how it can be controlled using JavaScript (to set and get XML content from it).
- The sample Applet `target/jnlp/author-component-dita.jnlp` file contains the list of used libraries. This list is automatically generated from the Maven dependencies of the project.
- The sample frameworks and options JAR archives can be found in the `bundle-frameworks` and `bundle-options` modules of the sample project.
- Use the Maven command `mvn package` to pack the component. More information are available [here](#). The resulting applet distribution is copied in the `target/jnlp/` directory. From this on, you can copy the applet files on your web server.

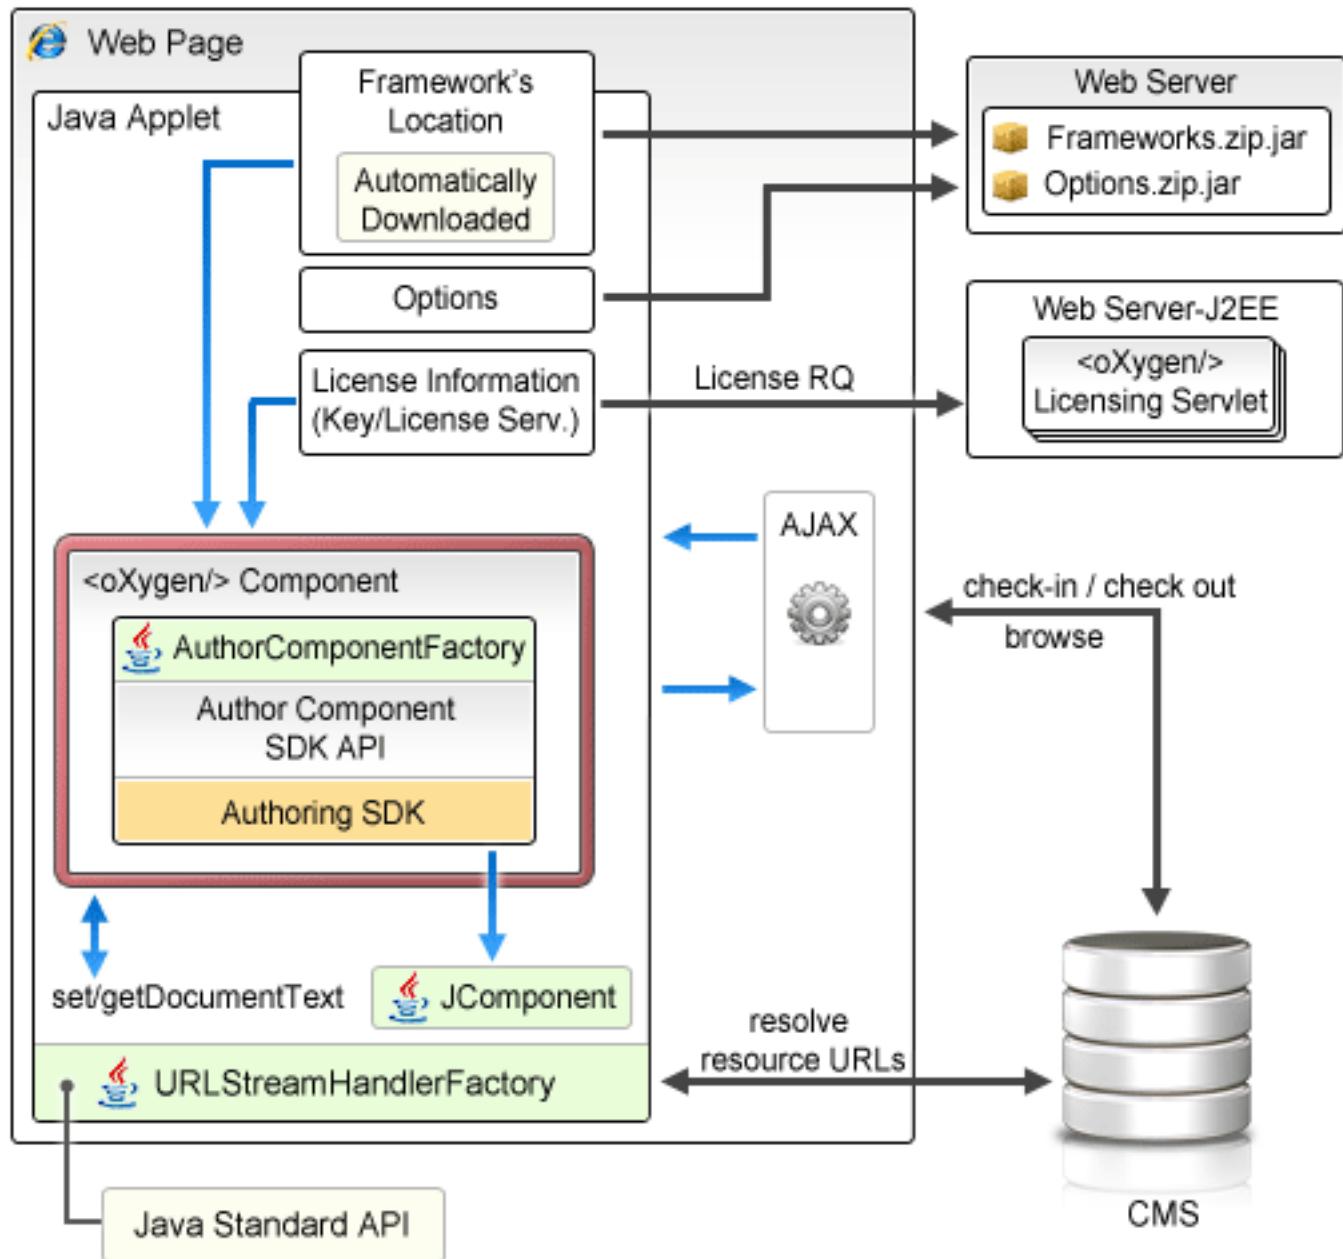

Figure 368: Oxygen XML Author Component Deployed as a Java Applet

Generate a Testing Certificate for Signing an Applet

[Edit on GitHub](#)

All jar files of an applet deployed on a remote Web server must be signed with the same certificate before the applet is deployed. The following steps describe how to generate a test certificate for signing the jar files. We will use the tool called keytool, which is included in the Oracle Java Development Kit.

1. Create a *keystore* with a RSA encryption key.

Invoke the following in a command line terminal:

```
keytool -genkey -alias myAlias -keystore keystore.pkcs -storetype PKCS12 -  
keyalg RSA -keysize 2048 -dname "cn=your name here, ou=organization unit  
name, o=organization name, c=US"
```

This command creates a *keystore* file called *keystore.pkcs*. The certificate attributes are specified in the *dname* parameter: common name of the certificate, organization unit name (for example, *Purchasing* or *Sales Department*), organization name, country.

2. Generate a self-signed certificate.

Invoke the following in a command line terminal:

```
keytool -selfcert -alias myAlias -keystore keystore.pkcs -storetype PKCS12
```

3. Optionally display the certificate details in a human readable form.

First, the certificate must be exported to a separate file with the following command:

```
keytool -export -alias myAlias -keystore keystore.pkcs -storetype PKCS12 -  
file certfile.cer
```

The certificate details are displayed with the command:

```
keytool -printcert -file certfile.cer
```

4. Edit the *default.properties* file and fill-in the parameters that hold the path to *keystore.pkcs* file (*keystore* parameter), *keystore* type (*storetype* parameter, with JSK or PKCS12 as possible values), alias (*alias* parameter) and password (*password* parameter).
5. The jar files are automatically signed during the *package* phase of the Maven build.

Supported Browsers and Operating Systems

[Edit on GitHub](#)

The applet was tested for compatibility with the following browsers:

	IE 7	IE 8	IE 9	IE 10	IE 11	Firefox	Safari	Chrome	Opera
Vista	-	Passed	Passed	Passed	Passed	Passed	-	Passed	Passed
Windows 7	-	-	Passed	Passed	Passed	Passed	-	Passed	Passed
Windows 8	-	-	-	Passed	Passed	Passed	-	Passed	Passed
OS X (10.6 - 10.9)	-	-	-	-	-	Passed	Passed	Failed	Passed
Linux Ubuntu 10	-	-	-	-	-	Passed	-	Failed	Passed

Communication Between the Web Page and Java Applet

[Edit on GitHub](#)

Applets can communicate with JavaScript code that runs in the Web Page. JavaScript code can call an applet Java methods and from the Java code you can invoke JavaScript code from the web page.

You are not limited to displaying only *Swing* dialog boxes from the applet. From the operations of an applet, you can invoke a JavaScript API that displays a web page and then obtains the data that has been filled in by the user.

Troubleshooting the Applet

[Edit on GitHub](#)

When the applet fails to start:

1. Make sure that your web browser really runs the next generation Java plugin and not the legacy Java plugin.

For Windows and OS X the procedure is straight forward. Some steps are given below for installing the Java plugin on Linux.

Manual Installation and Registration of Java Plugin for Linux: <http://www.oracle.com/technetwork/java/javase/manual-plugin-install-linux-136395.html>

2. Refresh the web page.
3. Remove the Java Webstart cache from the local drive and try again.
 - On Windows this folder is located in: %APPDATA%\LocalLow\Sun\Java\Deployment\cache.
 - On OS X this folder is located in: /Users/user_name/Library/Caches/Java/cache.
 - On Linux this folder is located in: /home/user/.java/deployment/cache.
4. Remove the Oxygen XML Author Component framework cache from the local drive and try again:
 - On Windows Vista/7/8/10 this folder is located in: %APPDATA%\Roaming\com.oxygenxml.author.component.
 - On Windows XP this folder is located in: %APPDATA%\com.oxygenxml.author.component.
 - On OS X this folder is located in: /Users/user_name/Library/Preferences/com.oxygenxml.author.component.
 - On Linux this folder is located in: /home/user/.com.oxygenxml.author.component.
5. Problems sometimes occur after upgrading the web browser and/or the JavaTM runtime. Redeploy the applet on the server by running Ant in your Oxygen XML Author Component project. However, doing this does not always fix the problem, which often lies in the web browser and/or in the Java plugin itself.
6. Sometimes when the HTTP connection is slow on first time uses the JVM would simply shut down while the jars were being pushed to the local cache (for example, first time uses). This shut down typically occurs while handling oxygen.jar. One of the reasons could be that some browsers (Firefox, for example) implement some form of "Plugin hang detector" See https://developer.mozilla.org/en/Plugins/Out_of_process_plugins/The_plugin_hang_detector.
7. If you are running the Applet using Safari on OS X and it has problems writing to disk or fails to start, do the following:
 - In Safari, go to **Safari->Preferences->Security**.
 - Select **Manage Website Settings**.
 - Then select Java and for the *oxygenxml.com* entry, choose the **Run in Unsafe mode** option.

Enable JavaWebstart logging on your computer to get additional debug information:

1. Open a console and run `javaws -viewer`.
2. In the **Advanced** tab, expand the **Debugging** category and select all boxes.
3. Expand the **Java console** category and choose **Show console**.
4. Save settings.
5. After running the applet, you will find the log files in:
 - On Windows this folder is located in: %APPDATA%\LocalLow\Sun\Java\Deployment\log.
 - On OS X this folder is located in: /Users/user_name/Library/Caches/Java/log.
 - On Linux this folder is located in: /home/user/.java/deployment/log.

Avoiding Resource Caching

[Edit on GitHub](#)

A Java plugin installed in a web browser caches access to all HTTP resources that the applet uses. This is useful to avoid downloading all the libraries each time the applet is run. However, this may have undesired side-effects when the applet presents resources loaded via HTTP. If such a resource is modified on the server and the browser window is refreshed, you might end-up with the old content of the resource presented in the applet.

To avoid such a behavior, you need to edit the `ro.sync.ecss.samples.AuthorComponentSampleApplet` class and set a custom `URLStreamHandlerFactory` implementation. A sample usage is already available in the class, but it is commented-out for increased flexibility:

```
//THIS IS THE WAY IN WHICH YOU CAN REGISTER YOUR OWN PROTOCOL HANDLER TO THE
JVM.
//THEN YOU CAN OPEN YOUR CUSTOM URLs IN THE APPLET AND THE APPLET WILL USE
YOUR HANDLER
URL.setURLStreamHandlerFactory(new URLStreamHandlerFactory() {
    public URLStreamHandler createURLStreamHandler(String protocol) {
        if("http".equals(protocol) || "https".equals(protocol)) {
            return new URLStreamHandler() {
                @Override
                protected URLConnection openConnection(URL u) throws IOException {
                    URLConnection connection = new HttpURLConnection(u, null);
                    if(!u.toString().endsWith(".jar")) {
                        //Do not cache HTTP resources other than JARS
                        //By default the Java HTTP connection caches content for
                        //all URLs so if one URL is modified and then re-loaded in the
                        //applet the applet will show the old content.
                        connection.setDefaultUseCaches(false);
                    }
                    return connection;
                }
            };
        }
        return null;
    }
});
```

Adding MathML support in the Oxygen XML Author Component Web Applet

[Edit on GitHub](#)

By default, the Oxygen XML Author Component Web Applet project does not come with the libraries necessary for viewing and editing MathML equations in the **Author** mode. You can view and edit MathML equations either by adding support for *JEuclid* or by adding support for *MathFlow*.

Adding MathML Support Using JEuclid

[Edit on GitHub](#)

By default, the *JEuclid* library is excluded from the *oxygen-SDK* artifact dependencies. To enable it, comment the following lines in the `pom.xml` file:

```
<exclusion>
    <artifactId>jeuclid-core</artifactId>
    <groupId>net.sourceforge.jeuclid</groupId>
</exclusion>
```

To edit specialized DITA Composite with MathML content, include the entire MathML2 framework directory (`[OXYGEN_INSTALL_DIR]/frameworks/mathml2`) in the frameworks bundled with the component in the `bundle-frameworks` module. This directory is used to solve references to MathML DTDs.

Adding MathML support using MathFlow

[Edit on GitHub](#)

In the pom.xml file add dependencies to the additional libraries used by the MathFlow library to parse MathML equations:

1. MFComposer.jar
2. MFExtraSymFonts.jar
3. MFSimpleEditor.jar
4. MFStructureEditor.jar
5. MFStyleEditor.jar

You can reference these additional libraries from the MathFlow SDK as in the example below:

```
<dependency>
    <groupId>com.dessci</groupId>
    <artifactId>MFComposer</artifactId>
    <version>1.0.0</version>
    <scope>system</scope>
    <systemPath>${MathFlowSDKDir}/lib/MFComposer.jar</systemPath>
</dependency>
```

In addition, you must obtain fixed MathFlow license keys for editing and composing *MathML* equations and register them using these API methods:

`AuthorComponentFactory.setMathFlowFixedLicenseKeyForEditor` and
`AuthorComponentFactory.setMathFlowFixedLicenseKeyForComposer`.

To edit specialized DITA Composite with *MathML* content, include the entire `[OXYGEN_INSTALL_DIR]/frameworks/mathml2` Mathml2 framework directory in the frameworks bundled with the component in the `bundle-frameworks` module. This directory is used to solve references to *MathML* DTDs.

More documentation is available on the [Design Science MathFlow](#) website.

Adding Support to Insert References from a WebDAV Connection

[Edit on GitHub](#)

Predefined actions that insert references, such as the **Insert Image** action, display a URL chooser that allows you to select the **Browse Data Source Explorer** action. To use an already configured WebDAV connection in the Oxygen XML Author Component, follow these steps:

1. Open a standalone Oxygen XML Author 18.0 and configure a WebDAV connection.
2. Pack the *fixed set of options* from the standalone to use them with the Oxygen XML Author Component project.
3. In the Oxygen XML Author Component, the defined connection still does not work when expanded because the additional JAR libraries used to browse the WebDAV repository are missing. By default, the `httpclient` dependency of the *oXygen SDK* artifact is excluded. You can enable it by commenting the following lines:

```
<exclusion>
    <artifactId>httpclient</artifactId>
    <groupId>org.apache.httpcomponents</groupId>
</exclusion>
```

If you want to have multiple WebDAV connection URLs, user names, and passwords (depending on the user who started the component), you can use a more flexible approach by using the following API:

```
//DBConnectionInfo(String id, String driverName, String url, String user,
String passwd, String host, String port)
DBConnectionInfo info = new DBConnectionInfo("WEBDAV", "WebDAV
FTP", "http://host/webdav-user-root", "userName", "password", null,
null);
```

```
AuthorComponentFactory.getInstance().setObjectProperty("database.stored.sessions1", n
DBConnectionInfo[] {info});
```

Using Plugins with the Oxygen XML Author Component

[Edit on GitHub](#)

To bundle Workspace Access plugins, that are developed for standalone application with the Oxygen XML Author Component, follow these steps:

- The `bundle-plugins` module must contain the additional plugin directories in the `dropins` subdirectory. The content must also contain a `plugin.dtd` file. Copy the `plugin.dtd` file from an `[OXYGEN_INSTALL_DIR]\plugins` folder.
- In the class that instantiates the `AuthorComponentFactory`, for example the `ro.sync.ecss.samples.AuthorComponentSample` class, call the methods `AuthorComponentFactory.getPluginToolbarCustomizers()`, `AuthorComponentFactory.getPluginViewCustomizers()` and `AuthorComponentFactory.getMenubarCustomizers()`, obtain the customizers that have been added by the plugins and call them to obtain the custom swing components that they contribute. There is a commented-out example for this in the `AuthorComponentSample.reconfigureActionsToolbar()` method for adding the toolbar from the **Acrolinx** plugin.

Important: As the Oxygen XML Author Component is just a subset of the entire application, there is no guarantee that all the functionality of the plugin works.

Sample SharePoint Integration of the Oxygen XML Author Component

[Edit on GitHub](#)

This section presents the procedure to integrate the Oxygen XML Author Component as a Java applet on a SharePoint site.

Microsoft SharePoint®

[Edit on GitHub](#)

Microsoft SharePoint® is a Web application platform developed by Microsoft®.

SharePoint comprises a multipurpose set of Web technologies backed by a common technical infrastructure. It provides the benefit of a central location for storing and collaborating on documents, which can significantly reduce emails and duplicated work in an organization. It is also capable of keeping track of the multiple versions created by multiple users.

Why Integrate the Oxygen XML Author Component with SharePoint

[Edit on GitHub](#)

The Oxygen XML Author Component can be embedded in a SharePoint site as a Java applet. This is a simple and convenient way for you to retrieve, open, and save XML and XML related documents stored on your company's SharePoint server, directly from your web browser.

For example, suppose that you are working on a team project that uses the DITA framework for writing product documentation. You have the DITA maps and topics stored on a SharePoint repository. By using a custom defined action from the contextual menu of a document, you can easily open it in the Oxygen XML Author Component applet that is embedded in your SharePoint Documents page.

You can embed the applet either on a site that is located on a standalone SharePoint server, or on your company Microsoft Office 365 account.

This example can be used as a starting point for other CMS integrations.

Deploying Resources

[Edit on GitHub](#)

You can embed the Oxygen XML Author Component in a SharePoint site as a Java Applet, using the new Applet with JNLP Java technology. Sign with a valid certificate the JNLP file and the associated JAR files that the applet needs.

Deploy these resources on a third party server (other than the SharePoint server). The Java applet downloads the resources as needed. If you deploy the JNLP and JAR files on the SharePoint server, the Java Runtime Environment will not be able to access the applet resources because it is not aware of the current authentication tokens from your browser. This causes the Java Class Loader to fail loading classes, making the applet unable to start.

Accessing Documents

[Edit on GitHub](#)

One of the main challenges when integrating the Oxygen XML Author Component applet in your SharePoint site is to avoid authenticating twice when opening a document resource stored in your SharePoint repository.

You have already signed in when you started the SharePoint session, but the applet is not aware of your current session. In this case every time the applet is accessing a document it will ask you to input your credentials again.

As a possible solution, do not execute HTTP requests directly from the Java code, but forward them to the web browser that hosts the applet, because it is aware of the current user session (authentication cookies).

To open documents stored on your SharePoint repository, register your own protocol handler to the JVM. We implemented a handler for both *http* and *https* protocols that forwards the HTTP requests to a JavaScript XMLHttpRequest object. This way, the browser that executes the JavaScript code is responsible for handling the authentication to the SharePoint site.

To install this handler, add the following line to your Java Applet code (in our case, in the `ro.sync.ecss.samples.AuthorComponentSampleApplet` class):

```
URL.setURLStreamHandlerFactory(new
    ro.sync.net.protocol.http.handlers.CustomURLStreamHandlerFactory(this));
```

To enable JavaScript calls from your Java applet code, set the MAYSCRIPT attribute to `true` in the `<applet>` element embedded in you HTML page:

```
<applet width="100%" height="600"
    code="ro.sync.ecss.samples.AuthorComponentSampleApplet"
    name="authorComponentAppName" id="authorComponentApplet"
    MAYSCRIPT="true">
    ...
</applet>
```

Tip: If the applet is not working, or you cannot open documents from your SharePoint repository, enable the debugging tools that come bundled with your Web Browser or the Java Console from your operating system to try to identify the cause of the problem.

Integrating the Oxygen XML Author Component

[Edit on GitHub](#)

To integrate the Oxygen XML Author Component as a Java applet with your SharePoint site, you need the Oxygen XML Author Component start-up project.

The project is available as a Maven archetype online. More information about the setup can be found [here](#).

An online demo applet is deployed at <http://www.oxygenxml.com/demo/AuthorDemoApplet/author-component-data-requirements.html>.

Customize Your Applet

[Edit on GitHub](#)

Follow these steps to customize the Oxygen XML Author Component Java applet:

1. Follow [this set of instructions](#) to setup the sample project and look for the Java sources (these can be customized to fit your requirements) of the sample applet implementation;
- Note:** The Java source files are located in the `src` folder of the `oxygen-sample-applet` module.
2. Look inside `web-resources/sharepoint/author-component-dita.aspx` and the associated `*.js` resources, to see how the applet is embedded in the page and how it can be controlled using JavaScript (to set and get XML content from it).
 3. Edit the `default.properties` configuration to specify your custom certificate information, used to sign the applet libraries. Also, specify the code base from where the applet resources will be downloaded.
 4. The sample Applet `target/jnlp/author-component-dita.jnlp` file contains the list of used libraries. This list is automatically generated from the Maven dependencies of the project. The sample frameworks and options JAR archives are located in the `bundle-frameworks` and `bundle-options` modules of the sample project.

Note: The JNLP file and the associated resources and libraries must be deployed on a non-SharePoint web server. Otherwise, the applet will not be loaded.

5. Use the Maven command `mvn package` to pack the component. More information are available [here](#). The resulting applet distribution is copied in the `target/jnlp/` directory. From now on, you can copy the applet files on your web server.

Add Resources to Your SharePoint Site

[Edit on GitHub](#)

Copy the following resources to a sub-folder (in our example named `author-component`) of the `SitePages` folder from your SharePoint site, where you want to embed the applet:

1. **`author-component-dita.aspx`** - an HTML document containing the Java applet.

Note: It has an `.aspx` extension instead of `.html`. If you use the latter extension, the browser will download the HTML document instead of displaying it.

Note: Edit the `.aspx` file and change the value of the applet parameter `jnlp_href` to the URL of the deployed `author-component-dita.jnlp`. Keep in mind that the JNLP file should be deployed on a third party server. For example:

```
<applet>
    <param name="jnlp_href"
        value="http://www.oxygenxml.com/demo/AuthorDemoApplet/author-
component-dita.jnlp"/>
    .....
</applet>
```

2. **`author-component-dita.css`** - contains custom styling rules for the HTML document.
3. **`author-component-dita.js`** - contains JavaScript code, giving access to the Oxygen XML Author Component contained by the Java applet.
4. **`connectionUtil.js`** - contains JavaScript utility methods.

Note: Replace the value of the `SPRootSiteURL` property with the URL of your SharePoint root site, without trailing `'/'`. This is used by the `openListItemInAuthor(itemUrl)` method, to compute the absolute URL of the list item that is to be opened in the applet.

Copy Resources Using Oxygen XML Author

[Edit on GitHub](#)

You can use Oxygen XML Author to copy your resources to the SharePoint server:

1. Configure a new connection to your SharePoint site in the **Data Source Explorer View**.

Note: To watch our video demonstration about connecting to repository located on a SharePoint server, go to http://www.oxygenxml.com/demo/SharePoint_Support.html.

2. Browse your new SharePoint connection site and select the **SitePages** folder.
3. Create a folder named **author-component** using the **New Folder** contextual menu action.
4. Upload your resources to this folder using the **Import Files** contextual menu action.

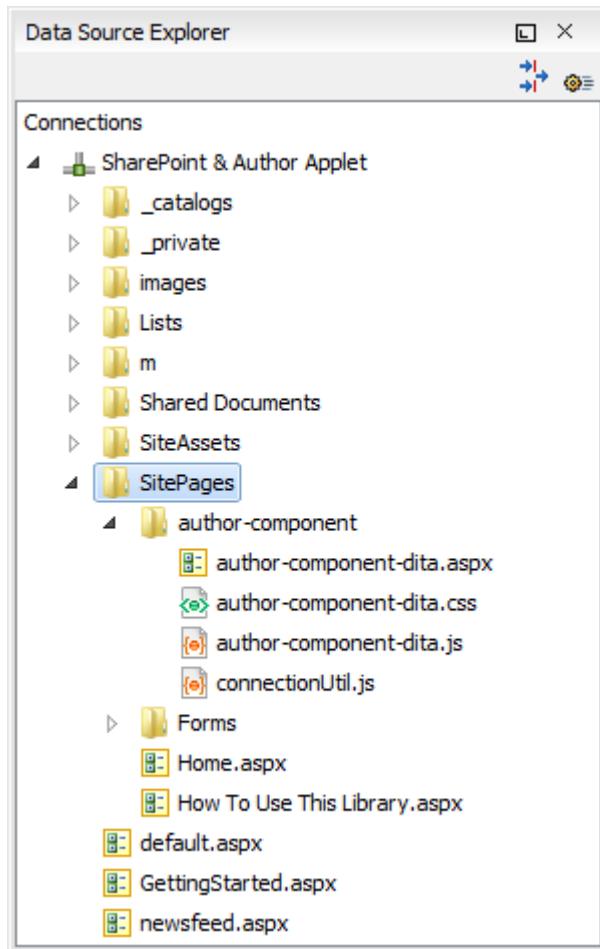

Figure 369: Data Explorer View

Embed the Java Applet in Your SharePoint Site

[Edit on
GitHub](#)

To embed the Java Applet in your SharePoint site, edit the page that contains the applet and add a new Script Editor Web Part next to an existing Documents web part.

Note: It is recommended that you deselect the **Enable Java content in the browser** option from the **Java Control Panel** until you finish editing the page. Otherwise, the browser will load the applet for every change that you will make.

Edit the page directly in your browser, following these steps:

1. Go to the home page of your SharePoint site where you want to add the *Author Component* Java applet.
2. Select the **Page** tab from the ribbon located at top of the page and click the **Edit** button.
3. Select the **Insert** tab and click **Web Part**.
4. In the **Categories** panel, select **Media and Content**.
5. In the **Parts** panel, select the **Script Editor** Web Part.
6. Click the **Add** button to insert the selected Web Part to your page content.

7. Select the newly added Web Part.
8. Select the **Web Part** tab and click the **Web Part Properties** button.
9. Click the **Edit Snippet** link under your Web Part.
10. Insert the following HTML snippet to your newly created Web Part:

```
<div>
  <iframe
    id="appletIFrame"
    src="/applet/SitePages/author-component/author-component-dita.aspx"
    width="800px" height="850px">
  </iframe>
  <script type="text/JavaScript">
    function openInAuthor(itemUrl) {
      var appletFrame = document.getElementById("appletIFrame");
      var appletWin = appletFrame.contentWindow;
      appletWin.openListItemInAuthor(itemUrl);
    }
  </script>
</div>
```

The above HTML fragment contains an **IFrame** that points to the page where the Java applet resides. Replace the value of the **src** attribute with the path of the **author-component-dita.aspx** HTML page that you added earlier to the **SitePages** folder;

Note: Use the **iframe** element from the HTML fragment with the expanded form (**<iframe></iframe>**). Otherwise, the Web Part will not display the target page of the frame.

11. Save the changes you made to the page.

Note: Do not forget to select the **Enable Java content in the browser**, to allow the browser to load the Java applet.

Create a SharePoint Custom Action

[Edit on
GitHub](#)

To open a document from your SharePoint repository in the Oxygen XML Author Component applet, add a new custom action to the contextual menu of your Documents Library:

1. Open your SharePoint site in **Microsoft SharePoint Designer®**.
2. Click **Lists and Libraries** in the **Navigation** pane.
3. Open the **Documents** library.
4. Go to the **Custom Actions** panel.
5. Click the **New** button to add a new custom action.
6. Give a name to the action (for example, **Open In Oxygen XML Author**).
7. In the **Select the type of action** section, select the **Navigate to URL** option and enter the following text:

```
javascript:openInAuthor("{ItemUrl}")
```

Note: This translates to a call to the `openInAuthor(itemUrl)` JavaScript function defined in the HTML fragment that was embedded in the Script Editor Web Part. The `{ItemUrl}` parameter will be expanded to the URL of the list item that the action is invoked on.

8. Click the **OK** button to save the action.

Integration Result

[Edit on GitHub](#)

The screenshot shows the Oxygen XML Author component integrated into a SharePoint page. The main content area displays a document titled "Gerbera". Below the title is a snippet from Wikipedia: "From Wikipedia, the free encyclopedia." The text describes the genus Gerbera as being named after the German naturalist Traugott Gerber. A large, vibrant yellow Gerbera flower is shown as an image. The interface includes standard Microsoft Word-like toolbars at the top and bottom, and a vertical ribbon on the right side showing file details like "gerbera.xml", "Changed by you on 12/12/2012", and "Shared with lots of people".

Frequently Asked Questions

[Edit on GitHub](#)

Installation and Licensing

- What hosting options are available for applet delivery and licensing services (for example, Apache, IIS, etc.)?

For applet delivery any web server. We currently use Apache to deploy the sample on our site. For the floating license server you would need a J2EE server (such as Tomcat) if you want to restrict the access to the licenses.

If you do not need the access restrictions that are possible with a J2EE server you can simplify the deployment of the floating license server by using the TCP version of this server. The TCP license server is a simple Java application that communicates with the Oxygen XML Author Component by TCP/IP connections.

- Are there any client requirements beyond the Java VM and (browser) Java PlugIn Technology?

Oracle (formerly Sun) Java JRE version 1.6 update 10 or newer. At least 200 MB disk space and 200MB free memory would be necessary for the Oxygen XML Author Component applet.

3. Are there any other client requirements or concerns that could make deployment troublesome (for example, browser security settings, client-side firewalls, and AV engines)?

The applet is signed and will request access to the user machine to store customization data (frameworks). The applet needs to be signed with a valid certificate.

4. How sensitive is the applet for the automatic Java VM updates that are typically on by default (for example, could automatic updates potentially "break" the run-time)?

The component should work well with newer Java versions but we cannot guarantee this.

5. How and when are "project" related files deployed to the client (for example, applet code, DTD, styling files, customizations, etc.)?

Framework files are downloaded on the first load of the applet. Subsequent loads will re-use the cached customization files and will be much faster.

6. For on-line demo (<http://www.oxygenxml.com/demo/AuthorDemoApplet/author-component-data.html>), noted a significant wait during initial startup. Any other mechanisms to enhance startup time?

See the explanation above.

7. Does the Oxygen XML Author Component support multiple documents being open simultaneously? What are the licensing ramifications?

A single `AuthorComponentFactory` instance can create multiple `EditorComponentProvider` editors that can then be added and managed by the developer who is customizing the component in a Swing `JTabbedPane`. A single license (floating or user-based) is enough for this.

If you need to run multiple Java Applets or distinct Java processes using the Oxygen XML Author Component, the current floating license model allows for now only two concurrent components from the same computer when using the HTTP floating license server. An additional started component will take an extra license seat.

8. Is there any internet traffic during an editing session (user actively working on the content, on the client side, in the Oxygen XML Author Component)?

No.

Functionality

1. How and when are saves performed back to the hosting server?

What you can see on our web site is just an example of the Oxygen XML Author Component (which is a Java Swing component) used in an Applet.

This applet is just for demonstration purposes. Its source can be at most a starting point for a customization. You should implement, sign and deploy your custom applet implementation.

The save operation could be implemented either in JavaScript by requesting the XML content from the Applet or in Java directly working with the Oxygen XML Author Component. You would be responsible to send the content back to the CMS.

2. Is there a particular XML document size (or range) when the applet would start to exhibit performance problems?

The applet has a total amount of used memory specified in the JNLP JavaWebstart configuration file, which can be increased if necessary. By default, it is 156 Mb. It should work comfortably with documents of 1-3 megabytes.

3. What graphic formats can be directly rendered in the Oxygen XML Author Component?

GIF, JPEG, PNG, BMP and SVG.

4. Can links be embedded to retrieve (from the server) and "play" other types of digital assets, such as audio or video files?

You could add listeners to intercept clicks and open the clicked links. This would require a good knowledge of the *oXygen SDK*. The Oxygen XML Author Component can only render static images (no GIF animations).

5. Does the Oxygen XML Author Component provide methods for uploading ancillary files (new graphics, for instance) to the hosting server?

No.

6. Does the Oxygen XML Author Component provide any type of autosave functionality?

By default no but you could customize the applet that contains the Oxygen XML Author Component to save its content periodically to a file on disk.

7. Assuming multiple documents can be edited simultaneously, can content be copied, cut and pasted from one Oxygen XML Author Component "instance" to another?

Yes.

8. Does the Oxygen XML Author Component support pasting content from external sources (such as a web page or a Microsoft Word document and, if so, to what extent?)

If no customizations are available the content is pasted as simple text. We provide customizations for the major frameworks (DITA, DocBook, TEI, etc.) that use a conversion XSLT stylesheet to convert HTML content from clipboard to the target XML.

9. Can UTF-8 characters (such as Greeks, mathematical symbols, etc.) be inserted and rendered?

Any UTF-8 character can be inserted and rendered, provided that the font used for editing supports rendering the characters. The font can be changed by developers but not by the users. When using a logical font (by default, *Serif* for the Oxygen XML Author Component), the JVM will know how to map all characters to glyphs. There is no character map available but you could implement one

Customization

1. Please describe, in general terms, the menus, toolbars, contextual menu options, helper panes, and so on, that are available for the Oxygen XML Author Component out-of-the box.

You can mount on your custom toolbar all actions available in the standalone Oxygen XML Author application for editing in the **Author** mode. This includes custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component also can provide the **Outline**, **Model**, **Elements**, and **Attributes** views that can be added to your own panels (see sample applet).

2. Please describe, in general terms, the actions, project resources (for example, DTD/Schema for validation purposes, CSS/XSL for styling, etc.) and typical level of effort that would be required to deploy a Oxygen XML Author Component solution for a customer with a proprietary DTD.

The **Author** mode internal engine uses CSS to render XML.

For a special type of XML, you can create a custom framework (which also works in an Oxygen XML Author standalone version) that would also contain default schemas and custom actions. A simple framework would probably need 2-3 weeks development time. For a complex framework with many custom actions it could take a couple of months. Oxygen XML Author already has frameworks for editing (DocBook, DITA, TEI, etc.) Sources for them are available in [the Oxygen SDK](#).

Multiple frameworks can co-exist in the same Oxygen XML Author instance (the desktop standalone version or the applet version) and can be used at the same time for editing XML documents.

3. Many customers desire a very simplistic interface for contributors (with little or no XML expertise) but a more robust XML editing environment for editors (or other users with more advanced XML expertise). How well does the Oxygen XML Author Component support varying degrees of user interface complexity and capability?

- *Showing/hiding menus, toolbars, helpers, etc.*

You assemble all the UI parts from the Oxygen XML Author Component. For example, you could provide two applet implementations: one for advanced users and one for content authors.

- *Forcing behaviors (for example, ensuring change tracking is on and preventing it from being shut down).*

You could avoid placing the change tracking toolbar actions in the custom applet. You could also use API to turn change tracking ON when the content has been loaded.

- Preventing access to "privileged" editor processes (for example, accept/reject changes).

You can remove the change tracking actions completely in a custom applet implementation. Including the ones from the contextual menu.

- Presenting and/or describing XML constructs (for example, tags) in "plain-English".

Using our API, you can customize what the Outline or Breadcrumb presents for each XML tag. You can also customize the in-place content completion list.

- Presenting a small subset of the overall XML tag set (rather than the full tag set) for use by contributors (for example, allowing an author to only insert Heading, Para and inline emphasis).

The API allows for a content completion filter that also affects the *Elements* view.

4. Does the Oxygen XML Author Component API provide access to the XML document, for manipulation purposes, using common XML syntax (such as DOM, XPath, etc.)?

Yes, using the Oxygen XML Author Component API.

5. Can custom dialog boxes be developed and launched to collect information in a "form" (with scripting behind to push tag the collection information and embed it in the XML document)?

Yes.

6. Can project resources and customizations be readily shared between the desktop and component versions of your Oxygen XML Author Component product line?

A framework developed for the desktop version of the Oxygen XML Author application can then be bundled with the Oxygen XML Author Component in a custom applet. For example, the demo applet from our web site is DITA-aware using the same framework as the Oxygen XML Author standalone distribution.

A custom version of the applet that includes one or more customized frameworks and user options can be built and deployed for non-technical authors by a technical savvy user using a built-in tool of Oxygen XML Author. All the authors that load the deployed applet from the same server location will share the same frameworks and options.

A custom editing solution can deploy one or more frameworks that can be used at the same time.

Print Document Within the Oxygen XML Author Component

[Edit on GitHub](#)

Question

Can a document be printed within the Oxygen XML Author Component?

Answer

You can use the following API method to either print the document content to the printer or to show the Print Preview dialog box, depending on the preview parameter value:

```
AuthorComponentProvider.print(boolean preview)
```

Here is the online Javadoc for this method: [http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print\(boolean\)](http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean))

Feature Matrix

[Edit on GitHub](#)

Comparison between products of the oXygen family.

The Oxygen XML Author Component was designed to provide the functionality of the standard **Author** mode and can be embedded either in a third-party standalone Java application or customized as a Java Web Applet to provide WYSIWYG-like XML editing directly in your choice of web browsers.

The Oxygen XML Web Author and Oxygen XML Web Author Component are re-implementations of the Oxygen XML Author **Author** mode user interface, based on JavaScript and HTML5. Its purpose is to enable XML editing and reviewing on your mobile devices and desktops, directly in a web browser environment. Since the interface was thinned down as much as possible, the core XML processing was moved into a Java-enabled server.

Table 11: Feature Matrix Showing Differences Between Web Author, Web Author Component, and Author Component

Feature	Oxygen XML Web Author	Oxygen XML Web Author Component	Oxygen XML Author Component
Intended audience	Reviewers and occasional contributors.	Reviewers and occasional contributors.	Content authors, technical writers.
Mobile device support	Specifically designed for mobile devices.	Specifically designed for mobile devices.	No
Compatibility with the standard version of Oxygen XML Author	Covers only editing and reviewing features.	Covers only editing and reviewing features.	100%
Text and Grid Mode	No	No	Yes
Client-side setup	Yes, with an <i>Administration</i> page.	Yes, with an <i>Administration</i> page.	Requires Java to be installed, and Java Applets to be allowed to run.
Server-side setup	Simply requires running an installer.	Requires a servlet container and performing a Maven build.	Requires a web server.
Ability to configure installation bundles	No	Yes	Yes

Oxygen XML Web Author Component

[Edit on GitHub](#)

The *oXygen SDK* includes a sample project that you can use to integrate the Oxygen XML Web Author Component.

This section describes the various ways that you can customize the Oxygen XML Web Author Component, and how to deploy it.

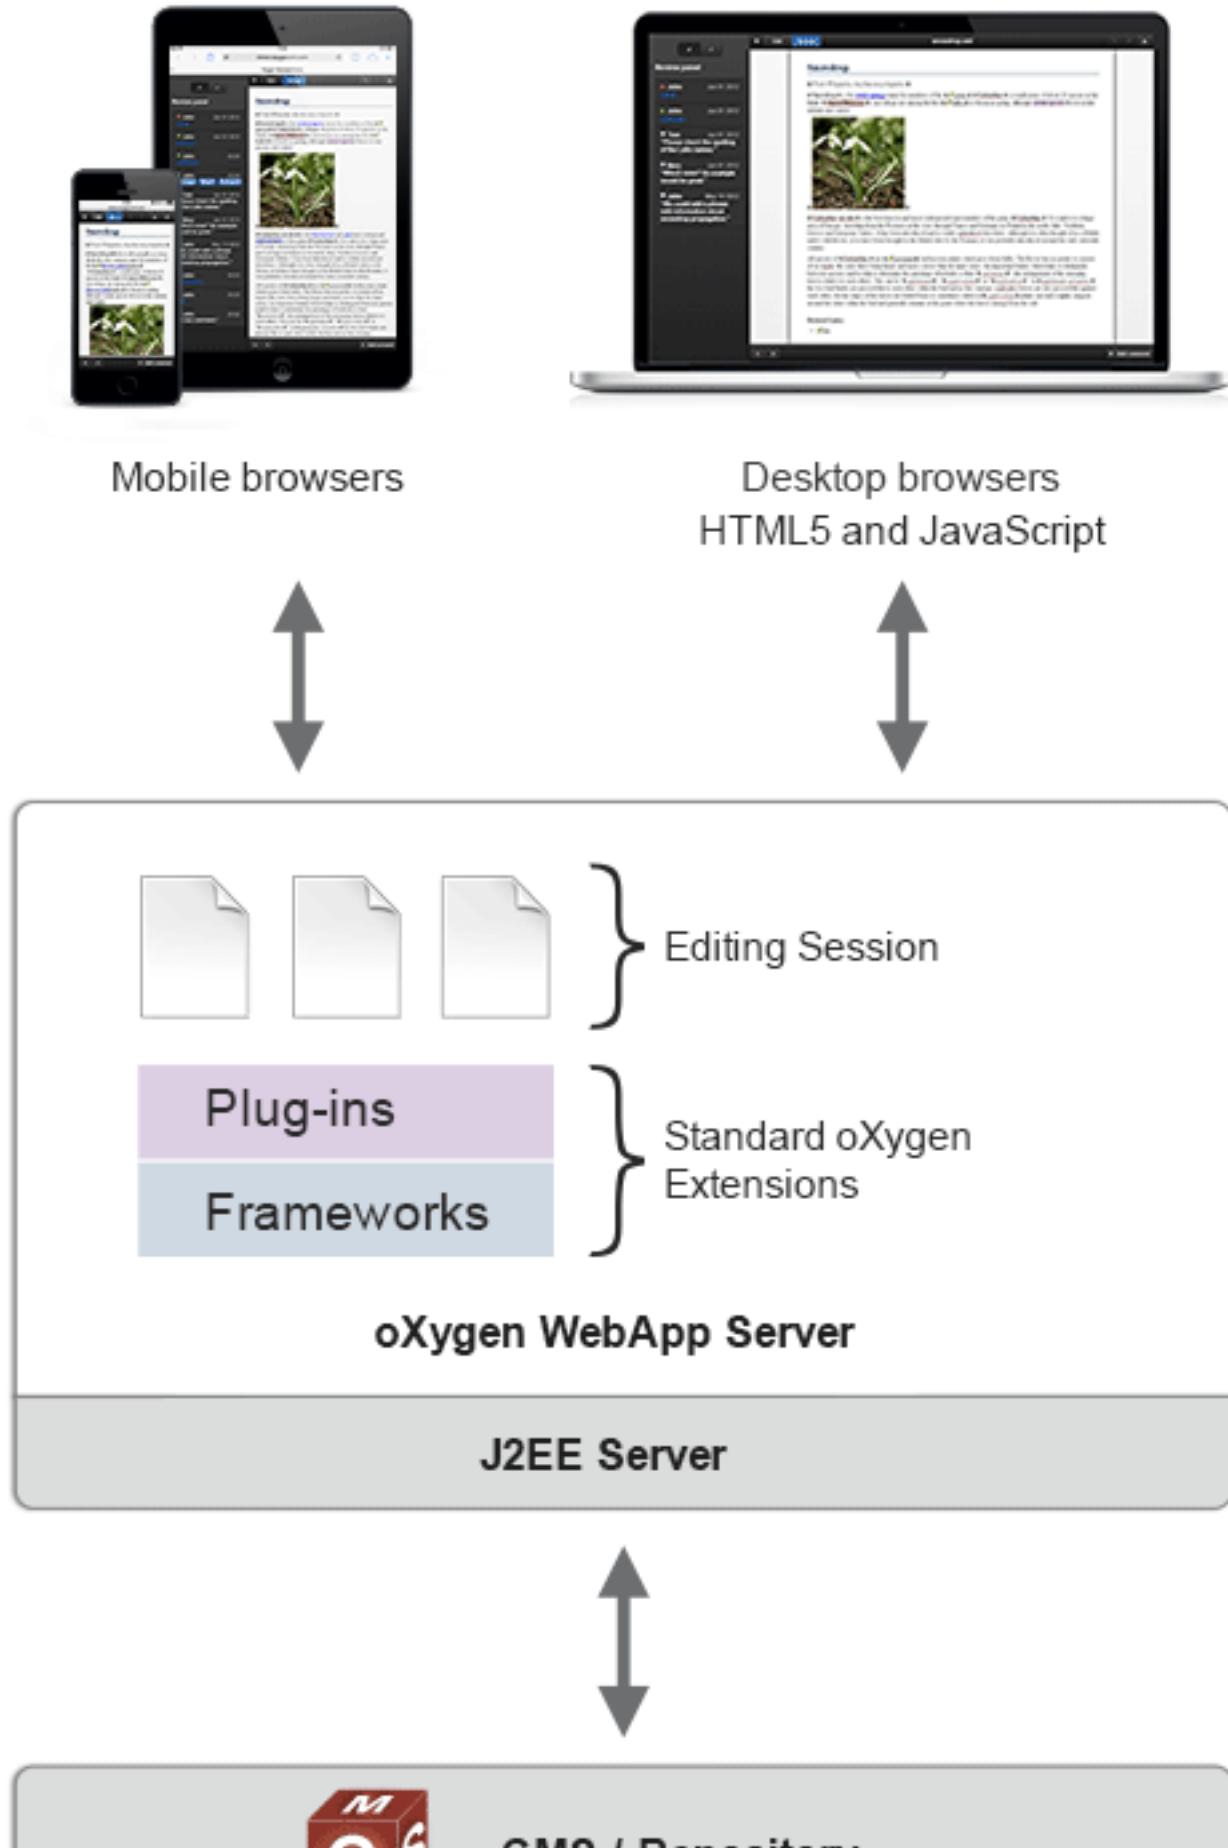

Oxygen XML Web Author Component Customization Overview

[Edit on GitHub](#)

The core of Oxygen XML Author can be deployed on a server, allowing a variety of HTML5-enabled client devices to edit and review XML content.

Oxygen XML Web Author Component is a highly versatile application that can be customized to work with any XML vocabulary and any file repository system. It uses the same extension points as the standalone version of Oxygen XML Author (frameworks, options, and plugins).

Note: The frameworks, options and plugins used by the Oxygen XML Web Author Component are similar with those used in the Oxygen XML Author product suite. This means that you can use them with a high degree of compatibility across oXygen products.

Customizing Options

[Edit on GitHub](#)

The Oxygen XML Web Author Component functionality is common with the standalone distribution of Oxygen XML Author, as they share the same options. This allows you to configure a consistent editing experience for all users.

Author Mode Options

You can modify the options in the Oxygen XML Author standalone application and then export them as an XML file by clicking the **Options > Export Global Options** menu action. The exported options file should replace the `options.xml` file from `bundle-options/oxygen-options/` folder in the [oxygen XML SDK project](#).

Oxygen XML Web Author Component Configuration File

A small number of options are specific only to the Oxygen XML Web Author Component and they can be configured in the `WEB-INF/web.xml` file. Each option is specified as a `context-param` element.

The following is a list of options and their accepted values:

Option name	Value	Description
<code>com.oxygenxml.loadBuiltInProtocolHandlers</code>	<code>false</code>	Controls whether or not the built-in handlers for HTTP/HTTPS and FTP/SFTP protocols are installed. Default value is <code>true</code> .
<code>com.oxygenxml.webapp.datastore.documentsessions</code>	<code>int</code>	Indicates the number of editing sessions stored in memory.
<code>com.oxygenxml.webapp.datastore.documentsessiontimeout</code>	<code>Duration(*)</code>	Indicates the delay after which inactive sessions are stored on disk.
<code>com.oxygenxml.webapp.datastore.documentsessionstodisk</code>	<code>int</code>	Indicates the number of inactive editing sessions that can be stored on disk.
<code>com.oxygenxml.webapp.datastore.documentsessionexpiry</code>	<code>Duration(*)</code>	Indicates the delay after which inactive sessions are discarded.

(*) - Duration is represented by an integer, followed by one of "d", "h", "m", or "s", representing days, hours, minutes, or seconds, respectively.

Here is an example of how to configure a context parameter:

```
<context-param>
    <param-name>com.oxygenxml.loadBuiltInProtocolHandlers</param-name>
    <param-value>false</param-value>
</context-param>
```

Customizing Oxygen XML Web Author Component Frameworks

[Edit on GitHub](#)

Custom documentation frameworks can be re-used between the Oxygen XML Author standalone distribution and the Oxygen XML Web Author Component.

The custom [frameworks](#) that are designed for documentation purposes (such as DITA, DocBook, or TEI) can be reused interchangeably between the Oxygen XML Author standalone distribution and the Oxygen XML Web Author Component. However, some fine-tuning might be necessary to maximize the editing experience for your content authors. The advantages of using a common framework include:

- Easier development and testing, since you can test most of the functionality in the standalone version of Oxygen XML Author using advanced tools such as the **CSS Inspector**, **CSS Editor**, or the **Document Type Association** customization dialog box.
- Uniform experience across multiple Oxygen XML Author distributions.
- Ability to reuse previously developed frameworks.

Developing and Testing a Framework Using the Oxygen XML Web Author Test Server Add-on

The following procedures assumes that you have access to an Oxygen XML Author standalone installation. This is not a mandatory requirement, but rather a way to speed up the development process.

1. Use the standalone installation of Oxygen XML Author to customize a specific framework for whatever type of documentation that you require. Modifications made to the framework are instantly visible in the standalone version of Oxygen XML Author, but if you want to preview them in the Oxygen XML Web Author Component, proceed to the next step.
2. *Run the Oxygen XML Web Author Component using the add-on distribution and test the framework.*

Note: The changes that you make to your framework will not automatically be reflected in the Oxygen XML Web Author Component if it was already running. To see the results of changes, close the server using the **Close and stop server** button and start it again.

Deploying a Framework

1. Copy your customized framework into the `bundle-frameworks/oxygen-frameworks/` folder of the *Oxygen XML SDK project*.
2. *Build the SDK project and deploy it.*

Customization Tips

- If you want to use CSS rules that only apply when the framework is used in the Oxygen XML Web Author Component, use the following media query:

```
@media oxygen AND (platform:webapp) {
  ...
}
```

- In the `web` folder of each framework, you can add a `framework.js` file that calls the *JavaScript API* to implement custom editing actions. The possible use cases include the following:
 - Create custom actions and add them to the toolbar or contextual menu. For more details, see the *JS custom action tutorial*.
 - Create custom form controls. For more details, see the *JS form control tutorial*.
 - Add more views. For more details, see the *JS custom view tutorial*.
- If the framework contains **Author** mode operations (Java implementations of the `ro.sync.ecss.extensions.api.AuthorOperation` interface), they can be enabled to be used by the Oxygen XML Web Author Component using the `ro.sync.ecss.extensions.api.WebappCompatible` annotation.

Note: **Author** mode operations that use *Java Swing* components to display a graphical interface are not compatible with the Oxygen XML Web Author Component and they should not be annotated.

- The Oxygen XML Web Author Component continuously validates the XML documents using the default validation scenarios defined at framework level. Only the validation units that have the *Automatic Validation option selected in the Edit Scenario dialog box* that is accessed by editing a scenario in the *Validation subtab* when editing a document type.

Oxygen XML Web Author Component CSS Limitations

[Edit on](#)
[GitHub](#)

The Oxygen XML Web Author Component CSS support is compatible with that offered by the standalone distribution of Oxygen XML Author, with the following exceptions:

- The `+ (direct adjacent)` and `> (child selector)` structural selectors cannot be used to match table-related elements.
- Oxygen XML Author CSS extensions are ignored on `print` media. If an Oxygen XML Author CSS extension is used on the `screen` media, it will also be used on the `print` media.
- Oxygen XML Author CSS extension `properties` and `functions` cannot be used in a rule that has a `:hover` pseudo-class in the selector. The `attr` function is also not supported in such a rule due to a lack of browser support.
- The `:hover` pseudo-class is only available for mouse-enabled platforms.
- Oxygen XML Author CSS extensions used in property values that express lengths may not behave as expected. Nevertheless, it is a good approximation.
- Oxygen XML Author synthetic DOM nodes `comment`, `reference`, `cdata`, `pi`, and `error` interfere with the `+ (direct adjacent)` structural selector. For example:

```
b + b {
  color: red;
}
```

will not match the following XML structure:

```
<root>
  <b>
    <!--comment-->
    <b>
  </root>
```

- The Oxygen XML Web Author Component does not render `non-table-row` children elements of tables and `non-table-cell` elements of `table-row` elements.
- A `width` or `height` property set on any element other than the root XML element may cause some resize handles, that cannot be disabled, to be displayed in IE11. This is also true for elements that have a `position` property with a value of `absolute` or `fixed`. For more information about this issue, see [this Microsoft Connect article](#).
- The Oxygen XML Web Author Component does not support the following:
 - `:nth-last-of-type`, `:first-of-type`, `:last-of-type`, `:nth-last-of-type` pseudo-classes.
 - `-oxy-tags-color`, `-oxy-tags-background-color`, and `-oxy-foldable` properties.
 - Subject selectors, since they are not supported by web browsers.
 - Specifying widths for inline elements.
 - Attribute selectors that use wildcard for the attribute name.
 - Oxygen XML Author CSS extensions to style `:before` and `:after` pseudo-elements, except in the `content` property.
 - CSS property values that contain the `oxy_xpath` function are not refreshed correctly.

Oxygen XML Web Author Component Editor Variable Limitations

[Edit on](#)
[GitHub](#)

The Oxygen XML Web Author Component processes Oxygen XML Author editor variables. However, the following categories of editor variables are not supported:

- Editor variables related with functionality that is not available in the Oxygen XML Web Author Component, such as `$/dbgXML` or `$/dbgXSL`.
- Editor variables related with Oxygen XML Author project location, such as `$/pdu`, `$/pd`, or `$/pn`.
- Any editor variable that displays Java Swing-based components, such as `$/ask`.

- Editor variables related with the Oxygen XML Author standalone installation directory, such as \${oxygenHome} or \${oxygenInstallDir}.

Related information

[Editor Variables](#) on page 226

Customizing Oxygen XML Web Author Component Plugins

[Edit on GitHub](#)

The Oxygen XML Web Author Component server side can be customized with a variety of plugin types.

We currently provide support for the following extension types:

- URLStreamHandler** - This extensions can be used to integrate the Oxygen XML Web Author Component with XML databases or CMS. There is an example URLStreamHandler provided in [oxygen XML SDK project](#) in the oxygen-sample-plugins/oxygen-sample-plugin-custom-protocol folder. The extension uses the `cproto` protocol to access the file system of the server and can be used as a starting point.

Note: For more details about implementing an authentication mechanism, see [Implementing a CMS Authentication Mechanism](#) on page 1374.

- WorkspaceAccess** - Most of the methods used to configure the Oxygen XML Author GUI are unavailable in theses extensions, but they can still be used, for example, to configure a `javax.xml.transform.URIResolver`.

Note: The `ro.sync.eml.workspace.api.PluginWorkspace` instance passed to the extension also implements the `ro.sync.ecss.extensions.api.webapp.access.WebappPluginWorkspace` interface and provides access to some Oxygen XML Web Author Component-specific functionality.

- WebappServlet** - This extension allows you to provide an implementation of a servlet-like interface (`ro.sync.ecss.extensions.api.webapp.plugin.WebappServletPluginExtension`) that will be dynamically loaded by the Oxygen XML Web Author Component. Your implementation will also provide the path to the location where the servlet will be exposed.
- AuthorStylesheet** - Allows you to add a stylesheet (CSS or LESS) used for rendering all XML documents.
- WebappStaticResourcesFolder** - This extension allows you to access a static resource folder. It should provide a `path` attribute (the static resources folder path relative to the plugin directory) and an `href` attribute that declares the plugin. An example of a use-case is you can use it to have the Oxygen XML Web Author Component provide icons for plugin-specific actions.

In the following example, the static resources will be available at `[OXYGEN_WEBAUTHOR_INSTALL_DIR]/plugin-resources/relative-href/path-to-file`, with the `path-to-file` being relative to the static resources folder:

```
<extension type="WebappStaticResourcesFolder" path="path-to-resource-
folder" href="relative-href"/>
```

Loading plugin-related custom JavaScript code

If your plugin needs accompanying JavaScript code to be loaded and executed on the client-side you can bundle it together with your plugin code. The Oxygen XML Web Author Component loads all files with the `.js` extension located in the `web` folder of the plugin.

Adding the Plugins in the Oxygen XML Web Author Component

If you have already developed such Oxygen XML Author plugins, they can be added in the `bundle-plugin/dropins` folder in the Maven project.

If you are developing a new Oxygen XML Author plugin you are encouraged to use as a starting point any of the existing plugins. Then you should add the resulting Maven project as a dependency (or even a sub-module) in the `oxygen-sample-plugins` module.

Public Plugin Integration Projects

Some public projects are available on github.com that can be used to help you integrate Oxygen XML Web Author Component. The following plugin projects are available:

- **Oxygen XML Web Author Component GitHub Connector** (<https://github.com/oxygenxml/webapp-github-plugin>) - This plugin enables Oxygen XML Web Author Component to open and commit files on GitHub.
- **WebDAV Server Plugin for Oxygen XML Web Author Component** (<https://github.com/oxygenxml/webapp-webdav-server>) - This project is a simple Oxygen XML Web Author Component plugin that provides a WebDAV-enabled workspace by registering the Tomcat built-in WebDAV servlet to manage a folder.
- **WebDAV Support for oXygen XML Web Author** (<https://github.com/oxygenxml/webapp-webdav-integration>)
- This project is a very simple integration of Oxygen XML Web Author Component with a WebDAV-enabled server, which can be extended with more features or can be adapted to work with any CMS.

Related tasks

[Setting Up a Development Environment for Oxygen XML Web Author Component Plugins](#) on page 1376

This procedure describes a development environment that can be used to increase your productivity in writing plugins for the Oxygen XML Web Author Component.

Related information

[Adding and Configuring Plugins](#) on page 1381

Customizing Oxygen XML Web Author Component Client Side

[Edit on GitHub](#)

Client side customization is available through a JavaScript API. Unlike the server side customization, it can be used to modify the application's GUI.

The Oxygen XML Web Author Component is an editing platform, but it is the job of the integrator to provide a way for the user to select which file is going to be edited. Afterwards, the user should be redirected to the Oxygen XML Web Author Component editing page, and the following three URL parameters specified:

- `url` - An absolute URL of the edited file.
- `ditamap` - (Optional parameter) An absolute URL taken into account only when editing a DITA file. Provides the DITA map context of the edited DITA file.
- `author` - The author name.

Suppose that the Oxygen XML Web Author Component is deployed at the following URL:

```
http://www.example.com/oxygen-sdk-sample-webapp/
```

The user (John Doe) wants to edit a file (located at `http://www.test.com/topics/topic.xml`) in the context of a DITA map (located at `http://www.test.com/map.xml`). In this case, the editing URL should be:

```
http://www.example.com/oxygen-sdk-sample-webapp/app/oxygen.html
?url=http%3A%2F%2Fwww.test.com%2Ftopics%2Ftopic.xml
&ditamap=http%3A%2F%2Fwww.test.com%2Fmap.xml
&author=John%20Doe
```

Note: The parameter values are percent encoded before being added to the editing URL.

JavaScript API Method for Loading Content

The Oxygen XML Web Author Component also offers an alternate method for loading editor content using a JavaScript plugin. The `BeforeEditorOpenedEvent` can be used for the following:

- To specify the XML content to be loaded in the editor.

- To add new actions to the action manager.
- To change the startup options for the editor. For example, you can choose whether to only load the **Review** mode editing actions or to enable full editing support (**Edit** mode editing actions).

Loading Custom JavaScript Code

To extend the functionality provided by the Oxygen XML Web Author Component, create a file called `plugin.js` and copy it in the `app` folder of the Oxygen XML Web Author Component deployment. *Alternatively, you can bundle JavaScript code with a Java Plugin.*

The `plugin.js` file can contain JavaScript code that calls the *JavaScript API* provided by the Oxygen XML Web Author Component.

Load JavaScript Code from a Framework

To load JavaScript code from a framework, put your code in the `framework.js` file (located in the `web` folder inside the particular framework folder) that calls the *JavaScript API* provided by the Oxygen XML Web Author Component.

Related information

[Customizing Oxygen XML Web Author Component Frameworks](#) on page 1366

Custom documentation frameworks can be re-used between the Oxygen XML Author standalone distribution and the Oxygen XML Web Author Component.

Oxygen XML Web Author Component How to ...

[Edit on GitHub](#)

This section includes information on how to accomplish a variety of common use cases.

Configuring Minimal File Access Permissions

[Edit on GitHub](#)

This topic includes information about configuring file permissions in relation to Oxygen XML Web Author Component.

The Oxygen XML Web Author Component requires access to the following file resources:

- *READ* access to the directory where the Oxygen XML Web Author Component is deployed.
- *READ* and *WRITE* access to the application's working directory.
- *READ* and *WRITE* access to JVM's temporary directory.

It is a good security practice to allow a component to access only the information and resources that are necessary for its purpose. In an environment that uses Apache Tomcat, you can enforce these rules following these steps:

- Start the Apache Tomcat server using the `-security` flag.
- Edit the `catalina.policy` file and add the following snippet:

```
grant codeBase "file:${catalina.base}/webapps/oxygen-webapp/-" {
    // Oxygen uses System properties for various configuration purposes.
    permission java.util.PropertyPermission "*", "read,write";
    // Oxygen custom protocols need access to network.
    permission java.net.NetPermission "*";
    permission java.net.SocketPermission "*",
    "accept,connect,listen,resolve";
    // The web framework used by Oxygen Webapp uses reflection and
    classloaders.
    permission java.lang.reflect.ReflectPermission "suppressAccessChecks";
    permission java.security.SecurityPermission "*";
    permission java.util.logging.LoggingPermission "control";
    permission java.lang.RuntimePermission "*";
```

```

// Oxygen requires these permissions to connect to a URL.
permission java.net.URLPermission "http:*", "*";
permission java.net.URLPermission "https:*", "*";
permission java.net.URLPermission "file:*", "*";

// Oxygen should be allowed to read JVM jars
permission java.io.FilePermission "${java.home}/-", "read";

// Oxygen uses the JVM's java.io.tmpdir for various file handling
tasks.
    permission java.io.FilePermission "${java.io.tmpdir}/-",
"read,write,delete";
    permission java.io.FilePermission "${java.io.tmpdir}",
"read,write,delete";

// Folder used by oXygen to deploy the plugins to.
    permission java.io.FilePermission "${oxygen.data.dir}/-",
"read,write,delete";
    permission java.io.FilePermission "${oxygen.data.dir}",
"read,write,delete";
};

// The jar that contains sandboxing code.
grant codeBase "jar:file:${catalina.base}/webapps/oxygen-webapp/WEB-INF/
lib/oxygen-sandbox.jar!/-" {
    permission java.security.AllPermission;
};
// Give all permissions to the plugins code unless otherwise instructed by
the plugin vendor.
grant codeBase "file:${oxygen.data.dir}/plugins-v18.0/-" {
    permission java.security.AllPermission;
};
// Give all permissions to the frameworks code unless otherwise instructed
by the plugin vendor.
grant codeBase "file:${oxygen.data.dir}/frameworks-v18.0/-" {
    permission java.security.AllPermission;
};

```

Note: In the previous example, in the first line, replace oxygen-webapp with the name of your deployment of the Oxygen XML Web Author Component.

Configuring File Permissions to Custom Locations

There are cases when the Oxygen XML Web Author Component needs to access files system resources, but due to security reasons, you want to prevent your users from opening them directly in the Oxygen XML Web Author Component editing page using the `file://` protocol.

You can do this by following these steps:

- Edit the `catalina.policy` file and add a line such as:

```

permission java.io.FilePermission "path/to/yourSecretDir/-",
"read,write,delete";
permission java.io.FilePermission "path/to/yourSecretDir",
"read,write,delete";

```

- Use the following system property when starting the Tomcat server:

```
-Dfile.protocol.blacklist=/path/to/yourSecretDir
```

Note: Use the value of `path.separator` system property to separate more directories. For example, under Linux, the value of `path.separator` property is a colon punctuation character `:`.

Embedding Oxygen XML Web Author Component in a CMS Page

[Edit on](#)

[GitHub](#)

Oxygen XML Web Author Component can be embedded in a CMS to offer editing functionality for documents stored in the CMS.

To embed Oxygen XML Web Author Component, load the main page (`app/oxygen.html`) in an `iframe`.

Security Restrictions

Oxygen XML Web Author Component uses cookies to enforce its licensing and to maintain the editing state of the opened documents. Some browsers block third-party cookies for security reasons. To avoid having the cookies blocked, Oxygen XML Web Author Component should be served from the same origin as the CMS host page.

Passing Parameters to the Editor

To control the editor, you can use URL parameters described in the [options section](#). To pass custom parameters, you can implement a [plugin for Oxygen XML Web Author Component](#) that contains JavaScript code to interpret those parameters.

Communicating with the Editor

To communicate with the editor, you can send messages between the host CMS page and the Oxygen XML Web Author Component page.

Browsers offer the `window.postMessage` JavaScript API that allows messages to be sent between pages. To receive the message, create a [plugin for Oxygen XML Web Author Component](#) that contains JavaScript code that listens for the messages sent by the CMS host page and uses the [Oxygen XML Web Author Component JavaScript API](#) to implement the required functionality.

Other problems

- We experienced problems if the `iframe` is hidden while loading using `display: none`. You can use `visibility: hidden` for the same purpose.
- Some XML vocabularies (for example, DITA) support cross-document links. By default, clicking on a cross-document link will open that document in the Oxygen XML Web Author Component in another browser tab. If the editor is embedded, you may want to change this behavior using the `sync.api.Editor.EventTypes.LINK_OPENED` event that is triggered on the `sync.api.Editor` instance.

Enabling File Browsing for a Custom Protocol Handler

[Edit on](#)

[GitHub](#)

This topic explains how to enable a file browsing widget that can be used for a custom protocol handler.

To allow users to insert images more easily, the Oxygen XML Web Author Component provides a file browsing JavaScript widget that can be used for any custom protocol plugin. To enable this widget, follow these steps:

1. Develop a plugin that implements the `ro.sync.exml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface. The `getURLStreamHandler` method should return an instance of `java.net.URLStreamHandler` (for example, `myHandler`).
2. `myHandler.openConnection()` should open an instance of the `ro.sync.net.protocol.FileBrowsingConnection` interface.
3. On the client-side, register the `sync.api.FileBrowsingDialog` widget as a `UrlChooser` using the following code snippet:

```
workspace.setUrlChooser(new sync.api.FileBrowsingDialog());
```

Implementing a CMS Authentication Mechanism

[Edit on GitHub](#)

This topic covers the case when you want to impose an authentication step to all users who want to edit documents in the Oxygen XML Web Author Component. This is usually required when the CMS needs authentication before granting access to a file.

The Oxygen XML Web Author Component provides both a server-side and client-side API that allows you to implement such a mechanism.

Implement CMS Authentication Mechanism

The following is a list of the basic building blocks of the authentication mechanism:

- Develop a plugin that implements the `ro.sync.eml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface. Considering the multiple user context of the Oxygen XML Web Author Component, the `getURLStreamHandler` method should return an instance of the `ro.sync.ecss.extensions.api.webapp.plugin.URLStreamHandlerWithContext` class. This class tracks the user, based on the URL connection that will be made.
- If the CMS rejects the connection attempt with a message that the user is not authenticated, you should throw a `ro.sync.ecss.extensions.api.webapp.plugin.UserActionRequiredException` exception. This exception is automatically relayed to the client-side as a `sync.api.WebappMessage` JavaScript object.
- On the client side, follow these steps:
 1. Use the `sync.api.Editor.EventTypes.CUSTOM_MESSAGE_RECEIVED` event to intercept the messages sent from the server-side.
 2. Display a dialog box to collect more authentication information from the user.
 3. Send the credentials to the server, more specifically to the `ro.sync.ecss.extensions.api.webapp.plugin.URLStreamHandlerWithContext` instance defined at step 1. For this part, you will need to implement a secure way to transmit the credentials. This can range from a simple servlet that runs in the Oxygen XML Web Author Component to an *OAuth* implementation.
 4. Retry the operation that triggered the authentication procedure.

Locating and Configuring Logs

[Edit on GitHub](#)

How to Locate Log Files in the Windows, Linux, and All Platforms Versions

The **log configuration file** can be found in: \${web-author-install-dir}/tomcat/webapps/oxygenxml-web-author/WEB-INF/log4j.properties.

The **log files** can be found at: \${web-author-install-dir}/tomcat/logs/.

Note: \${web-author-install-dir} is the directory where Oxygen XML Web Author Component is installed.

How to Locate the Logs of the WAR Version

By default, the WAR version of Oxygen XML Web Author Component sends its logs to standard output. To configure it to send logs to a file, edit the **log configuration file** that can be found at WEB-INF/log4j.properties inside the folder where the WAR file was unpacked.

Example: For Tomcat, the WAR file is unpacked in \${tomcat-dir}/webapps/.

In the log configuration file, replace the first line with:

```
log4j.rootCategory= warn, R2
```

Also replace the value of the `log4j.appender.R2.File` property with the path of the file where you want the logs to be saved.

Enabling HTTP Request Logging

To enable a detailed logging of the HTTP requests sent by Oxygen XML Web Author Component, edit the **log configuration file** and add the following lines:

```
log4j.category.org.apache.http.impl.conn=debug
log4j.category.org.apache.http.impl.client=debug
log4j.category.org.apache.http.client=debug
log4j.category.org.apache.http.wire=debug
log4j.category.org.apache.http=debug
```

Opening a File as Read-Only in Oxygen XML Web Author Component

[Edit on GitHub](#)

This topic explains how to open a file as *read-only* in Oxygen XML Web Author Component.

Note: This topic assumes that you are using a [URLStreamHandler](#) plugin to open the files in your repository.

When a file is opened, your plugin is asked to provide a `URLConnection` object that Oxygen XML Author uses to read the contents of the file.

By opening the file as read-only, the Oxygen XML Web Author Component is instructed to visually warn users that the content of the document cannot be edited. This is an alternative to having them edit the content and then receive an error when trying to check it in.

You can instruct the Oxygen XML Web Author Component to open a file as read-only by using one of the following methods:

- Implement the `java.net.URLConnection.getHeaderField(String)` method to return a value of `true` for the `oxygen_read_only` header name.
- Use a JavaScript extension that invokes an **Author** mode operation that changes the document status to read-only:

```
editor.getActionsManager().invokeOperation(
    'SetReadOnlyStatusOperation',
    {'read-only': true}
);
```

Registering Actions to Create or Open Documents for Configured Plugins

[Edit on GitHub](#)

This topic describes how you can register actions for creating and opening documents and they will appear in the Oxygen XML Web Author Component **Dashboard** for configured plugins.

The Oxygen XML Web Author Component has a user-friendly **Dashboard** and if a particular plugin registers a create or open action, then it will include sections for creating and opening documents for plugin integrations.

Register Create and Open actions for the Oxygen XML Web Author Component Dashboard

To register *Create* and *Open* actions, follow these steps:

1. [Create a plugin](#) that has a `plugin.js` file in its web folder.

2. In the plugin.js file, add code similar to the following example:

```
// The base url to browse.
var initialUrl = 'file:[PATH_TO_RESOURCE_FOLDER]';

var createAction = new sync.api.CreateDocumentAction(
    new sync.api.FileBrowsingDialog({initialUrl : initialUrl}));
createAction.setActionName('New Document');

var openAction =new sync.actions.OpenAction(
    new sync.api.FileBrowsingDialog({initialUrl : initialUrl}));
openAction.setActionName('Open Document');

var actionsManager = workspace.getActionsManager();
actionsManager.registerCreateAction(createAction);
actionsManager.registerOpenAction(openAction);
```

Note: This example will provide browsing capabilities on your local file system. More complex connectors can be implemented using our Java and [JavaScript API](#). Also, to see information for a more complex example, you can also look at our [Oxygen XML Web Author Component storage services integration project that is hosted on GitHub](#).

3. [Deploy the plugin](#) in the Oxygen XML Web Author Component.

Result: The registered *create* action will appear in the **New** section on your **Dashboard**, while a registered *open* action will appear in the **Open** section.

Setting Up a Development Environment for Oxygen XML Web Author Component Plugins

[Edit on GitHub](#)

This procedure describes a development environment that can be used to increase your productivity in writing plugins for the Oxygen XML Web Author Component.

You will need a recent Eclipse EE.

Developing a plugin for the Oxygen XML Web Author Component might require repetitive coding-testing cycle. Since the [process of building a whole SDK project](#) requires a full Maven build, the whole process might prove to be time consuming. The following procedure provide a faster alternate way of testing the plugin:

1. Setup an SDK sample project as described in the [oxygen XML SDK tutorial](#).
 2. Create a new plugin project as a sub-module of the oxygen-sample-plugins module (from the SDK) or start from one of the existing sample plugins.
 3. Follow [these instructions](#) to run the Oxygen XML Web Author Component in a Tomcat server.
 4. Look in the Tomcat logs (or in the console) for a line like "Loading plugins from: \${path}" and note the path of the plugins folder.
 5. In the plugins folder, create a sub-folder with a name of your choice (for example, myplugin).
 6. In that folder (myplugin), create a plugin.redirect file that contains the path to your plugin project (created in step 2) on a single line.
 7. Import your plugin project in Eclipse.
 - a) Click **File > Import**.
 - b) Choose **Existing Maven Project**.
 - c) Browse for the location of your plugin.
 8. Modify the plugin.xml file to add a library reference to the directory where Eclipse places the compiled output.
- With the default setup of a Maven project, this step requires that you add the following element:
- ```
<library name="target/classes/" />
```
9. You can now open a document in the Oxygen XML Web Author Component and it will automatically load your plugin.

Every time you make changes to the plugin sources, you will need to restart the Oxygen XML Web Author Component.

Once you are happy with the result, you need to add the plugin back in your SDK project and follow [these instructions](#) to perform a final testing of the project.

## Related information

[Adding and Configuring Plugins](#) on page 1381

### Sharing a Tomcat Instance

[Edit on GitHub](#)

Describes how to share a Tomcat instance between Oxygen XML Web Author Component and other applications.

If you want to share a Tomcat instance between Oxygen XML Web Author Component and another web application, the following issues need to be considered:

- Oxygen XML Web Author Component reads and sets system properties, and while we try to namespace those that are specific to Oxygen XML Web Author Component, there is no guarantee that there will not be any clashes with those set by other applications.
- You have to adapt the JVM's memory configuration to the scenario where there will be more applications competing for the same pool of memory.
- The Oxygen XML Web Author Component currently does not restart (or *reload* in Apache Tomcat terminology) correctly unless the Servlet Container is also restarted.

### Using an IIS Reverse Proxy

[Edit on GitHub](#)

Describes how to use Oxygen XML Web Author Component behind an IIS reverse proxy.

If you want to use Oxygen XML Web Author Component with IIS as a reverse proxy, follow this procedure:

1. Configure IIS to allow double escaping in URLs. See the following examples:

- For Microsoft Azure, the `applicationHost.xdt` file should contain the following:

```
<?xml version="1.0" encoding="utf-8"?>
<configuration xmlns:xdt="http://schemas.microsoft.com/XML-Document-Transform">
 <system.webServer>
 <security>

 <requestFiltering allowDoubleEscaping="true" xdt:Transform="SetAttributes(allowDo
 />
 </security>
 </system.webServer>
 </configuration>
```

- For other types, insert the following fragment inside the `applicationHost.config` file:

```
<security>
 <requestFiltering allowDoubleEscaping="true"/>
</security>
```

2. Configure Tomcat to allow escaped slashes. Append the following line in the `tomcat\conf\catalina.properties` file:

```
org.apache.tomcat.util.buf.UDecoder.ALLOW_ENCODED_SLASH=true
```

3. Set an environment variable to instruct Oxygen XML Web Author Component that the URL path is already decoded. Insert the following line in the `tomcat\bin\catalina.bat` file:

```
set "URL_DECODING_PROXY=true"
```

## Deploying Oxygen XML Web Author Component

[Edit on GitHub](#)

Describes how to deploy Oxygen XML Web Author Component.

This section includes information about deploying the Oxygen XML Web Author Component.

### Server Requirements

Even though the requirements are not very strict, you should consider the following metrics when provisioning the server for running the Oxygen XML Web Author Component:

- A processor core can handle 50 to 100 active users.
- Editing an average DITA file consumes about 10MB of RAM. However, the Oxygen XML Web Author Component includes a *configurable caching mechanism* that stores the oldest files to disk when memory resources become low.

### Software Requirements

On the server side, the following applications are supported:

- Servlet container:
  - Apache Tomcat 7 or 8
  - WildFly 9.0.2.Final
  - IBM WebSphere Liberty 8.5.5.8
- Java Virtual Machine 1.7 or newer (if started in security mode, Java 1.8 is required).

### Important Deployment Notes

- All Oxygen XML Web Author Component configuration files are stored in a single folder that can be shared amongst multiple servers in a distributed deployment. It can also be reused when you update the server to a new version. The location of this folder is defined by the `oxygen.data.dir` system property. If not set, a folder that is private to the application is used.

**Note:** If the Oxygen XML Web Author Component is started in security mode, you must set the `oxygen.data.dir` system property.

**Note:** WildFly and WebSphere will erase the folder with configuration files upon restart. For these servers you must set the `oxygen.data.dir` system property to a folder that persists across restarts.

- It is recommended that you install the Oxygen XML Web Author Component in its own instance of Tomcat, without sharing it with other applications.
- If you need to reload the application, you need to restart the server.

### Related information

[Setting up an HTTP Floating License Server](#) on page 55

Setting up the floating license server as an HTTP server.

### Licensing

[Edit on GitHub](#)

How to license Oxygen XML Web Author Component.

The Oxygen XML Web Author Component uses a floating license model, where the license key is stored on a server and individual users consume license seats from a common pool.

## How it works

The license key contains the maximum number of users that can simultaneously access the Oxygen XML Web Author Component at any given moment. After a period of inactivity, the license allocated to that user becomes available.

While no personal information is sent to the server, a cookie that identifies the user is auto-generated. Note that the use of two different browsers (for example, Firefox and Chrome) by a single user, will consume two floating licenses. However, using two or more windows or tabs of the same browser, consumes a single floating license.

## Licensing

Follow these steps to license a deployment of the Oxygen XML Web Author Component:

1. *Install a floating license server.* You can deploy the HTTP license server in the same Tomcat server, alongside with Oxygen XML Web Author Component.
2. Configure the license server connection.

**Note:** Information about your license will be displayed in the **About** section of the Oxygen XML Web Author Component **Dashboard**.

## Configuring the License Server Connection

For information on configuring the license server connection with a simple GUI, see *Configuring the License Server Connection* on page 1381.

## Bundling the License Server Configuration in the Oxygen XML Web Author Component

If you need to build the Oxygen XML Web Author Component with the license configuration bundled inside, use this method.

The connection to the server should be configured in a file located at `WEB-INF/license.properties`. It should have the following keys:

### **licensing.server.type**

Type of licensing server. Set it to `http`.

### **licensing.server.url**

The URL of the license server.

### **licensing.server.user**

The user name used for the license server.

### **licensing.server.password**

The password used for the license server.

### **licensing.server.encryptedPassword**

This is an alternative to **licensing.server.password**. The value should be the encrypted password.

To encrypt the password, setup the *SDK project* and run the following command in the `oxygen-sample-webapp` module:

```
mvn exec:java -Dexec.mainClass="com.oxygenxml.webapp.EncryptionTool" -Dexec.args="encryptionKey passwd"
```

where `passwd` is the password and `encryptionKey` is the encryption key used to encrypt the password.

A configuration file might look like this:

```
licensing.server.type=http
licensing.server.url=http://example.com:8080/oxygenLicenseServlet/license-servlet
```

```
licensing.server.user=admin
licensing.server.password=*****
```

## Administration Page

[Edit on  
GitHub](#)

Details about the Administration Page.

Oxygen XML Web Author Component includes a user-friendly **Administration Page** that helps you to configure your instance of the Oxygen XML Web Author Component. You can use this page to configure your **License**, **Plugins**, **Frameworks**, and **Proxy** settings. You need to enable the **Administration Page** before you can access it, but once you do, you can access it from a link on the top-right corner of the **Dashboard** page.

### Enabling the Administration Page

To enable the **Administration Page**, follow these steps:

1. Configure Tomcat to use a security Realm element. Refer to the [Tomcat Documentation](#) for more information.
2. Edit the `tomcat-users.xml` file from your Tomcat installation and configure a user for the `admin` role.
3. Your Administration Page is now enabled. To access it, go to the following URL:

```
http://example.com:8080/oxygen-webapp/app/admin.html
```

where `http://example.com:8080/oxygen-webapp` is the URL of your instance of the Oxygen XML Web Author Component.

4. You will be prompted for authentication credentials and you will enter those configured in the steps above.

### Accessing the Administration Page

You can easily access the **Administration** page from a link on the **Dashboard** page.

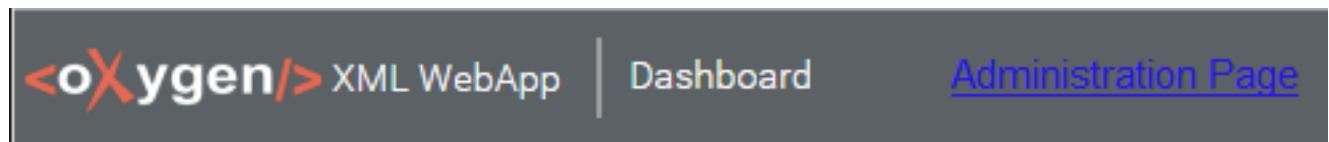

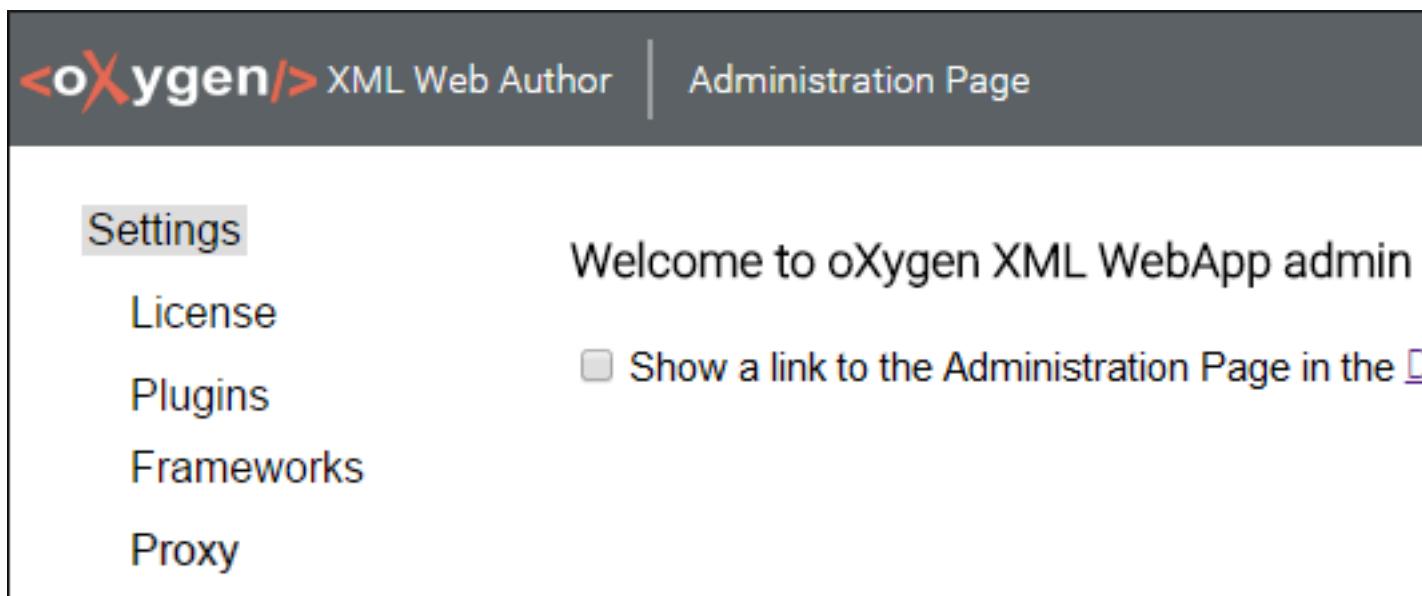

Figure 372: Administration Page Link

### How to Hide the Administration Page Link

You can hide the **Administration Page** link from regular users by disabling the **Show a link to the Administration Page** option that is available in the **Settings** section of the **Administration Page**.

**Figure 373: Show Administration Page Link Option**

### Types of Settings in the Administration Page

You can click on any of the listed types of settings to access configurable options for each type. The **Administration Page** allows you to configure settings for the following:

- **License** - Allows you to configure a license server connection.
- **Plugins** - Allows you to add and configure plugins for your Oxygen XML Web Author Component.
- **Frameworks** - Allows you to add or remove frameworks for your Oxygen XML Web Author Component.
- **Proxy** - Allows you to configure the proxy settings for your Oxygen XML Web Author Component.

#### Configuring the License Server Connection

[Edit on GitHub](#)

To configure the license server connection for your Oxygen XML Web Author Component, follow these steps:

**Note:** This method only applies to *the oXygen HTTP Floating License Server*.

1. Go to your [Administration Page](#).
2. Select **License**.
3. Enter the server URL and your authentication credentials for the license server.
4. Click **Submit**.

You should see a message that informs you that the license configuration was successfully applied.

#### Adding and Configuring Plugins

[Edit on GitHub](#)

Oxygen XML Web Author Component includes a user-friendly **Administration Page** that helps you to configure your instance of the Oxygen XML Web Author Component.

#### Add a New Plugin

To add a new plugin to the Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Plugins**.
3. Click **Add Plugin** and choose a plugin file to upload.

4. Click **OK** to upload the file. The plugin should appear in the list on this page.
5. Once you are finished with all of your changes, restart the server.

## Enable or Disable a Plugin

To enable or disable a plugin, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Plugins**.
3. Click the **disabled** button to enable the plugin, or the **enabled** button to disable it.
4. Once you are finished with all of your changes, restart the server.

## Configure a Plugin

If the plugin can be configured, a  **Configure** icon is displayed next to its name in the [Administration Page](#). To configure the plugin, click the icon and follow the instructions.

## Delete a Plugin

To delete a plugin from your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Plugins**.
3. Find the plugin you want to delete and click the  **Delete the plugin** button on the right side of its name.
4. Restart the server to apply the changes.

## Creating a Plugin Configuration Page

[Edit on GitHub](#)

To create a configuration page for a plugin that does not already have the  **Configure** icon displayed in the [Administration](#) page, follow these steps:

1. Register a `WebappServlet` extension type with a `role` attribute set to `config` in your `plugin.xml` file, as in the following example:

```
<extension type="WebappServlet" role="config" class="com.example.MyPluginConfigExtens>
```

The `class` attribute value should point to an extension of the `PluginConfigExtension` class.

2. When extending the `PluginConfigExtension` class, consider the following notes:

- Implement the `getOptionsForm` method to return an HTML form and make sure that contains inputs with the `name` attribute the same as the option you want to configure.
- Implement the `getOptionsJson` method to return a JSON string that contains the options that you want to make available to the JavaScript code. They will be accessible in your plugin JavaScript code, using the `sync.options.PluginsOptions.getClientOption(optionName)` method.

**Note:** The JSON should only contain key values, where values is of the type `string | number | boolean` with no arrays or other objects.

**Tip:** You should not include any sensitive information (e.g. OAuth secrets) in the options returned by this method.

- Implement the `getPath` method to return a non-empty string that represents the path for which this extension will be served.

For example:

```
{webapp-context}/plugins-dispatcher/RESULT_OF_GETPATH
```

- If you need to override the `init` method, make sure you call `super.init()`. Otherwise, options will not be saved to disk and will be lost when you restart the application.
- If you need to override any of the `doPut`/`doDelete` methods, make sure you call the `saveOptions` method at the end to save the options to disk.
- If you need to override the `doGet` method, make sure it responds with the result of `getOptionsForm` for header `Accept=text/html`, and with the result of `getOptionsJson` when called with header `Accept=application/json`. Use the `getOption` or `getDefaultOptions` methods to access the current or default options.

**Tip:** For an implementation example, you can look at `com.oxygenxml.sdksamples.github.GithubPluginConfigExtension` in the [webapp-github-plugin project](#).

**Result:** A  **Configure** icon is now displayed next to its name in the **Administration** page.

#### Related information

[Adding and Configuring Plugins](#) on page 1381

## Adding or Removing a Framework

[Edit on GitHub](#)

### Add a New Framework

To add a new framework to your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Frameworks**.
3. Click **Add Frameworks** and choose a framework file to upload.
4. Click **OK** to upload the file. The framework should appear in the list on this page.
5. Once you are finished with all of your changes, restart the server.

### Delete a Framework

To delete a framework from your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Frameworks**.
3. Find the framework you want to delete and click the  **Schedule for deletion** button on the right side of its name.
4. Restart the server to apply the changes.

## Configuring Proxy Settings

[Edit on GitHub](#)

### Configure Proxy Settings for Oxygen XML Web Author Component

To configure the proxy setting for your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Proxy**.
3. Specify how HTTP(S) connections go through the proxy server. You can choose between the following:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.
- **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

Depending on the option you choose, you can configure the following additional options:

<b>Web Proxy (HTTP/HTTPS) section</b>	<b>Address</b>	The address of the proxy server used for manual configurations.
	<b>Port</b>	The port of the proxy server used for manual configurations.
	<b>No proxy for</b>	Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, myhost.example.com) or as a domain name (for example, example.com). Use a comma to separate multiple hosts.
	<b>User</b>	The user name for authentication with the proxy server.
	<b>Password</b>	The password for authentication with the proxy server.
	<b>Address</b>	The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.
	<b>Port</b>	The port of a SOCKS proxy that all connections will pass through.

4. Click **Apply** to accept your changes.

## Setting up a *Load-Balanced Server*

[Edit on GitHub](#)

Describes the required setup for scaling a deployment to a larger number of users.

To scale a deployment to a larger number of users and to increase the availability, Oxygen XML Web Author Component can be deployed on a set of *load-balanced* servers. This topic describes the required setup for such a scenario.

### Configure Session Stickyness

Every Oxygen XML Web Author Component server keeps the state of the edited documents in memory for performance reasons. This implies that every user should connect to the same back-end server for the duration of an editing session. To achieve this result in a *load-balanced* setting, you should enable **session stickyness**.

### Configure Server Health Checks

To detect unhealthy servers, Oxygen XML Web Author Component offers a health check REST API. The endpoint has the following interface:

<b>URL</b>	rest-public/status
<b>Response status code</b>	200 for a healthy server and 503 for an unhealthy server.
<b>Response body</b>	For an unhealthy server, the response body contains a text description of the problem.

### Configure the License Server

All Oxygen XML Web Author Component servers can use the same pool of floating licenses. To this end, they all need to be *configured to use the same license server*.

### Share Options Between All Instances

The configuration options are stored in the file system in a directory that can be changed using the `oxygen.data.dir` system property. In order for all instances to use the same options, `oxygen.data.dir` should point to the same directory on a shared file system.

## Feature Matrix

[Edit on GitHub](#)

Comparison between products of the oXygen family.

The Oxygen XML Author Component was designed to provide the functionality of the standard **Author** mode and can be embedded either in a third-party standalone Java application or customized as a Java Web Applet to provide WYSIWYG-like XML editing directly in your choice of web browsers.

The Oxygen XML Web Author and Oxygen XML Web Author Component are re-implementations of the Oxygen XML Author **Author** mode user interface, based on JavaScript and HTML5. Its purpose is to enable XML editing and reviewing on your mobile devices and desktops, directly in a web browser environment. Since the interface was thinned down as much as possible, the core XML processing was moved into a Java-enabled server.

**Table 12: Feature Matrix Showing Differences Between Web Author, Web Author Component, and Author Component**

Feature	Oxygen XML Web Author	Oxygen XML Web Author Component	Oxygen XML Author Component
Intended audience	Reviewers and occasional contributors.	Reviewers and occasional contributors.	Content authors, technical writers.
Mobile device support	Specifically designed for mobile devices.	Specifically designed for mobile devices.	No

<b>Feature</b>	<b>Oxygen XML Web Author</b>	<b>Oxygen XML Web Author Component</b>	<b>Oxygen XML Author Component</b>
Compatibility with the standard version of Oxygen XML Author	Covers only editing and reviewing features.	Covers only editing and reviewing features.	100%
<b>Text and Grid Mode</b>	No	No	Yes
Client-side setup	Yes, with an <i>Administration</i> page.	Yes, with an <i>Administration</i> page.	Requires Java to be installed, and Java Applets to be allowed to run.
Server-side setup	Simply requires running an installer.	Requires a servlet container and performing a Maven build.	Requires a web server.
Ability to configure installation bundles	No	Yes	Yes

- [\*Multiple Files\*](#)
- [\*Canonicalizing Files\*](#)
- [\*Signing Files\*](#)
- [\*Verifying Signature\*](#)
- [\*Large File Viewer\*](#)
- [\*Hex Viewer\*](#)
- [\*Standalone SVG Viewer\*](#)
- [\*Compare Files\*](#)
- [\*Compare Directories\*](#)
- [\*Syncro SVN Client\*](#)
- [\*External Tools\*](#)

This chapter presents the various tools that are included in Oxygen XML Author.

Oxygen XML Author includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools.

## Refactoring XML Documents

[Edit on GitHub](#)

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

### XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project** view.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view.

**Note:** The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that are used also appear in the **Refactoring** submenu of the contextual menu in the **Project** view and the **DITA Maps Manager**.

### XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

#### Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

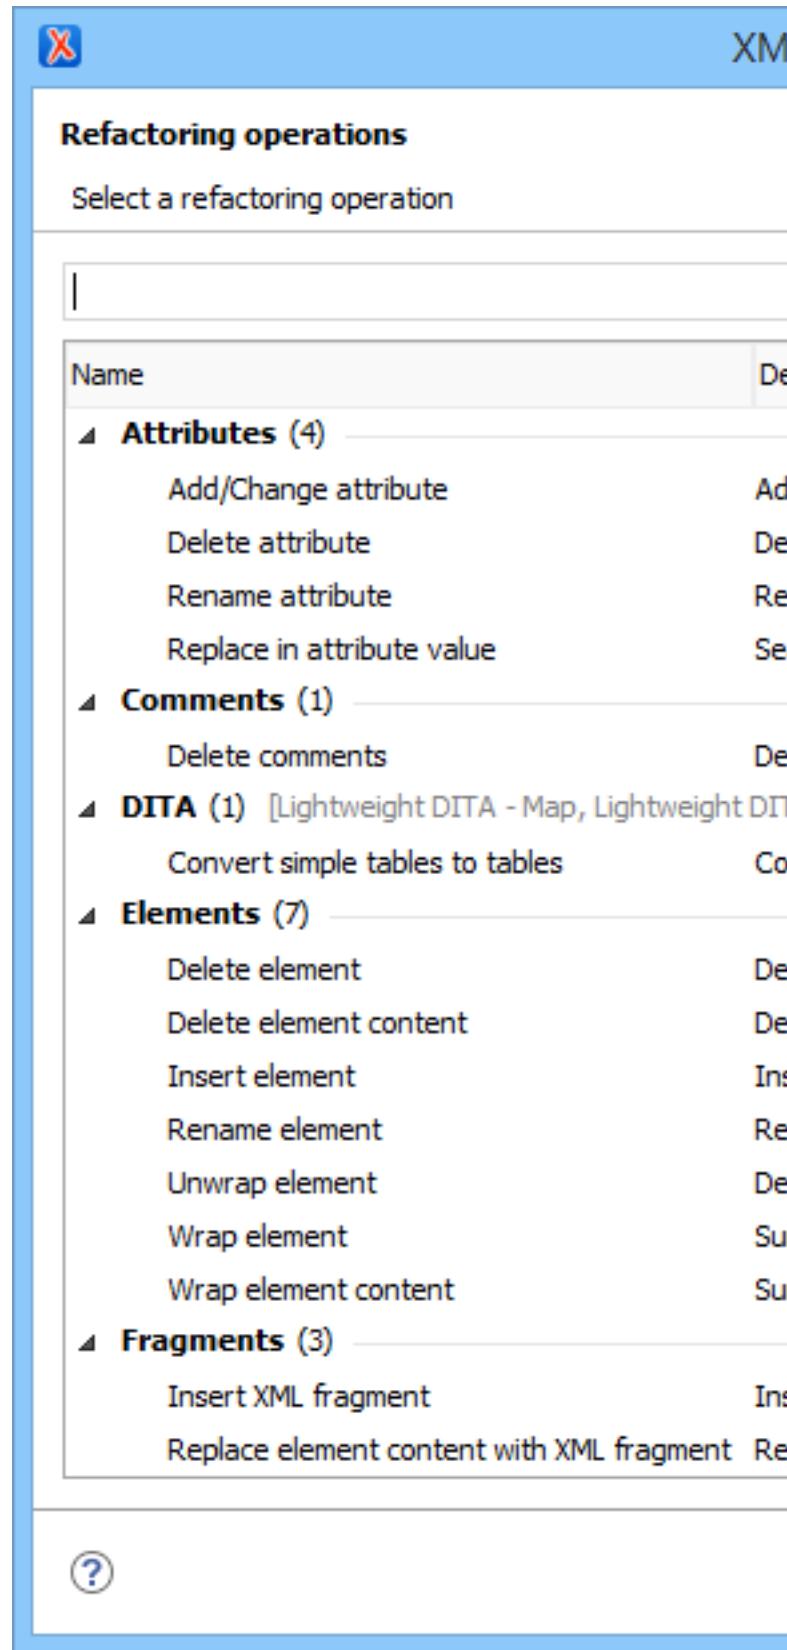

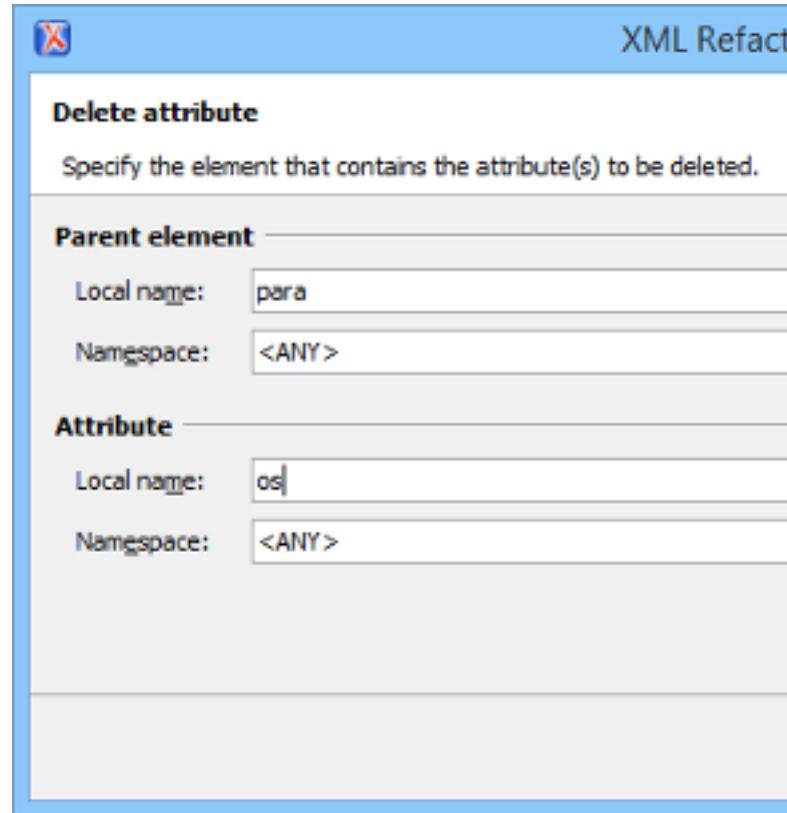

Figure 374: XML Refactoring Wizard

## Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

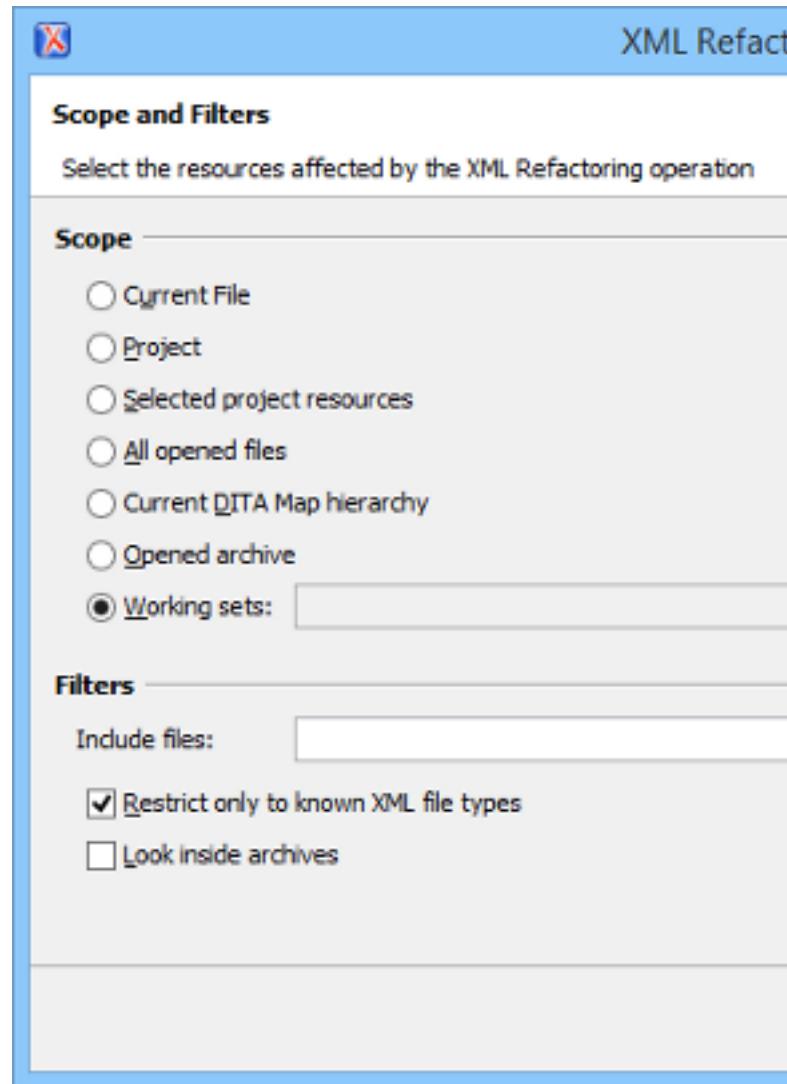

**Figure 375: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)**

## Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map hierarchy, etc.) or you can define your own set of resources by creating a working set.

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When enabled, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When enabled, the resources inside archives will also be affected.

**Figure 376: XML Refactoring - Scope and Filters Wizard Page**

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

**Note:** It is recommended that you use the **Preview** button to review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:** After clicking the **Finish** button, the operation will be processed and Oxygen XML Author provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

## Predefined Refactoring Operations

[Edit on GitHub](#)

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:** Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:

## Refactoring Operations for *Attributes*

### Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
  - **Value** - The value for the affected attribute.
- **Options** section
  - You can choose between one of the following options for the **Operation mode**:
    - **Add the attribute in the parent elements where it is missing**
    - **Change the value in the parent elements where the attribute already exists**
    - **Both**

### Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

### Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

### Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
  - **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
  - **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
  - **Find** - The text fragments to find. You can use Perl-like regular expressions.
  - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

## Refactoring Operations for *Comments*

### Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

## Refactoring Operations for *Elements*

### Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

### Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

### Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
  - **Local name** - The local name of the element to be inserted.

- **Namespace** - The namespace of the element to be inserted.
- **Location** section
  - **XPath**- An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  - **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

### Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

### Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

### Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element*.
  - **Namespace** - The namespace of the *Wrapper element*.

### Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
  - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

## Refactoring Operations for *Fragments*

### Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
- **Location** section
  - **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  - **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

### Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

### Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

## Additional Notes

**Note:** There are some operations that allow <ANY> for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO\_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

**Note:** Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the *Options > Preferences > XML > XSLT-FO-*

[XQUERY > XPath](#) page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

## Storing and Sharing Refactoring Operations

[Edit on GitHub](#)

Oxygen XML Author scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a *framework* you are customizing.
- Any folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Refactoring**, and specify the same folder in the **Load additional refactoring operations from text box**.

**Note:** If you share a project with your team, you can also share the custom operation by doing the following: Then by doing the following:

1. Save the custom operation in a folder that is part of your project.
  2. Switch the **XML Refactoring** option page to project level:
    - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**.
    - b. Select **Project Options** at the bottom of the dialog box.
  3. In the **Load additional refactoring operations from text box**, use the \${pd} editor variable so that the folder path is declared relative to the project.
- A folder specified by the [XML Refactoring Operations Plugin Extension](#).
  - The refactoring folder from the Oxygen XML Author installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

### Sharing Refactoring Operations

The purpose of Oxygen XML Author scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the refactoring operations to other resources, such as frameworks or projects.

After storing operations, you can share them with other users by sharing the resources.

## Localizing XML Refactoring Operations

[Edit on GitHub](#)

Oxygen XML Author includes localization support for the XML refactoring operations.

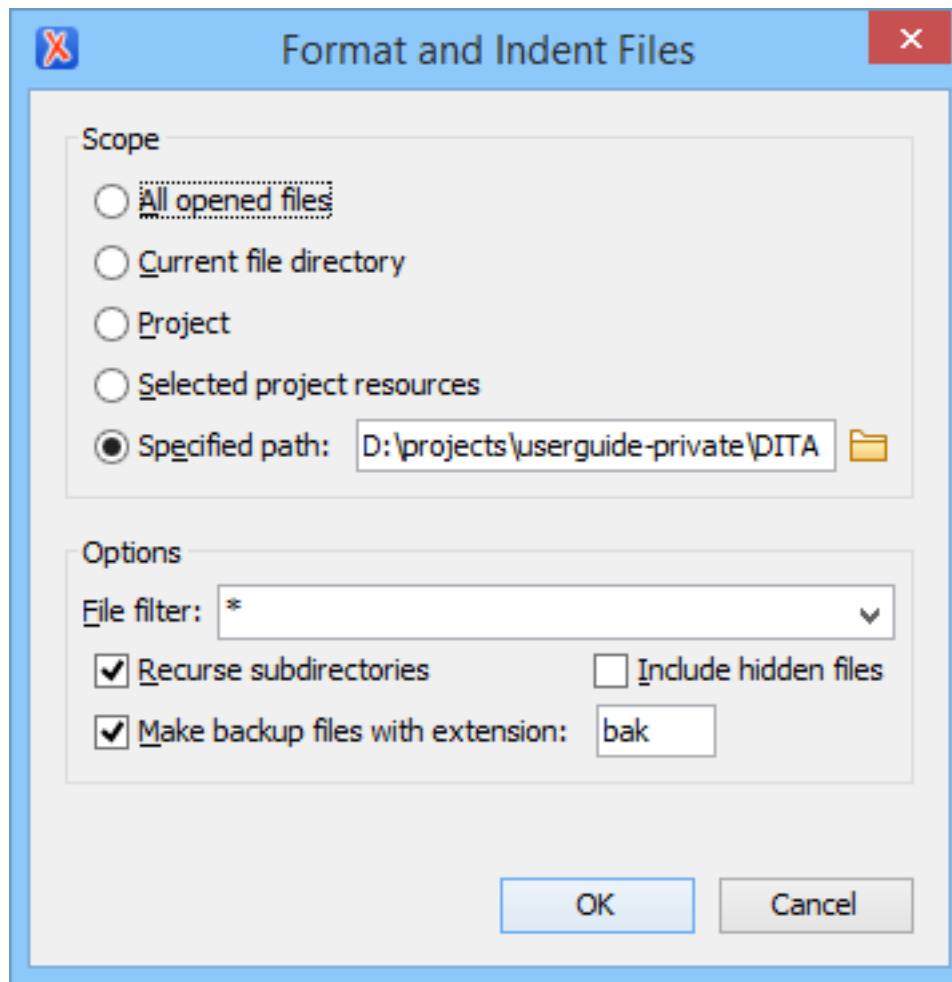

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

## Format and Indent (Pretty Print) Multiple Files

[Edit on GitHub](#)

Oxygen XML Author provides support for formatting and indenting (*pretty printing*) multiple files at once. This action is available for any document in XML format, as well as for CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project** view or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

**Figure 377: Format and Indent Files Dialog Box**

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty print* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - *Pretty prints* the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the *pretty print* is also performed in the hidden files.
- **Make backup files with extension** - When enabled, Oxygen XML Author makes backup files of the modified files. The default extension is **.bak**, but you can change the extension as you prefer.

## Canonicalizing Files

[Edit on GitHub](#)

You can select the canonicalization algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

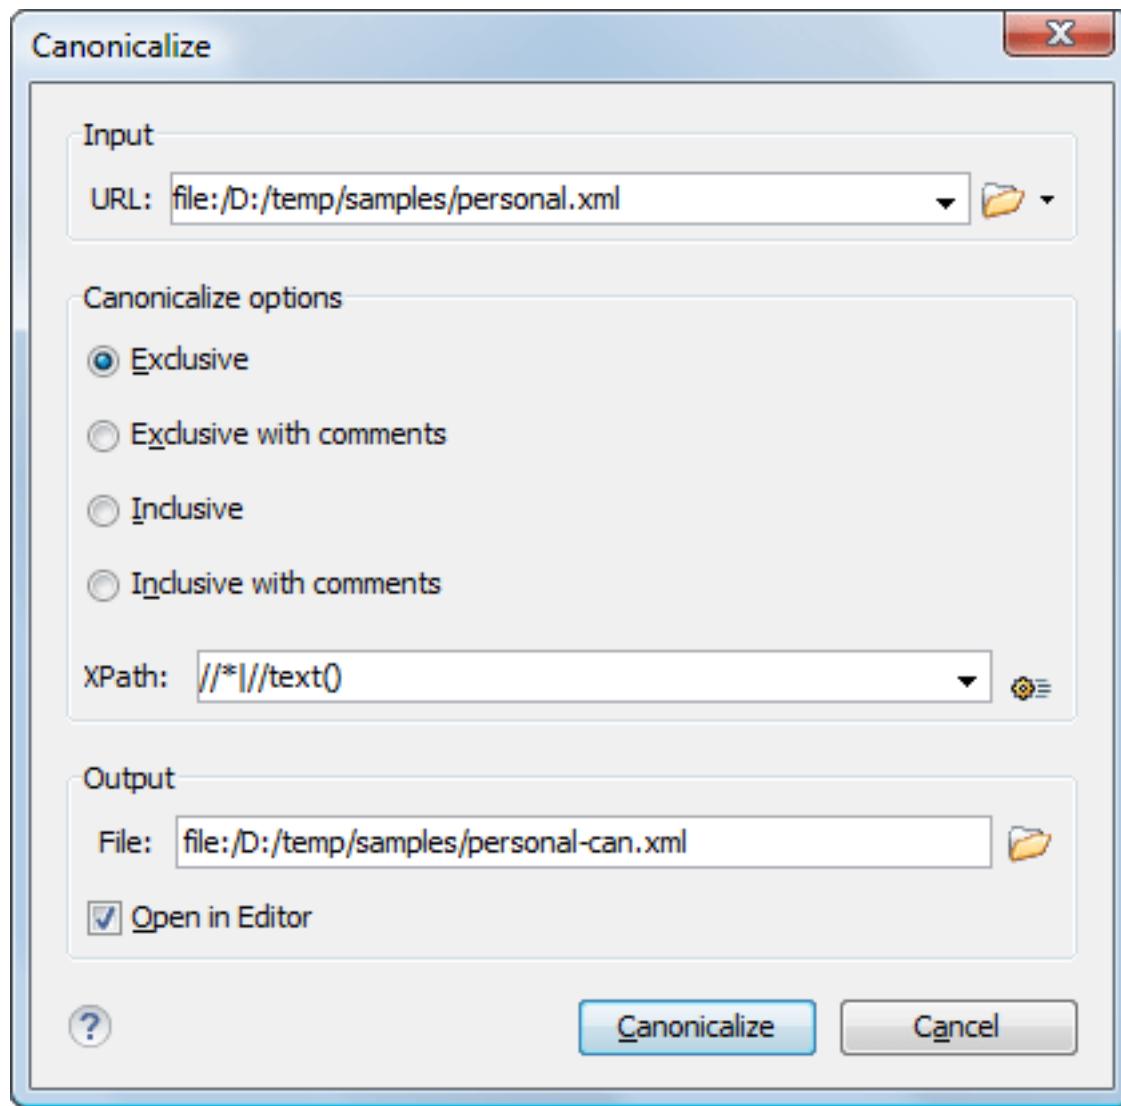

Figure 378: Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

**Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in the editor.

[Digital Signatures Overview](#) on page 655

## Signing Files

[Edit on GitHub](#)

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

**Figure 379: Signature Settings Dialog Box**

The following options are available:

**Note:** If Oxygen XML Author could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page](#) where you can configure a valid certificate.

**! Could not obtain a valid certificate. You must configure a valid certificate.**

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.

- **Transformation Options** - See the [Digital Signature Overview](#) section for more information about these options.
  - **None** - If selected, no canonicalization algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

**Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

  - **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
  - **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) for more information.
- **Append KeyInfo** - If this option is checked, the `ds:KeyInfo` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in Oxygen XML Author.

[Edit on GitHub](#)

## Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

## Large File Viewer

[Edit on GitHub](#)

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an *out of memory* error (**OutOfMemoryError**) that would require either increasing the Java heap memory with the -Xmx startup parameter or decreasing the total number of lines in the file.

The powerful **Large File Viewer** is available from the **Tools** menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing the opened document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the opened file is XML, the encoding used to display the text is detected from the XML prolog of the file. For other file types, the encoding is taken from the Oxygen XML Author options. See [Encoding for non XML files](#).

The screenshot shows the 'Large File Viewer - Othello.xml' window. The menu bar includes File, Edit, Find, and Help. The main content area displays the XML code for 'The Tragedy of Othello, the Moor of Venice'. The XML structure includes sections for PLAY, FMD, PERSONAE, and various character descriptions. The status bar at the bottom shows the file path 'D:\...', the character offset 'U+0000', and the line number '1:1'.

```

<?xml version = "1.0" encoding = "UTF-8"?>
<PLAY>
 <TITLE>The Tragedy of Othello, the Moor of Venice</TITLE>
 <FMD>
 <P>Text placed in the public domain by Moby Lexical Tools, 1992.</P>
 <P>SGML markup by Jon Bosak, 1992-1994.</P>
 <P>XML version by Jon Bosak, 1996-1998.</P>
 <P>This work may be freely copied and distributed worldwide.</P>
 </FMD>
 <PERSONAE>
 <TITLE>Dramatis Personae</TITLE>
 <PERSONA>DUKE OF VENICE</PERSONA>
 <PERSONA>BRABANTIO, a senator.</PERSONA>
 <PERSONA>Other Senators.</PERSONA>
 <PERSONA>GRATIANO, brother to Brabantio.</PERSONA>
 <PERSONA>LODOVICO, kinsman to Brabantio.</PERSONA>
 <PERSONA>OTHELLO, a noble Moor in the service of the Venetian state.</PERSONA>
 <PERSONA>CASSIO, his lieutenant.</PERSONA>
 <PERSONA>IAGO, his ancient.</PERSONA>
 <PERSONA>RODERIGO, a Venetian gentleman.</PERSONA>
 <PERSONA>MONTANO, Othello's predecessor in the government of Cyprus.</PERSONA>
 <PERSONA>Clown, servant to Othello. </PERSONA>
 </PERSONAE>

```

**Figure 380: Large File Viewer**

**Large File Viewer** components:

- The menu bar provides menu driven access to all the features and functions that are available in **Large File Viewer**:

**File > Open**

Opens files in the viewer (also available in the contextual menu).

**File > Exit**

Closes the viewer.

**Edit > Copy**

Copies the selected text to clipboard (also available in the contextual menu).

**Find > Find**

Opens a reduced **Find** dialog box that provides some basic search options, such as:

- **Case sensitive** - When checked, operations are case-sensitive.
- **Regular Expression** - When checked, allows you to use any regular expression in *Perl-like syntax*.
- **Wrap around** - Continues the find operation from the start/end of the document after reaching the end/, depending on whether the search is in forward or backward direction.

**Help > Help**

Provides access to the User Manual.

- The status bar provides information about the current opened file path, the Unicode representation of the character at cursor position and the line and column in the opened document where the cursor is located.

**Attention:** For faster computation the **Large File Viewer** uses a fixed font (plain, monospace font of size 12) to display characters. The font is *not* configurable from the [Preferences page](#).

**Tip:** The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

## Hex Viewer

[Edit on GitHub](#)

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the **Hex Viewer** that is available on the **Tools** menu. It has two panels: the characters are rendered in the right panel and the bytes of each character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

Hex Viewer D:\Projects\samples\docbook\v5\sample.xml

**Figure 381: Hex Viewer**

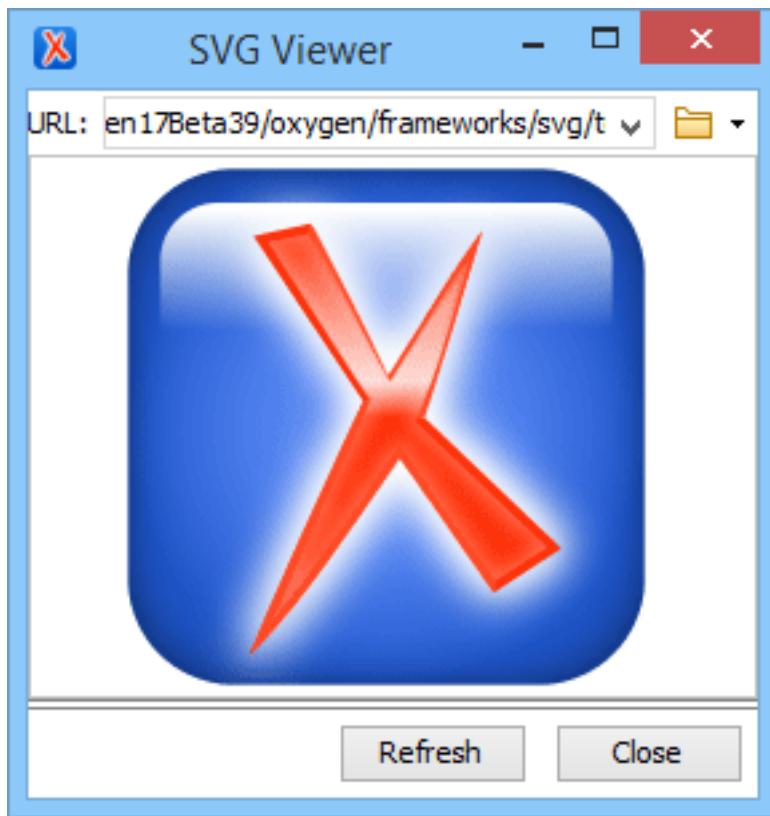

To open a file in **Hex Viewer** use the **File > Open** action. Alternatively, you can drag a file and drop it in the **Hex Viewer** panel.

## Standalone SVG Viewer

[Edit on GitHub](#)

Oxygen XML Author includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

**Figure 382: SVG Viewer**

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project** view and selecting **Open with > SVG Viewer**.

#### **Actions Available in the SVG Viewer**

The following actions are available in the **SVG Viewer**:

##### **Zoom in**

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

##### **Zoom out**

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

##### **Rotate**

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.

- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

## Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

## Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

## Pan

To pan an image, **click and drag** the image with your mouse.

[SVG 1.2 Rendering Issues](#) on page 1573

## Compare Files

[Edit on GitHub](#)

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffFiles.exe`).

**Figure 383: Compare Files Tool**

### Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

#### Compare Files

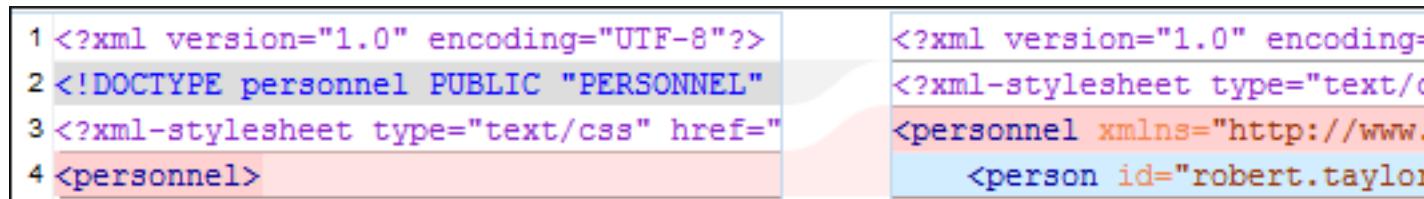

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the  **Browse** drop-down menu.

**Step Result:** The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the  **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
4. You can also use the  **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <!DOCTYPE personnel PUBLIC "PERSONNEL"
3 <?xmlstylesheet type="text/css" href="
4 <personnel>
```

**Figure 384: Two-Way Differences**

### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

### Compare Fragments

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the  **Close (Ctrl + W (Command + W on OS X))** button, before pasting the fragments. If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

### Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

### Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

 **Append left change to right and Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

 **Copy change from left to right and Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

 **Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

## Two-Way Diff Algorithms

Oxygen XML Author offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the [New](#) dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

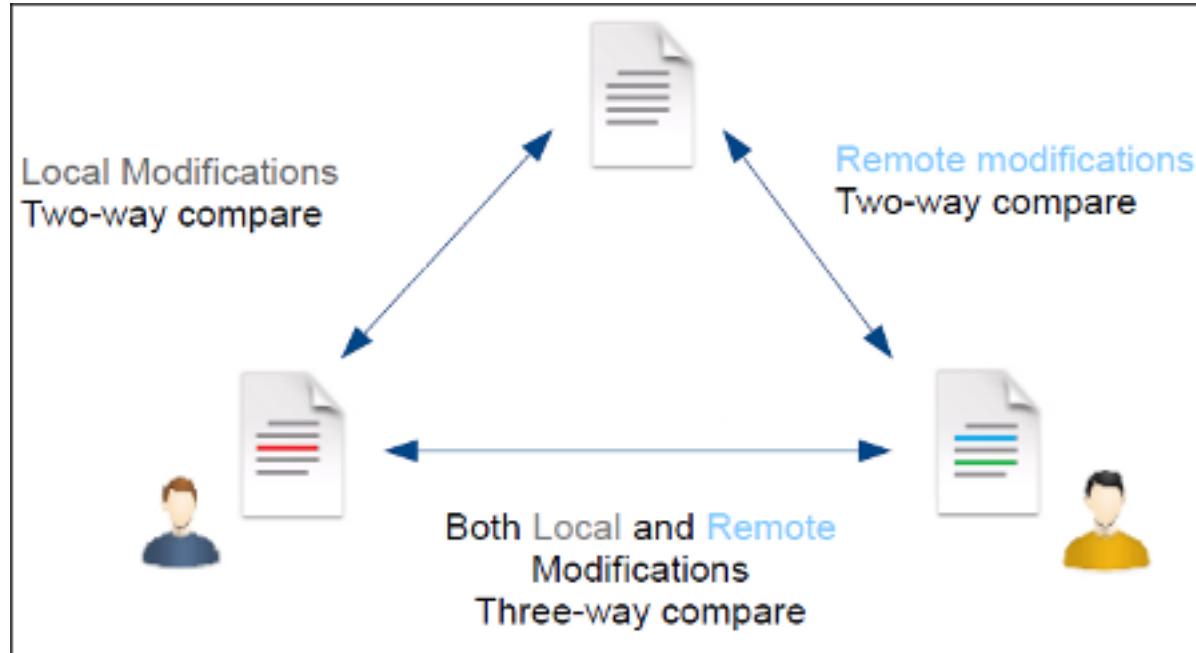

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The < character
  - The /> sequence of characters
  - The name of an attribute inside an XML tag
  - The = sign
  - The " character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

## Three-Way Comparisons

Oxygen XML Author also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, a remote change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

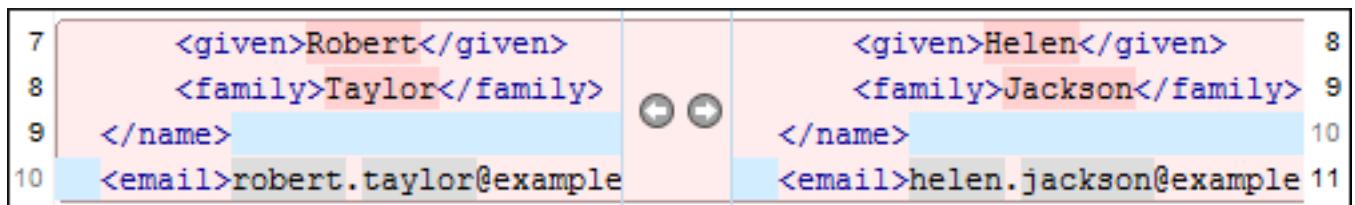

**Figure 385: Three-Way Comparison**

### Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.  
**Step Result:** The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.
2. Click the **Three-Way Comparison** button on the toolbar and select the base file in the **Ancestor** field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the **algorithm** for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

**Figure 386: Three-Way Differences**

### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

### Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

### Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

**Append left change to right and Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

**Copy change from left to right and Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

**Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

### Three-Way Diff Algorithms

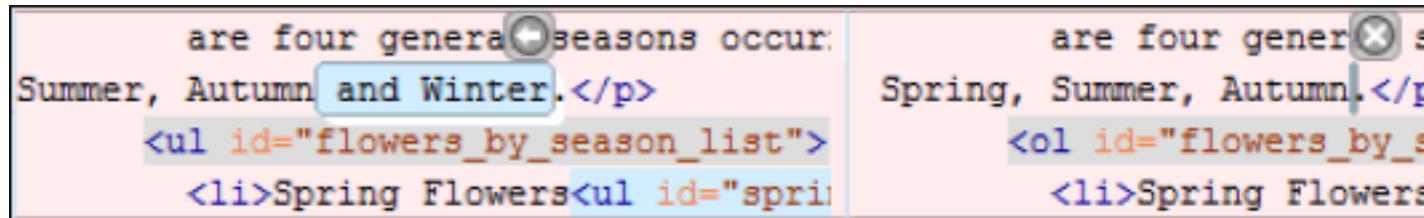

Oxygen XML Author offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Second Level Comparisons

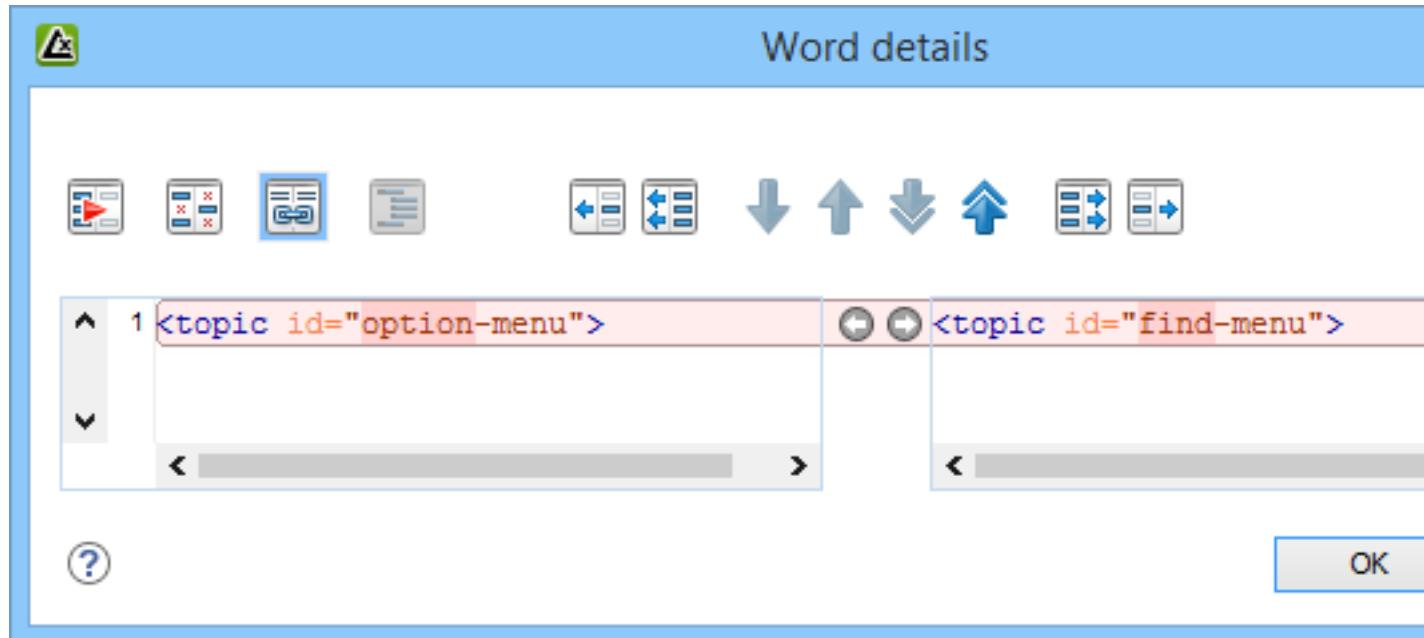

Oxygen XML Author automatically performs a second level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons are processed on text nodes using a word level comparison, meaning that it looks for identical words. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

**Figure 387: Second Level Diff Comparison**

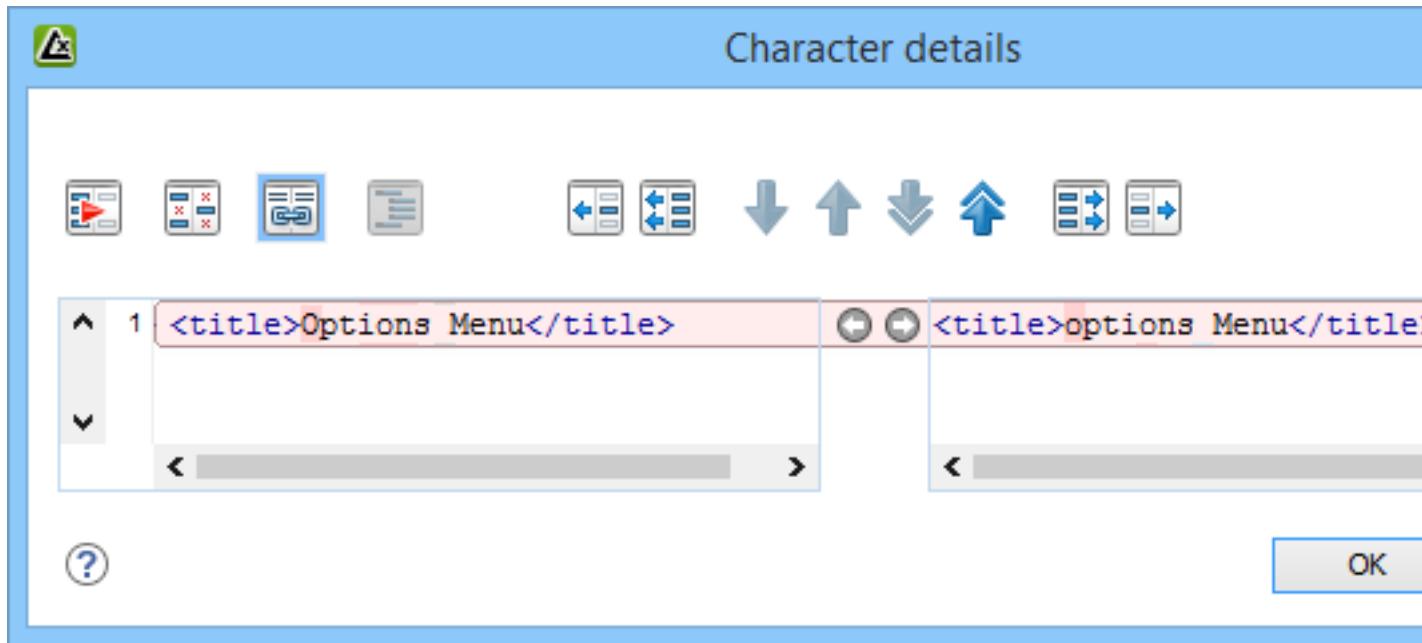

**Note:** If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second level comparison will not automatically be performed. In this case you can manually select a second level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

**Figure 388: Word Level Comparison**

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

**Figure 389: Character Level Comparison**

## Compare Files Tool Menus

[Edit on GitHub](#)

This section describes the actions that are available in the menus of the **Files Comparison** interface.

### File Menu

[Edit on GitHub](#)

The **File** menu of the files comparison tool contain the following actions:

#### Source

The file that is displayed in the left side of the application window.

- **Source > Open** - Browses for a source file.
- **Source > Open URL** - Opens the URL to be used as a source file. See [Open URL](#) for details.
- **Source > Open File from Archive** - Browses an archive content for a source file.
- **Source > Save** - Saves the changes made in the source file.
- **Source > Save As** - Displays the **Save As** dialog box that allows you to save the source file with a new name.
- **Source > Close** - Closes the source file.

#### Target

The file that is displayed in the right side of the application window.

- **Target > Open** - Browses for a target file.
- **Target > Open URL** - Opens the URL to be used as a target file. See [Open URL](#) for details.
- **Target > Open File from Archive** - Browses an archive content for a target file.
- **Target > Save** - Saves the changes made in the target file.
- **Target > Save As** - Displays the **Save As** dialog box that allows you to save the target file with a new name.
- **Target > Close** - Closes the target file.

### Ancestor

The base file that will be compared with both files in a [three-way comparison](#).

- **Ancestor > Open** - Browses for a target file.
- **Ancestor > Open URL** - Opens the URL to be used as a target file. See [Open URL](#) for details.
- **Ancestor > Open File from Archive** - Browses an archive content for a target file.

### Exit

Quits the application.

## Edit Menu

[Edit on GitHub](#)

The following actions are available in the **Edit** menu:

#### Select all

Cut the selection from the currently focused editor panel to the clipboard.

Copy the selection from the currently focused editor panel to the clipboard.

Paste content from the clipboard into the currently focused editor panel.

Selects all content in the currently focused editor panel.

Undo changes in the currently focused editor panel.

Redo changes in the currently focused editor panel.

## Find Menu

[Edit on GitHub](#)

The **Find** menu includes the following actions:

#### Find Next

Perform *find/replace* operations in the currently focused **Editor**.

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

**Find Previous**

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

**Compare Menu**
[Edit on GitHub](#)

The following actions are available in the **Compare** menu:

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

**Last Change (Ctrl + E (Command + E on OS X))**

**First Change (Ctrl + B (Command + B on OS X))**

**Copy All Changes from Right to Left**

**Copy All Changes from Left to Right**

**Copy Change from Right to Left**

**Copy Change from Left to Right**

**Show Word Level Details**

**Show Character Level Details**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Looks for differences between the two files displayed in the left and right side of the application window.

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Jumps to the last change.

Jumps to the first change.

Copies all changes from the target file in the right side to the source file in the left side.

Copies all changes from the source file in the left side to the target file in the right side.

Copies the selected difference from the target file in the right side to the source file in the left side.

Copies the selected difference from the source file in the left side to the target file in the right side.

Provides a word-level comparison of the selected change.

Provides a character-level comparison of the selected change.

 **Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

## Options Menu

[Edit on GitHub](#)

The **Options** menu contains the following actions:

**Preferences**

Opens the preferences.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

## Help Menu

[Edit on GitHub](#)

The **Help** menu contains the following actions:

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Author Support Center web page in a browser.

**Support Tools > Clipboard Inspector**

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into

Oxygen XML Author. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Author support team.

## Compare Toolbar of the Compare Files Tool

[Edit on GitHub](#)

The toolbar of the **Compare Files** tool contains the operations that can be performed on the source and target files or XML fragments.

**Figure 390: Compare Toolbar**

The following actions are available:

### Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Author, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

### Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

### Perform Files Differencing

Looks for differences between the two files displayed in the left and right side of the application window.

### Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the

**Synchronized scrolling****Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))****Copy Change from Right to Left****Copy All Changes from Right to Left****Next Block of Changes (Ctrl + Period (Command + Period on OS X))****Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))****Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))****Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))****Copy All Changes from Left to Right****Copy Change from Left to Right****Ignore Nodes by XPath**

comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Enables or disables synchronized scrolling so that a selected difference can be seen on both sides of the application window. This option is enabled by default.

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

Copies the selected difference from the target file in the right side to the source file in the left side.

Copies all changes from the target file in the right side to the source file in the left side.

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Copies all changes from the source file in the left side to the target file in the right side.

Copies the selected difference from the source file in the left side to the target file in the right side.

You can use this text field to enter an XPath 2.0 expression to ignore certain nodes from the comparison. This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms. If an XPath 2.0 expression is specified in the **Ignore nodes by XPath option** in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be

used instead of the default. If you delete the expression from this field, neither will be used.

#### **First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

## Compare Directories

[Edit on GitHub](#)

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffDirs.exe`).

The directories comparison results are presented as a tree of files and directories. The directories and folders that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Author starts a *file comparison* between the two files, using the **Compare Files** tool.

**Compare Directories**

Compared using 'Auto'. 11 differences from which: 10 modified files, 0 only in left side, 1 only in right side.

**Figure 391: Compare Directories Tool**

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the

path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

**Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the  **Perform Directories Differencing** button from the toolbar.
3. You can also use the  **Diff Options** button to access the *Directories Comparison preferences page* where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the  **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Author treat supported archives as directories, enable the *Look in archives option* in the **Directories Comparison** preferences page.
3. To highlight the differences, click the  **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date.

A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An X symbol, when a file or a folder exists in only one of the compared directories.
- A #symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the *Directories Comparison / Appearance preferences page*. You can double-click lines marked with the # symbol to open a **Compare Files** window, which shows the differences between the two files.

## Compare Directories Tool Menus

[Edit on GitHub](#)

This section describes the actions that are available in the menus of the **Directories Comparison** interface.

### Compare Menu

[Edit on GitHub](#)

This menu contains the following actions:

Looks for differences between the two directories displayed in the left and right side of the application window.

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Options Menu**
[Edit on GitHub](#)

The **Options** menu contains the following actions:

**Preferences**

Opens the preferences.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**
[Edit on GitHub](#)

The **Help** menu contains the following actions:

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

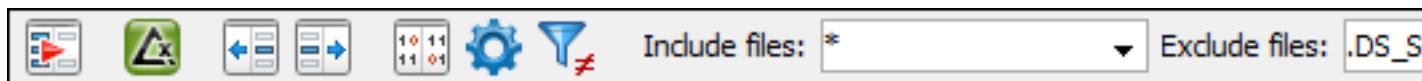

Opens the Oxygen XML Author Support Center web page in a browser.

**Support Tools > Clipboard Inspector**

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Author. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Author support team.

**Compare Toolbar of the Compare Directories Tool**
[Edit on GitHub](#)

The toolbar contains the following actions:

**Figure 392: Compare toolbar**

**Perform Directories Differencing**

Looks for differences between the two directories displayed in the left and right side of the application window.

**Perform Files Differencing**

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

**Copy Change from Right to Left**

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

**Copy Change from Left to Right**

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Binary Compare**

Performs a byte-level comparison on the selected files.

**Diff Options**

Opens the [Directory Comparison preferences page](#) where you can configure various options.

**Show Only Modifications**

Displays a more uncluttered file structure by hiding all identical files.

**File and folder filters**

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the \* and ? wildcards. For example, to filter out all jpeg and gif image files, edit the **Exclude files** filter box to read \*.jpeg, \*.png. Each filter includes a drop-down menu with the latest 15 filters applied.

## Compare Images

[Edit on GitHub](#)

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF, JPG, JPEG, PNG, and BMP*.

## Syncro SVN Client

[Edit on GitHub](#)

Describes how to use the Syncro SVN Client.

The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to **Tools > SVN Client**.

## Main Window

[Edit on GitHub](#)

This section explains the main window of Syncro SVN Client.

### Views

[Edit on GitHub](#)

The main window consists of the following views:

- **Repositories view** - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view** - Allows you to manage with ease the content of the working copy.
- **History view** - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view** - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view** - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view** - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel** - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view** - Displays two images side by side.
- **Properties view** - Displays the SVN properties of a resource under version control.
- **Console view** - Displays information about the currently running operation, similar with the output of the Subversion command line client.
- **Dynamic Help view** - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

### SVN Main Menu

[Edit on GitHub](#)

The main menu of the Syncro SVN Client is composed of the following menus:

#### File Menu

##### New submenu:

##### New File

This operation creates a new file as a child of the selected folder from the **Repositories view** tree or the **Working Copy view** tree, depending on the view that was last used.

Note that for the ***Working Copy view***, the file is added to *version control* only if the selected folder is under *version control*.

**New Folder(Ctrl + Command + on OS X) + Shift + F)** This operation creates a new folder as a child of the selected folder from the ***Repositories view*** tree or the ***Working Copy view*** tree, depending on the view that was last used. Note that for the ***Working Copy view***, the file is added to *version control* only if the selected folder is under *version control*.

**New External Folder (Ctrl + Command + on OS X) + Shift + W)** This operation allows you to add a new external definition on the selected

folder. An external definition is a mapping of a local directory to *a URL of a versioned directory*, and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

**Tip:** You can specify a particular revision of the external item by using a *peg revision* at the end of the URL (for example, `URL@rev1234`).

You

can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to

by using  
one of the  
following  
relative  
formats:

- `../` -  
Relative  
to the  
URL  
of the  
directory  
that the  
`svn:externals`  
property  
is set.
- `^/` -  
Relative  
to the  
root  
of the  
repository  
in  
which  
the  
`svn:externals`  
property  
is  
versioned.
- `//` -  
Relative  
to the  
scheme  
of the  
URL  
of the  
directory  
that the  
`svn:externals`  
property  
is set.
- `/` -  
Relative  
to the  
root  
URL  
of the  
server  
in  
which  
the  
`svn:externals`  
property  
is  
versioned.

**Important:**

To change the target URL of an external definition, or to delete an external item, do the following:

- 1.** Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
- 2.** For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:**

Syncro SVN Client does not support definitions of local relative external items.

**Open (Ctrl (Command on OS X) + O)**

This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal

editor or the external application associated with that file type. This action works on any file selection from the *Repositories view*, *Working Copy view*, *History view*, or *Directory Change Set view*, depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on OS X, etc). Note that opening folders is available only for folders selected in the *Working Copy view*.

**Open with(Ctrl (Command on OS X) + Shift + **O**)**

Displays the **Open with** dialog box for specifying the editor in which the selected file is opened. If multiple files are selected only external applications can be used to open the files. This action works on any file selection from *Repositories view*, *Working Copy view*, *History view*, or *Directory Change Set view*, depending on the view that was last used to invoke it.

**Show in Explorer/Show in Finder**

Opens the parent directory of the selected working copy file and selects the file.

 **Save (Ctrl (Command on OS X) + **S**)**

Saves the local file currently opened in the editor or the **Compare view**.

**Save as**

Saves any file selected in the **Repositories**, **History**, or **Directory Change Set** view.

**Copy URL Location (Ctrl (Command on OS X) + Alt + **U**)**

Copies the URL location of the resource currently selected in the

**Repositories** view to clipboard.

Copies the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

**Note:** This action can also be used from **History** and **Directory Change Set** views to recover older versions of a repository item.

**Move to(Ctrl (Command on OS X) + M)** Moves the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

**Rename(F2)**

Renames the resource currently selected, either in **Repositories** or **Working copy** view.

**Delete (Delete)**

Deletes the resource currently selected either, in **Repositories** or **Working copy** view.

**Locking:**

- **Scan for locks (Ctrl (Command on OS X) + L)** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under *version control*. For more details see [Scanning for locks](#).

- **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (*steal*) the lock. This action is active only

on files under *version control*. For more details on the use of this action see [Locking a file](#).

-  **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

 **Show SVN Properties (Ctrl (Command on OS X) + P)**

Opens the [Properties view](#) and displays the SVN properties for a selected resource from [Repositories view](#) or [Working Copy view](#), depending on the view that was last used to invoke it.

 **Show SVN Information (Ctrl (Command on OS X) + I)**

Provides additional information for a selected resource. For more details, go to [Obtain information for a resource](#).

**Exit (Ctrl (Command on OS X) + Q)**

Closes the application.

 **Undo (Ctrl (Command on OS X) + Z)**

Undo edit changes in the local file that is currently opened in the editor or the **Compare** view.

 **Redo (Ctrl (Command on OS X) + Y)**

Redo edit changes in the local file that is currently opened in the editor or the **Compare** view.

 **Cut (Ctrl (Command on OS X) + X)**

Cut selection from the local file that is currently opened in the editor view or the **Compare** view to clipboard.

 **Copy (Ctrl (Command on OS X) + C)**

Copy selection from the local file that is currently opened in the editor or the **Compare** view to clipboard.

 **Paste (Ctrl (Command on OS X) + V)**

Paste selection from clipboard into the local file that is currently opened

## Edit Menu

in editor or the **Compare** view.

**Find/Replace (Ctrl + Command on OS X) + F**

Perform find and replace operations in the local file that is currently opened in the editor or the **Compare** view.

**Find Next (F3)**

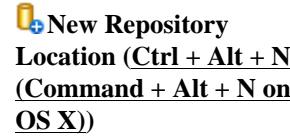

Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

**Find Previous (Shift + F3)**

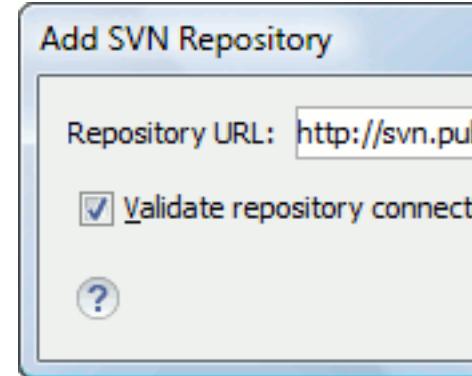

Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

## Repository Menu

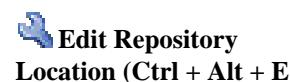

**New Repository**  
**Location (Ctrl + Alt + N)**  
**(Command + Alt + N on OS X)**

Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

**Figure 393: Add SVN Repository Dialog Box**

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

**Edit Repository Location (Ctrl + Alt + E)**

Context-dependent action that allows you to edit

**(Command + Alt + E on OS X)**

the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

**Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))**

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

**Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))**

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

** Refresh (F5)**

Refreshes the resource selected in the **Repositories** view.

** Check out (Ctrl + Alt + O (Command + Alt + O on OS X))**

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section [Check out a working copy](#).

**Export**

Opens the [Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

**Import:**

**Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))** Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation,

see the section *Importing resources into a repository*.

**Note:** The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))** Imports the files selected from the files system into the selected folder in the repository.

## Working Copy Menu

### Working Copies Manager

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

### Switch to

Selects one of the following view modes:

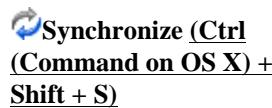

>All Files, ↪

Modified, ↪ Incoming,  
⇒ Outgoing, or ⇢  
Conflicts.

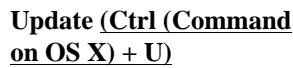

### Refresh (F5)

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the *Always switch to 'Modified' mode* option is selected.

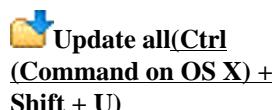

Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the [sparse checkouts](#) section.

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

Commits all the resources with outgoing changes. It is disabled when **Incoming** mode is selected.

or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.

 **Revert (Ctrl + Command on OS X) + Shift + V**

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is enabled only for modified resources. See [Revert your changes](#) for more information.

 **Edit conflict (Ctrl + Command on OS X) + E**

Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see [Edit conflicts](#).

 **Mark Resolved (Ctrl + Command on OS X) + Shift + R**

Instructs the Subversion system that you resolved a conflicting resource. For more information, see [Merge conflicts](#).

 **Mark as Merged (Ctrl + Command on OS X) + Shift + M**

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts](#) section for more information about how you can solve the pseudo-conflicts.

**Override and Update**

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the [Revert your changes](#) section.

**Override and Commit**

Drops any incoming changes and sends your local version of the resource to the repository.

This action is available on conflicting resources. For more information see [Drop incoming modifications](#).

#### **Mark as copied**

You can use this action to mark an item from the working copy as a copy of an other item under *version control*, when the copy operation was performed outside of an SVN client. The **Mark as copied** action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

#### **Mark as moved**

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The **Mark as moved** action is available when you select two items from different locations (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

#### **Mark as renamed**

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

#### **Add to "svn:ignore"** (Ctrl (Command on OS X) + Alt + I)

Allows you to add files that should not participate in the *version control* operations inside your working copy . This action

can only be performed on resources not under *version control*. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control](#) section.

 **Add to version control**  
(Ctrl (Command on OS X) + Alt + V)

Allows you to add resources that are not under *version control*. For further details, see [Add Resources to Version Control](#) section.

**Remove from version control**

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

 **Clean up (Ctrl (Command on OS X) + Shift + C)**

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

 **Expand All (Ctrl (Command on OS X) + Alt + X)**

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

 **Collapse all (Ctrl (Command on OS X) + Alt + Z)**

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking a expanded folder.

## Compare Menu

 **Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side of the application window.

 **Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

 **Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

 **Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

 **Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

 **Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

 **First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

 **Copy All Changes from Right to Left**

Copies all changes from the target file in the right side to the source file in the left side.

**Copy Change from Right to Left**

Copies the selected difference from the target file in the right side to the source file in the left side.

**Show Word Level Details**

Provides a word-level comparison of the selected change.

**Show Character Level Details**

Provides a character-level comparison of the selected change.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

## History Menu

**Show History(Ctrl + Command on OS X + H)**

Displays the history for a SVN resource at a given revision. The resource can be one selected from the **Repositories** view, **Working Copy** view, or from the **Affected Paths** table from the **History** view, depending on which view was last focused when this action was invoked.

**Show Annotation (Ctrl + Shift + A)**

Opens the **Show Annotation** dialog box that computes *the annotations for a file*

**(Command + Shift + A  
on OS X)**

and displays them in the **Annotations** view, along with the history of the file in the **History** view.

**Repositories**

This operation is available for any resource selected from view, **Working Copy** view, **History** view or **Directory Change Sets** view, depending on which view was last focused when this action was invoked.

 **Revision Graph (Ctrl  
(Command on OS X) +  
G)**

This action allows you to see the graphical representation of a resource's history. For more details about a resource's revision graph see the section *Revision Graph*. This operation is enabled for any resource selected into the **Repositories** view or **Working Copy** view.

**Tools Menu**

**Share project**

Allows you to *share a new project* using an SVN repository. The local project is automatically converted into an SVN working copy.

**Branch / Tag**

Allows you to copy the selected resource from the **Repositories** view or **Working Copy** view to a branch or tag into the repository. To read more about this operation, see the section *Creating a Branch / Tag*.

 **Merge (Ctrl  
(Command on OS X) + J)**

Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section *Merging*.

**Switch (Ctrl (Command  
on OS X) + Alt + W)**

Allows you to change the repository location of a working copy, or only of a versioned

item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for *external* items. To read more about this action, see the [Switching the Repository Location](#) section.

#### **Relocate**

Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the [Relocate a Working Copy](#) section.

#### **Create patch (Ctrl + Command on OS X) + Alt + P**

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see [the section about patches](#).

#### **Working copy format**

This submenu contains the following two operations:

**Upgrade** Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

**Downgrade** Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

**Note:** SVN 1.7 working copies cannot be downgraded to older formats.

See the section [Working Copy Format](#) to read more about this subject.

## Options Menu

### Preferences

Opens the **Preferences** dialog box.

### Menu Shortcut Keys

Opens the [Menu Shortcut Keys preferences page](#), where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

### Global Run-Time Configuration

Allows you to configure SVN general options, that should be used by all the SVN clients you may use:

- **Edit 'config' file -**  
In this file you can

		configure various SVN client-side behaviors.
	• <b>Edit 'servers' file</b> -	In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.
<b>Window Menu</b>	<b>Export Options</b>	Allows you to export the current options to an XML file.
	<b>Import Options</b>	Allows you to import options you have previously exported.
	<b>Reset Options</b>	Resets all your options to the default ones.
	<b>Reset Authentication</b>	Resets the Subversion authentication information.
<b>Help Menu</b>	<b>Show View</b>	Allows you to select the view you want to bring to front.
	<b>Show Toolbar</b>	Allows you to select the toolbar you want to be visible.
	<b>Enable flexible layout</b>	Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.
	<b>Reset Layout</b>	Resets all the views to their default position.
	<b>Help (F1)</b>	Opens the <b>Help</b> dialog box.
	<b>Use online help (Enabled by default)</b>	If this option is enabled, when you select <b>Help</b> or press <b>F1</b> while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help

	documentation is opened in offline mode.
<b>Show Dynamic Help view</b>	Displays the <b>Dynamic Help</b> view.
<b>Report Problem</b>	Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.
<b>Support Center</b>	Opens the Support Center web page in a browser.
<b>Support Tools &gt; Clipboard Inspector</b>	Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Author. You can use the <b>Copy</b> button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Author support team.
<b>About</b>	Opens the <b>About</b> dialog box.

## SVN Main Toolbar

[Edit on](#)

[GitHub](#)

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

**Check out**

Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

**Synchronize**

Synchronizes the current working copy with the repository.

**Update All**

Updates all resources of the working copy that have an older revision than the repository.

**Commit All**

Commits all resources of working copy that have a newer version compared to that of the repository.

**Refresh**

Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to repository yet, are displayed in the **Working Copy** view.

The selected resource is compared with:

- The **BASE** revision, when the selected resource is:
  - Locally modified and the **All Files** view mode is currently selected (no matter if there are incoming changes).
  - Locally modified and there are no incoming changes when any other view mode is selected.
- The remote version of the same resource, when remote information is available after a **Synchronize** operation (only when one of **Modified**, **Incoming**, **Outgoing** and **Conflicts** view modes is selected).
- The working copy revision, when the selected resource is from the **History** view.

Displays the history of the selected resource (from the **Working Copy** or **Repository** views) in the **History** view.

Displays the annotations of the selected resource. The selected resource can be in the **Working Copy** or the **History** views.

Displays the revision graph of the selected resource. The selected resource can be in the **Working Copy** or the **Repositories** views.

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

## Status Bar

[Edit on GitHub](#)

The status bar of the Syncro SVN Client window displays important details of the current status of the application. This information is available only in the **Working Copy** view.

**Figure 394: Status bar**

The status bar is composed of the following areas:

- The path of the currently processed file from the current working copy (during an operation such as **Check out** or **Synchronize**) or the result of the last operation.
- The current status of the following working copy options:
  - Show ignored files (⊖).
  - Show deleted files (⊖).
  - Process `svn:externals` definitions (⊕).

The options for ignored and deleted files are switched on and off from *the Settings menu* of the **Working Copy** panel:

- The format of the currently loaded working copy.
- The current numbers of incoming changes (←), outgoing changes (→) and conflicting changes (↔).

- A progress bar for the currently running SVN operation and a button (■) that allows you to stop it.

## Getting Started

[Edit on GitHub](#)

This section explains the basic operations that can be done in Syncro SVN Client.

### SVN Repository Location

[Edit on GitHub](#)

This section explains how to add and edit the repository locations in Syncro SVN Client.

#### Add / Edit / Remove Repository Locations

[Edit on GitHub](#)

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Author supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the [Repositories view](#).

To create a repository location, use the  **New Repository Location** action that is available in the **Repository** menu, the **Repositories** view toolbar, and in the contextual menu. This action opens the **New Repository Location** dialog box, which prompts you for the [URL of the repository](#) you want to connect to. You can also [use peg revisions at the end of the URLs](#) (for example, URL@rev1234) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Author tries to contact the server to get the content of the repository for displaying it in the [Repositories view](#). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the  **Stop** button from the toolbar of the view.

To edit a repository location, use the  **Edit Repository Location** action that is available in the **Repository** menu and in the contextual menu. This action opens the **Edit Repository Location** dialog box, which prompts you for the [URL of the repository](#) you want to connect to. You can also [use peg revisions at the end of the URLs](#) (for example, URL@rev1234) to browse only that specific revision.

To remove a repository location, use the  **Remove Repository Location** action that is available in the **Repository** menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.

The order of the repositories can be changed in the [Repositories](#) view at any time with the  **Up** arrow and

 **Down** arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the **Change the Revision to Browse** action that is available in the **Repository** menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the [Repositories view](#). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository tree. Also, this revision number is used for all the operations executed directly from the [Repositories view](#).

## Authentication

[Edit on  
GitHub](#)

Five protocols are supported: *HTTP*, *HTTPS*, *SVN*, *SVN + SSH* and *FILE*. If the repository that you are trying to access is password protected, the **Enter authentication data** dialog box requests a user name and a password. If the **Store authentication data** checkbox is checked, the credentials are stored in Apache Subversion™ default directory:

- Windows - %HOME%\Application Data\Subversion\auth. Example: C:\Documents and Settings\John\Application Data\Subversion\auth
- Linux and OS X - \$HOME/.subversion/auth. Example: /home/John/.subversion/auth

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the **Reset authentication** command from the **Options** menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Author for the change to take effect.

**Tip:** The *FILE* protocol is recommended if the SVN repository and Oxygen XML Author are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a **Certificate Information** dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.

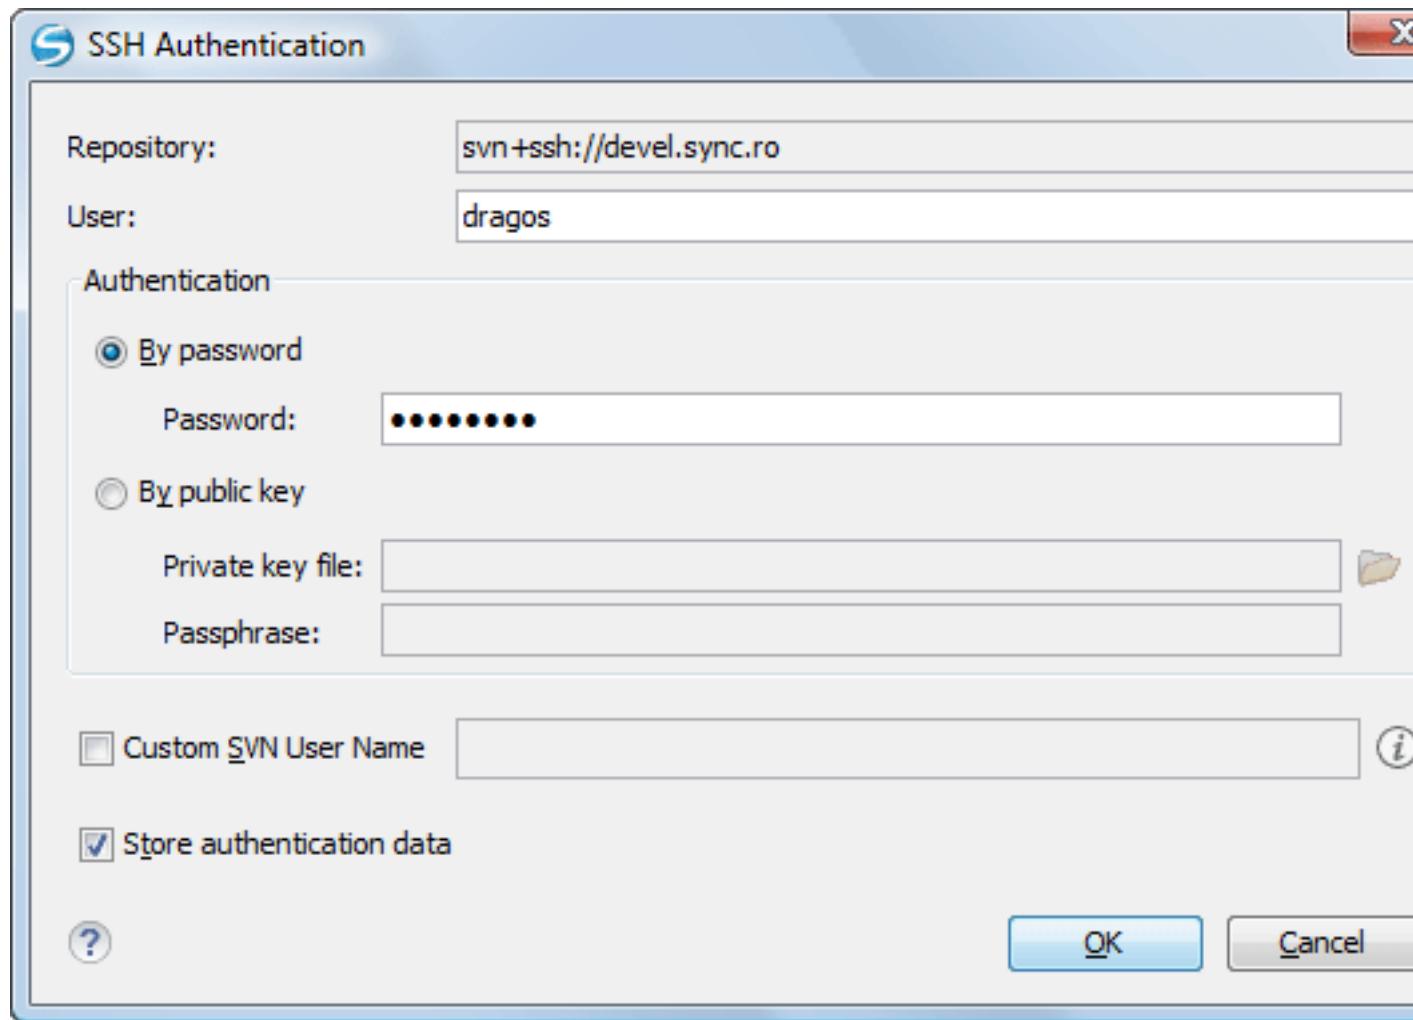

Figure 395: SSH Authentication Dialog Box

After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the *committer* in SVN operations.

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.

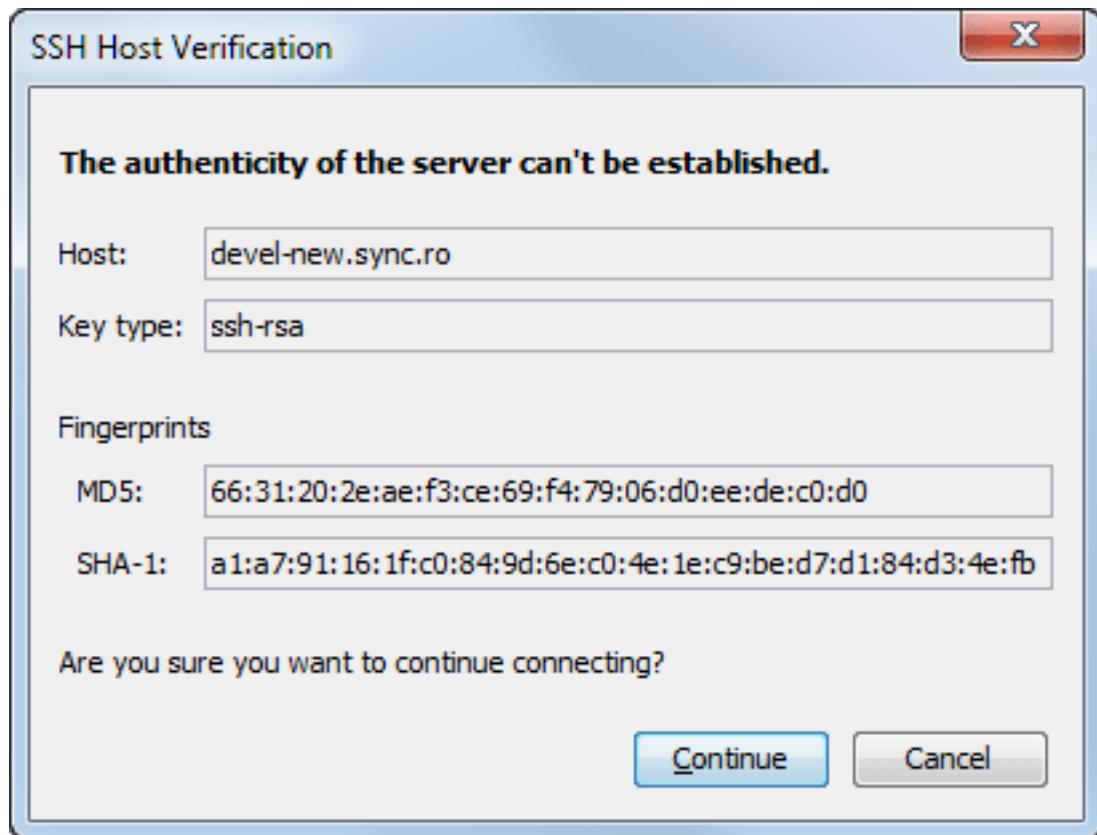

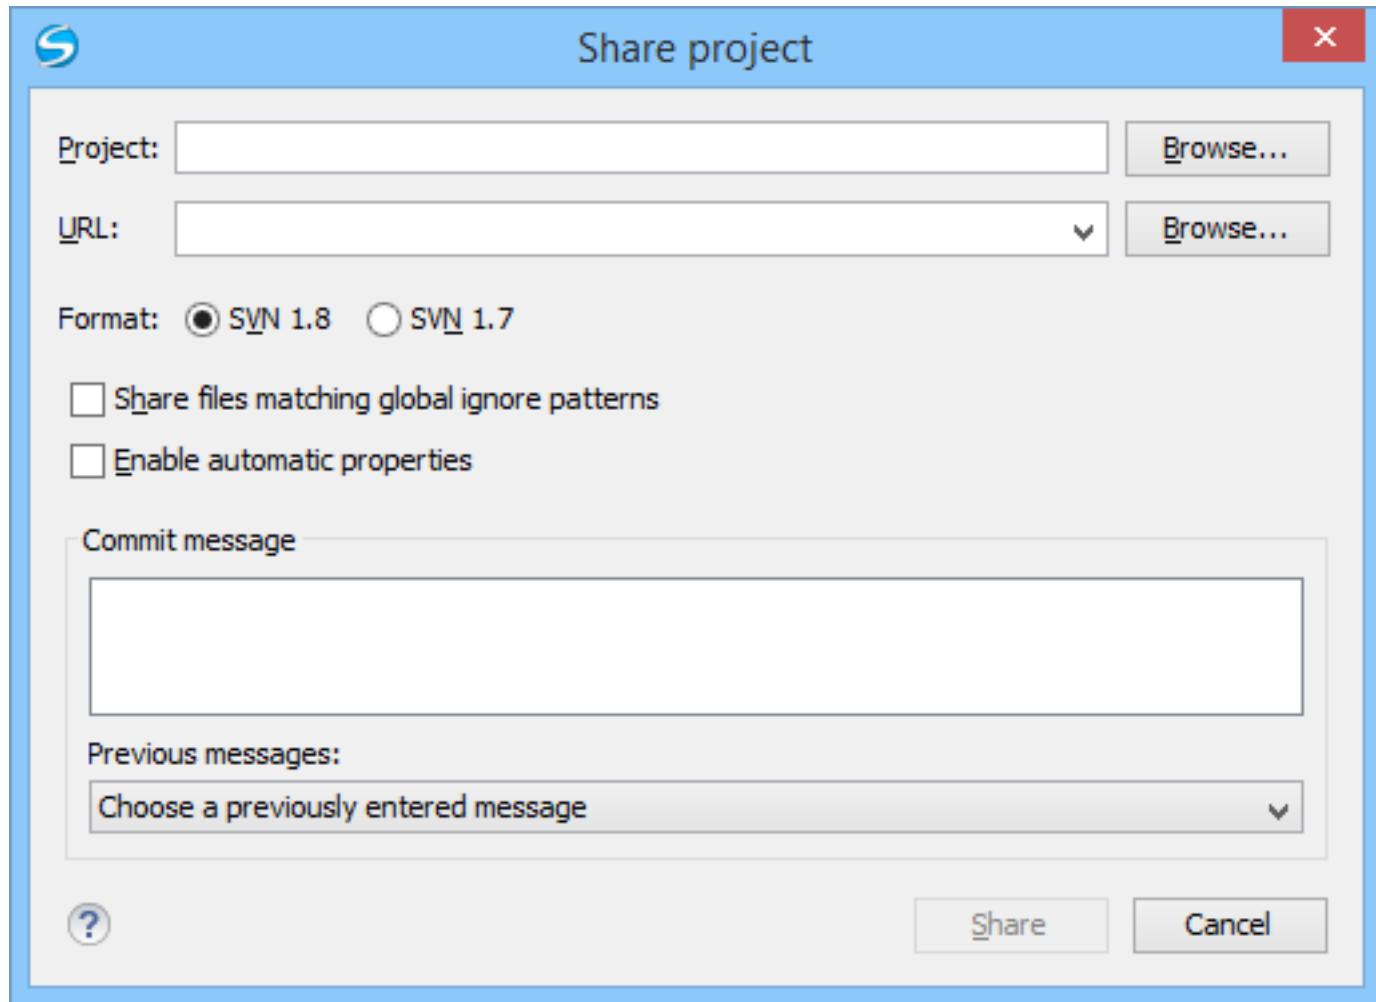

Figure 396: SSH server name and key fingerprint

### Share a Project

[Edit on  
GitHub](#)

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is automatically converted to a working copy and added under Syncro SVN Client management. The **Share project** action is available in the **Tools** menu and the contextual menu of the **Repositories** view.

**Figure 397: Share Project Dialog Box**

The following options can be configured in the **Share project** dialog box:

#### Project

*The location of the project folder* on the local disk by using the text box or the **Browse** button. This folder should not be empty or already under version control.

**Important:** By default, the SVN system only imports the content of the specified folder, and not the root folder itself. Therefore, it is recommended to use the **Browse** button to select the project folder so that the client will automatically append the name of it to the specified URL.

#### URL

*The new location of the project* (inside the repository) that will be used to access it.

**Note:** *Peg revisions* have no effect for this operation since it is used to send information to the repository.

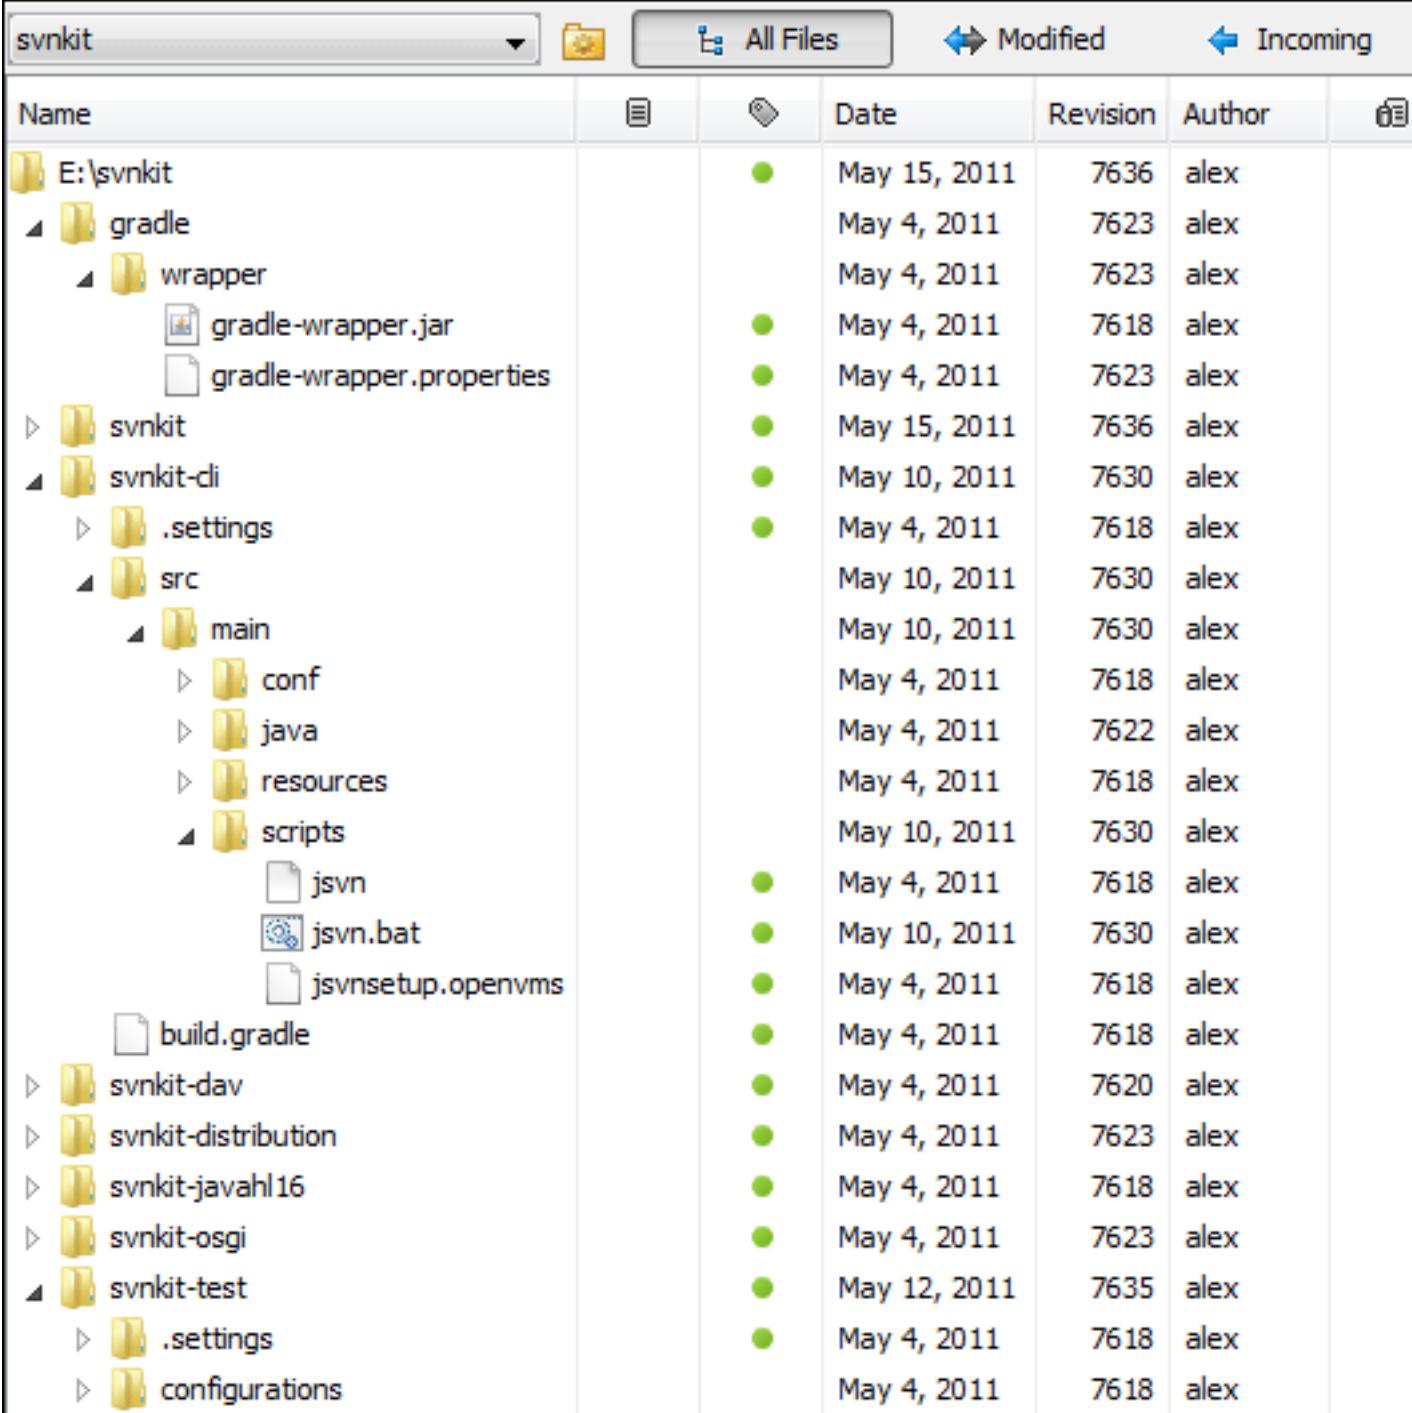

**Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed).

	Otherwise, if the address does not exist, it is created automatically.
<b>Format</b>	The SVN format of the working copy. You can choose between <b>SVN 1.8</b> or <b>SVN 1.7</b> .
<b>Share files matching global ignore patterns</b>	When enabled, the file names that match the patterns defined in either of the following locations are also imported into the repository:
	<ul style="list-style-type: none"> <li>• The <code>global-ignores</code> property in <a href="#">the SVN configuration file</a>.</li> <li>• The <b>File name ignore patterns option</b> in the <a href="#">SVN &gt; Working Copy preferences page</a>.</li> </ul>
<b>Enable automatic properties/Disable automatic properties</b>	Enables or disables automatic property assignment (per runtime configuration rules), overriding the <code>enable-auto-props</code> runtime configuration directive, defined in <a href="#">the SVN configuration file</a> .
	<b>Note:</b> This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the <code>auto-props</code> section). Based on the value of the <code>enable-auto-props</code> runtime configuration directive, the presented option is either <b>Enable automatic properties</b> , or <b>Disable automatic properties</b> .

## Defining a Working Copy

[Edit on GitHub](#)

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.

The screenshot shows the 'Working Copy View' in the Oxygen XML Author interface. The left pane displays a tree view of the repository structure under 'E:\svnkit'. The right pane is a table with columns: Name, Date, Revision, Author, and a small icon column.

Name	Date	Revision	Author
E:\svnkit	May 15, 2011	7636	alex
gradle	May 4, 2011	7623	alex
wrapper	May 4, 2011	7623	alex

**Figure 398: Working Copy View**

A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named `.svn`, also known as the working copy *administrative directory*. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the *pristine copy* or the *BASE revision* of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others' work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository's file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

## Check Out a Working Copy

[Edit on GitHub](#)

*Check out* means to make a copy of a project from a repository to your local file system. This copy is called a *working copy*. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional .svn directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the **Repositories** view and select the **Check out** action from the contextual menu, the toolbar, or the **Repository** menu.

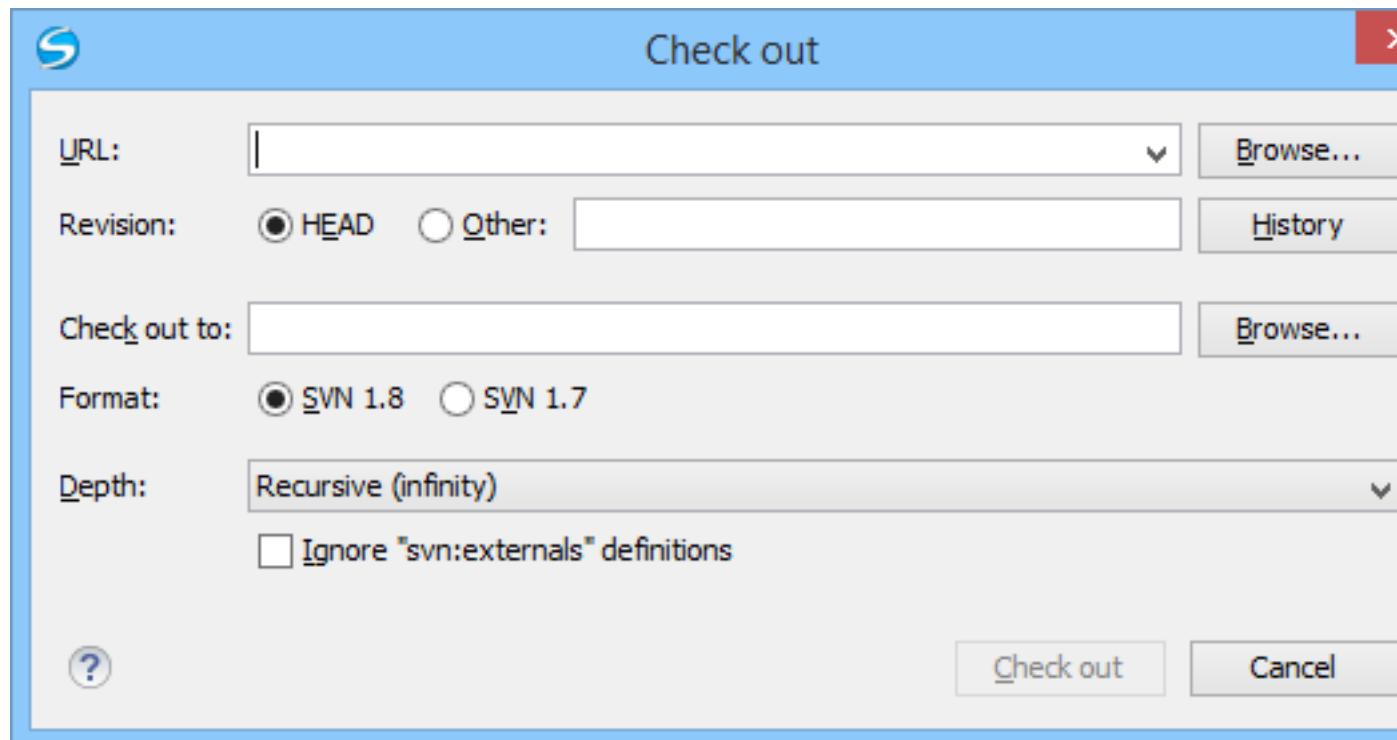

Figure 399: Check Out Dialog Box

The following options can be configured in the **Check out** dialog box:

### URL

*The location of the repository directory* to be checked out.

**Note:** To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

### Revision

You can choose between the **HEAD** or **Other** revision. If you need to *check out* a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from *the History dialog box*.

### Check out to

Specify *the location where you want to check out* the new working copy by typing the local path in the text box or by using the **Browse** button. If the specified

local path does not point to an existing directory, it will automatically be created.

**Important:** By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the *check out* location so that the client will automatically append the name of the remote directory to the path of the selected directory.

**Warning:** The destination directory should be empty. If files exist, they are skipped (left unchanged) by the *check out* operation and *displayed as modified* after the operation has finished. Also, the destination directory must not already be under version control.

#### Format

The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

#### Depth

The depth is useful if you want to *check out* only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the *sparse checkouts* section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

#### Ignore "svn:externals" definitions

When enabled, external items are ignored in the *check out* operation. This option is only available if you choose the **Recursive (infinity)** depth.

After a check out, the new working copy is added to the list in the [Working Copy view](#) and loaded automatically.

#### History Dialog Box

[Edit on GitHub](#)

The **History** dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as [the Check Out dialog box](#) or [the Branch / Tag dialog box](#). It presents information about revision, commit date, author, and commit comment.

Figure 400: History Dialog Box

The initial number of entries in the list is 50. Additional revisions can be added to the list using the **Get next 50** and **Get all** buttons. The list of revisions can be refreshed at any time with the **Refresh** button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

The **Affected Paths** area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the **Compare with previous version** action, available in the contextual menu.

## Use an Existing Working Copy

[Edit on GitHub](#)

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section [Import resources into the repository](#). The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the **Working Copies Manager** toolbar button  ( on Mac OS X) in the [Working Copy view](#).

This action opens the **Working copies list** dialog box.

2. Press the **Add** button.
3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

**Note:** For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Press the **OK** button.

The selected working copy is loaded and presented in the [Working Copy view](#).

**Notice:** You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

## Manage Working Copy Resources

[Edit on GitHub](#)

This section explains how to work with the resources that are displayed in the **Working Copy** view.

### Edit Files

[Edit on GitHub](#)

You can edit files from the [Working Copy view](#) by double clicking them or by right clicking them and choosing **Open** from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (\*) - will be added to the file's icon in the [Working Copy view](#). The asterisk marks the files that have local modifications that were not committed to the repository.

### Add Resources to Version Control

[Edit on GitHub](#)

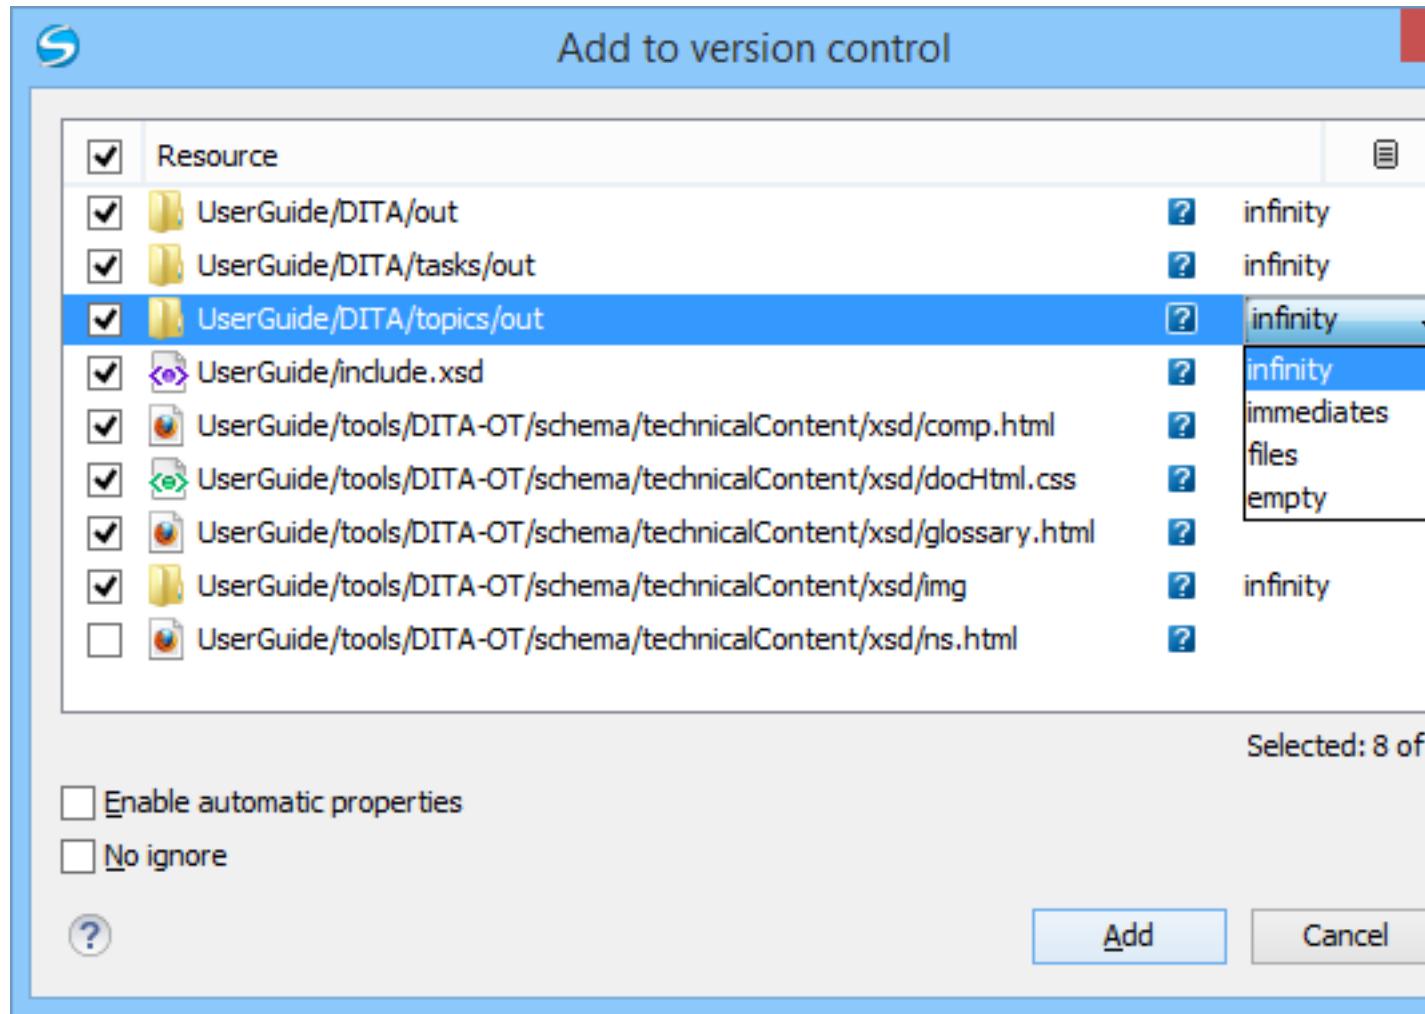

To share new files and folders (created in your working copy), add them to version control using the **Add to version control** option from the [Working Copy view](#).

You can easily spot resources not under version control by the  (*unversioned*) icon displayed in the  **Local file status** column. Resources scheduled for addition (*added*) are displayed with this icon  in the [Working Copy](#) view and are added in the repository after you commit them.

**Note:** Do not make a confusion between and icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are *scheduled for addition with history*.

When you use the **Add to version control** option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.

Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you *commit your changes*, the resource is presented in the commit dialog box, but not selected. When you commit an *unversioned* resource, it is automatically added under version control before starting the commit operation.

**Figure 401: Add to Version Control Dialog Box**

**Note:** *Ignored* () items can also be added under version control.

The **Depth** column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

**Note:** The initial value of the **Depth** field can have the following values, depending on the *listing mode of the items in the working copy view*:

- *infinity* - When the working copy items are presented as a tree.
- *files* - When the working copy items are presented compressed.
- *empty* - When the working copy items are presented flat.

When you add unversioned or ignored directories, the initial value of the **Depth** field also depends on the state of the **Show unversioned directories content** and **Show ignored directories content** options. If these options are enabled,

the value is based on the listing mode of the items in the working copy view. When they are disabled, the value is *empty*.

The following options are available in this dialog box:

- **Enable automatic properties or Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.
- **Note:** This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.
- **No ignore** - when you enable this option, file-name patterns defined to ignore *unversioned* resources do not apply. Resources that are located inside an *unversioned* directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

**Note:** This option is available only when directories are also presented in the dialog box.

You can define file-name patterns to ignore *unversioned* resources in one of the following locations:

- In the `config` file of the Subversion configuration directory (the `global-ignores` option from the `miscellany` section).
- In the Oxygen XML Author options ([open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN > Working copy > Application global ignores**).

Each of the above two options is activated only when you select an item for which the option can be applied.

## Ignore Resources Not Under Version Control

[Edit on GitHub](#)

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, `*.obj`, `*.class`, `*.lst`, or output folders used to store temporary files. Whenever you [commit changes](#), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the **Add to svn:ignore** action in the contextual menu of the [Working Copy view](#).

In the **Add to svn:ignore** dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- \* - Matches any string of characters of any size, including the empty string.
- ? - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: `*.txt`.

The action **Add to svn:ignore** adds a predefined Subversion property called `svn:ignore` to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the **Working Copy** view. The ignored resources are represented with gray icons.

## Delete Resources

[Edit on GitHub](#)

The  **Delete** action is available in the contextual menu of the **Working Copy view**. When you delete an item from the working copy, it is marked as *deleted* (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as *missing* () in your working copy. You can decide what you want to do with a *missing* item:

- In the case of a commit, any *missing* item is first automatically deleted and then committed.
- Note:** Not any *missing* item can be committed as *deleted*, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition () previously, since this item does not exist in the repository, but you can use the **Delete** action instead.
- If you want to recover *missing* items, either *update* the items themselves or one of their parent directories. This fetches their latest version from the repository.

You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

**Note:** It is recommended that you resolve conflicts manually to avoid losing any important remote modifications.

Finally, you can change your mind and *revert* the deleted items to their initial, pristine, state.

## Copy Resources

[Edit on GitHub](#)

You can copy resources from various locations of the working copy. You select them in the **Working Copy view** and then use **Copy to** from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the **Copy to** action is enabled only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Author performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

### Note:

- If you copy an item to a directory that is *not under version control* (*unversioned* or *ignored*), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
- If you copy a directory that contains *external* items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the *external* items, use the **Update** operation on the copied directory.

In the **Copy to** dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource's name. For *versioned* items, you can select **Ignore resource history** to copy them without their history (similar to a simple file system copy).

**Note:** The **Copy to** dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the *working copy settings* are taken into account.

In the **Commit** dialog box, only the directory in question will appear without its children.

## Move Resources

[Edit on GitHub](#)

As in the case of the copy command, you can move several resources at once. Select the resources in the **Working Copy view** and choose the **Move to** action from the contextual menu. The move command actually behaves as if a

copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as *deleted*.

**Note:** *External* items cannot be moved using the **Move to** action, because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item and use the **Update** operation on the item's parent folder for the change to take effect.

**Attention:** For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

## Rename Resources

[Edit on GitHub](#)

The **Rename** action is available in the contextual menu of the [Working Copy view](#) and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as *deleted*.

**Note:** *External* items cannot be renamed using the **Rename** action because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item, then use the **Update** operation on the item's parent folder for the change to take effect.

**Attention:** For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

## Lock / Unlock Resources

[Edit on GitHub](#)

The idea of version control is based on the *copy-modify-merge* model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.

The *copy-modify-merge* model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a *lock-modify-unlock* model. Without this, one or more users could end up wasting time on changes that cannot be merged.

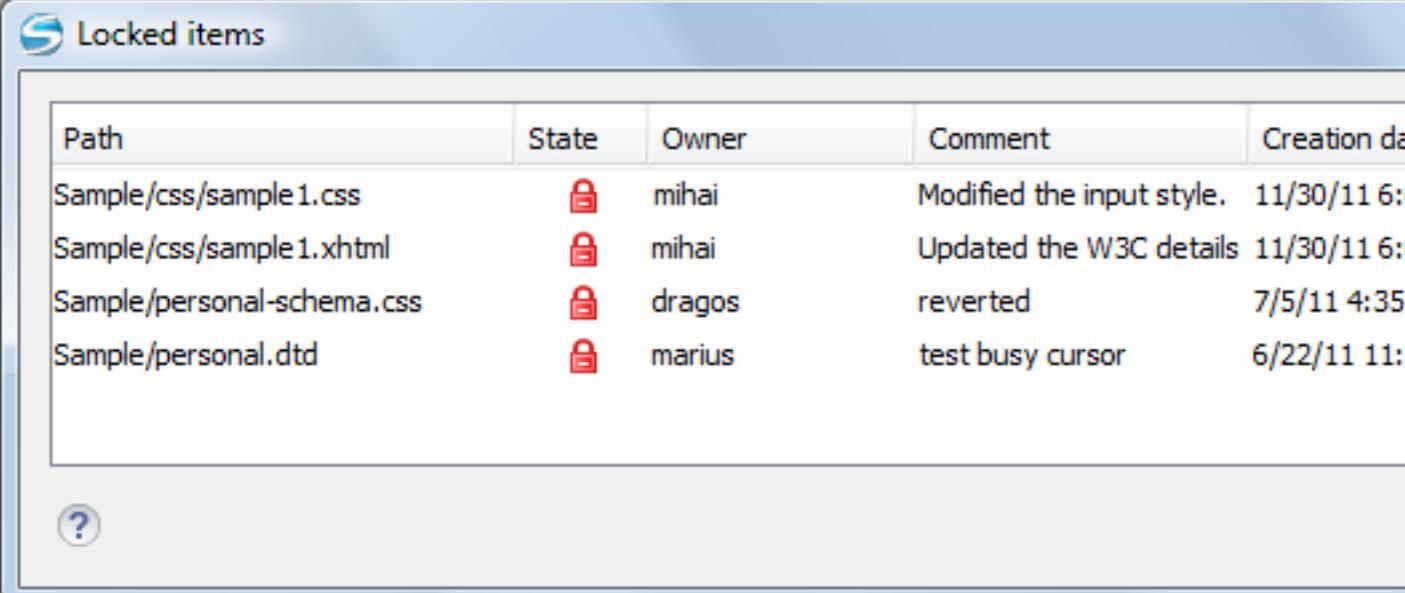

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner
- Software authorization - the user's working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.

## Scanning for Locks

[Edit on GitHub](#)

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the [Working Copy view](#) by selecting one or more resources, then right-clicking them and choosing the **Scan for Locks** action from the contextual menu.

The screenshot shows a dialog box titled "Locked items". It contains a table with columns: Path, State, Owner, Comment, and Creation date. The table lists four resources:

Path	State	Owner	Comment	Creation date
Sample/css/sample1.css		mihai	Modified the input style.	11/30/11 6:0
Sample/css/sample1.xhtml		mihai	Updated the W3C details	11/30/11 6:0
Sample/personal-schema.css		dragos	reverted	7/5/11 4:35
Sample/personal.dtd		marius	test busy cursor	6/22/11 11:3

A question mark icon is located at the bottom left of the dialog box.

**Figure 402: Locked Items Dialog Box**

The **Locked items** dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:

- - Appears when one of the following conditions apply:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the **Repositories** view.
- - Displayed after you have locked a file from the current working copy.
- - A file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).
- - A file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the **Unlock** button.

#### Related information

[Working Copy Locks](#) on page 1525

[Repository Locks](#) on page 1515

#### Locking a File

[Edit on GitHub](#)

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the **Repositories** view.

**Note:** You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The **Lock** dialog box allows you to write a comment when you set a lock or when you *steal* an existing one. Note that you should *steal* a lock only after you made sure that the previous owner no longer needs it. Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the lock expires after a period of time specified in the Subversion server policy.

#### *Unlocking a File*

[Edit on GitHub](#)

A file can be unlocked from the contextual menu of the [Working Copy view](#). A dialog box will prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

#### Synchronize with Repository

[Edit on GitHub](#)

In the work cycle you will need to incorporate other people's changes (update) and to make your own work available to others (commit). This is what the **Incoming** and **Outgoing** modes of [the Working Copy view](#) was designed for, to help you send and receive modifications from the repository.

The **Incoming** and **Outgoing** modes of this view focus on incoming and outgoing changes. The incoming changes are the changes that other users have committed in the repository since you last updated your working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.

The view presents the status of the working copy resources against the BASE revision after a **Refresh** operation. You can view the state of the resources versus a repository HEAD revision by using the **Synchronize** action from [the Working Copy view](#).

#### **View Differences**

[Edit on GitHub](#)

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the **Open in compare editor** action from the contextual menu.

The text files are compared using a built-in [Compare view](#) that uses a line differencing algorithm or a specified external diff application (if such an application is set in the [SVN Diff preferences page](#)). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a *diff pseudo-conflict*. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the **SVN** preferences page and enable the [Allow unversioned obstructions option](#).

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the **Compare** view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the [Working Copy view](#).

**Figure 403: Compare View**

At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- Incoming changes - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- Outgoing changes - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- Conflicting changes - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the [Compare View toolbar](#) or in the **Compare** menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called **Perform files differencing**. After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions **Go to first**, **Go to previous**, **Go to next** and **Go to last modification**. If you decide that some incoming change needs to be present in your working file you can use the action **Copy change from right to left**. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The **Copy all non-conflicting changes from right to left** action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the **Word Details** and **Character Details** dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files disregarding the changes in the number of white spaces between words or lines there is available an option in the [SVN Preferences](#) which allows you to enable or disable the white space ignoring feature of the compare algorithm.

## Conflicts

[Edit on GitHub](#)

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

### Real Conflicts vs Mergeable Conflicts

[Edit on GitHub](#)

There are two types of conflicts:

- *real conflict* ( icon in *Name* column) - Syncro SVN Client considers the following resource states to be real conflicts:
  - *conflicted* state - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict ( icon in *Local file status* column) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict ( icon in *Local properties status* column) is reported when a property's value was modified both locally and remotely.
  - *tree conflicted* state ( icon in *Local file status* column) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
  - *obstructed* state ( icon in *Local file status* column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.
- *pseudo-conflict* ( icon in *Name* column) - A file is considered to be in *pseudo-conflict* when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation

may automatically merge the incoming file content into the existing locally one. In this case, the *pseudo-conflict* marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.

**Note:**

- A conflicting resource cannot be committed to repository. You have to resolve it first, by using **Mark Resolved** action (after manually editing/merging file contents) or by using **Mark as Merged** action (for pseudo-conflicts).
-  and  icons are presented only when one of the following view modes is selected: **Modified, Incoming, Outgoing, Conflicts**.
- The  icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

### *Content Conflicts vs Property Conflicts*

[Edit on GitHub](#)

A *Content conflict* appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, Apache Subversion™ cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<< filename
your changes
=====
code merged from repository
>>>>> revision
```

Also, for every conflicted file Subversion places three additional temporary files in your directory:

- `filename.ext.mine` - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.
- `filename.ext.rOLDREV` - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.
- `filename.ext.rNEWREV` - This is the file that Subversion client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

`OLDREV` and `NEWREV` are revision numbers. If you have conflicts with binary files, Subversion does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get `filename.ext.r*` files also.

A *Property conflict* is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named `filename.ext.proj` is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the **Mark resolved** action to commit the file. Note that the **Mark resolved** action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.

### *Edit Real Content Conflicts*

[Edit on GitHub](#)

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the **Compare** view (the built-in file comparison tool) or with an *external diff application*. Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The **Compare** view (or the external diff application *set in Preferences*) is opened with the **Edit Conflict** action, which is available on the contextual menus of *the Working Copy view* and is enabled only for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If [the option Show warning dialog when edit conflicts is enabled](#) you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<, =====, >>>>>) with the original local version of the file that preceded the update operation. If you press the **OK** button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension .sync.bak to the file as stored on the SVN server. If you press the **Cancel** button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:

**Save**

**Perform Files Differencing**

**Ignore Whitespaces**

**Synchronized scrolling**

**Format and Indent Both Files ([Ctrl + Shift + P](#) ([Command + Shift + P on OS X](#)))**

**Copy Change from Right to Left**

**Copy All Changes from Right to Left**

**Next Block of Changes ([Ctrl + Period](#) ([Command + Period on OS X](#)))**

**Previous Block of Changes ([Ctrl + Comma](#) ([Command + Comma on OS X](#)))**

**Next Change ([Ctrl + Shift + Period](#) ([Command + Shift + Period on OS X](#)))**

**Previous Change ([Ctrl + Shift + Comma](#) ([Command + Shift + M on OS X](#)))**

Saves the modifications of the local version of the file displayed in the left side of the view.

Looks for differences between the two files displayed in the left and right side of the application window.

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronizes scrolling so that a selected difference can be seen on both sides of the application window. This action enables/disables the previously described behavior.

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

Copies the selected difference from the target file in the right side to the source file in the left side.

Copies all changes from the target file in the right side to the source file in the left side.

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block

of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

 **First Change (Ctrl + B (Command + B on OS X))** Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<, =====, >>>>>) with the original local version of the file before running the update action that created the conflict. After that the differences between this original local version and the repository version are displayed in the **Compare** view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the **Compare** view you should work on the local working copy file after the update operation without running the action **Edit Conflict**. If you decide that you want to edit the conflict version directly after running the action **Edit Conflict** you have to work on the .sync.bak file.

If you did not finish editing the conflicts in a file at the first run of the action **Edit Conflict** you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:

- The **Mark Resolved** action on the file so that the result of the conflict editing process can be committed to the SVN repository.
- The **Revert** action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

### *Revert Your Changes*

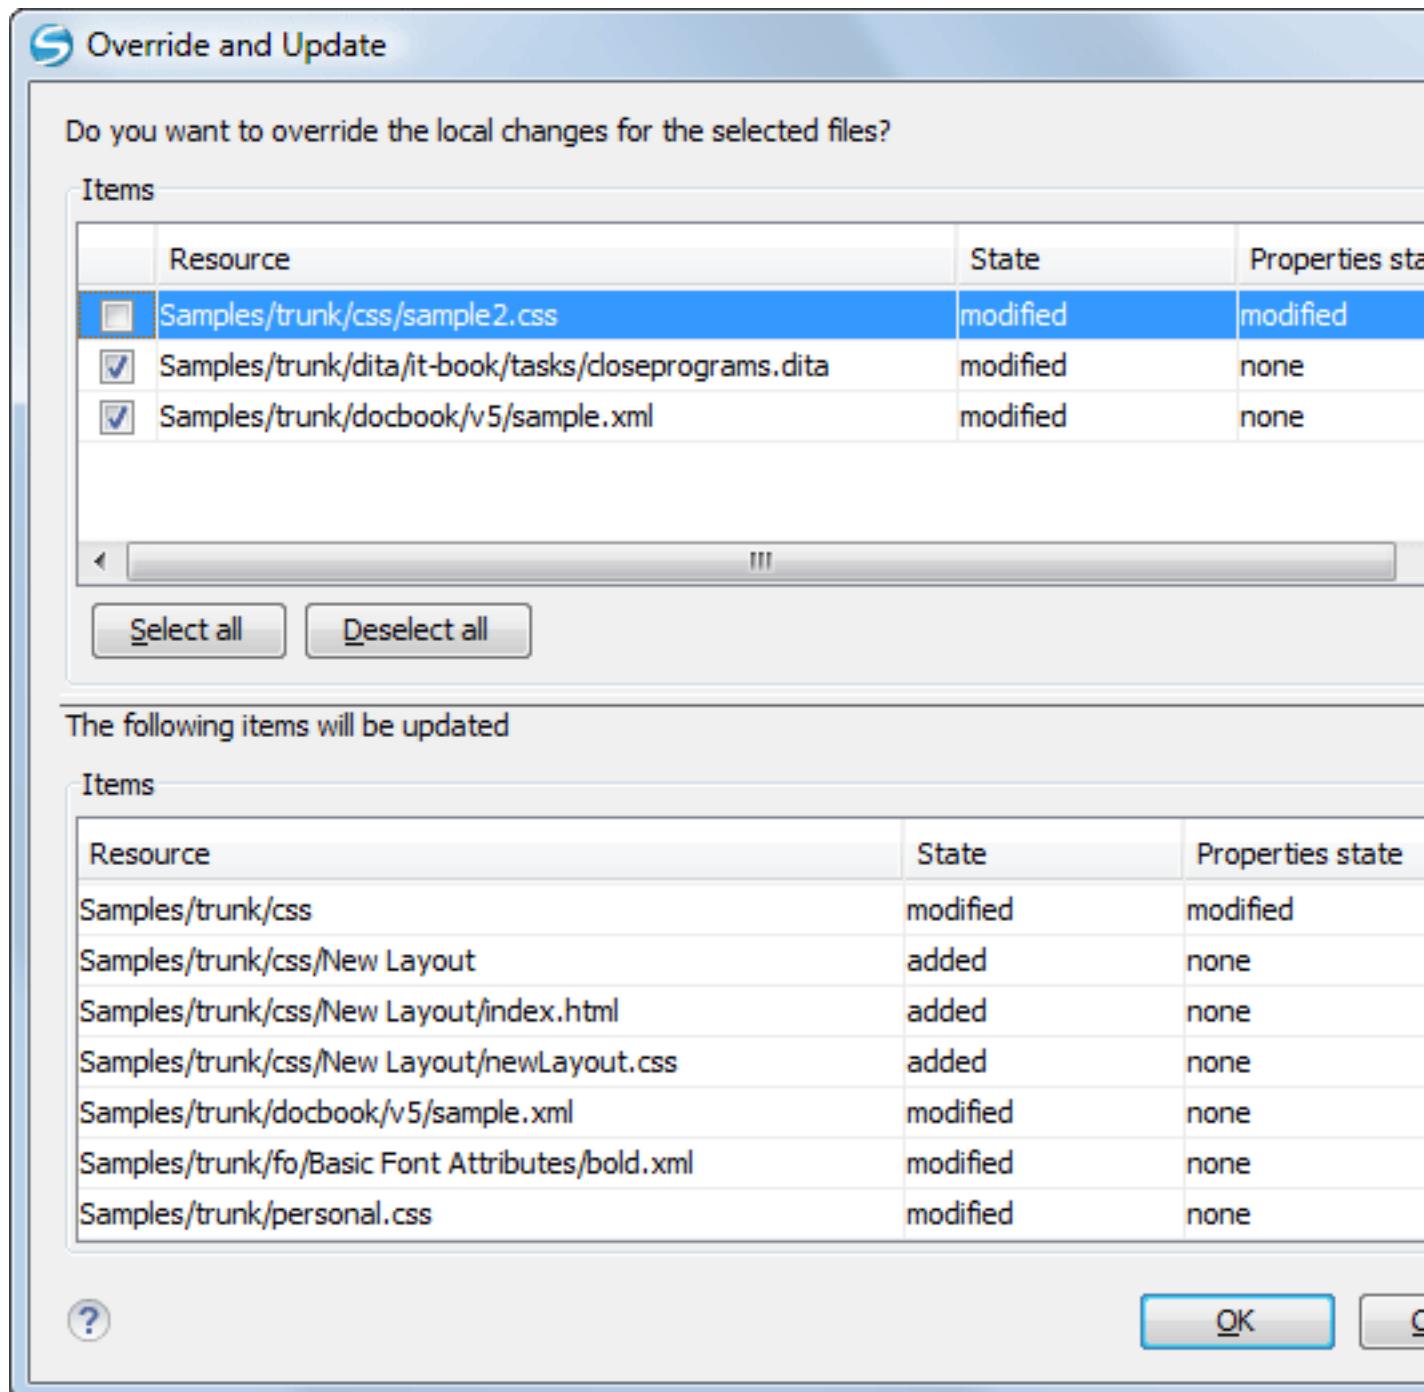

[Edit on GitHub](#)

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select **Revert**. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you want to revert and click the **OK** button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

**Note:** By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in **Compare view** and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action **Copy change from right to left** from the **Compare view toolbar**. After editing the conflicting file you have to run the action **Mark as merged** before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the **Override and update** action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.

**Figure 404: Override and Update Dialog Box**

In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

**Tip:** If you want to roll-back out of your working copy changes that have already been committed to the repository, see [Merge Revisions](#).

[Merge Conflicted Resources](#)

[Edit on GitHub](#)

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming

modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the **Properties view**. Before you can commit you must *mark as resolved* the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must be overridden or modified. After saving your local file you have to use the *Mark as merged* action from the contextual menu before committing.

### *Drop Incoming Modifications*

[Edit on GitHub](#)

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action **Mark as merged** proves to be useful in this case too. After opening the conflicting files with **Compare view, Editor** or editing their properties in the **Properties** view and deciding that your file can be committed in the repository replacing the existing one, you should use the **Mark as merged** action. When you want to override completely the remote file with the local file you should run the **Override and commit** action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the **Compare** view and only after to update and commit.

### *Tree Conflicts*

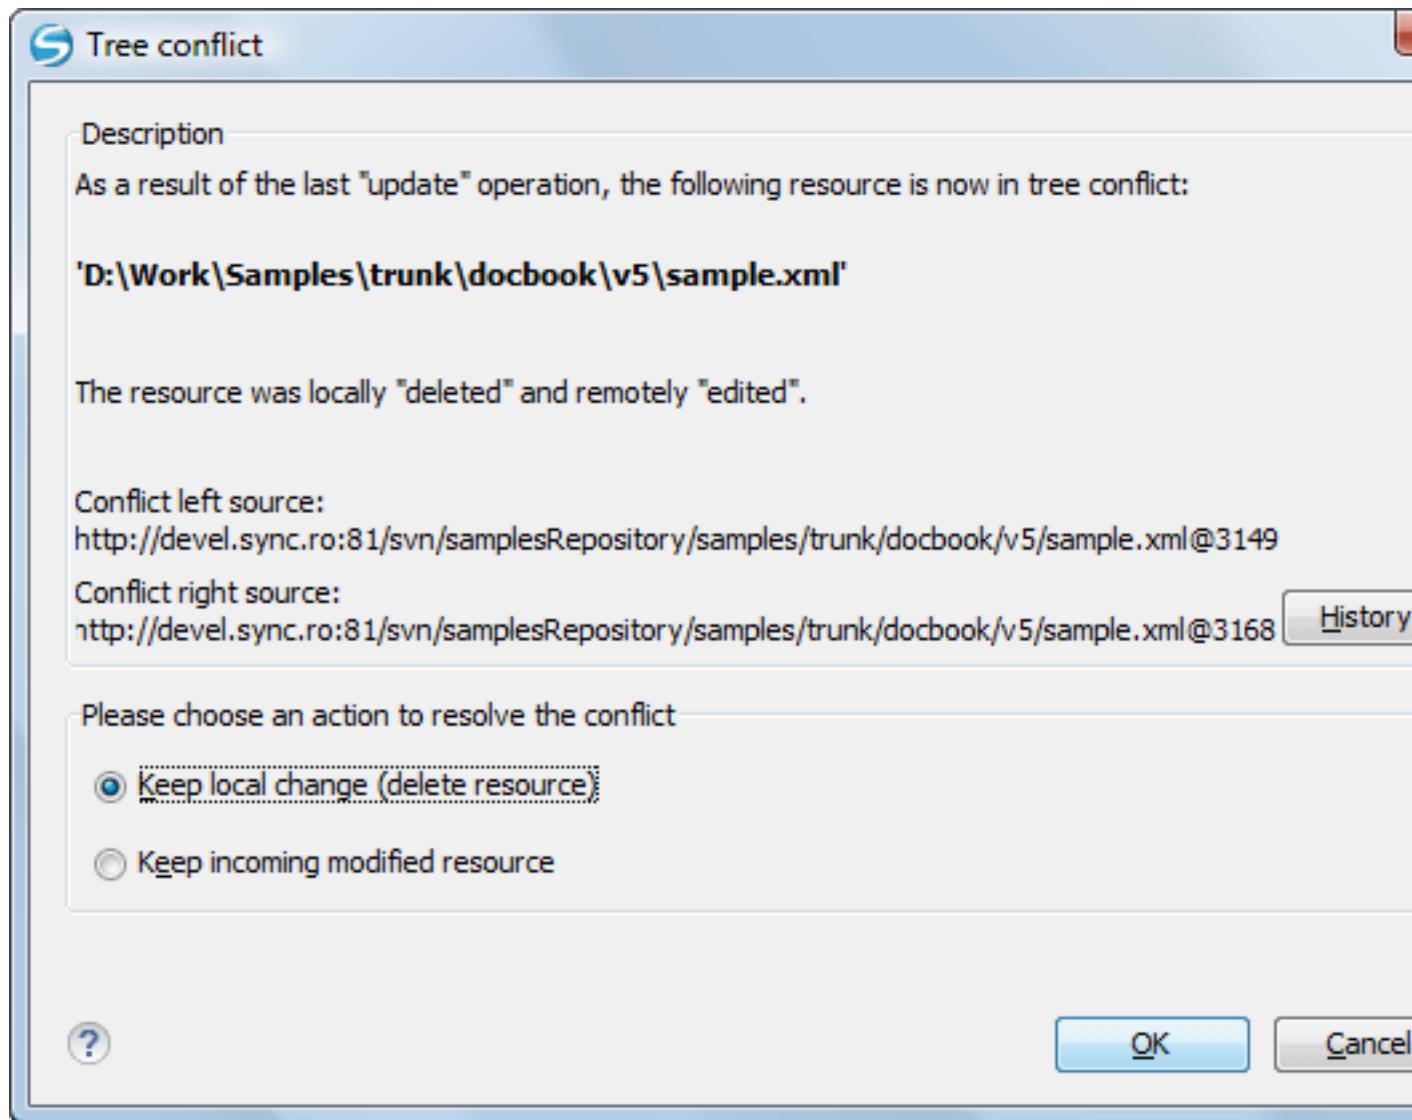

[Edit on GitHub](#)

A *tree conflict* is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
- It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the **Edit conflict** action:

**Figure 405: Resolve a tree conflict**

- **Keep local change (delete resource)** - Keeps the incoming change that comes from the repository.
- **Keep incoming modified resource** - If there is a renamed version of the file committed by other user that will be added to the working copy too.

### Update the Working Copy

[Edit on GitHub](#)

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to *update* your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from [Working Copy view](#). It updates the selected resources to the last synchronized revision (if remote information is available) or to the *HEAD* revision of the repository.

There are three different kinds of incoming changes:

- *Non-conflicting* - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.

- *Conflicting, but auto-mergeable* - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files)
- *Conflicting* - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.

If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Author allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the **Update to revision/depth** action from the **Working Copy** view (**All Files** view mode) or the **Update to revision** action from the **History view** contextual menu.

If you select multiple files and folders and then you perform an **Update** operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

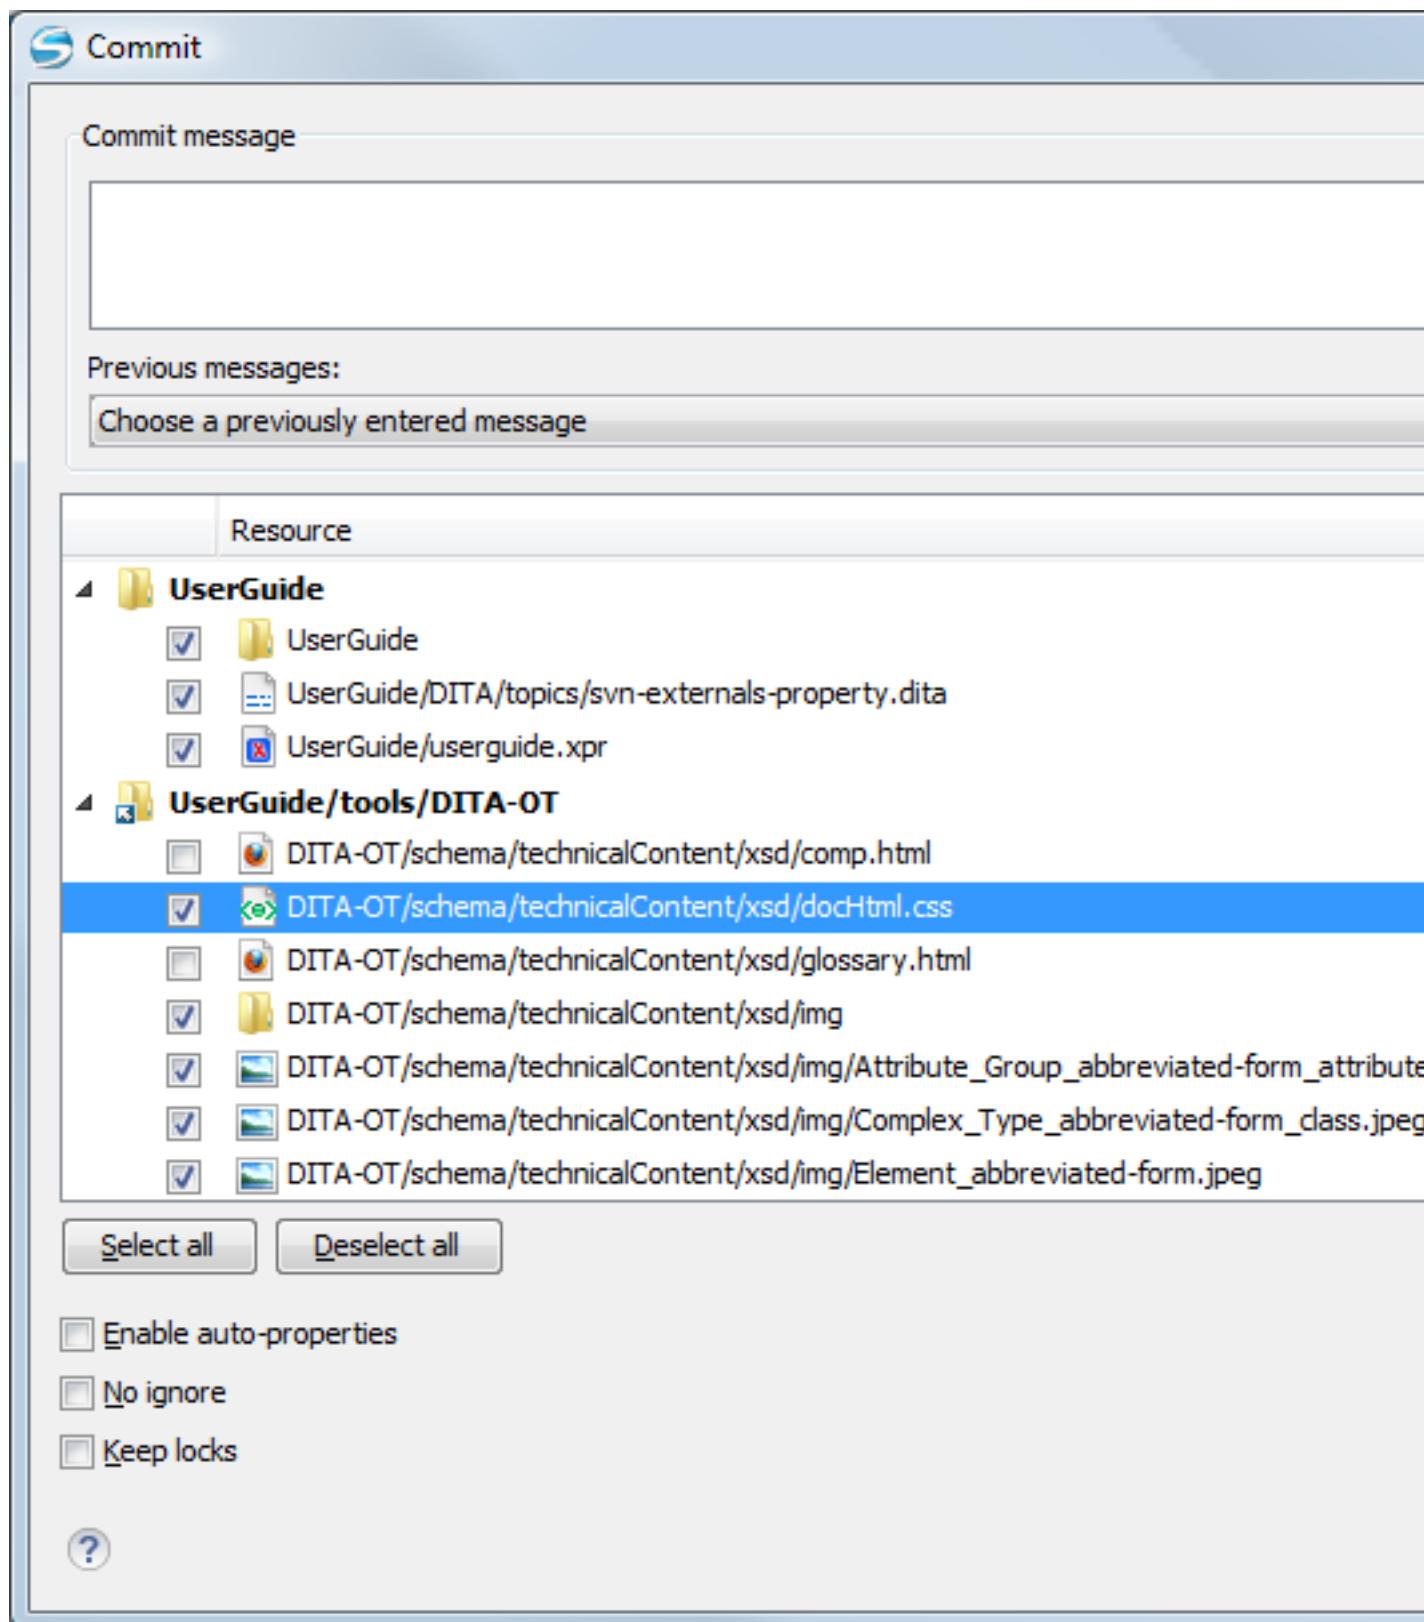

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an **Override and update** action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

## Send Your Changes to the Repository

[Edit on GitHub](#)

Sending the changes you made to your working copy is known as *committing* the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.

The **Commit** action sends the changes from your local working copy to the repository. The **Commit** dialog box presents all the items that you can commit.

**Figure 406: Commit dialog box**

Enter a message to associate with the commit, or choose a previous message from the **Previous messages** list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: *added*, *modified* (content or properties), *replaced*, and *deleted*. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, uncheck it.

**Attention:** For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being *unversioned* or *missing* and these items are handled automatically:

- *Unversioned* items are added under version control.
- *Missing* items are deleted.

**Note:** If the **Show unversioned directories content** is disabled, the **Commit** dialog box does not display the items inside an *unversioned* directory.

*Unversioned* or *missing* items are not selected by default in the **Commit** dialog box, unless you have selected them explicitly when issuing the commit command.

**Note:** In some cases, items that have one of the above states are not presented in the **Commit** dialog box.

For example:

- Items that have been *added* or *replaced* previously, but now are presented as *missing* after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the **Delete** action to remove them from your working copy.
- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

**Note:** Due to dependencies between items, when you select or clear an *unversioned* ( ? ) or *added* ( + ) item in the **Commit** dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double clicking a file in the **Commit** dialog box, or by right clicking and selecting the **Show Modifications** action from the contextual menu. This option is available to review only file content changes, not property changes.

The **Local file status** column indicates the actual state of the items and the **Local properties status** column indicates whether or not the properties of an item are modified.

The **Lock information** column is displayed if at least one of the files in the **Commit** dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.

**Note:** This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

- **Keep locks** - selecting the **Keep locks** option preserves any locks you set on various files.

**Note:** This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item for which the option can be applied.

Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the **Update** action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

### *Committing to Multiple Locations*

[Edit on GitHub](#)

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding *external* items.

If items to be committed belong to different *external* definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow (↗) if they are *external* definitions. The working copy root directory is never decorated and is not presented if there are no *external* items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

**Note:** When an *external* directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for *external* files.

The sets of items belonging to *external* definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of *externals*. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.

**Note:** *External* files are always from the same repository as the parent directory that defines them, so they are always committed together with the changes from their parent directory.

### **Integration with Bug Tracking Tools**

[Edit on GitHub](#)

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message that they enter in the **Commit** dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following *SVN properties* that must be set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the *Commit dialog box* will display a text field for entering the bug ID. It must contain the string `%BUGID%`, which is replaced with the bug number on commit.
- **bugtraq:label** - A string property that sets the label for the text field configured with the **bugtraq:message** property.
- **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring `%BUGID%` which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.
- **bugtraq:warnifnoissue** - A boolean property with the values *true/yes* or *false/no*. If set to *true*, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.
- **bugtraq:number** - A boolean property with the value *true* or *false*. If this property is set to *false*, then any character can be entered in the bug ID text field. If the property is set to *true* or is missing then only numbers are allowed as the bug ID.
- **bugtraq:append** - A boolean property. If set to *false*, then the bug ID is inserted at the beginning of the commit message. If *yes* or not set, then it's appended to the commit message.
- **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID's must be matched in the groups of the regular expression string (for example, `[Ii]ssue #?(\\d+)`). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, `Issue #123 or resolves issue`

123). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern `issue #XXX` and `issue #890, #789` inside a log message you could use the following strings:

- `[Ii]ssue #?( \d+ ) ( ,? ?#?( \d+ ) )+`
- `( \d+ )`

The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tools can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the **bugtraq:url** property was filled in with the URL of the bug tracking system and this URL includes the `%BUGID%` substring as specified above in the description of the **bugtraq:url** property then the **History view** presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.

## Obtain Information for a Resource

[Edit on GitHub](#)

This section explains how to obtain information for a SVN resource:

### Request Status Information for a Resource

[Edit on GitHub](#)

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the **Synchronize** action from the **Working Copy view** comes in handy. The **Working Copy** view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the  **Show SVN Information** action. This action is available from the **File** menu or the contextual menu of the **Working Copy**, **Repositories**, **History**, or **Directory Change Set** views, or from the **Revision Graph** dialog box. The **SVN Information** dialog box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number
- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the **Copy** action.

### Request History for a Resource

[Edit on GitHub](#)

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be

accessed from [Repositories view](#), [Working Copy view](#), [Revision Graph](#), or [Directory Change Set view](#). From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened from the **Window > Show View** menu.

### Related information

[History View](#) on page 1535

## Management of SVN Properties

[Edit on GitHub](#)

In the [Properties view](#) you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the [Working Copy view](#) and run the **Show properties** action from the contextual menu. The [Properties view](#) will show the local properties for the resource in the working copy. Once the [Properties view](#) is visible, it will always present the properties of the currently selected resource. There are actions available in the [Properties view toolbar](#) that allow you to add, change, and delete the properties.

If you choose the **Add a new property** action, a new dialog box will appear that contains the following:

- **Name** - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as `svn:ignore`, `svn:externals`, `svn:needs-lock`, etc.)
- **Current value** - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by checking the **Set property recursively** checkbox.

If you want to change the value for a previously set property, you can use the **Edit property** action, which will display a dialog box with the following information:

- **Name** - Property name (cannot be changed).
- **Current value** - The current value (can be changed).
- **Base value** - The value of the property, if any, from the resource in the pristine copy (cannot be changed).

If you want to completely remove a property previously set you can choose the **Remove property** action. It will display a confirmation dialog box in which you can also choose if the property will be removed recursively.

There is a **Refresh** action in the [Properties view](#) that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an **Update** operation.

## Branches and Tags

[Edit on GitHub](#)

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a *branch*. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (*trunk*).

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as *tagging*. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a *tag* and a *branch*. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.

### Create a Branch / Tag

[Edit on GitHub](#)

To create a branch or tag by copying a directory, use the **Branch/Tag** action that is available in the **Tools** menu when an item is selected in the *Working Copy view* or *Repositories view*, or from the contextual menu of the **Repositories** view.

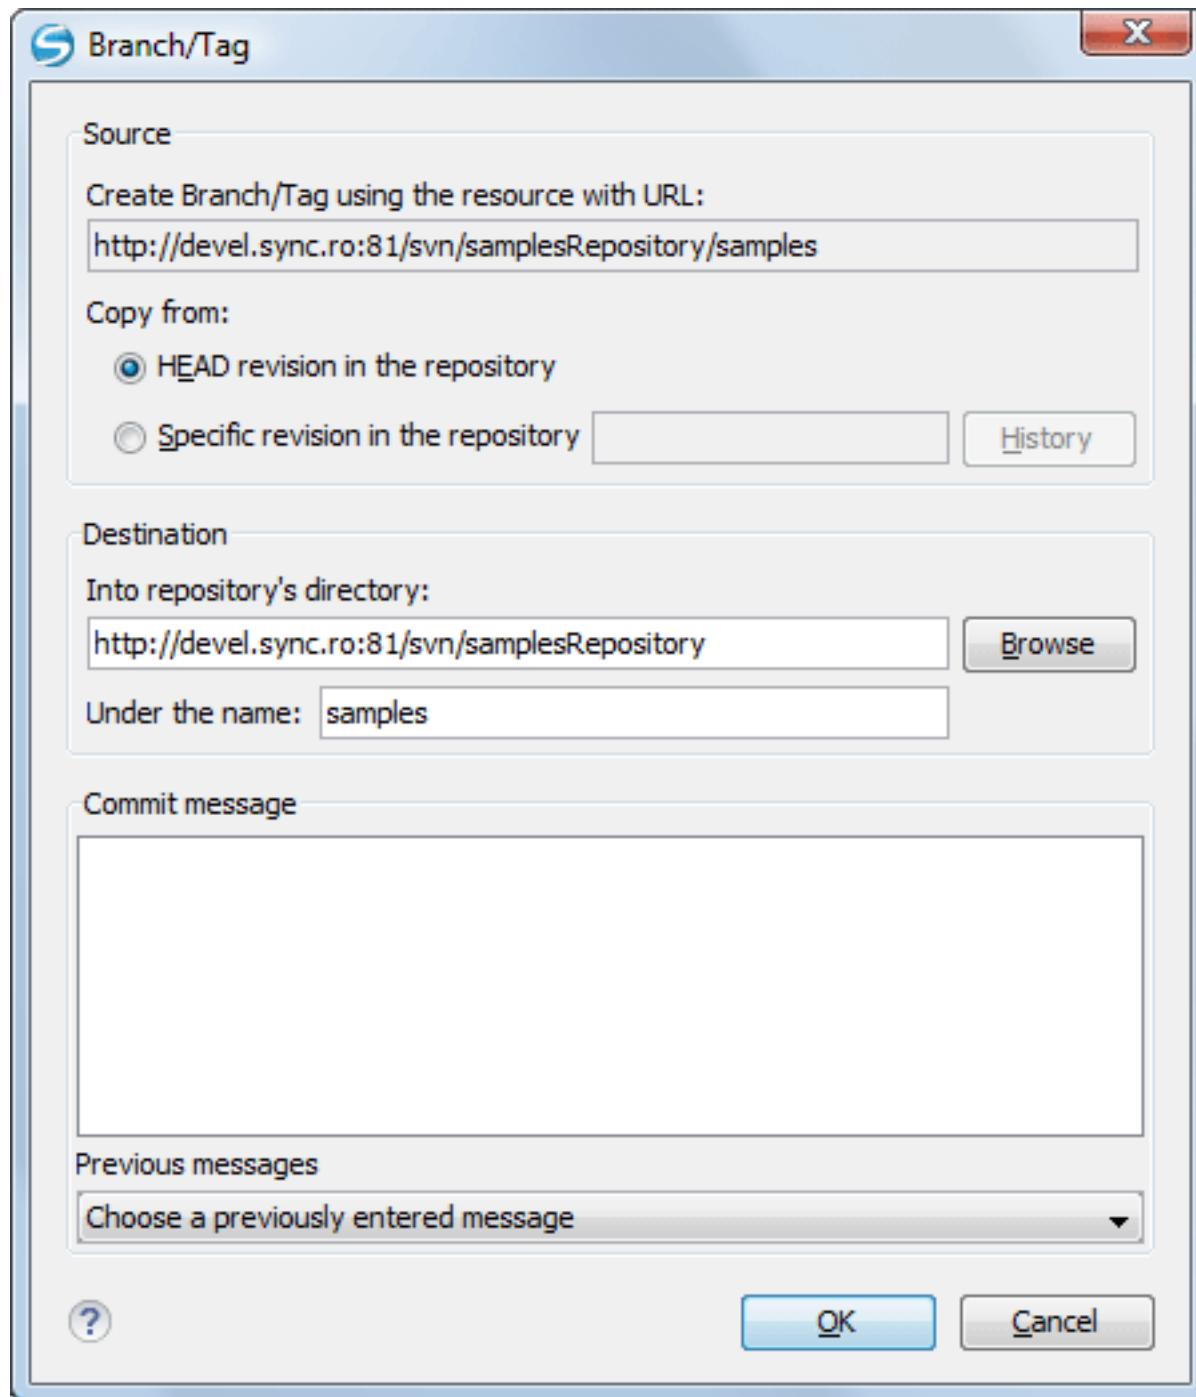

Figure 407: Branch/Tag Dialog Box

You can configure the following options in this dialog box:

You can specify the source revision of the copy in the **Copy from** section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the HEAD revision. The branch will be created very quickly, as the repository will make a *cheap* copy.
- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the **History** button you can select the revision number from *the History dialog box*. This type of branch will also be created very quickly.
- **Working copy** - (Available only if the item is selected from the **Working copy** view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the **Destination** section:

- **Into repository's directory** - *The URL of the parent directory* of the new branch or tag.  
**Note:** *Peg revisions* have no effect for this operation since it is used to send information to the repository.
- **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the **Repositories** or **Working copy** view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

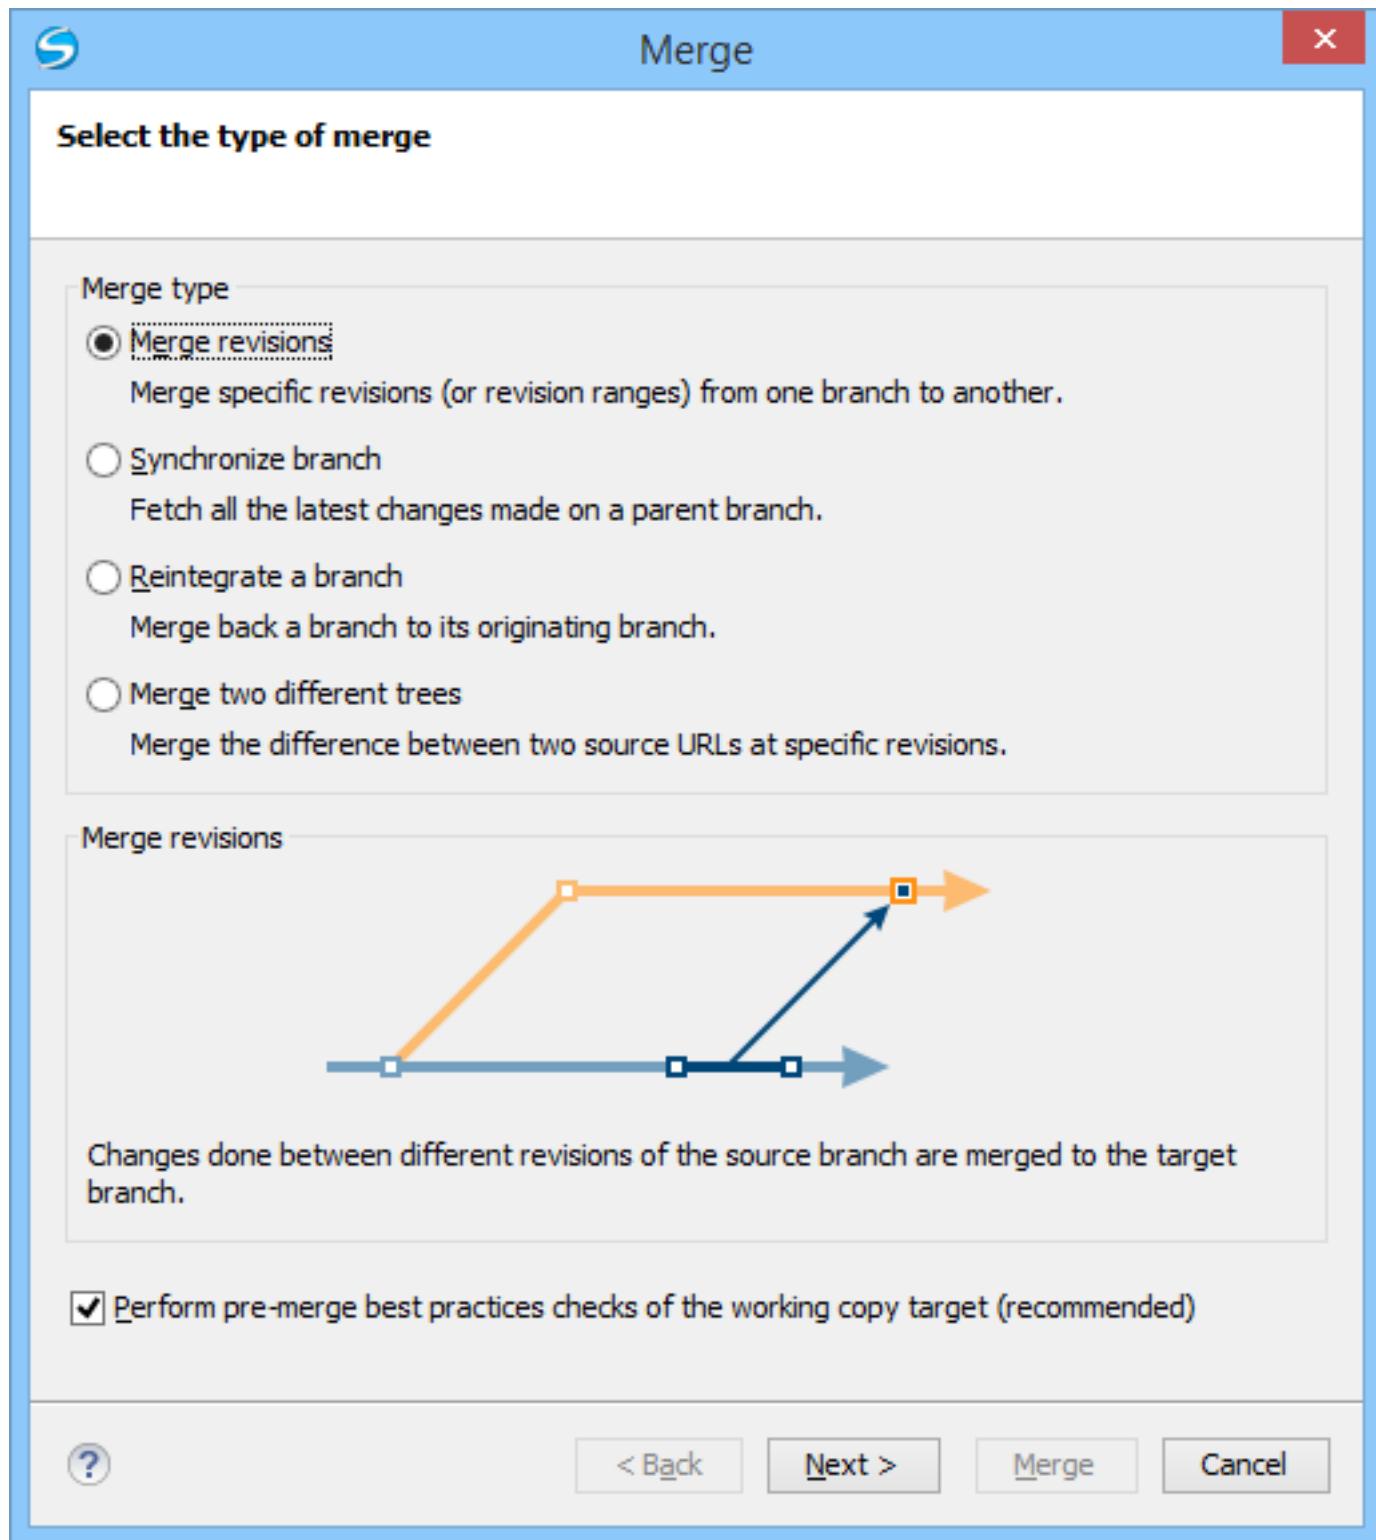

## Merging

[Edit on GitHub](#)

At some stage during the development process, you will want to merge the changes made on a *branch* back into the *trunk*, or vice-versa. The *merge* is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the *diff* concept.

**Note:** A *branch* is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A *branch* always begins life as *a copy of something* (such as a trunk, another branch, or tag), and moves on from there, generating its own history.

The  **Merge** action is available in the **Tools** menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the *merge* operation will be performed on the entire working copy.

**Figure 408: Merge Wizard**

The four types of merging are as follows:

- **Merge revisions** - Port changes from one branch to another. Note that the *trunk* can also be considered a branch, in this context.
- **Synchronize branch** - Fetch all the changes made on a parent branch (or the *trunk*) to a child branch.

- **Reintegrate a branch** - Merge a branch back to its parent branch (can also be the *trunk*).
- **Merge two different trees** - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check option:

- **Perform pre-merge best practices checks of the working copy target** - When enabled, the SVN Client checks if the working copy target item is ready for the merge operation and displays the **pre-merge checks** wizard page.

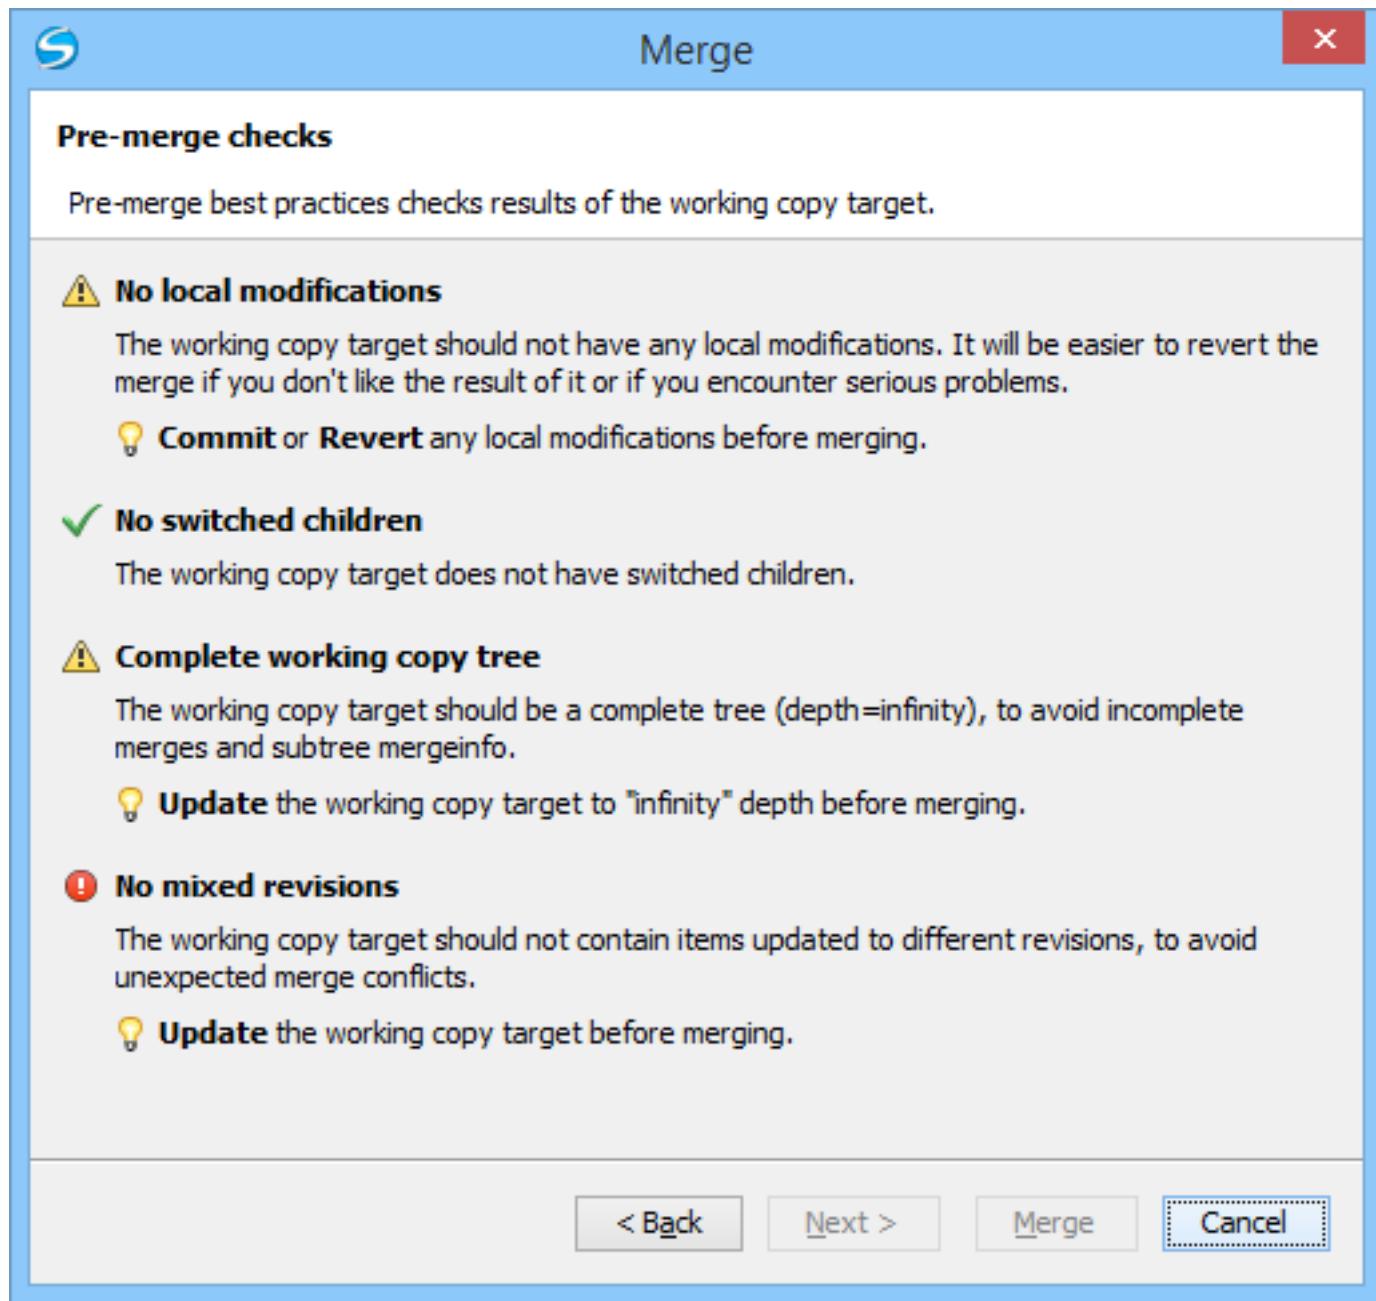

**Remember:** It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the *merge* does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.

**Important:** The above recommendation becomes mandatory when *reintegrating a branch*.

### Pre-Merge Checks

[Edit on GitHub](#)

Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By enabling the **Perform pre-merge best practices checks of the working copy target** option in the first page of the **Merge** wizard, the **Pre-merge checks** wizard page is displayed to give you a summary of the verified conditions.

**Figure 409: Pre-Merge Checks Wizard Page**

The following conditions are checked in this operation:

**No local modifications**

The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

**Tip:** If this condition fails, you should *commit* or *revert* the local modifications before merging.

**No switched children**

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and *subtree mergeinfo*.

**Complete working copy tree**

**Tip:** If this condition fails, you should switch back all the children before merging.

**No mixed revisions**

The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and *subtree mergeinfo*.

**Tip:** If this condition fails, you should change the *sticky* depth of the working copy item receiving the merge to *infinity* value.

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

**Tip:** If this condition fails, you should *update* the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

-  **(Successful)** - The condition is fulfilled successfully.
-  **(Warning)** - The condition is not fulfilled, but it is not mandatory.
-  **(Error)** - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).

**Tip:** For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

**Important:** After solving any of the warnings or errors, it is recommended that you perform the *pre-merge checks* again to make sure your new changes are valid.

*Merge Revisions*

[Edit on GitHub](#)

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, we know that a problem has been fixed by committing revisions 17, 20, and 25 on branch B1. These changes are also needed in branch B2. Thus, to merge them, we need a working copy of the B2 branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu **Tools > Merge**.  
The **Merge** wizard is opened.
2. Select the **Merge revisions** option.
3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
  - a) Press the **Next** button.  
If the **Perform pre-merge best practices checks of the working copy target** option was enabled, [the Pre-Merge Checks wizard page](#) is displayed.

**Note:** If errors are found you need to solve them before proceeding.

4. Press the **Next** button.  
The **Merge revisions** wizard page is displayed.
5. In the **Merge from (URL)** text box, enter [the URL of the branch or tag](#) that contain the changes that you want to duplicate in your working copy. In our example, it is the URL of the B1 branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Note:** If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option, in the [Merge Options wizard page](#), will be enabled automatically (and you cannot change this). This is because the [Subversion client cannot track changes between different repositories](#).

**Tip:** You can also specify a *peg revision* at the end of the URL (for example, URL@rev1234). The peg revision does not affect the merge range you select. By default, the HEAD revision is assumed.

**6.** In the **Revisions to merge** section, choose between the **all revisions** and **specific revision(s)** options.

- **all revisions** - The operation will include *all eligible revisions* that were not yet merged.
- **specific revision(s)** - You can specify one or more individual revisions and/or revision ranges. Also, you can mix *forward* ranges (for example, 1–5), *backward* ranges (for example, 20–15), and subtract specific revisions from a range (for example, 1–5, –3).

**Note:** If using the Subversion command-line client, a revision range of the form 1–5 means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in Syncro SVN Client the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.

**Attention:** The HEAD revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, 10–HEAD). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

**Tip:** If you want to perform a *reverse merge* and roll-back your working copy changes that have already been committed to the repository, use the *negative revisions* notation (for example, –7) or *backward revision ranges* (for example, 20–10).

- a) If you press the **History** button, [the History dialog box](#) is displayed, which allows you to select one or more revisions to be merged.

**7.** Optionally, if you want to [configure the options](#) for your merge, press the **Next** button.

The [Merge Options wizard page](#) is displayed that allows you to configure options for the operation.

**Warning:** If the **Ignore ancestry / Disable merge tracking** option is enabled and you selected **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

**8.** Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts](#) after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

## Synchronize a Branch

[Edit on GitHub](#)

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the *trunk* itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a *synchronize merge*, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized. Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses *merge tracking* to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

**Important:** It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the *synchronize merge*, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the *trunk* since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:

1. Go to **Tools > Merge**.  
The **Merge** wizard is opened.
2. Select the **Synchronize branch** option.
3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
  - a) Press the **Next** button.  
If the **Perform pre-merge best practices checks of the working copy target** option was enabled, *the Pre-Merge Checks wizard page* is displayed.

**Note:** If errors are found you need to solve them before proceeding.

4. Press the **Next** button.  
The **Synchronize branch** wizard page is displayed.
5. In the **Parent branch (URL)** text box, enter *the URL of the branch from which you created your branch*. This means that the URL must belong to the same repository as your working copy that was created from the child branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** You can also specify a *peg revision* at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

6. Optionally, if you want to *configure the options* for your merge, press the **Next** button.  
*The Merge Options wizard page* is displayed that allows you to configure options for the operation.

**Note:** The **Ignore ancestry / Disable merge tracking** option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Press the **Merge** button.  
The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, *you may need to resolve conflicts* after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### *Reintegrate a Branch*

[Edit on GitHub](#)

There are some conditions that apply to reintegrate a branch:

- The server must support merge tracking.
- The source branch (to be reintegrated) must be coherently synchronized with its parent branch. This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
- The working copy **must not** contain the following:

- Local modifications.
- A mixture of revisions (all items must point to the same revision).
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.
- The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.

**Tip:** You can use [the pre-merge checks option](#) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the **Reintegrate a branch** option.

This method uses the *merge-tracking* features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.

**Tip:** Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.

To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu **Tools > Merge**.  
The **Merge** wizard is opened.
2. Select the **Reintegrate a branch** option.

**Note:** This option is disabled if the selected working copy item (or if it is a directory, any of the items inside of it) has any type of modification. This is because it is mandatory for the target item to have no modifications.

3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
  - a) Press the **Next** button.  
If the **Perform pre-merge best practices checks of the working copy target** option was enabled, [the Pre-Merge Checks wizard page](#) is displayed.

**Note:** If errors are found you need to solve them before proceeding.

4. Press the **Next** button.  
The **Reintegrate a branch** wizard page is displayed.
5. In the **Child branch (URL)** text box, enter [the URL of the child branch to be reintegrated](#). This means that the URL must belong to the same repository as your working copy that was created from the parent branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** You can also specify a [peg revision](#) at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

The [Merge Options wizard page](#) is displayed that allows you to configure options for the operation.

**Note:** Since a *reintegrate merge* is so specialized, most of the merge options are not available, except for those in the **File Comparison** category.

6. Press the **Merge** button.  
The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, *you may need to resolve conflicts* after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### Merge Two Different Trees

[Edit on GitHub](#)

This merge type is useful when you need to duplicate changes from one child branch (for example, CB1) to another child branch (CB2) from the same parent branch. The SVN client will calculate the changes necessary to get from the HEAD revision of the parent branch (or the *trunk*) to the HEAD revision of one of its child branches (CB1), and apply those changes to your working copy of the other branch (CB2). The result is that the latter child branch (CB2) will also include the changes made on the original child branch (CB1), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support *merge tracking*.

**Note:** If the server does not support *merge-tracking*, then this is the only way to merge a branch back to its parent.

1. Go to menu **Tools > Merge**.  
The **Merge** wizard is opened.
2. Select the option **Merge two different trees**.
3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
  - a) Press the **Next** button.  
If the **Perform pre-merge best practices checks of the working copy target** option was enabled, *the Pre-Merge Checks wizard page* is displayed.

**Note:** If errors are found you need to solve them before proceeding.

4. Press the **Next** button.  
The **Merge two different trees** wizard page is displayed.
5. In the **From (starting URL and revision)** section enter *the URL of the first branch*.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

**Note:** If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option, in the *Merge Options wizard page*, will be enabled automatically (and you cannot change this). This is because the *Subversion client cannot track changes between different repositories*.

**Tip:** You can also specify a *peg revision* at the end of the URL (for example, URL@rev1234). By default, the HEAD revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.
  - **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
  - **other revision** - Use this option to input a specific revision number and avoid losing recent commits. You can use the **History** button to see a list of all revisions.
7. In the **To (ending URL and revision)** section enter *the URL of the second branch*.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

**Attention:** The URL must point to the same repository as the one in the **From (starting URL and revision)** field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

**Tip:** You can also specify a *peg revision* at the end of the URL (for example, URL@rev1234). By default, the HEAD revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between **HEAD revision** and **other revision**.
  - **HEAD revision** - This is the default selected revision.
  - **other revision** - Use this option if you want to enter a previous revision. You can use the **History** button to see a list of all revisions.
9. Optionally, if you want to *configure the options* for your merge, press the **Next** button.  
The **Merge Options wizard page** is displayed that allows you to configure options for the operation.

**Warning:** If the **Ignore ancestry / Disable merge tracking** option is enabled and you selected **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

10. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

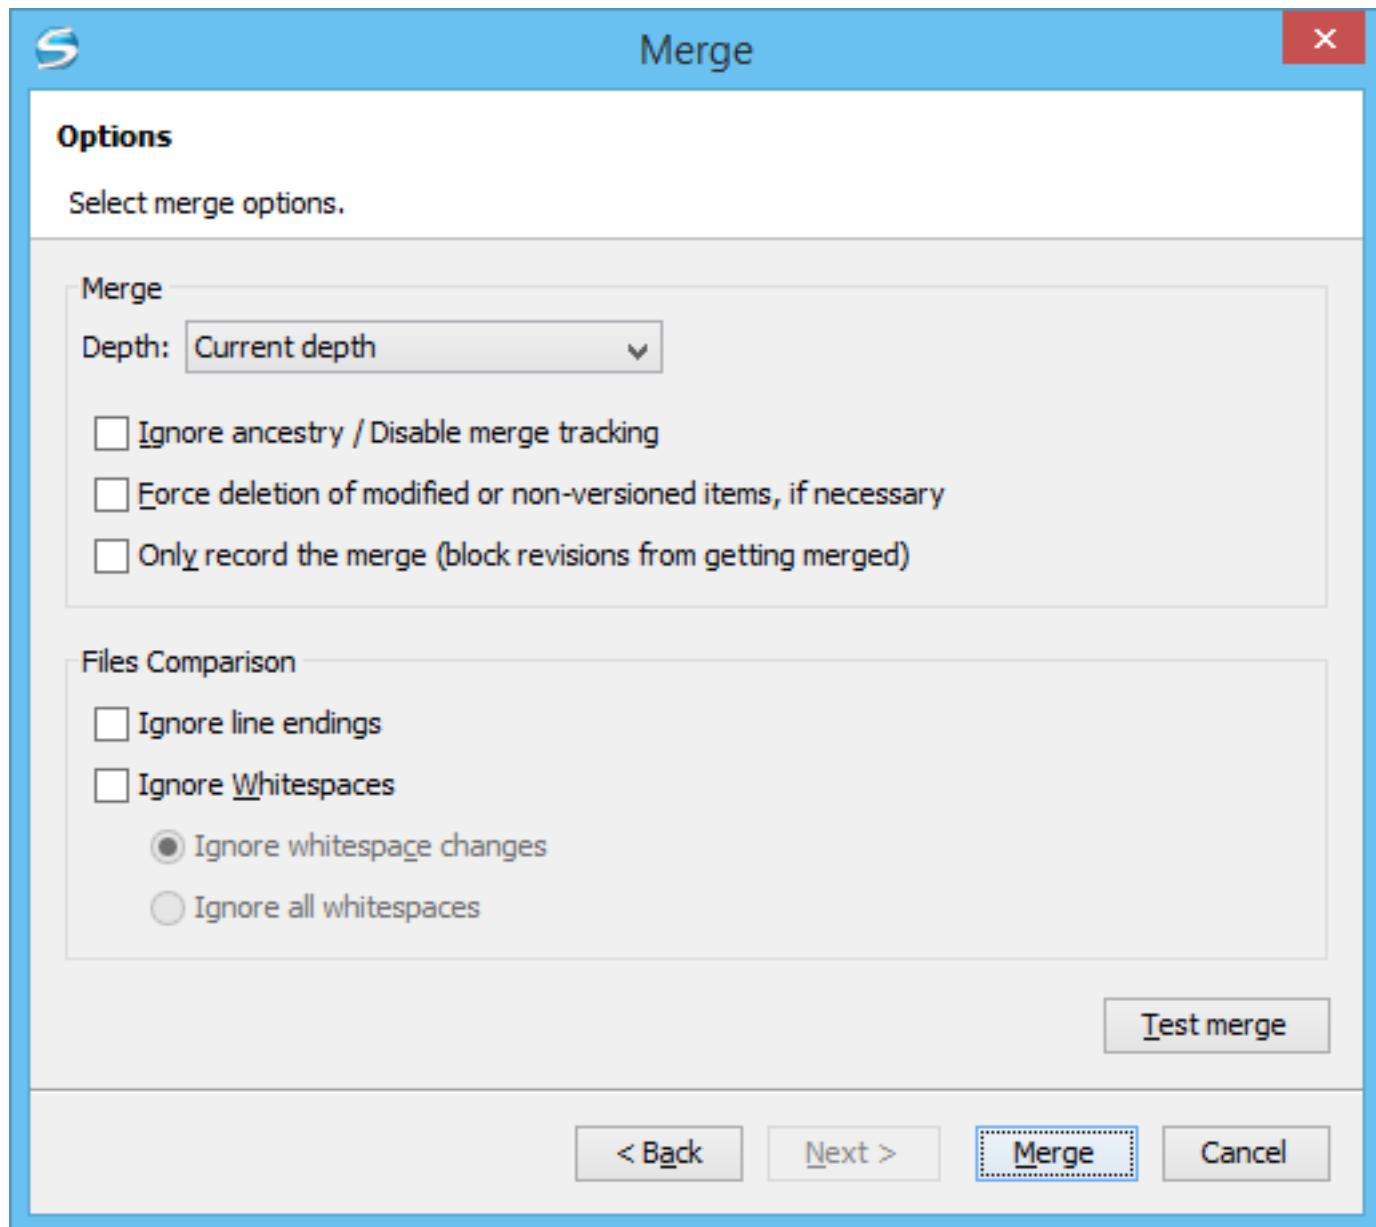

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, *you may need to resolve conflicts* after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### Merge Options

[Edit on GitHub](#)

Here is the list of options that can be used when merging:

**Figure 410: Merge Wizard - Advanced Options**

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
  - **Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.
  - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and *subtree mergeinfo*.
  - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
  - **File children only (files)** - Merges only the child files.
  - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).
- **Note:** The *depth* term is described in the [Sparse checkouts](#) section. The default depth is the current depth of the working copy item receiving the merge.
- **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is disabled, the first item will be replaced with

the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, disabling the option replaces one of the files with the other one, and enabling it merges their contents.

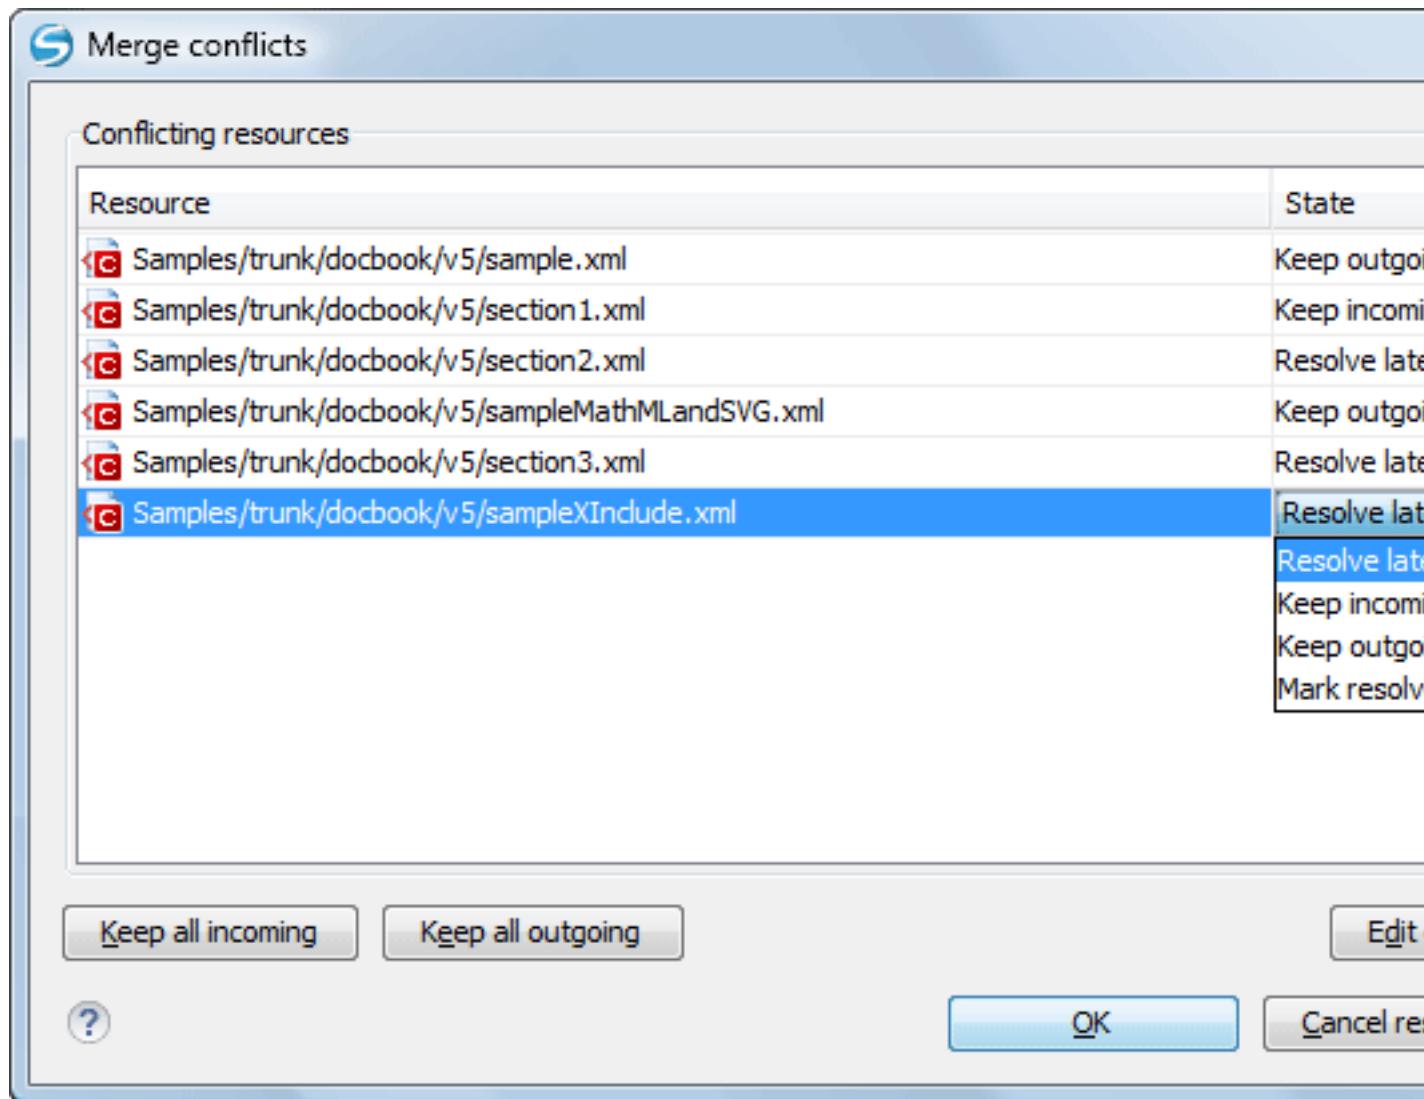

**Note:** If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot change this). This is because the *Subversion client cannot track changes between different repositories*.

- **Force deletion of modified or non-versioned items, if necessary** - If disabled, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.
- **Only record the merge (block revisions from getting merged)** - Available when the *Ignore ancestry / Disable merge tracking option* is disabled. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to enable this option for two possible reasons:
  - You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
  - You want to prevent one or more particular changes from being fetched in subsequent merges.
- **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
- **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
  - **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).
  - **Ignore all whitespaces** - Ignores all types of whitespace changes.
- **Test merge** - Performs a dry run of the merge operation, allowing you to *preview* it without actually performing the merge. In the **Console** view you will see a list of the working copy items that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

### Resolving Merge Conflicts

[Edit on GitHub](#)

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the **Merge conflicts** dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.

**Figure 411: Merge Conflicts Dialog Box**

The options to resolve a conflict are as follows:

- **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
- **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
- **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
- **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).

*Additional Notes About the Merge Operation*

[Edit on GitHub](#)

### Sub-tree Merges

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid *sub-tree mergeinfo*. *Sub-tree mergeinfo* is the *mergeinfo* recorded to describe a *sub-tree merge*. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about *sub-tree merges* or *sub-tree mergeinfo* except that the complete record of merges to a branch may not be

contained solely in the *mergeinfo* on the branch root and you may have to look to any *sub-tree mergeinfo* to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

## Merging from Foreign Repositories

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source. However, copies made in the merge source will be transformed into plain additions in the merge target. Also, *merge-tracking* is not supported for merges from foreign repositories.

**Note:** When performing merges from repositories other than the one corresponding to the target item (from the working copy), the *Ignore ancestry / Disable merge tracking option*, in the *Merge Options wizard page*, will be enabled automatically (and you cannot change this).

## General Merge Recommendations

As a recommendation, you should only merge into clean working copies that **do not** contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.

**Important:** This recommendation becomes mandatory when performing a *reintegrate merge* operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

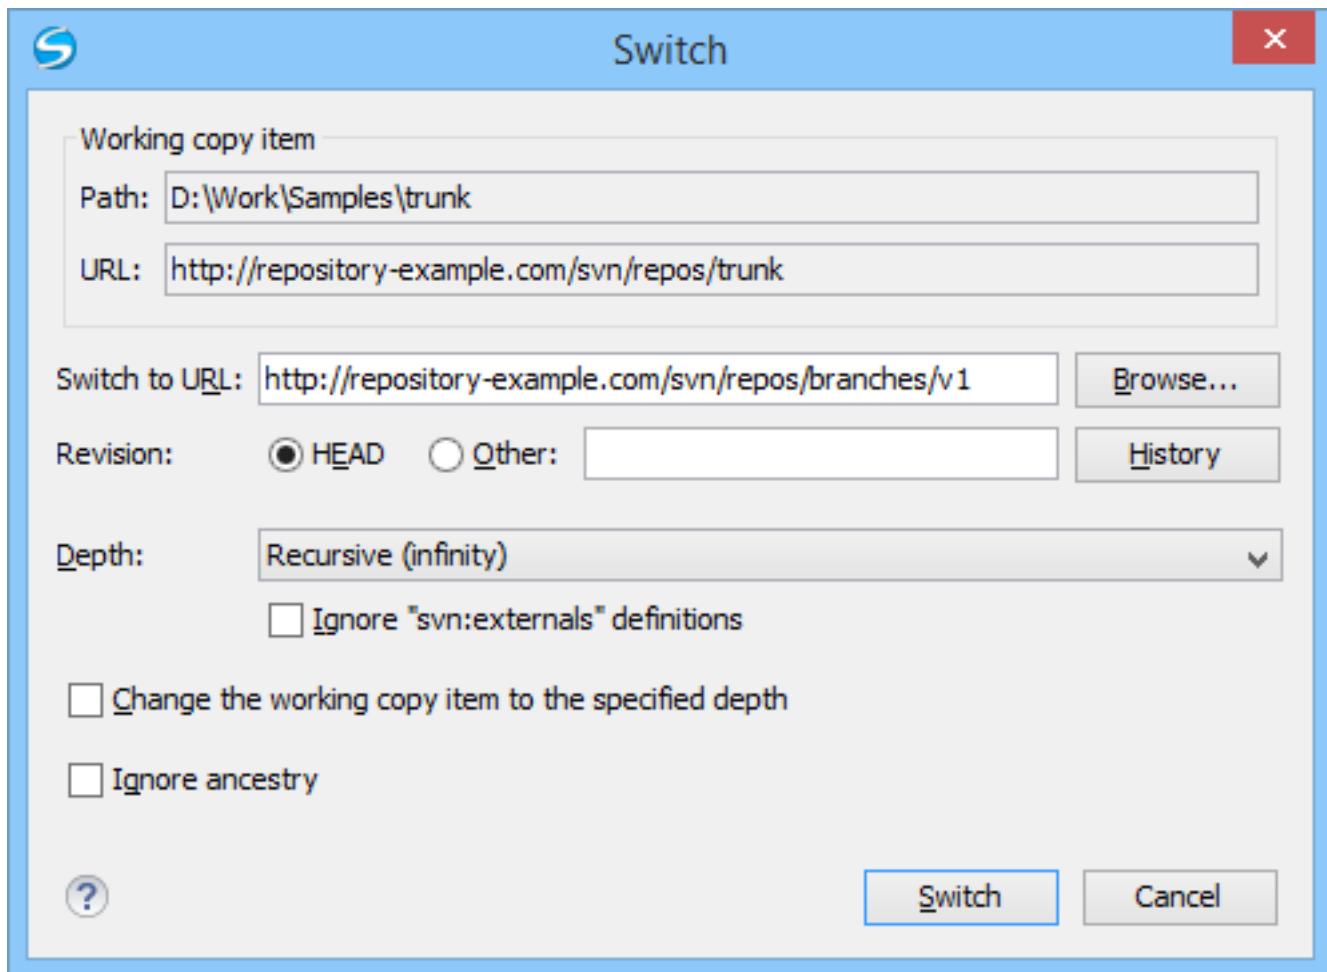

**Remember:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

## Switch the Repository Location

[Edit on GitHub](#)

The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the *Working Copy view*.

**Note:** *External* items cannot be switched using this action. Instead, change the value of the `svn:externals` property set on the parent directory of the external item and update the parent directory.

**Figure 412: Switch Dialog Box**

The following options can be configured in the **Switch** dialog box:

#### Switch to URL

*The new location in the same repository* you are switching to.

**Tip:** You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

**Note:** For items that are already *switched* that you want to switch back, the proposed URL is the original location of the item.

#### Revision

The specific version of the location that you are switching to.

#### Depth - (This option is applicable only for directories)

**Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.

**Recursive (infinity)** - Switches the location of the selected folder and all of its files and folders.

**Immediate children (immediates)** - Switches the location of the selected folder and its child files and folders without recursing subfolders.

<b>Ignore "svn:externals" definitions</b>	<b>File children only (files)</b> - Switches the location of the selected folder and its child files.
<b>Change the working copy item to the specified depth</b>	<b>This folder only (empty)</b> - Switches the location of the selected folder (no child files or folders are included).
<b>Ignore ancestry</b>	When enabled, external items are ignored in the switch operation. This option is only available if you choose the <b>Current depth</b> or <b>Recursive (infinity)</b> depth.
<b>Changes the sticky depth on the directory in the working copy.</b>	Changes the <i>sticky</i> depth on the directory in the working copy.
<b>Ignore ancestry</b>	When disabled, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If enabled, the SVN does not check for a common ancestry.

## Relocate a Working Copy

[Edit on GitHub](#)

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to *the new URL of the repository*.

**Note:** *Peg revisions* have no effect for this operation.

This **Relocate** action is available in the **Tools** menu when selecting the root item of the working copy.

**Note:** *External* items that are defined using absolute URLs and that point to the same repository as the working copy are not affected by the **Relocate** action (the URL is not updated). To relocate these items, change the value of the `svn:externals` property for each external item (set on their parent directories). For example, if an external item is defined as `externalDir http://host/path/to/repo/to/dir` and the repository was moved to another server (`host2`) and its protocol changed to `https`, then the value of the property needs to be updated to `externalDir https://host2/path/to/repo/to/dir`.

**Tip:** If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

## Patches

[Edit on GitHub](#)

This section explains how to work with patches in Syncro SVN Client.

### What is a Patch

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in *the Unified Diff format*, but it can also use *the Git format*.

Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:

- *Two revisions of a version item* - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- *Two different versioned items from the repository* - the items are remote and you need to specify a revision for both.

**Warning:** The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

### Generating a Patch - Local Items

[Edit on GitHub](#)

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

To open the **Create patch** wizard, use the **Create patch** action from the **Tools** menu or from the contextual menu in the **Modified**, **Incoming**, **Outgoing**, or **Conflicts** modes.

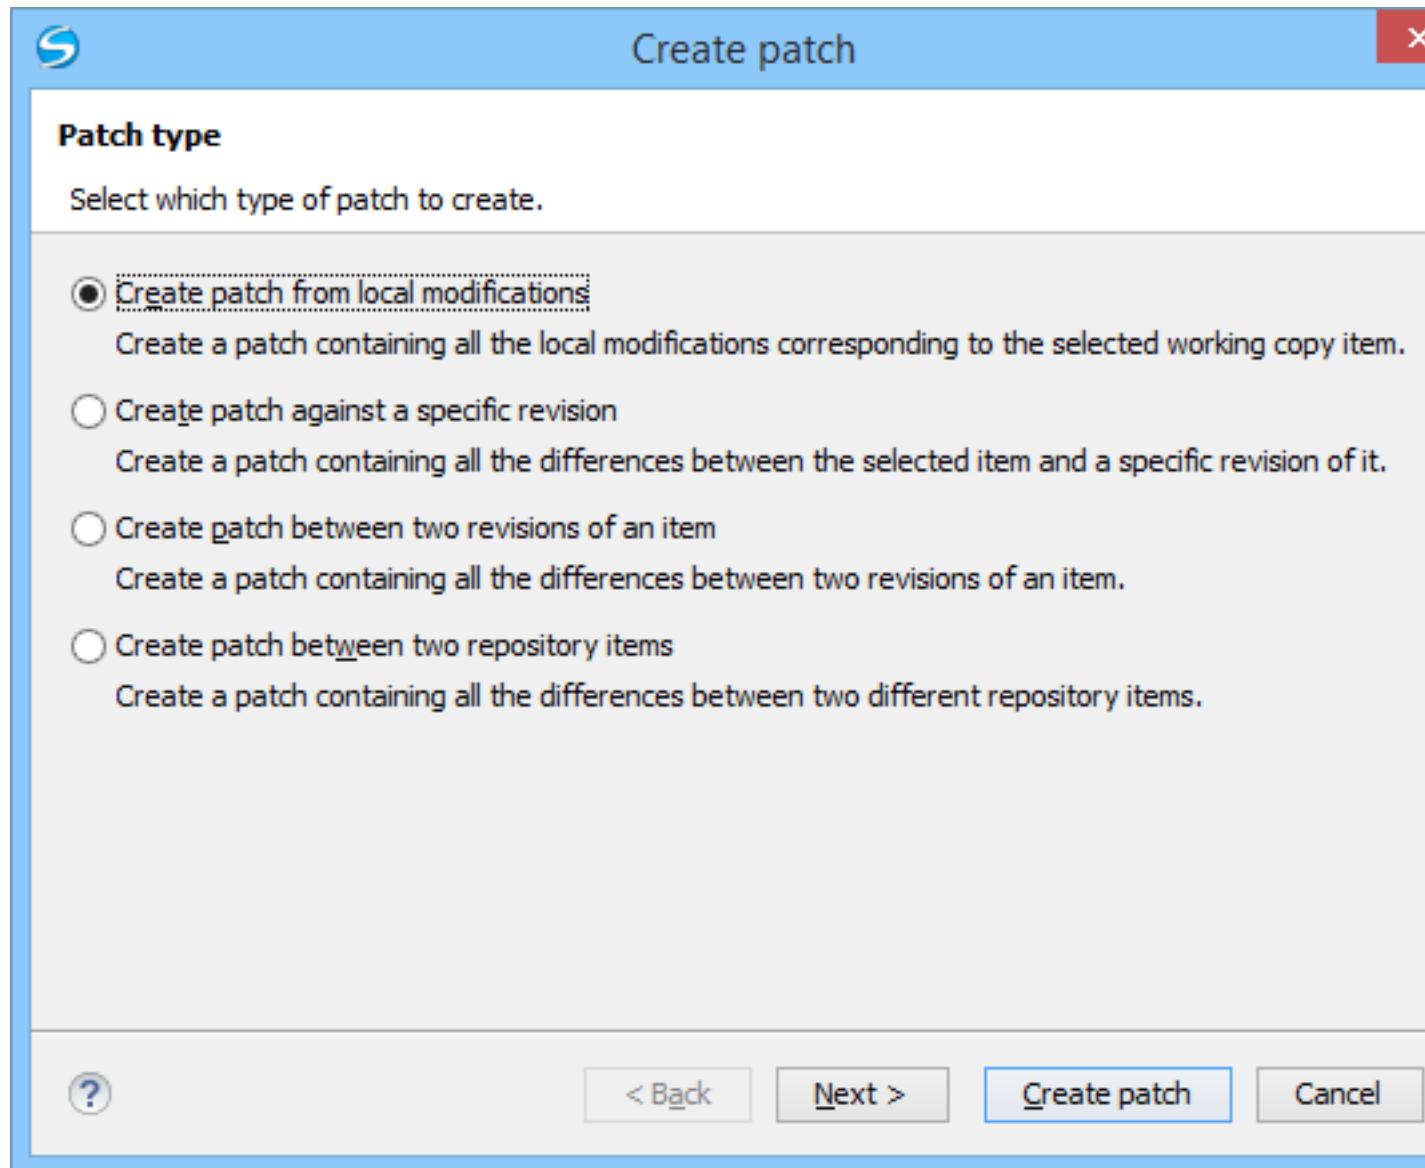

Figure 413: Create Patch Wizard - Local Items

#### Create Patch from Local Modifications

[Edit on GitHub](#)

This is the most commonly used type of patch and contains only the local changes for the selected item.

This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items in which the local file status is *unversioned or ignored, and in some cases missing or obstructed*.

The steps are as follows:

1. Go to menu **Tools > Create patch**.

This opens the **Create patch** wizard.

2. Select the **Create patch from local modifications** option in the dialog box.

3. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

4. Press the **Create patch** button.

If the patch is applied on a folder of the working copy and that folder contains *unversioned files*, this step of the wizard offers the option of selecting the ones that will be included in the patch.

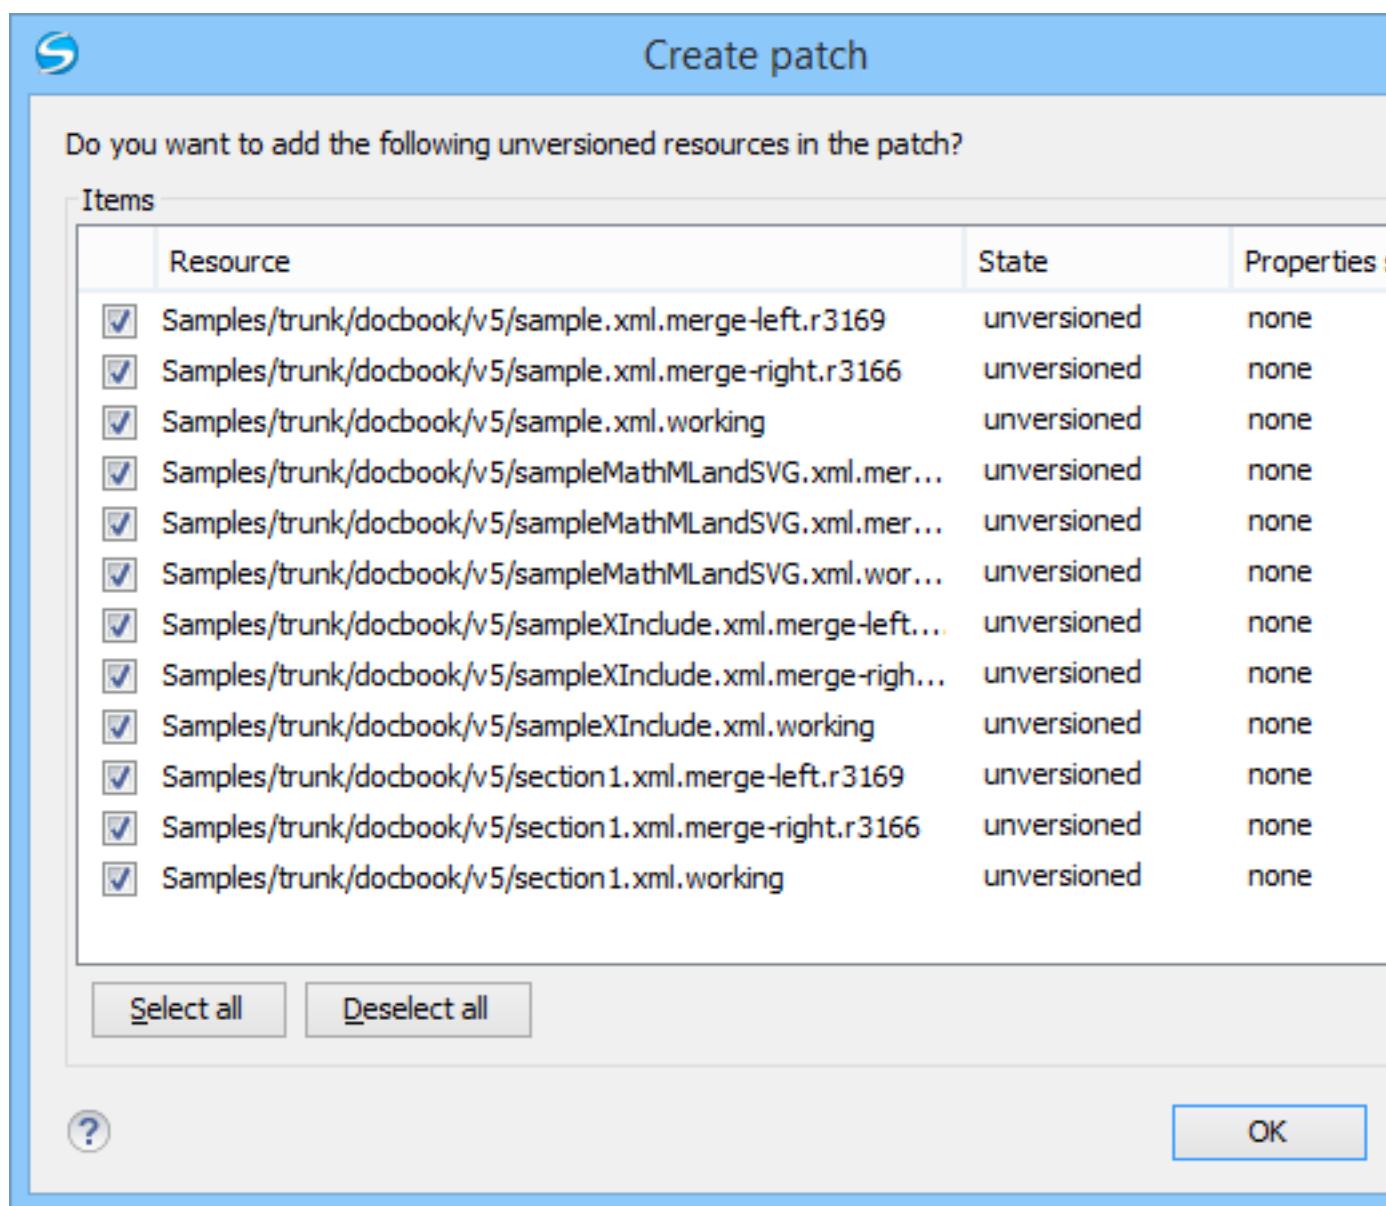

Figure 414: Create Patch Dialog Box - Add Unversioned Resources

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

#### Create Patch Against a Specific Revision

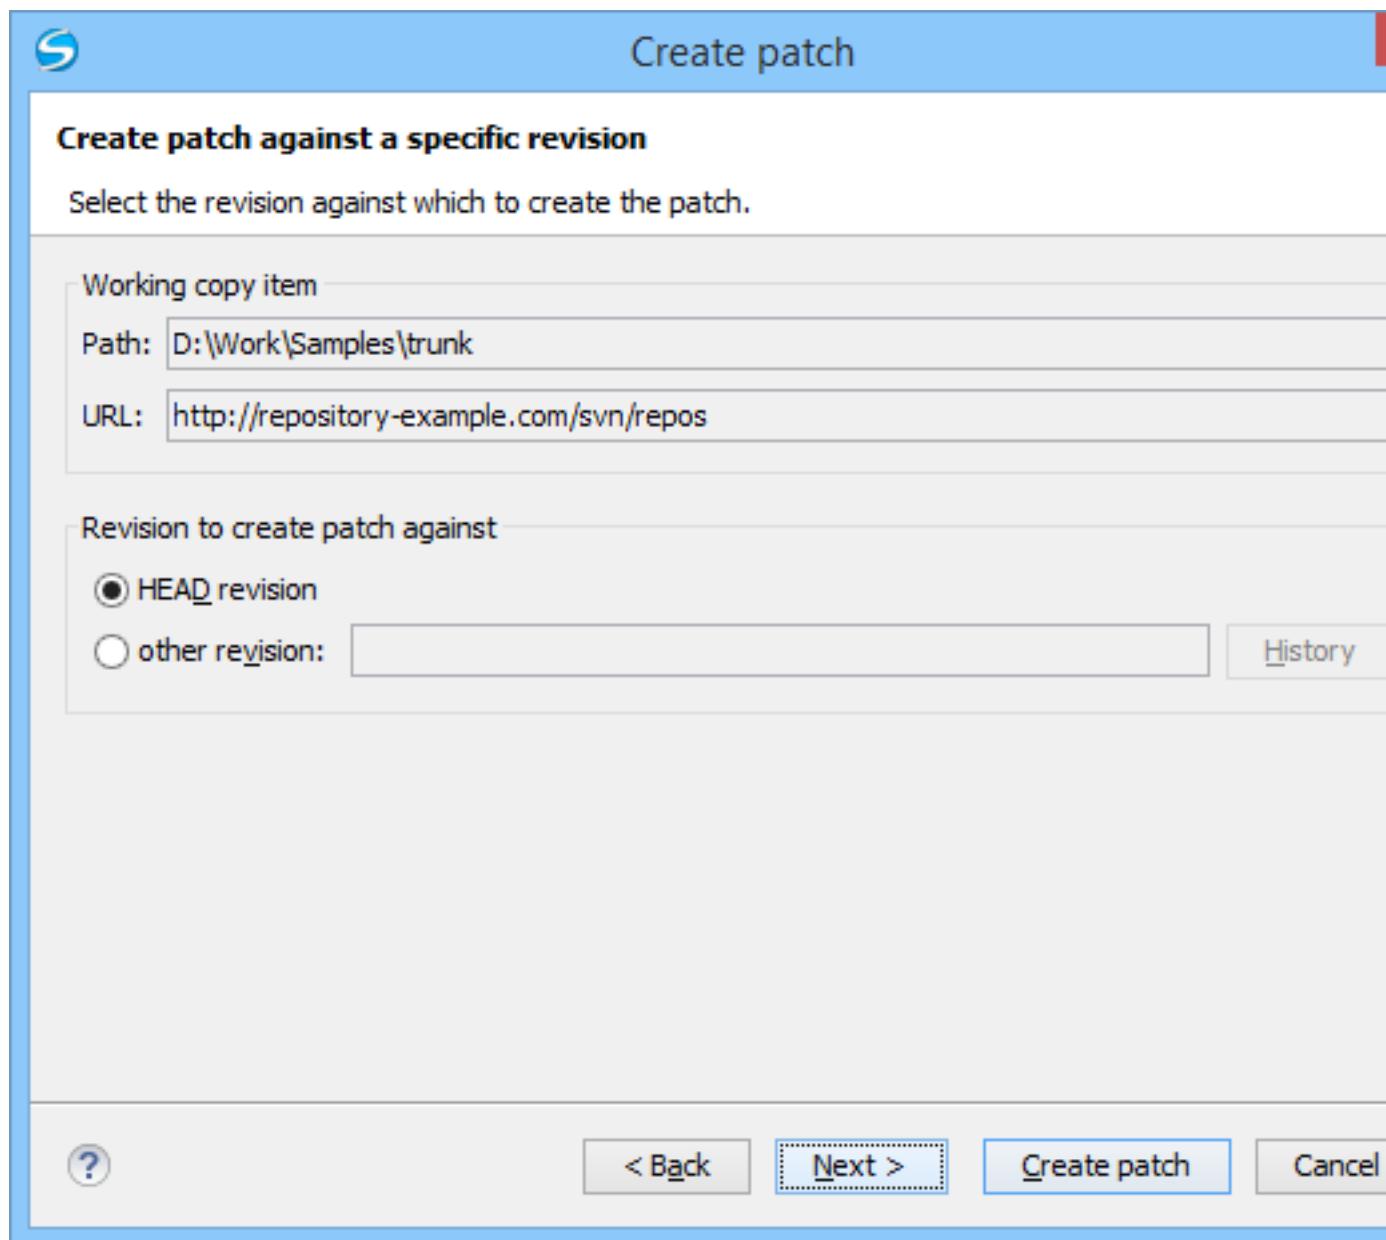

[Edit on GitHub](#)

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.

This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu **Tools > Create patch**.  
This opens the **Create patch** wizard.
2. Select the **Create patch against a specific revision** option in the dialog box.
3. Press the **Next** button.  
The second step of the wizard is opened:

**Figure 415: Create Patch Wizard - Step 2**

4. Select the **revision to create patch against**.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press *the History button* to display a list of the item revisions.

**Note:** If the **revision to create patch against** is older than the revision for which the working copy item was updated, the patch will include changes that were made **after** the selected revision.

5. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

## Create Patch Between Two Revisions of an Item

[Edit on GitHub](#)

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

**Tip:** If you need to generate a patch between two revisions of a previously *deleted*, *moved*, or *replaced* item, you should use [the Create patch between two repository items option](#) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.  
This opens the **Create patch** wizard.
2. Select the **Create patch between two revisions of an item** option in the dialog box.
3. Press the **Next** button.  
The second step of the wizard is opened:

**Figure 416: Create Patch Wizard - Step 2**

4. Select the starting and ending revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press [the History button](#) to display a list of the item revisions.

**Note:** The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

**Tip:** If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want [to configure the options](#) for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in [the Output section of the Options page](#) or in the default location.

## Create Patch Between Two Repository Items

[Edit on GitHub](#)

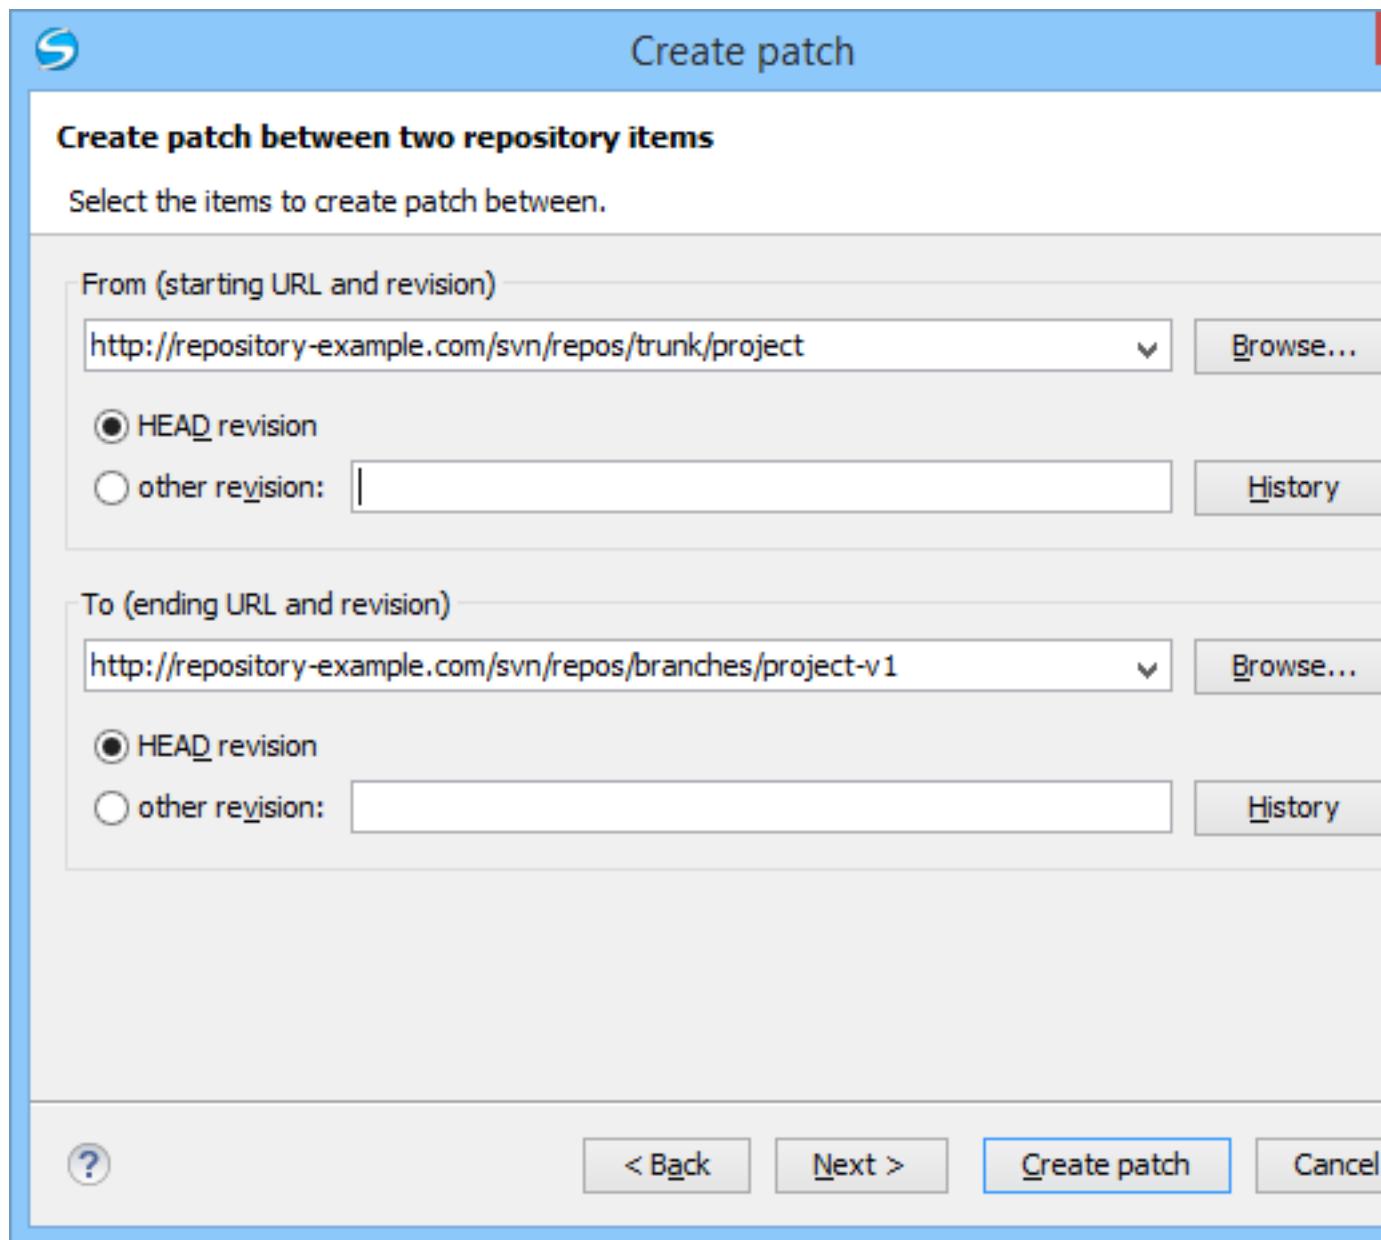

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu **Tools > Create patch**.  
This opens the **Create patch** wizard.
2. Select the **Create patch between two repository items** option in the dialog box.
3. Press the **Next** button.  
The second step of the wizard is opened:

**Figure 417: Create Patch Wizard - Step 2**

4. Select *the starting and ending URLs* and revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press *the History button* to display a list of the item revisions.

**Important:** Both URLs must point to items from the same repository.

**Note:** If you use a *peg* revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

#### Generating a Patch - Remote Items

[Edit on GitHub](#)

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the **Create patch** wizard, use the  **Create patch** action from the **Tools** menu.

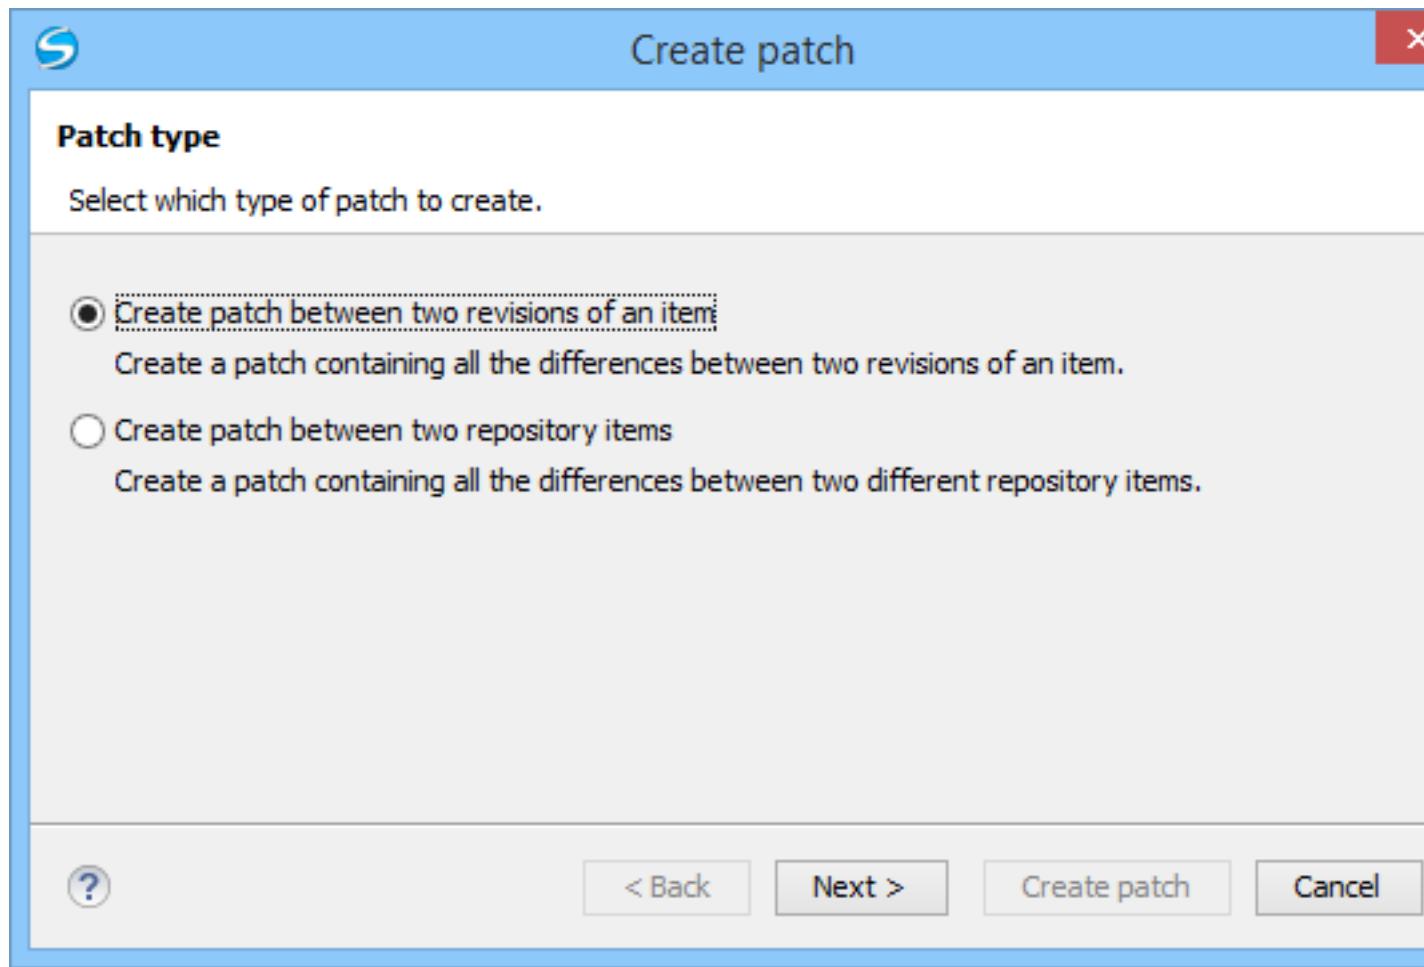

Figure 418: Create Patch Wizard - Remote Items

#### Create Patch Between Two Revisions of an Item

[Edit on GitHub](#)

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

**Tip:** If you need to generate a patch between two revisions of a previously *deleted*, *moved*, or *replaced* item, you should use *the Create patch between two repository items option* instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.  
This opens the **Create patch** wizard.
2. Select the **Create patch between two revisions of an item** option in the dialog box.
3. Press the **Next** button.  
The second step of the wizard is opened:

**Figure 419: Create Patch Wizard - Step 2**

4. Select the starting and ending revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press *the History button* to display a list of the item revisions.

**Note:** The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

**Tip:** If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

## Create Patch Between Two Repository Items

[Edit on GitHub](#)

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

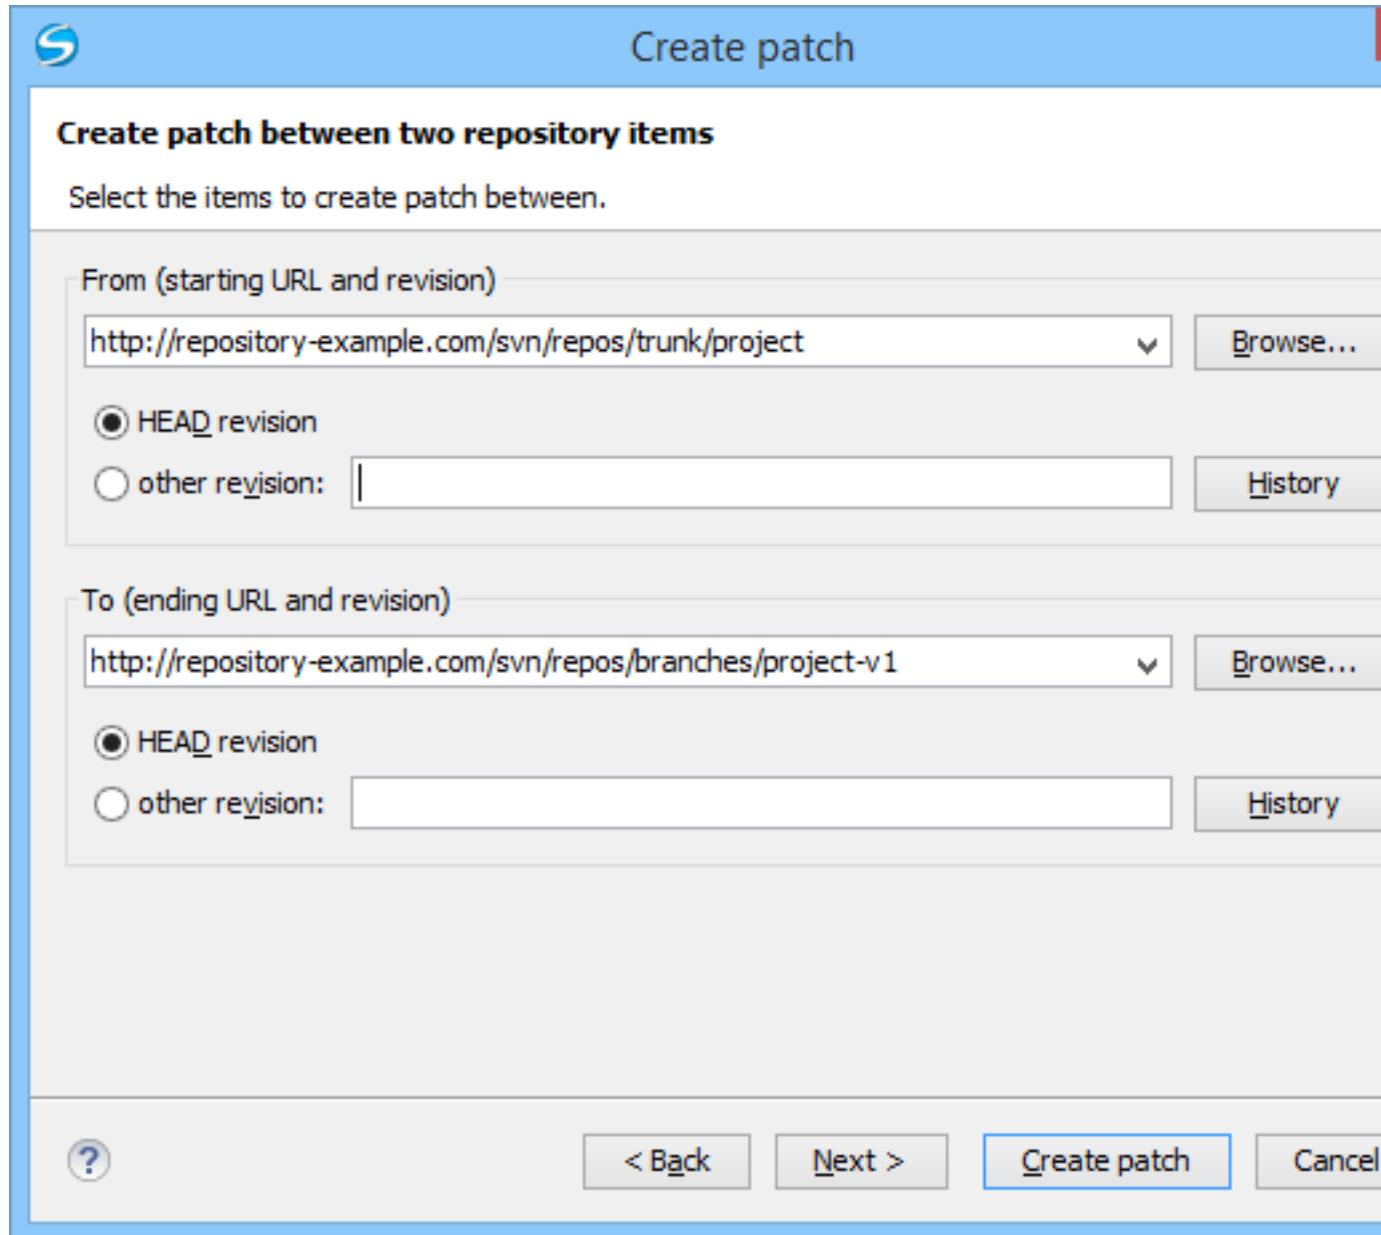

The steps are as follows:

1. Go to menu **Tools > Create patch**.

This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.
3. Press the **Next** button.

The second step of the wizard is opened:

**Figure 420: Create Patch Wizard - Step 2**

4. Select *the starting and ending URLs* and revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press *the History button* to display a list of the item revisions.

**Important:** Both URLs must point to items from the same repository.

**Note:** If you use a *peg* revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

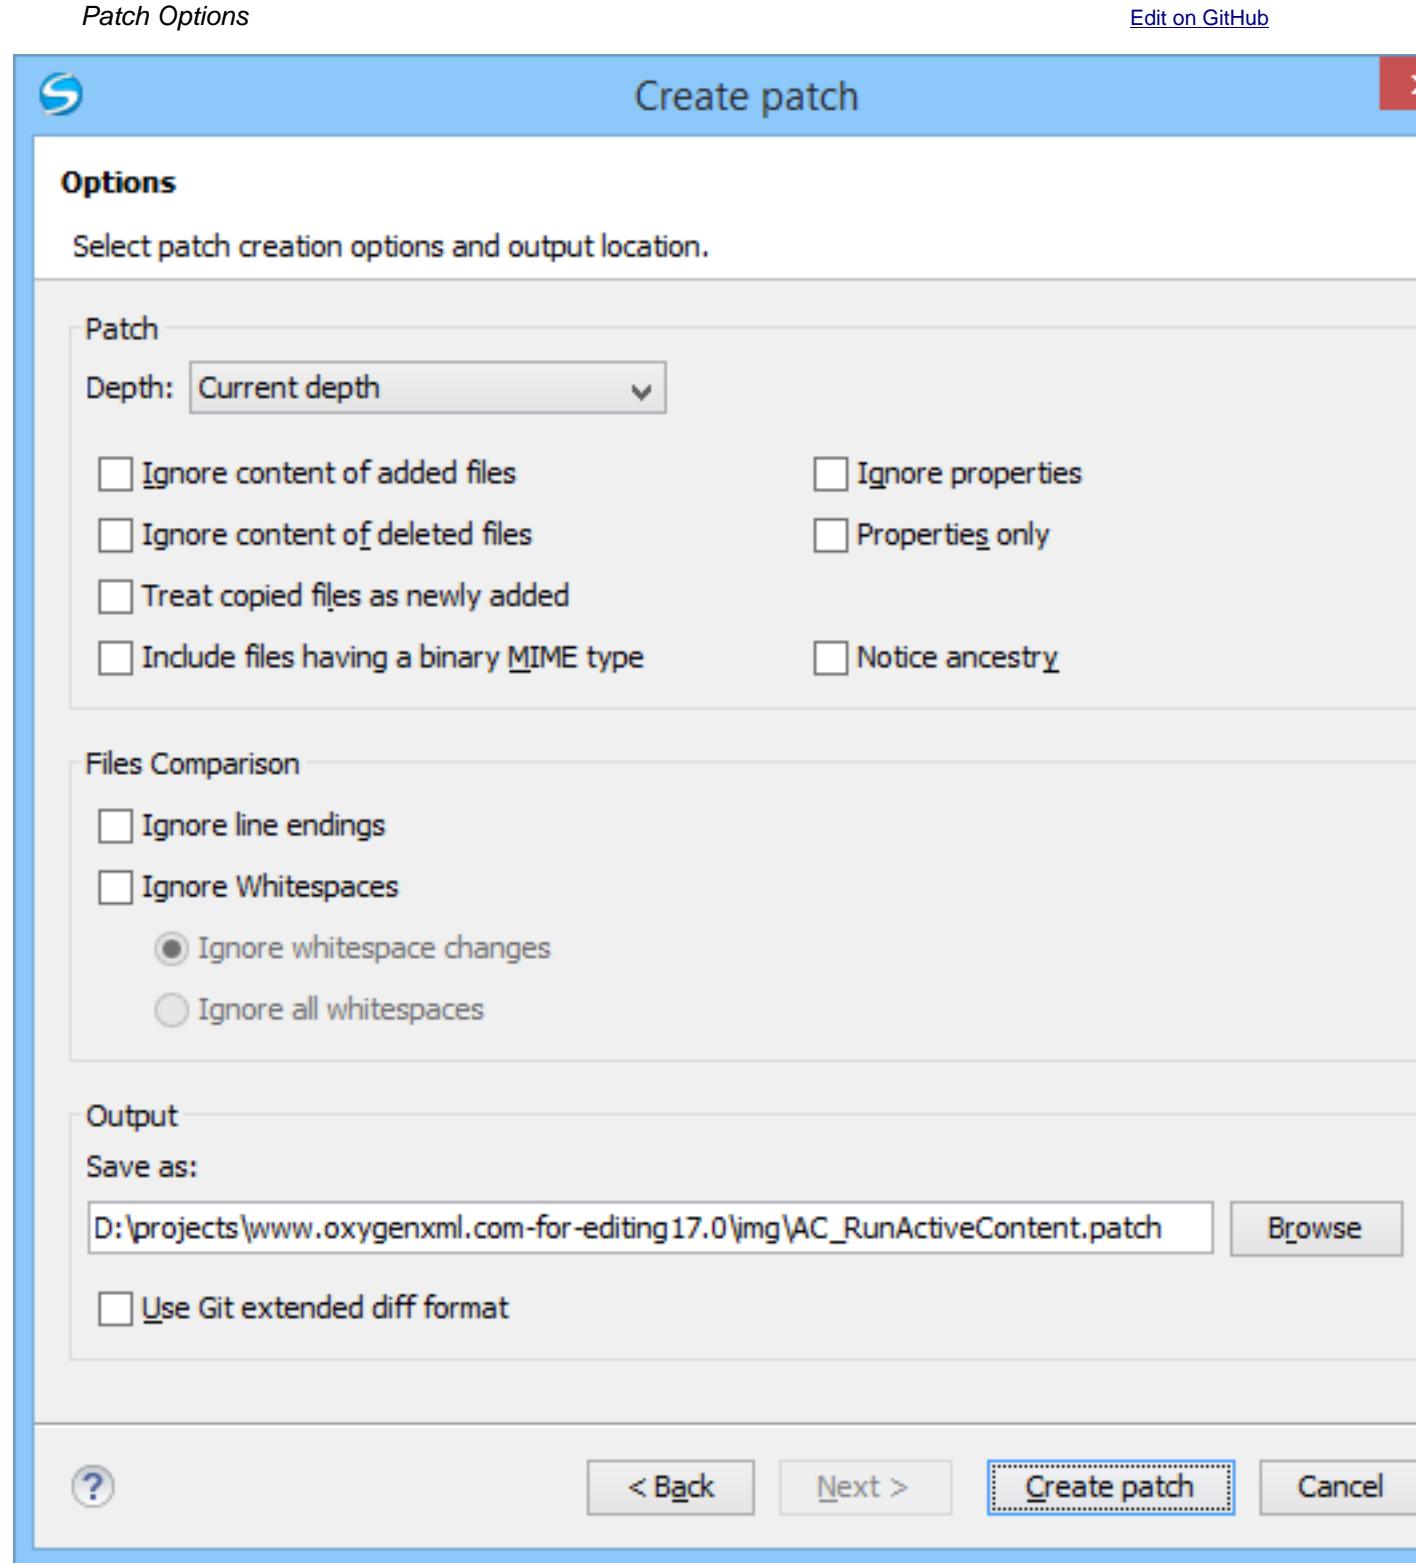

Figure 421: Create Patch Wizard - Options

#### Patch Section

Depth - (This option is applicable only for directories)

Current depth - The depth of recursing the folder for creating the patch is the same as the depth of that

<b>Ignore content of added files</b>	same folder in the working copy (available only when generating patches that contain changes from the working copy).
<b>Recursive (infinity)</b>	- The patch is created on all the files and folders contained in the selected folder.
<b>Immediate children (immediates)</b>	- The patch is created only on the child files and folders without recursing subfolders.
<b>File children only (files)</b>	- The patch is created only on the child files.
<b>This folder only (empty)</b>	- The patch is created only on the selected folder (no child file or folder is included in the patch).
<b>Ignore content of delete files</b>	When enabled, the patch file does not include the content of the <i>added</i> items. This option corresponds to the --no-diff-added option of the <code>svn diff</code> command.
<b>Treat copied files as newly added</b>	When enabled, the patch file does not include the content of the <i>deleted</i> items. This option corresponds to the --no-diff-deleted option of the <code>svn diff</code> command.
<b>Include files having a binary MIME type</b>	When enabled, copied items are treated as new, rather than comparing the items with their sources. This option corresponds to the --show-copies-as-adds option of the <code>svn diff</code> command.
<b>Ignore properties</b>	When enabled, the application is forced to compare items that are considered binary file types. This option corresponds to the --force option of the <code>svn diff</code> command.
<b>Properties only</b>	When enabled, differences in the properties of items are ignored. This option corresponds to the --ignore-properties option of the <code>svn diff</code> command.
<b>Notice ancestry</b>	When enabled, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the --properties-only option of the <code>svn diff</code> command.
<b>Note:</b> The <b>Ignore properties</b> and <b>Properties only</b> options are mutually exclusive.	
<b>Files Comparison Section</b>	
<b>Ignore line endings</b>	If enabled, the differences in line endings are ignored when the patch is generated. This option corresponds to the --ignore-eol-style option of the <code>svn diff</code> command.

## Ignore whitespaces

If enabled, it allows you to specify how the whitespace changes should be handled. When enabled, you can then choose between two options:

- **Ignore whitespace changes** (`--ignore-space-change`) - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).
 

**Note:** Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.
- **Ignore all whitespaces** (`--ignore-all-space`) - Ignores all types of whitespace changes.

## Output Section

### Save as

The patch will be created and saved in the specified file.

### Use Git extended diff format

When enabled, the patch is generated using the *Git* format. This option corresponds to the `--git` option of the `svn diff` command.

## Working with Repositories

[Edit on GitHub](#)

This section explains how to locate and browse SVN repositories in Syncro SVN Client.

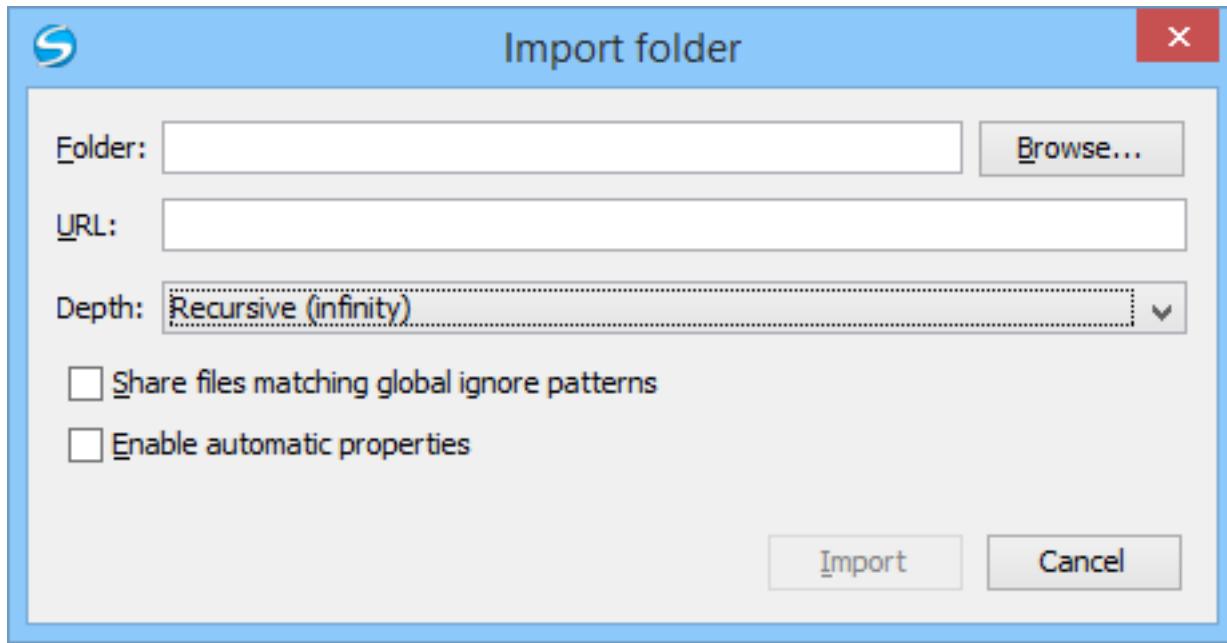

### Importing Resources Into a Repository

[Edit on GitHub](#)

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for *using an existing working copy*.

The **Import folder** and **Import Files** actions are available from the **Import** submenu of the **Repository** menu or of the contextual menu in the **Repositories** view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The **Import folder** action opens the **Import folder** dialog box.

**Figure 422: Import Folder Dialog Box**

You can configure the following options:

#### Folder

Specify *the local folder* by using the text box or the **Browse** button. This folder should not be empty or already under version control.

**Important:** By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the **Browse** button to select the local folder so that the client will automatically append the name of it to the specified URL.

#### URL

Specify *the repository location* that will be used to access the folder to be imported.

**Note:** *Peg revisions* have no effect for this operation since it is used to send information to the repository.

**Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

#### Depth

**Recursive (infinity)** - Imports all the files and folders contained in the selected folder.

**Immediate children (immediates)** - Imports only the child files and folders without recursing subfolders.

**File children only (files)** - Import only the child files.

**This folder only (empty)** - Imports only the selected folder (no child file or folder is included).

**Share files matching global ignore patterns**

When enabled, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in [the SVN configuration file](#).
- The **File name ignore patterns option** in the [SVN > Working Copy preferences page](#).

**Enable automatic properties/Disable automatic properties**

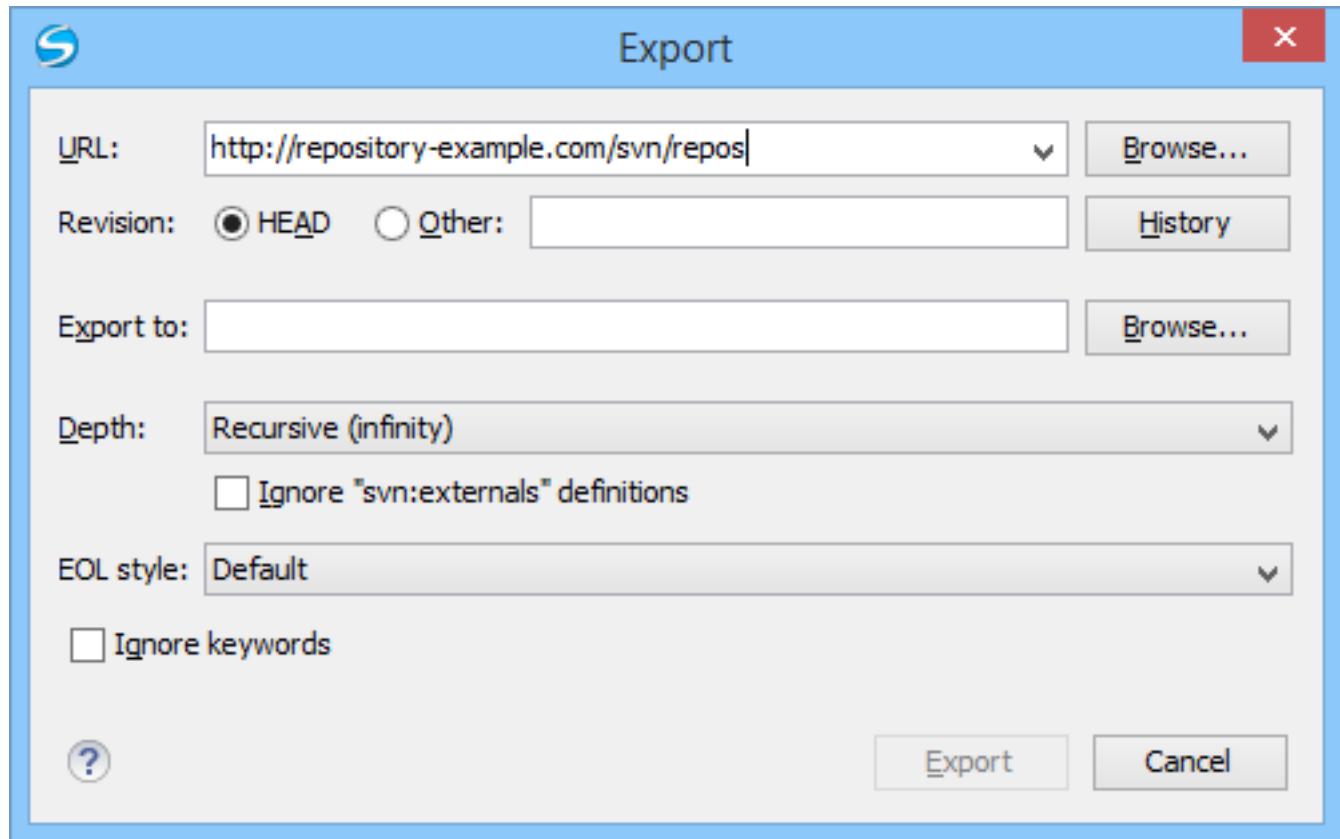

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in [the SVN configuration file](#).

**Note:** This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

**Exporting Resources From a Repository**[Edit on GitHub](#)

This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.

The **Export** dialog box is similar to the **Check out** dialog box:

**Figure 423: Export from Repository Dialog Box**

You can configure the following options:

#### URL

Specify *the source directory from the repository* by using the text box or the **Browse** button.

**Tip:** To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

**Note:** The content of the selected directory from the repository and not the directory itself will be exported to the file system.

#### Revision

You can choose between the **HEAD** or **Other** revision. If you need to export a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box.

#### Export to

Specify *the location where you want to export* the repository directory by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

**Important:** By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the *export* location so

**Depth**

that the client will automatically append the name of the remote directory to the path of the selected directory.

**Warning:** The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

**Ignore "svn:externals" definitions**

**Recursive (infinity)** - Exports all the files and folders contained in the selected folder.

**Immediate children (immediates)** - Exports only the child files and folders without recursing subfolders.

**File children only (files)** - Export only the child files.

**This folder only (empty)** - Exports only the selected folder (no child file or folder is included).

When enabled, external items are ignored in the export operation. This option is only available if you choose the **Recursive (infinity)** depth.

**EOL style**

Defines the *end-of-line (EOL)* marker that should be used when exporting files that have the value or the `svn:eol-style` property set to `native`. You can choose between the following styles:

- **Default** - It uses the system-specific *end-of-line* marker.
- **CRLF** - The **Windows**-specific *end-of-line* marker (*carriage return - line feed*).
- **LF** - The **Unix / OS X**-specific *end-of-line* marker (*line feed*).
- **CR** - The **Mac OS 9 (or older)**-specific *end-of-line* marker (*carriage return*).

**Ignore keywords**

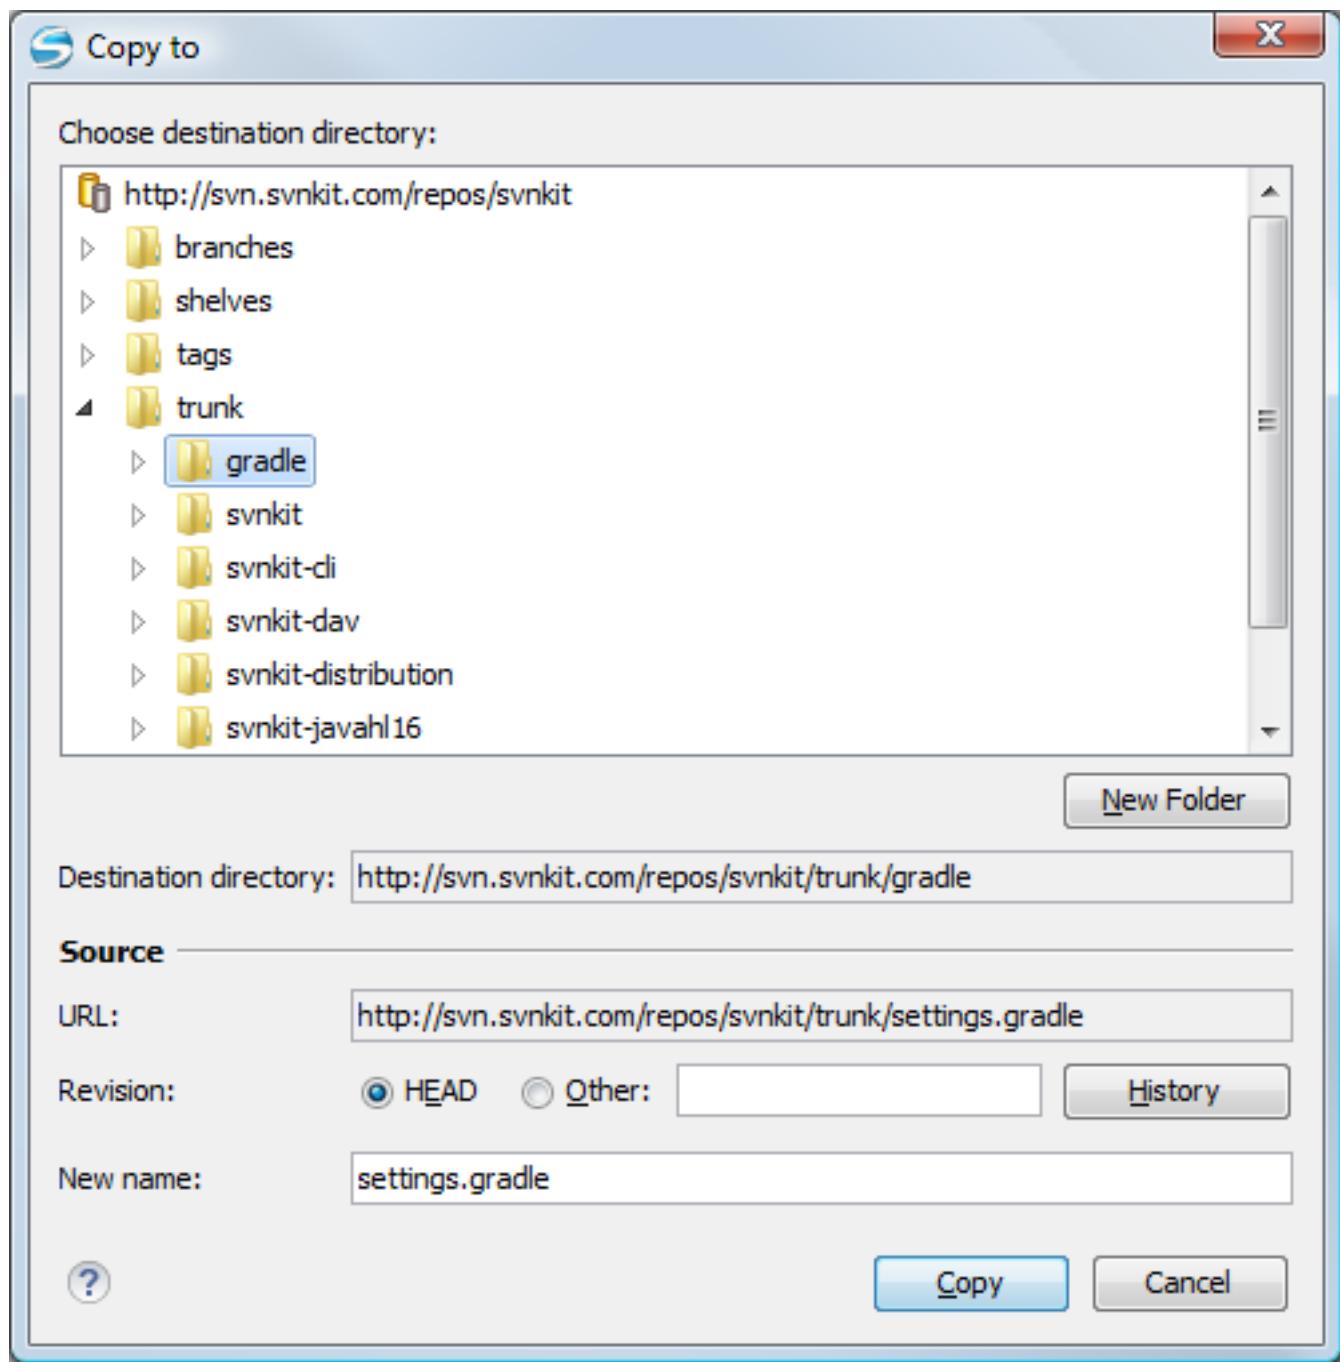

When enabled, the export operation does not expand the *SVN keywords* found inside the files.

**Copy / Move / Delete Resources From a Repository**

[Edit on GitHub](#)

Once you have a location defined in the [Repositories view](#), you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The **Copy to** and **Move to** action allows you to copy and move individual or multiple resources to a specific directory from the *HEAD* revision of the repository.

**Figure 424: Copy/Move Items in Repository**

The dialog box used to copy or move items allows you to browse the *HEAD* revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The **Source** section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision from which you copy one or more items, allowing you to also choose another revision.

**Note:** Since only items from the *HEAD* revision can be moved, the **Revision** options are not presented for the **Move to** action.

**Note:** When you copy a single item while browsing a revision other than *HEAD*, the **Revision** options present this revision but does not allow you to change it. The same applies if copying multiple items.

- **New name** - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is **Delete**, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the **Commit message** dialog box.

## Sparse Checkout

[Edit on](#)

[GitHub](#)

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the [Check out action from the Repositories view](#)) and then recursively update only the needed directories (using the [Update action from the Working Copy view](#)). Each directory then has a depth set to it, with four possible values:

- **Recursive (*infinity*)** - Updates all descendant directories and files recursively.
- **Immediate children (*immediates*)** - Updates the directory, including direct child directories and files, but does not populate the child directories.
- **File children only (*files*)** - Updates the directory, including only child files without the child directories.
- **This folder only (*empty*)** - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value **Current depth**). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the [Working Copy view](#) with a marker corresponding to each depth value, in the top left corner, as follows:

-  **Recursive (*infinity*)** - This is the default value and it is has no mark. The directory has no limiting depth.
-  **Immediate children (*immediates*)** - The directory is limited to direct child directories (without contents) and files.
-  **File children only (*files*)** - The directory is limited to direct child files only.
-  **This folder only (*empty*)** - The directory has *empty* depth set.

A depth set on a directory means that some operations process only items within the specified depth range. For example, **Synchronize** on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the **SVN Information** dialog box and in the tool tip displayed when hovering a directory in the [Working Copy](#) view.

## Syncro SVN Client Views

[Edit on GitHub](#)

The main working area occupies the center of the application window, which contains the most important views:

- [Repositories View](#)
- [Working Copy View](#)
- [History View](#)
- [Console View](#)

The other views that support the main working area are also presented in this section.

## Repositories View

[Edit on](#)[GitHub](#)

The **Repositories** view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If no connections to your repository are available, you can *add a new repository location*. Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

- **Date** - Date when the resource was last modified.
- **Revision** - The revision number at the time the resource was last modified.
- **Author** - Name of the person who made the last modification on the resource.
- **Size** - Resource size on disk.
-  **Lock information** - Information about the lock status of a file. When a repository file is locked by a user the  icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
  - **Owner** - The name of the user who created the lock.
  - **Date** - The date when the user locked the file.
  - **Expires on** - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
  - **Comment** - The message attached when the file was locked.
- **Type** - Contains the resource type or file extension.

Figure 425: Repositories View

**Toolbar**
[Edit on GitHub](#)

The **Repositories** view's toolbar contains the following buttons:

-  **New Repository Location** - Allows you to enter a new repository location by means of the **Add SVN Repository** dialog box.
-  **Move Up** - Move the selected repository up one position in the list of repositories in the **Repositories** view.
-  **Move Down** - Move the selected repository down one position in the list of repositories in the **Repositories** view.
-  **Collapse all** - Collapses all repository trees.
-  **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.
-  **Settings** - Allows you to configure the resource table appearance.

### Repositories View Contextual Menu Actions

[Edit on GitHub](#)

The **Repositories** view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:

 **New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))**

Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

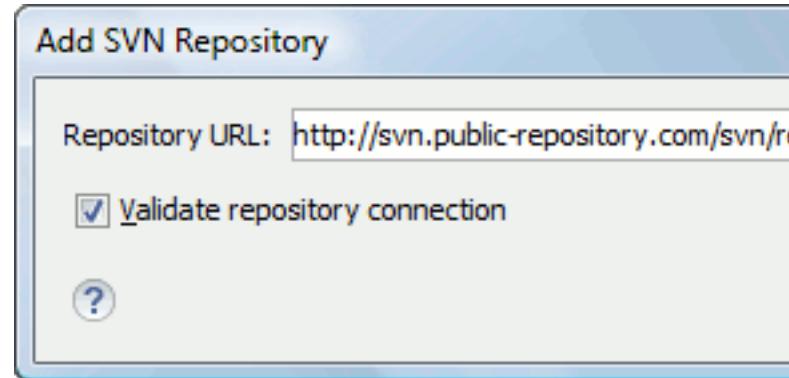

Figure 426: Add SVN Repository Dialog Box

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

 **Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))**

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

**Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))**

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

 **Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))**

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

<b>Open</b>	Opens the selected file in the Editor view in read-only mode.
<b>Open with</b>	Displays the <b>Open with</b> dialog box to specify the editor in which the selected file is opened. If multiple files are selected, only external applications can be used to open the files.
<b>Save as</b>	Saves the selected files locally, as they are in the browsed revision.
 <b>Refresh (F5)</b>	Refreshes the resource selected in the <b>Repositories</b> view.
 <b>Check out (Ctrl + Alt + O (Command + Alt + O on OS X))</b>	Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section <a href="#">Check out a working copy</a> .
<b>Branch/Tag</b>	Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the <a href="#">Creation and management of Branches/Tags</a> section.
<b>Share project</b>	Allows you to <a href="#">share a new project</a> using an SVN repository. The local project is automatically converted into an SVN working copy.
<b>Import:</b>	<p><b>Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))</b> Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section <a href="#">Importing resources into a repository</a>.</p> <p><b>Note:</b> The difference between the <b>Import folder</b> and <b>Share project</b> actions is that the latter also converts the selected directory into a working copy.</p>
	<p><b>Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))</b> Imports the files selected from the files system into the selected folder in the repository.</p>
<b>Export</b>	Opens <a href="#">the Export dialog box</a> that allows you to configure options for exporting a folder from the repository to the local file system.
 <b>Show History (Ctrl + H (Command + T on OS X))</b>	Displays the history of the selected resource. At the start of the operation, you can set filtering options.
 <b>Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))</b>	Opens the <b>Show Annotation</b> dialog box that computes <a href="#">the annotations for a file and displays them in the Annotations view</a> , along with the history of the file in the <b>History</b> view.

**Revision Graph (Ctrl + G (Command + G on OS X))**

**Copy URL Location (Ctrl + Alt + U (Command + Alt + U on OS X))**

**Move to (Ctrl + M (Command + M on OS X))**

**Rename (F2)**

**New Folder (Ctrl + Shift + F (Command + Shift + F on OS X))**

**Locking**

**Show SVN Properties (Ctrl + Shift + P (Command + Shift + P on OS X))**

**Show SVN Information (Ctrl + I (Command + I on OS X))**

### Assistant Actions

[Edit on GitHub](#)

When there is no repository configured, the **Repositories** view mode lists the following two actions:

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see the section [Revision Graph](#). This operation is enabled for any resource selected into the **Repositories** view or **Working Copy** view.

Copies to clipboard the URL location of the selected resource.

Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (*HEAD*), to allow restoring previous versions of an item.

Moves to a specified location the currently selected resource(s).

Renames the selected resource.

Deletes selected items from the repository via an immediate commit.

Allows you to create a folder in the selected repository path (available only for folders).

(available only for files):

**Lock (Ctrl + K (Command + K on OS X))**

Allows you to lock certain files for which you need exclusive access. For more details on the use of this action, see [Locking a file](#).

**Unlock (Ctrl + Shift + K (Command + Shift + K on OS X))**

Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

Brings up the [Properties view](#) displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

Provides additional information for the selected resource. For more details, go to [Obtain information for a resource](#).

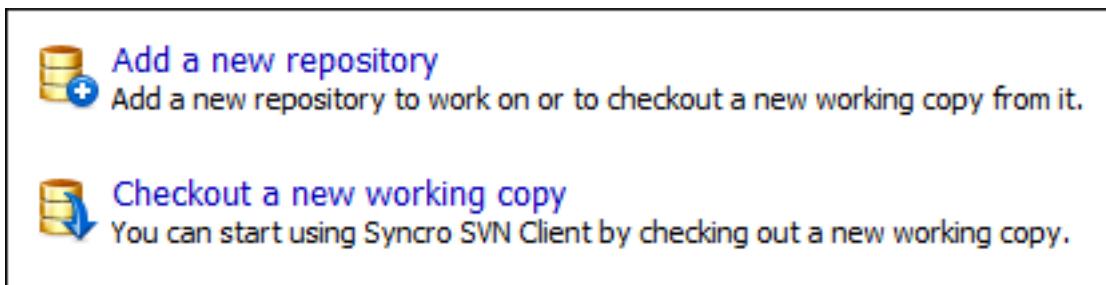

Figure 427: Repositories View Actions

### Drag and Drop Operations

[Edit on GitHub](#)

The structure of the files tree can be changed with drag and drop operations inside the **Repositories** view. These operations behave in the same way with the **Copy to/Move to** operations.

### Working Copy View

[Edit on GitHub](#)

The **Working Copy** view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- **Settings** menu.

If you click any of the view modes (**All Files**, **Modified**, **Incoming**, **Outgoing**, **Conflicts**), the information displayed changes as follows:

- **All Files** - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

**Figure 428: Working Copy View - All Files View Mode**

- **Modified** - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:
  - Incoming modification from repository:
    - - File content or properties modified remotely.
    - - New file added remotely.

-  - File deleted remotely.
- Outgoing modification to repository:
  -  - File content or properties modified locally.
  -  - New file added locally.
  -  - File deleted locally.
-  - **Pseudo-conflict state** - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.
-  - **Real conflict state** - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

**Figure 429: Working Copy View - Modified View Mode**

- **← Incoming** - The resource tree presents only incoming changes.
- **→ Outgoing** - The resource tree presents only outgoing changes.
- **↔ Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).

The following columns provide information about the resources:

- **Name** - Resource name. Resource icons can have the following decorator icons:

- Additional status information:
  -  **Propagated modification marker** - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.
  -  **External** - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a `svn:externals` property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.
  -  **Switched** - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of [the Switch action](#) executed from the contextual menu of the Working Copy view.
  -  **Grayed** - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the **Add to svn:ignore** action.
- Current SVN depth of a folder:
  -  **Immediate children (immediates)** (a variant of [sparse checkout](#)) - The directory contains only direct file and folder children. Child folders ignore their content.
  -  **File children only (files)** (a variant of [sparse checkout](#)) - The directory contains only direct file children, disregarding any child folders.
  -  **This folder only (empty)** (a variant of [sparse checkout](#)) - The directory discards any child resource.

**Note:**

- Any folder not marked with one of the depth icons, has recursive depth (*infinity*) set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Author presents *unversioned* and *ignored* folders with *empty* depth when **Show unversioned directories content** or **Show ignored directories content** options are disabled.

-  **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:

-  - Resource is *not under version control (unversioned)*.
-  - Resource is being *ignored* because it is not under version control and its name matches a file name pattern defined in one of the following places:
  - *global-ignores* section in the SVN client-side [config file](#).

**Attention:** If you do not explicitly set the `global-ignores` runtime configuration option (either to your preferred set of patterns or to an empty string), Subversion uses the default value.

- [Application global ignores option](#) of Oxygen XML Author.
- The value of a `svn:ignore` property set on the parent folder of the resource being ignored.
-  - Marks a newly created resource, *scheduled for addition* to the version control system.
-  - Marks a resource *scheduled for addition*, created by copying a resource already under version control and inheriting all its SVN history.
-  - The content of the resource has been *modified*.
-  - Resource has been *replaced* in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
-  - Resource is *deleted* (scheduled for deletion from **Repository** upon the next commit).
-  - The resource is *incomplete* (as a result of an interrupted *check out* or *update* operation).
-  - The resource is *missing* because it was moved or deleted without using an SVN-aware application.
-  - The contents of the resource is in [real conflict state](#).

-  - Resource is in a *name conflict* state.
-  - Resource is in *tree conflict* state after an update operation because:
  - Resource was locally modified and incoming deleted from repository.
  - Resource was locally scheduled for deletion and incoming modified.
-  - Resource is *obstructed* (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).
-  **Local properties status** - Marks the resources that have SVN properties, with the following possible states:
  -  - The resource has SVN properties set.
  -  - The resource properties have been modified.
  -  - Properties for this resource are in *real conflict* with property updates received from the repository.
- **Revision** - The current revision number of the resource.
- **Date** - Date when the resource was last time modified on the disk.
- **BASE Revision** - The revision number of the pristine version of the resource.
- **BASE Date** - Date when the pristine version of the resource was last time committed in the repository.
- **Author** - Name of the person who made the last modification on the pristine version of the resource.
-  **Remote file status** - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
  -  - Resource is newly added in repository.
  -  - The content of the resource has been modified in repository.
  -  - Resource was replaced in repository.
  -  - Resource was deleted from repository.
-  **Remote properties status** - Resources marked with the  icon have incoming modified properties from the repository.
- **Remote revision** - Revision number of the resource latest committed modification.
- **Remote date** - Date of the resource latest modification committed on the repository.
- **Remote author** - Name of the author who committed the latest modification on the repository.
-  **Lock information** - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.

A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the  symbol. To clear the locked state of a folder, use the **Clean up** action.

**Note:** Users can lock only files.

The following lock states are displayed:

- *no lock* - the file is not locked. This is the default state of a file in the SVN repository.
- *remotely locked* () - shown when:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the **Repositories** view.

If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

**Note:** To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to *break* or *steal* the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- *locked* (  ) - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.

**Note:** Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not *stolen* or *broken*).

- *stolen* (  ) - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.
- *broken* (  ) - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

**Note:** To remove the *stolen* or *broken* states from your working copy files, you have to **Update** them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- Lock type - current file lock state
- Owner - the name of the user who created the lock
- Date - the date when the user locked the file
- Expires on - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- Comment - the message attached when the file was locked
- Size - Resource size on disk
- Type - Contains the resource type or file extension

**Note:** The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.

The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Author is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the **Working Copy** view.
-  ( on Mac OS X) **Working Copies Manager** - Opens a dialog box that displays the working copies Oxygen XML Author is aware of. In this dialog box, you can add existing working copies or remove those you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Author warns you that the selected directory is not under version control.

**Note:** Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

## Working Copy Settings

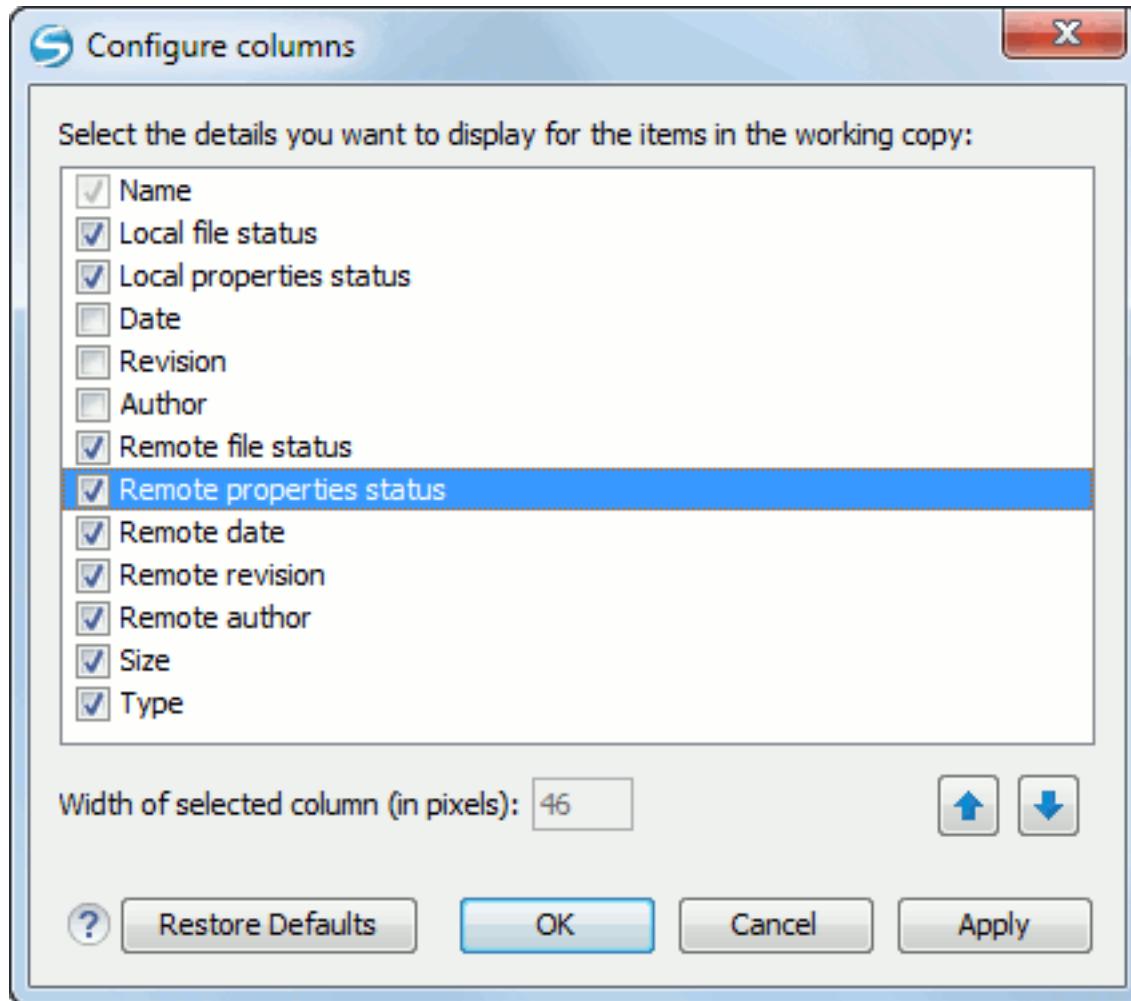

[Edit on GitHub](#)

The **Settings** button from the toolbar of the **Working Copy** view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.
- **Note:** If this option is disabled, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except **All Files**.
- **Show ignored items** - Displays the ignored resource when **All Files** mode is selected.
- **Show ignored directories content** - Displays the content of ignored directories when **All Files** mode is selected.

**Note:** Although *ignored* items are not presented in the **Modified**, **Incoming**, and **Conflicts** modes, they will be if, after a synchronize, they are reported as incoming from the repository.

- **Show deleted items** - Displays the deleted resource when **All Files** mode is selected. All other modes always display deleted resources, disregarding this option.
- **Tree / Compressed / Flat** - Affect the way information is displayed inside the **Modified**, **Incoming**, **Outgoing**, and **Conflicts** view modes.
- **Configure columns** - Allows you to customize the structure of the **Working Copy** view data. This action opens the following dialog box:

**Figure 430: Configure Columns of Working Copy View**

The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width and enabled/disabled state from the installation of the application.

## Working Copy Format

[Edit on GitHub](#)

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the **When loading an old format working copy** option.

To change how working copy formats are handled, [open the Preferences dialog box \(Options > Preferences\)](#), go to **SVN > Working copy**, and configure the options in the **Administrative area** section.

**Note:**

- The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the **Tools** menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
- SVN 1.7 working copies cannot be downgraded to older formats.

**Refresh a Working Copy**
[Edit on GitHub](#)

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the **Working Copy** view and when you switch between Oxygen XML Author and other applications.

The **Working Copy** view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

**Working Copy View Contextual Menu Actions**
[Edit on GitHub](#)

The contextual menu in the **Working Copy** view contains the following actions:

**Edit conflict (Ctrl (Command on OS X) + E)**

Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see [Edit conflicts](#).

**Open in Compare Editor (Ctrl (Command on OS X) + Alt + C)**

Displays changes made in the currently selected file.

**Open (Ctrl (Command on OS X) + O)**

Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on OS X, etc).

**Open with...**

Submenu that allows you to open the selected resource either with Oxygen XML Author or with another application.

**Show in Explorer/Show in Finder**

Opens the parent directory of the selected working copy file and selects the file.

** Expand All (Ctrl (Command on OS X) + Alt + X)**

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

** Refresh (F5)**

Re-scans the selected resources recursively and refreshes their status in the working copy view.

** Synchronize (Ctrl (Command on OS X) + Shift + S)**

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the [Always switch to 'Modified' mode option](#) is selected.

**Update (Ctrl (Command on OS X)+ U)**

Updates the selected resources to the **HEAD** revision (latest modifications) from the repository. If the selection

**Update to revision/depth**

contains a directory, it will be updated depending on its depth.

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the [sparse checkouts](#) section.

**Commit**

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

 **Revert (Ctrl (Command on OS X) + Shift + V)**

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is enabled only for modified resources. See [Revert your changes](#) for more information.

**Override and Update**

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the [Revert your changes](#) section.

**Override and Commit**

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see [Drop incoming modifications](#).

 **Mark Resolved (Ctrl (Command on OS X) + Shift + R)**

Instructs the Subversion system that you resolved a conflicting resource. For more information, see [Merge conflicts](#).

 **Mark as Merged (Ctrl (Command on OS X) + Shift + M)**

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts](#) section for more information about how you can solve the pseudo-conflicts.

 **Create patch (Ctrl (Command on OS X) + Alt + P)**

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see [the section about patches](#).

**Compare with:**

- **Latest from HEAD (Ctrl (Command on OS X) + Alt + H)** - Performs a 3-way diff operation between the selected file and the *HEAD* revision from the repository and displays the result in the **Compare view**. The common ancestor of the 3-way diff operation is the *BASE* version of the file from the local working copy.
- **BASE revision (Ctrl (Command on OS X) + Alt + C)** - Compares the working copy file with the *BASE* revision file (the so-called *pristine copy*).

- **Revision (Ctrl (Command on OS X) + Alt + R)**  
- Displays the **History view** that contains the log history of that resource.
- **Branch/Tag** - Opens the **Compare with Branch/Tag** dialog box that allows you to specify *another file from the repository* (To URL field) to compare with the working copy file. You can specify the revision of the repository file by choosing between **HEAD revision** or specific **Other revision**.

**Tip:** To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a *peg revision* at the end (for example, URL@rev1234).

- **Each other** - Compares two selected files with each other.

These *compare* actions are enabled only if the selected resource is a file.

#### Replace with:

- **Latest from HEAD** - Replaces the selected resources with their versions from the *HEAD* revision of the repository.
- **BASE revision** - Replace the selected resources with their versions from the pristine copy (the *BASE* revision).

**Note:** In some cases it is impossible to replace the currently selected resources with their versions from the *BASE/HEAD* revision:

- For the **Replace with BASE revision** action, the resources being unversioned or added have no *BASE* revision, and thus cannot be replaced. However, they will be deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders
- For the **Replace with latest from HEAD** action, you must be aware that there are cases when resources will be completely deleted or reverted to the *BASE* revision and then updated to a *HEAD* revision to avoid conflicts. These cases are:
  - The resource is *unversioned, added, obstructed, or modified*.
  - The resource is affected by a `svn:ignore` or `svn:externals` property that is locally added on the parent folder and not yet committed to the repository.

#### Show History (Ctrl (Command on OS X) + H)

Displays the **History view** where the log history for the selected resource will be presented. For more details about resource history, see the sections about *the resource history view* and *requesting the history for a resource*.

 **Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

Opens the **Show Annotation** dialog box that computes *the annotations for a file and displays them in the Annotations view*, along with the history of the file in the **History** view.

 **Revision Graph (Ctrl (Command on OS X) + G)**

This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see [Revision Graph](#).

**Copy URL Location (Ctrl (Command on OS X) + Alt + U)**

Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

**Mark as copied**

You can use this action to mark an item from the working copy as a copy of an other item under *version control*, when the copy operation was performed outside of an SVN client. The **Mark as copied** action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

**Mark as moved**

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The **Mark as moved** action is available when you select two items from different locations (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

**Mark as renamed**

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

 **Copy to**

Copies the currently selected resource to a specified location.

**Move to Ctrl + M (Command + M on OS X)**

Moves the currently selected resource to a specified location.

**Rename (F2)**

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

 **Delete (Delete)**

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

**New:**

 **New File**

Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.

**New Folder (Ctrl (Command on OS X) + Shift + **F**)**

Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.

**New External Folder (Ctrl (Command on OS X) + Shift + **W**)**

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a *URL of a versioned directory*, and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

**Tip:** You can specify a particular revision of the external item by using a *peg revision* at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository in which the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.

- / - Relative to the root URL of the server in which the `svn:externals` property is versioned.

**Important:** To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:** Syncro SVN Client does not support definitions of local relative external items.

#### Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)

Allows you to add files that should not participate in the *version control* operations inside your working copy . This action can only be performed on resources not under *version control*. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control](#) section.

#### Add to version control (Ctrl (Command on OS X) + Alt + V)

Allows you to add resources that are not under *version control*. For further details, see [Add Resources to Version Control](#) section.

#### Remove from version control

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

#### Clean up (Ctrl (Command on OS X) + Shift + C)

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

#### Locking:

- **Scan for locks** (Ctrl (Command on OS X) + L) - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources

- under *version control*. For more details see [Scanning for locks](#).
-  **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (*steal*) the lock. This action is active only on files under *version control*. For more details on the use of this action see [Locking a file](#).
  -  **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).
-  **Show SVN Properties (Ctrl + P (Command + P on OS X))** Brings up the *Properties view* and displays the SVN properties for the selected resource.
-  **Show SVN Information (Ctrl + I (Command + I on OS X))** Provides additional information for the selected resource from the working copy. For more details, go to [Obtain information for a resource](#).

## Drag and Drop Operations

[Edit on GitHub](#)

The structure of the files tree can be changed with drag and drop operations inside the **Working Copy** view. These operations behave in the same way with the **Copy to/Move to** operations.

Also, files and folders can be added to the file tree of the view as *unversioned* resources by drag and drop operations from other applications (for example, from Windows Explorer or Mac OS X Finder). In this case, the items from the file system are only copied, without removing them from their original location.

**Attention:** When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as *missing* in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).

## Assistant Actions

[Edit on GitHub](#)

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the **All Files** view mode lists the following two actions:

 **Check out a new working copy**  
You can start using Syncro SVN Client by checking out a new working copy.

 **Add a working copy**  
If you already have a working copy on disk, you can add it to Syncro SVN Client and start to work.

**Figure 431: All Files Panel**

For **Modified**, **Incoming**, **Outgoing**, **Conflicts** view modes, the following actions may be available, depending on the current working copy state in various contexts:

-  **Synchronize with Repository** - Available only when there is nothing to present in the **Modified** and **Incoming** view modes.
-  **Switch to Incoming** - Selects the **Incoming** view mode.
-  **Switch to Outgoing** - Selects the **Outgoing** view mode.
-  **Switch to Conflicts** - Selects the **Conflicts** view mode.
-  **Show all changes/incoming/outgoing/conflicts** - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.
-  **(Information message)** - Informs you why there are no resources presented in the currently selected view mode.

## History View

[Edit on](#)

[GitHub](#)

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from *Repositories view*, *Working Copy view*, *Revision Graph*, or *Directory Change Set view*. From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The view consists of four distinct areas:

- The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author's name, and a fragment of the commit message.

Some revisions may be highlighted to emphasize:

- The current revision of the resource for which the history is displayed - a bold font revision.
- The last revision in which the content or properties of the resource were modified - blue font revision.

**Note:** Both font highlights may be applied for the same revision.

- The complete commit message for the selected revision.
- A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.
- The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:
  -  - A newly created resource.
  -  - A newly created resource, copied from another repository location.
  -  - The content/properties of the resource were *modified*.
  -  - Resource was *replaced* in the repository.
  -  - Resource was *deleted* from the repository.

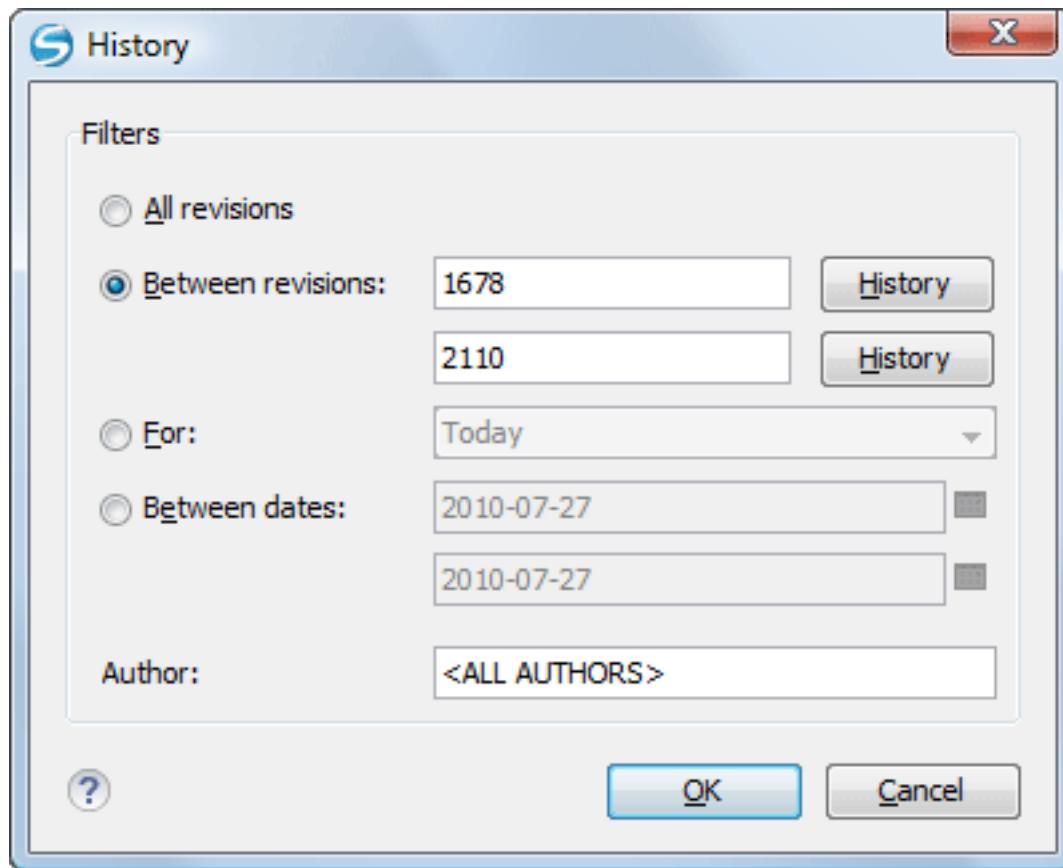

Figure 432: History View

You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the  **Group by date** button from the toolbar.

#### History Filter Dialog Box

[Edit on GitHub](#)

The **History view** does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more recent ones. That is why you can specify the criteria for the revisions displayed in the **History view** by selecting one of several options presented in the **History** dialog box that is displayed when you invoke the **Show History** action.

**Figure 433: History Filters Dialog Box**

Options for the set of revisions presented in the History view are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the **History view** has two buttons for extending the set of revisions presented in the view: **Get next 50** and **Get all**.

#### History Filter Field

[Edit on GitHub](#)

When only the history entries that contain a specified substring need to be displayed in the **History** view, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the **Find** label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the **History** view. When you press the **Search** button, the filter action is executed and the content of the table is updated.

#### History View Contextual Menu Actions

[Edit on GitHub](#)

The **History** view contains the following contextual menu actions:

<b>Compare with working copy</b>	Compares the selected revision with your working copy file. It is enabled only when you select a file.
<b>Open</b>	Opens the selected revision of the file into the Editor. This is enabled only for files.
<b>Open with</b>	Displays the <b>Open with</b> dialog box to specify the editor in which the selected file will be opened.
<b>Get Contents</b>	Replaces the current version from the working copy with the contents of the selected revision from the history of the file. The <i>BASE</i> version of the file is not changed in the working copy so that after this action the file will appear as modified in a synchronization operation, that is newer than the <i>BASE</i> version, even if the contents is from an older version from history.
<b>Save as</b>	Allows you to save the contents of a file as it was committed at a certain revision. This option is available only when you access the history of a file.
<b>Copy to</b>	Copies to the repository the item whose history is displayed, using the selected revision. This option is active only when presenting the history for a repository item (URL).
<b>Note:</b> This action can be used to resurrect deleted items also.	
<b>Revert changes from this revision</b>	Reverts changes that were made in the selected revisions. The changes are reverted only in your working copy and does not affect the repository items. It does not replace your working copy items with those from the selected revisions. This action is enabled when the resource history was launched for a local working copy resource.
<b>Note:</b> For items displayed in the <b>Affected Paths</b> section that were <i>added</i> , <i>deleted</i> , or <i>replaced</i> , this action has no effect because such changes are considered to be changes to the parent directory. To revert these type of changes, follow these steps:	
	<ol style="list-style-type: none"> <li>1. Request the history for the parent directory.</li> <li>2. Identify the revision that contains the changes you want to revert.</li> <li>3. Invoke the action on that revision.</li> </ol>
	 <b>Warning:</b> There are instances where the SVN Client is not able to identify the corresponding working copy item for the selected item in the <b>Affected Paths</b> section. In this case, the action does not proceed and an error message is displayed. For example, the selected item in the <b>Affected Paths</b> section is from a different repository location than the working copy item for which the history is displayed.
<b>Update to revision</b>	Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file.

### Export

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

### Change

Otherwise, your working copy is inconsistent and you are unable to commit your changes.

Checks out a new working copy of the directory for which the history is presented, from the selected revision.

Opens *the Export dialog box* that allows you to configure options for exporting a folder from the repository to the local file system.

Opens the **Show Annotation** dialog box that computes *the annotations for a file and displays them in the Annotations view*, along with the history of the file in the History view.

Allows you to change commit data for a file:

- *Author* - Changes the name of the SVN user that committed the selected revision.
- *Message* - Changes the commit message of the selected revision.

When two resources are selected in the **History** view, the contextual menu contains the following actions:

#### Compare revisions

When the resource is a file, the action compares the two selected revisions using the **Compare** view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

#### Revert changes from these revisions

Similar to the `svn merge` command, it merges two selected revisions into the working copy resource. This action is only enabled when the resource history was requested for a working copy item.

For more information about the **History** view and its features, see the [Request history for a resource](#) and [Using the resource history view](#) sections.

## Directory Change Set View

[Edit on GitHub](#)

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.

Directory Change Set - /userguide/trunk  
From revision 8913 to revision 10857

Commit message

EXM-17248 Display child map AuthorDevelGuide as one entry in parent EditorUserManual.ditamap.

**Figure 434: Directory Change Set View**

The set of changed resources displayed in the tree is obtained by running the action **Compare revisions** available on the contextual menu of the **History** view when two revisions of a folder resource are selected in the **History** view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right side list of the view performs a diff operation between that revision and the previous one of the same file.

The contextual menu of the right side list contains the following actions:

**Compare with previous version**

Performs a diff operation between the selected revision in the list and the previous one.

**Open**

Opens the selected revision in the associated editor type.

**Open with**

Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

**Save as**

Saves the selected file as it was in the selected revision.

**Copy to**

Copies to the repository the item whose history is displayed, using the selected revision.

### Export

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

**Show SVN Information (Ctrl (Command on OS X) + I)**

**Note:** This action can be used to resurrect deleted items also.

Checks out a new working copy of the selected directory, from the selected revision.

Opens *the Export dialog box* that allows you to configure options for exporting a folder from the repository to the local file system.

Opens the **Show Annotation** dialog box that computes *the annotations for a file and displays them in the Annotations view*, along with the history of the file in the **History** view.

Provides additional information for a selected resource. For more details, go to *Obtain information for a resource*.

## Editor Panel of SVN Client

[Edit on GitHub](#)

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in *the File Types preferences panel*.

The internal editor can be accessed either from the *Working copy view* or from the *History view*. No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file's content type is unknown you will be prompted to choose the proper way the file should be opened.

After editing the content of the file in an internal editor you can save it to disk by using the **Save** action from the *File* menu or the **Ctrl + S (Command + S on OS X)** key shortcut. After saving your file you can see the file changed status in *the Working Copy view*.

If the internal editor associated with a file type is not the XML Editor, then the encoding set in *the preferences for Encoding for non XML files* is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

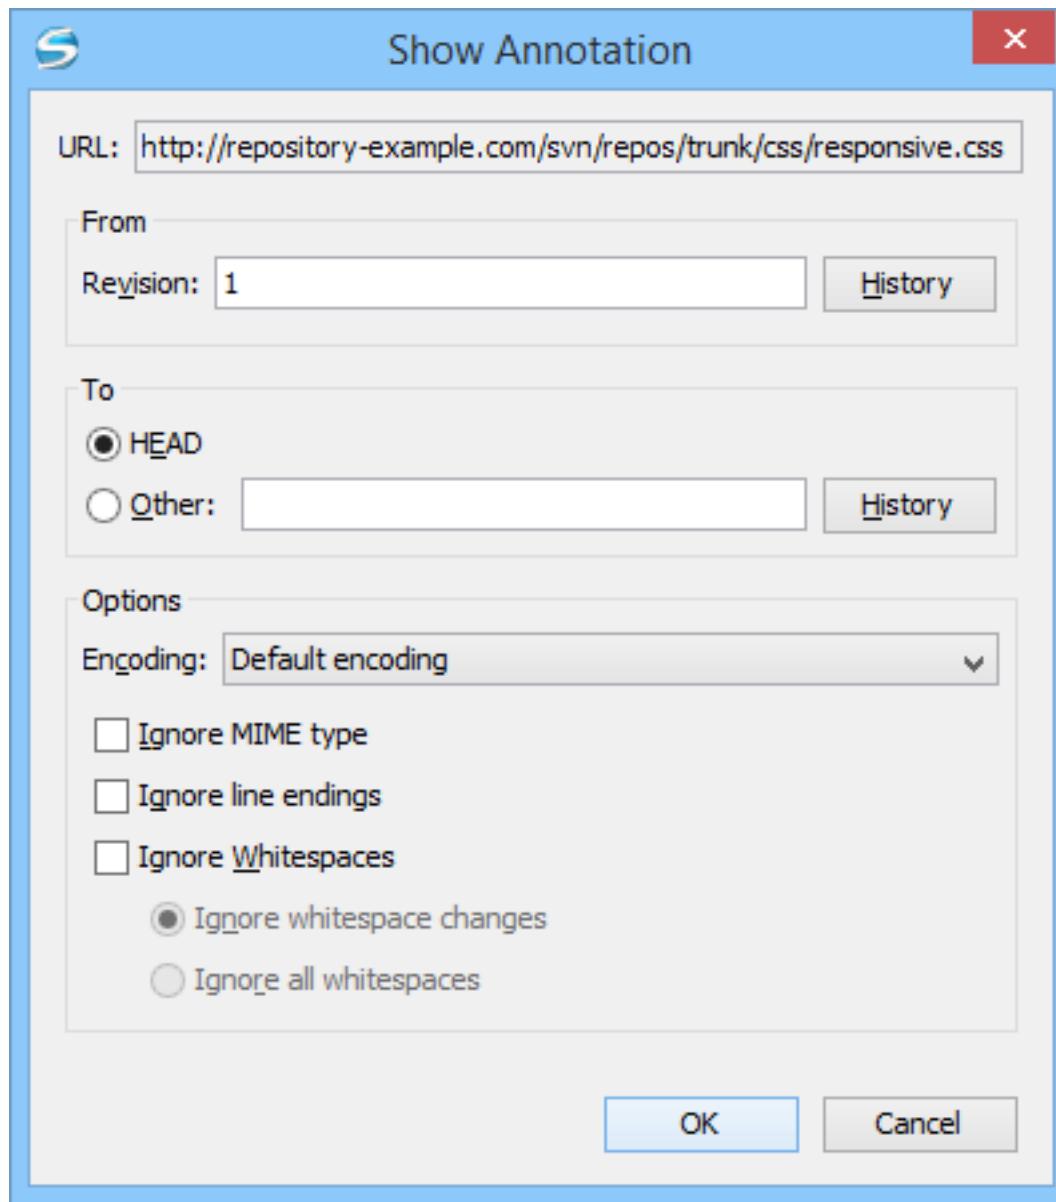

## Annotations View

[Edit on GitHub](#)

Sometimes you need to know not only what was changed in a file, but also who made those changes. The **Annotations** view displays the revision and the author that changed every line in a file. The annotations of a file are

computed and this view is opened with the **Show Annotation** action, which is available in the **History** menu, and from the contextual menu of the following views: *the Repositories view*, *Working copy view*, *History view*, and *Directory Change Set view*.

This action opens a dialog box that allows you to configure some options for showing the annotations.

**Figure 435: Show Annotation Options Dialog Box**

Once you have configured the options and click **OK**, the **Annotations** view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to see the revision in which the line was last modified. The same revision is highlighted in the **History view** and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the **Annotations view** corresponding to that revision are highlighted. Therefore, the **Annotations view**, **History view**, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.

**Figure 436: Annotations View**

The following options can be configured in the **Show Annotation** dialog box:

**From Revision Section**

Select the revision from which to start computing the annotation. If you press the **History** button, [the History dialog box](#) is displayed, which allows you to select a revision.

**To Revision Section**

Select the ending revision by choosing between the **HEAD** revision or specify it in the **Other** text box . If

## Encoding

you press the **History** button, [the History dialog box](#) is displayed, which allows you to select a revision.

### Ignore MIME type

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file. Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

### Ignore line endings

If enabled, the file is treated as a text file and ignores what the SVN system infers from the `svn:mime-type` property.

### Ignore whitespaces

If enabled, the differences in line endings are ignored when the annotation is computed.

If enabled, it allows you to specify how the whitespace changes should be handled. When enabled, you can then choose between two options:

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

**Note:** Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

**Tip:** Enabling any of these *ignore* options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and press **OK**, the annotations will be computed and the **Annotations** view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

**Note:** If the file has a very long history, the computation of the annotation data can take a long time to process.

## Compare View

[Edit on GitHub](#)

In the Oxygen XML Author, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in **Compare** view. This view is automatically opened if you select two files and use the **Compare with > Each Other** action in the contextual menu.

**Figure 437: Compare View**

At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a *line differencing algorithm*. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a **Refresh** operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the **Synchronize** operation, you can examine the exact differences between your local file and the *HEAD* revision file.
- You can use the **Compare view** from the **History view** to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see [View Differences](#).

### Compare View Toolbar

[Edit on GitHub](#)

The toolbar of the **Compare** view contains the operations that can be performed on the source and target files.

**Figure 438: Compare View Toolbar**

The following actions are available:

#### Algorithm

The algorithm to be used for performing a comparison.  
The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

#### Perform Files Differencing

Saves the content of the left editor when it can be edited.

Looks for differences between the two files displayed in the left and right side of the application window.

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronizes scrolling so that a selected difference can be seen on both sides of the application window. This action enables/disables the previously described behavior.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys the same in both files to make it easier to compare the files.

**Copy Change from Right to Left**

Copies the selected difference from the target file in the right side to the source file in the left side.

**Copy All Changes from Right to Left**

Copies all changes from the target file in the right side to the source file in the left side.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

**Ignore Nodes by XPath**

You can use this text field to enter an XPath 2.0 expression to ignore certain nodes from the comparison. This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms. If an XPath 2.0 expression is specified in the *Ignore nodes by XPath option* in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

Most of these actions are also available from the *Compare* menu.

## Image Preview

[Edit on](#)  
[GitHub](#)

You can view your local files by using the built-in **Image Preview** component. The view can be accessed from the [Working copy view](#) or from the [Repository view](#). It can also be used from the [History view](#) to view a selected revision of a image file.

Only one image file can be opened at a time. If an image file is opened in the *Image preview* and you try to open another one it will be opened in the same window. Supported image types are *GIF, JPEG/JPG, PNG, BMP*. Once the image is displayed in the **Image Preview** panel using the actions from the contextual menu, you can scale the image at its original size (**1:1** action) or scale it down to fit in the view's available area (**Scale to fit** action).

## Compare Images View

[Edit on](#)  
[GitHub](#)

The images are compared using the **Compare Images** view. This view is automatically opened if you select two image files and use the **Compare with > Each Other** action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view's available area.

The supported image types are: *GIF, JPG / JPEG, PNG, BMP*.

## Properties View

[Edit on](#)  
[GitHub](#)

The properties view presents Apache Subversion™ properties for the currently selected resource from either the **Working Copy** view or the **Repositories** view. If the view is not displayed, it can be opened from the **Window > Show View** menu.

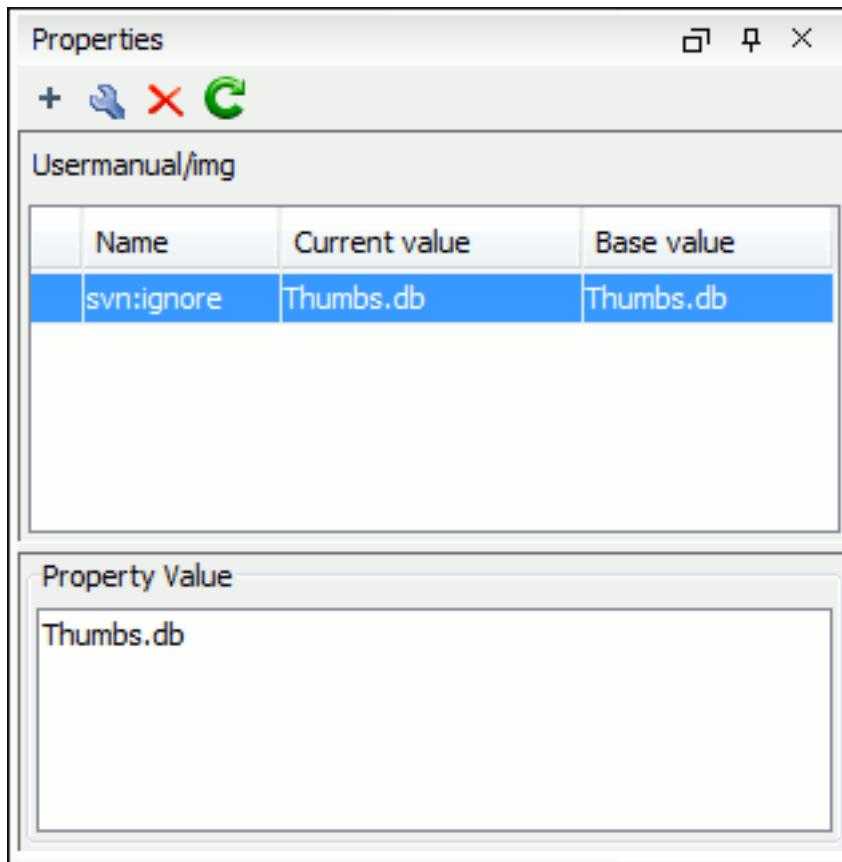

Figure 439: Properties View

The table includes four columns:

- **State** - Can be one of the following:
  - *(empty)* - Normal unmodified property (same current and base values)
  - *\** (*asterisk*) - Modified property (current and base values are different)
  - *+* (*plus sign*) - New property
  - *-* (*minus sign*) - Removed property
- **Name** - The property name.
- **Current value** - The current value of the property.
- **Base value** - The base (original) value of the property.

### **svn:externals** Property

[Edit on GitHub](#)

The `svn:externals` property can be set on a folder or a file. In the first case it stores *the URL of a folder from other repository*.

In the second case it stores the URL of a file from other repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and file externals:

- The path to the file external must be in a working copy that is already checked out. While directory externals can place the external directory at any depth and it will create any intermediate directories, file externals must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the file external will be inserted into; interrepository file externals are not supported.
- While commits do not descend into a directory external, a commit in a directory containing a file external will commit any modifications to the file external.

The differences between a normal versioned file and a file external:

- File externals cannot be moved or deleted; the `svn:externals` property must be modified instead; however, file externals can be copied.

A file external is displayed as a X in the switched status column.

### Toolbar / Contextual Menu

[Edit on GitHub](#)

The properties view toolbar and contextual menu contain the following actions:

- **Add a new property** - This button invokes the *Add property* dialog box in which you can specify the property name and value.
- **Edit property** - This button invokes the *Edit property* dialog box in which you can change the property value and also see its original(base) value.
- **Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
- **Refresh** - This action will refresh the properties for the current resource.

### Console View

[Edit on GitHub](#)

The **Console View** shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the Subversion command-line notation. For a detailed description of the Subversion console output read the [SVN User Manual](#).

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

**Clear**

Erases all the displayed messages.

**Lock scroll**

Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the [Preferences](#) page. By default, this value is set to 100.

### Dynamic Help View

[Edit on](#)

[GitHub](#)

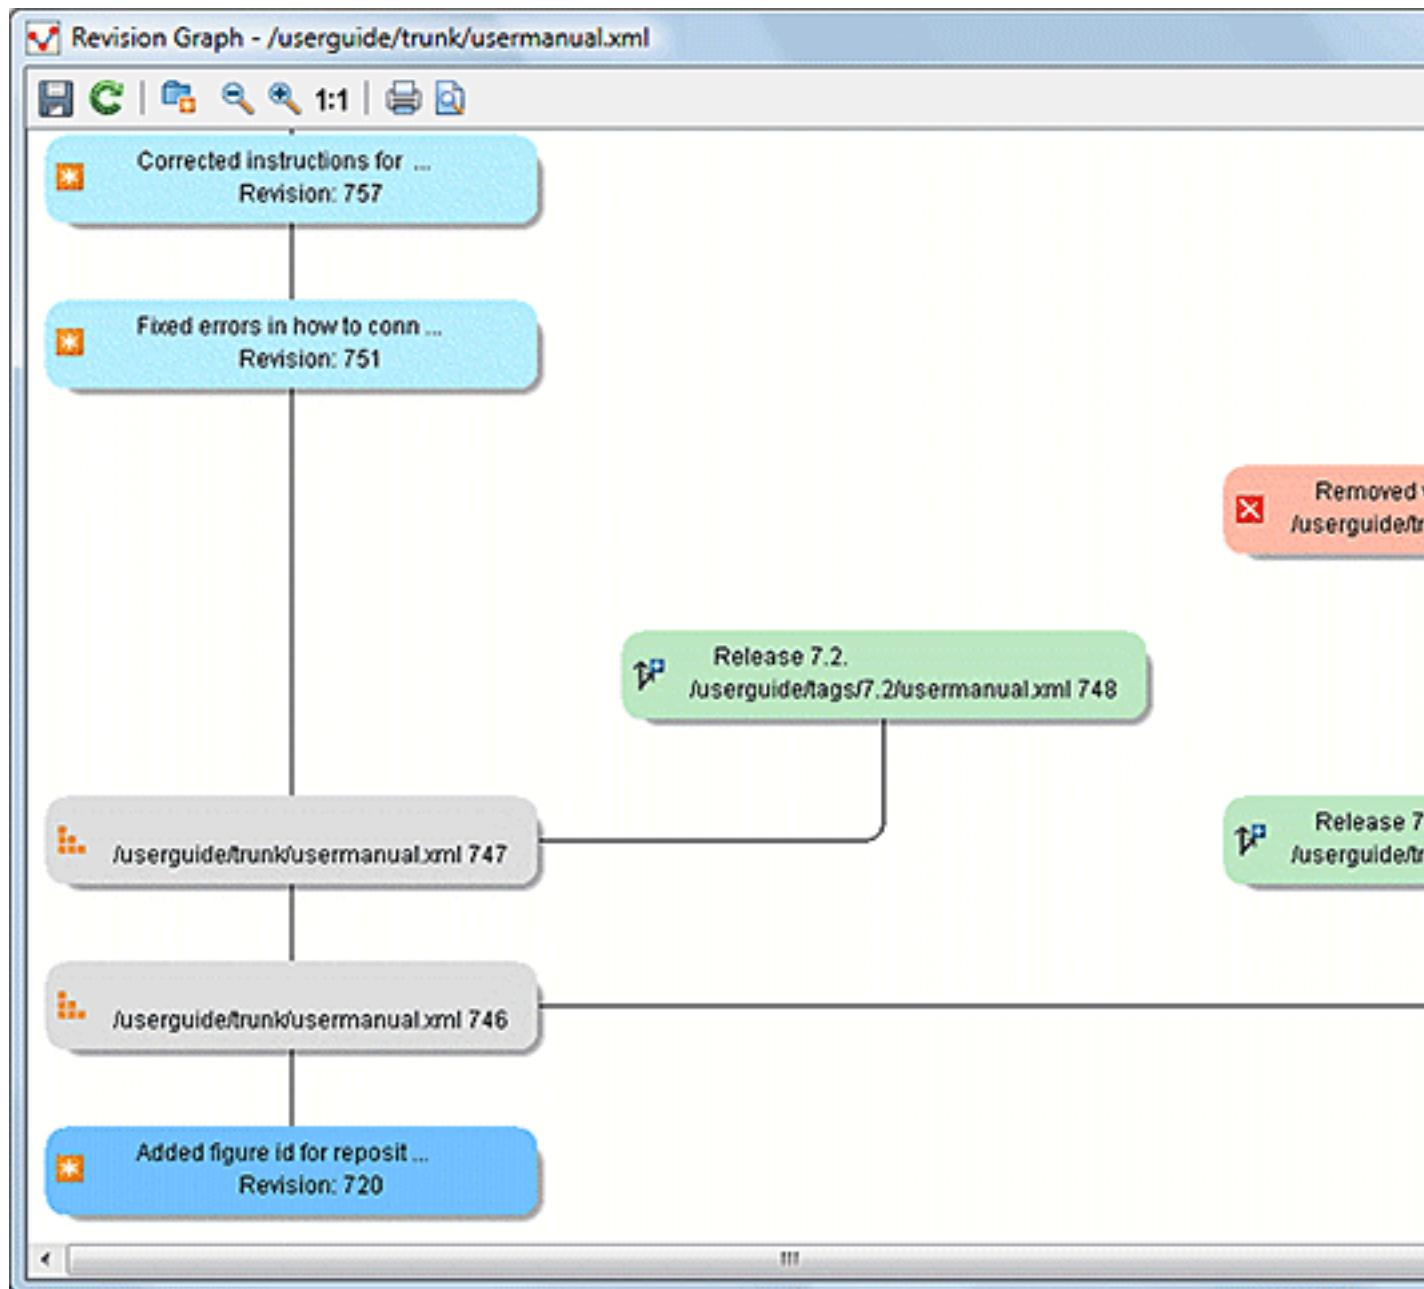

**Dynamic Help view** is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened from the **Window > Show View** menu.

### Revision Graph of a SVN Resource

[Edit on GitHub](#)

The history of a SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

The graphical representation of a resource history is invoked with the **Revision graph** action available on the right-click menu of a SVN resource in [the Working Copy view](#) and [the Repository view](#).

**Figure 440: Revision Graph of a File Resource**

In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who created the revision of that node, the revision number, the date of creation, the commit message, the modification type and *the affected paths*.

The types of nodes used in the graph are:

#### Added resource

The icon for a new resource added to the repository and a green background.

**Copied resource**

The icon for a resource copied to other location (for example, when a SVN tag is created and a green background).

**Modified resource**

The icon for a modified resource and a blue background.

**Deleted resource**

The icon for a resource deleted from the repository and a red background.

**Replaced resource**

The icon for a resource removed and replaced with another one on the repository and a orange background.

**Indirect resource**

The icon for a revision from where the resource was copied or an indirectly modified resource, that is a directory in which a resource was modified and a gray background. The *Modification type* field of the tooltip specifies how that revision was obtained in the history of the resource.

A directory resource is represented with two types of graphs:

**Simplified graph**

Lists only the changes applied directly to the directory;

**Complete graph**

Lists also the indirect changes of the directory resource, that is the changes applied to the resources contained in the directory.

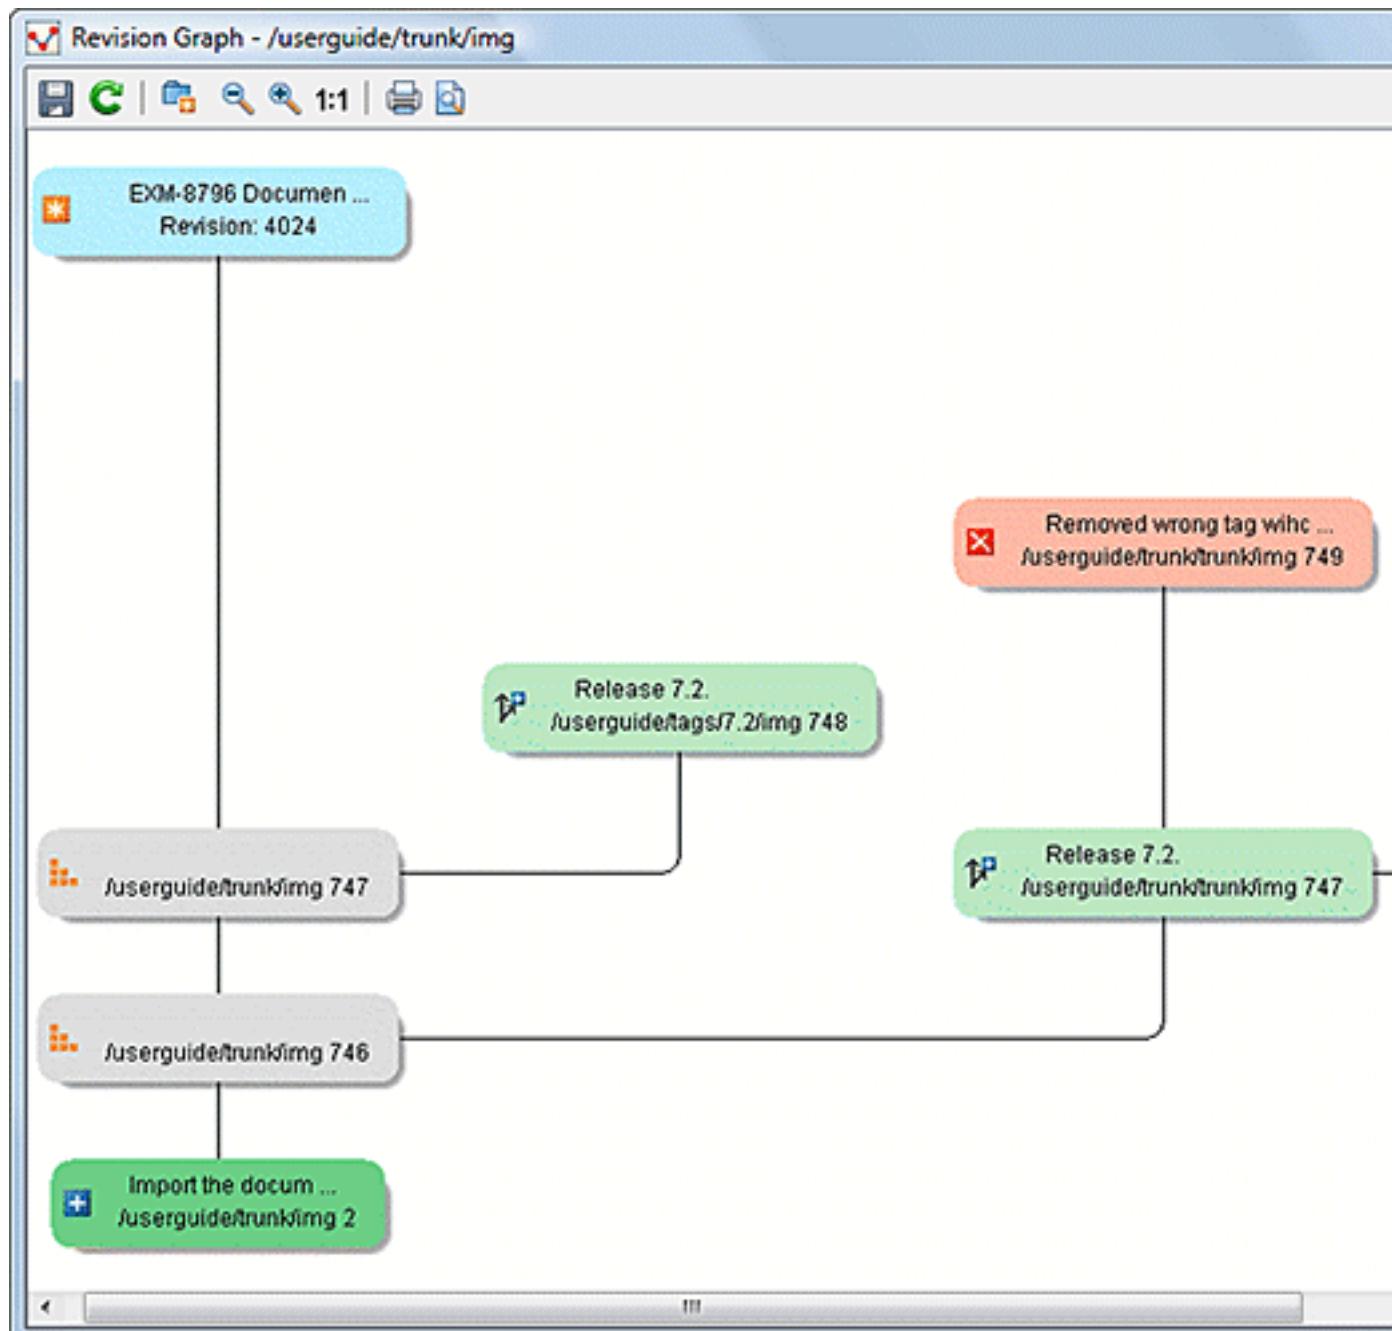

Figure 441: Revision Graph of a Directory (Direct Changes)

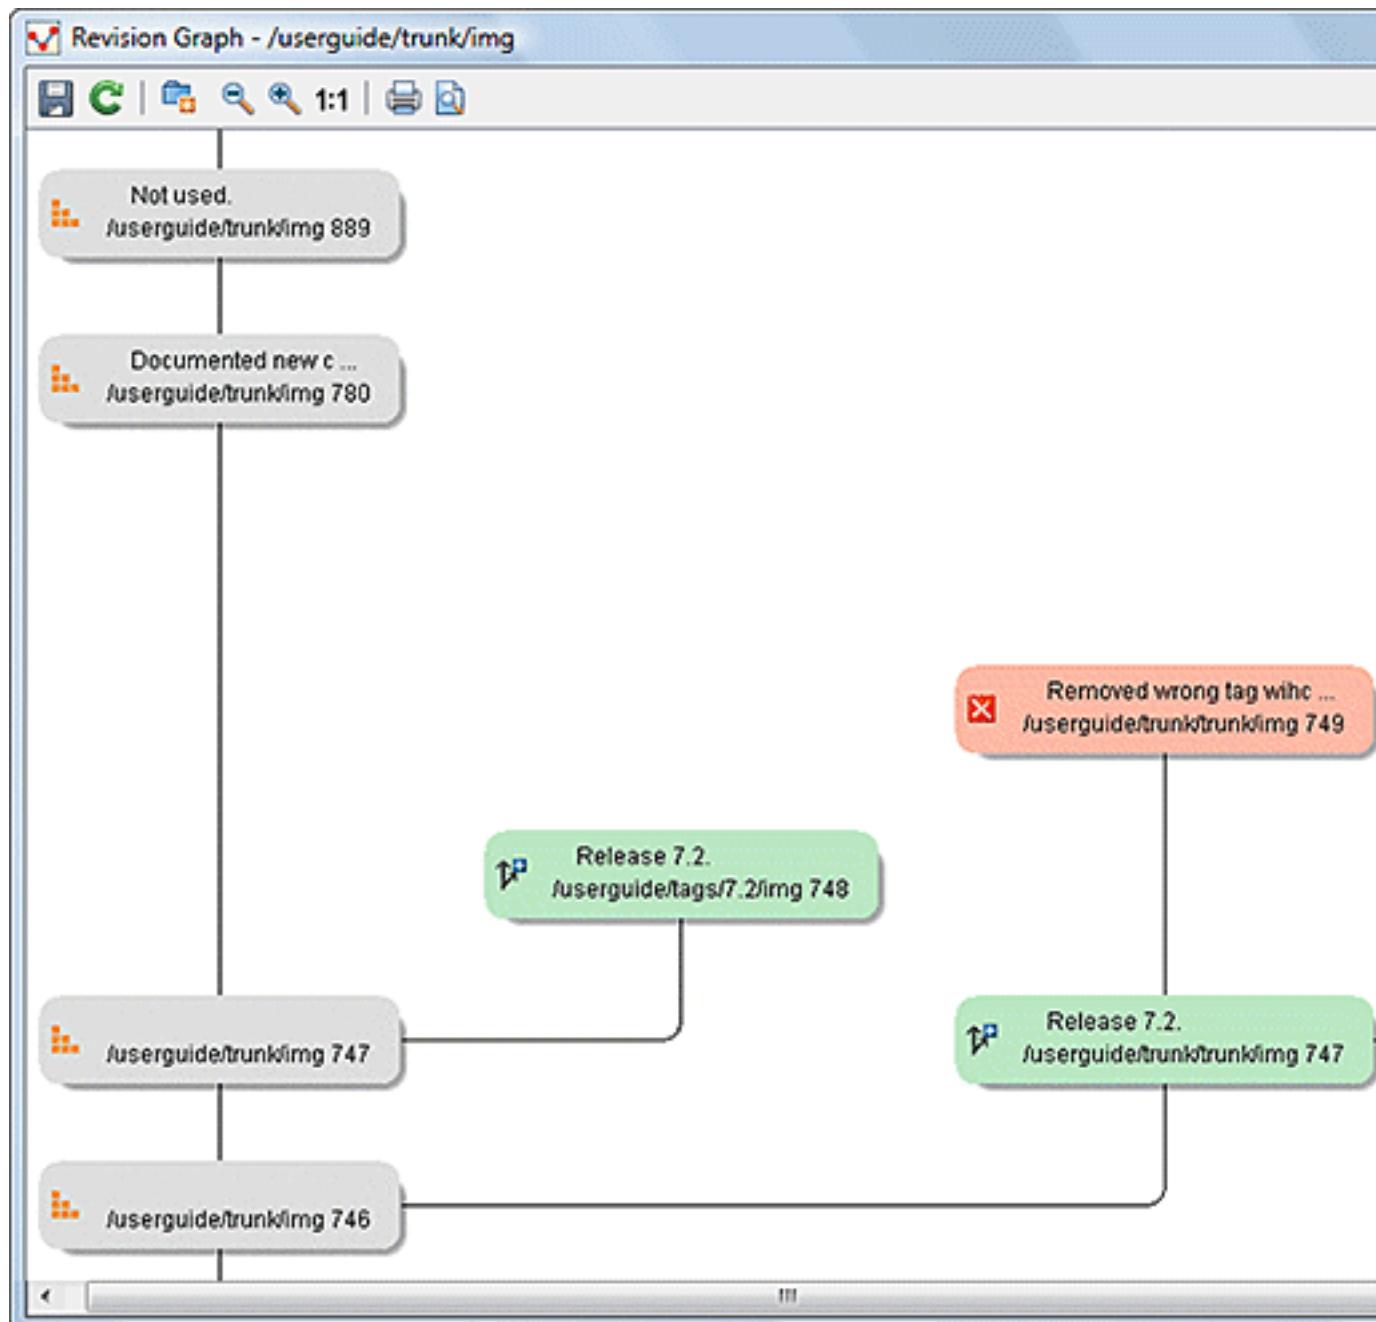

Figure 442: Revision Graph of a Directory (Including Indirect Changes)

The **Revision graph** toolbar contains the following actions:

**Save as image**

Saves the graphical representation as image. For a large revision graph you have to [set more memory in the startup script](#). The default memory size is not enough when there are more than 100 revisions that are included in the graph.

**Show/Hide indirect modifications**

Switches between simplified and complete graph.

**Zoom In**

Zooms in the graph.

**Zoom Out**

Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

**Reset scale**

Resets the graphical scale to a default setting.

**Print**

Prints the graph.

**Print preview**

Offers a preview of the graph to allow you to check the information to be printed.

The contextual menu of any of the graph nodes contains the following actions:

**Open**

Opens the selected revision in the editor panel. Available only for files.

**Open with**

Opens the selected revision in the editor panel. Available only for files.

**Save as**

Saves the file for which the revision graph was generated, based on the selected node revision.

**Copy to**

Copies to the repository the item whose revision graph is displayed, using the selected revision.

**Note:** This action can be used to resurrect deleted items also.

**Compare with HEAD**

Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

**Show History**

Displays the history of the resource in [the History view](#). Available for both files and directories.

**Check out**

[Checks out](#) the selected revision of the directory. Available only for directories.

**Export**

Opens [the Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the **Compare** for comparing the two revisions corresponding to the selected nodes. If the resource for which the revision graph was built is a folder then the right-click menu displayed for a two nodes selection also contains the **Compare** action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the [Directory Change Set](#) view.

**Attention:** Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.

## Oxygen XML Author SVN Preferences

[Edit on GitHub](#)

The options used in the SVN client are saved and loaded independently from the Oxygen XML Author options. However, if Oxygen XML Author cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).

There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the **Global Runtime Configuration** submenu of the **Options** menu. These actions, **Edit 'config' file** and **Edit 'servers' file**, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.

## Entering Local Paths and URLs

[Edit on GitHub](#)

The Oxygen XML Author includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Author provides support in these text boxes to make it easier to specify these paths and URLs.

### Local Item Paths

The text boxes used for specifying local item paths support the following:

- *Absolute Paths* - In most cases, the Oxygen XML Author expects absolute paths for local file system items.
- *Relative Paths* - The Oxygen XML Author only accepts relative paths in the form `~[ / . . . ]`, where `~` is the user home directory.
- *Path Validation* - Oxygen XML Author validates the path as you type and invalid text becomes red.
- *Drag and Drop* - You can drag files and folders from the file system or other applications and drop them into the text box.
- *Automatic Use of Clipboard Data* - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

### Repository Item URLs

- *Local Repository Paths* - You can use local paths (absolute or relative) to access local repositories. When you use the **Browse** button, the Oxygen XML Author will convert the file path to a `file://` form of URL, provided that the location is a real repository.
  - *Absolute Paths* - In most cases, the Oxygen XML Author expects absolute paths for local file system items.
  - *Relative Paths* - The Oxygen XML Author only accepts relative paths in the form `~[ / . . . ]`, where `~` is the user home directory.
- *Peg Revisions* - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can *use peg revisions at the end of the URLs* (for example, `URL@rev1234`).

**Note:** If you try to use a *peg revision* number in a dialog box where you are sending information to the repository then the peg revision number will become part of the name of the item rather than searching for the specified revision. For example, in the URL `http://host/path/inside/repo/item@100`, the item name is considered to be `item@100`.

**Tip:** You can even use *peg revisions* with local repository paths. For example, `C:\path\to\local\repo@100` will be converted to `file:///C:/path/to/local/repo@100` and the **Repository browser** will display the content of the local repository as it is at revision 100.

- *URL Validation* - Oxygen XML Author validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the **Browse** button to convert them to valid URLs.
- *Drag and Drop* - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid `file://` type URLs.
- *Automatic Use of Clipboard Data* - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to `file://` type URLs.

**Note:** The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the **Repositories** view.

## Technical Issues

[Edit on GitHub](#)

This section contains special technical issues found during the use of Syncro SVN Client.

### Authentication Certificates Not Saved

[Edit on GitHub](#)

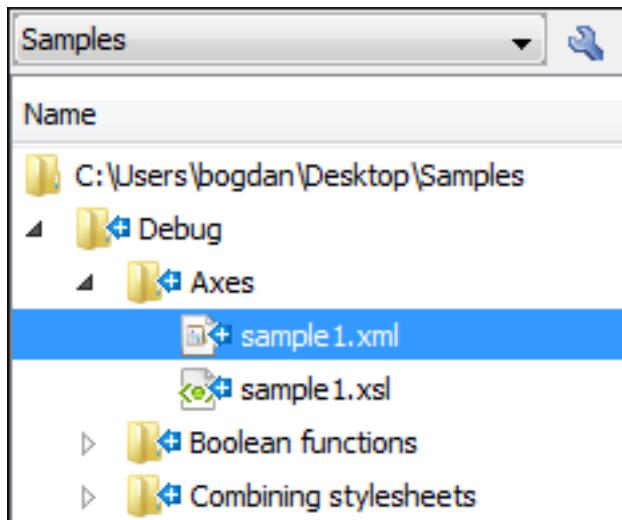

If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the *Subversion* configuration folder (write access to *Subversion* folder and all its subfolders). Usually, it is located in the following locations:

- Windows: [ HOME\_DIR ]\AppData\Roaming\Subversion
- Mac OS X and Linux: [ HOME\_DIR ]/.subversion

### Updating Newly Added Resources

[Edit on GitHub](#)

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

**Figure 443: Incoming Changes**

Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

#### Update ancestor directories recursively

This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

#### Update selected files only (leave ancestor directories empty)

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to *empty* in your working copy, thus subsequent **Synchronize** operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the [Update to revision/depth action](#) from the working copy view.

## Cannot Access a Repository through HTTPS

[Edit on  
GitHub](#)

If you have issues when trying to access a repository through HTTPS protocol, one of the possible causes can be the encryption protocol currently used by the application. This is happening when:

- You are running Oxygen XML Author with Java 1.6 or older.
- The repository is set to use only one of the SSLv3 or TLSv1 encryption protocols.

To solve this issue, set the **HTTPS encryption protocols** option to **SSLv3 only** or **TLSv1 only** (depending on the repository configuration).

## Accessing Old Items from a Repository

[Edit on  
GitHub](#)

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a *peg revision* is needed.

A Subversion repository tracks any change made to its items by using *revisions*, which contain information such as the name of the author who made the changes, the date when they were made, and a number that uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a *peg revision* comes in handy. A *peg revision* is nothing more than a normal revision, but the difference between them is made by their usage. Many of the Subversion commands accept also a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision we are interested in, regarding the used command).

To illustrate an example, consider the following:

- We created a new repository file config, identified by the URL `http://host.com/myRepository/dir/config`.
- The file has been created at revision 10.
- Over time, the file was modified by committing revisions 12, 15, 17.

To access a specific version of the file identified by the `http://host.com/myRepository/dir/config` URL, we need to use a corresponding revision (the operative revision):

- If we use a revision number less than 10, an error is triggered, because the file has not been created yet.
- If we use a revision number between 10 and 19, we will obtain the specific version we are interested in.

**Note:** Although the file was modified in revisions 12, 15, 17, it existed in all revisions between 10 and 19. Starting with a revision at which the file is modified, it has the same content across all revisions generated in the repository until another revision in which it is modified again.

At this point, we delete the file, creating revision 20. Now, we cannot access any version of the file, because it does not exist anymore in the latest repository revision. This is due to the fact that Subversion automatically uses the HEAD revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the 10–19 interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If we use a revision number greater than 19, this will also trigger an error.

Continuing our example, suppose that at revision 30 we create a directory called `config` in the same repository location as our deleted file. This means that our new directory will be identified by the same repository address: `http://host.com/myRepository/dir/config`. If we use only this URL in any Subversion command, we will access the new directory. We will also access the same directory if we use any revision number equal with or greater than 30 as peg revision. However, if we are interested in accessing an old version of the previously existing file, then we must use one of the revisions that existed (10–19), as a peg revision, similar to the previous case.

## Checksum Mismatch Error

[Edit on GitHub](#)

A *Checksum Mismatch* error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).  
  
**Note:** If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.
2. Identify the *current depth* of that directory.
3. Update the parent directory using the **Update to revision/depth** action that is available from the contextual menu or the **Working copy** menu.
  - a. For the **Depth** option, select **This folder only (empty)**.

**Warning:** If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking **OK** the contents of the directory will be erased and the directory is be marked as having *an empty depth*.
5. Once again, update the same directory using the **Update to revision/depth** action.
  - a. This time, for the **Depth** option, select the depth that was previously identified in step 2.
6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.

## External Tools

[Edit on GitHub](#)

A command-line tool can be started in the Oxygen XML Author user interface as if from the command line of the operating system shell. Oxygen XML Author offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

The [External Tools preferences page](#) presents a list of the external tools that have been configured. Once *a tool has been configured*, you can open it by selecting it from the **Tools > External Tools** menu or from the **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be enabled in the [Configure Toolbars dialog box](#)). You can also *assign a keyboard shortcut* to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Author, the ***Save all files before calling external tools option*** (in the **Open/Save** preference page) should be enabled so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon (  ) and you can use this button to stop the tool. When the tool has finished running (or you close it), the icon changes back to the original icon (  ).

**Note:** Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

## Integrating the Ant Tool

This is an example for integrating *the Ant build tool* into Oxygen XML Author:

1. [Download](#) and [install Apache Ant](#) on your computer.
2. Test your *Ant* installation from the command-line interface in the directory where you want to use *Ant* from. For example, run the `clean` target of your `build.xml` file `C:\projects\XMLproject\build.xml`:

```
ant clean
```
3. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).
4. Click the **New** button to create a new external tool entry and enter the following information:
  - **Name** - For example, *Ant tool*.
  - **Working directory** - For example, `C:\projects\XMLproject`.
  - **Command line** - For example, "`C:\projects\XMLproject\ant.bat`" `clean`.
5. Click **OK** to add the new tool to the list of external tools.
6. Run the tool from **Tools > External Tools > Ant tool**. You can see the output in the **Command** results panel:

```
Started: "C:\projects\XMLproject\ant.bat" clean
Buildfile: build.xml

clean:
[echo] Delete output files.
[delete] Deleting 5 files from C:\projects\XMLproject

BUILD SUCCESSFUL
Total time: 1 second
```

## Common Problems

---

**Topics:**

- *Performance Problems*
- *Common Problems and Solutions*

A compilation of common problems and their solutions.

This section provides a variety of common problems and their solutions.

## Performance Problems

[Edit on GitHub](#)

This section contains solutions for some common performance problems that may appear when running Oxygen XML Author.

### Related information

[Editing Documents with Long Lines](#) on page 654

[Loading Large Documents](#) on page 653

[External Tools](#) on page 1559

## Performance Issues with Large Documents

[Edit on GitHub](#)

When starting Oxygen XML Author from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40% of the amount of physical RAM, but not more than 700 MB.

When starting Oxygen XML Author from a command-line script, the default maximum memory is 512 MB.

While editing large documents in Oxygen XML Author, if you see that performance slows down considerably over time, then a possible cause is that the application needs more memory to run properly. You can increase the maximum amount of memory available to Oxygen XML Author by [setting the -Xmx parameter in a configuration file](#) that is specific to the platform that runs the application.

**Attention:** The maximum amount of memory should not be equal to the physical amount of memory available on the machine because in that case the operating system and other applications will have no memory available.

When installed on a multiple user environment, each instance of Oxygen XML Author will be allocated the amount stipulated in the memory value. To avoid degrading the general performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

## External Processes

[Edit on GitHub](#)

The [Memory available to the built-in FOP option](#) controls the amount of memory allocated to generate PDF output with the built-in Apache FOP processor. If Oxygen XML Author throws an *Out Of Memory* error, [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XSLT-FO-XQuery > FO Processors**, and increase the value of the [Memory available to the built-in FOP option](#).

For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

## Display Problems on Linux or Solaris

[Edit on GitHub](#)

Display problems (such as screen freezes) on Linux or Solaris can be solved by [adding the startup parameter](#): -Dsun.java2d.pmoffscreen=false.

## Common Problems and Solutions

[Edit on GitHub](#)

This chapter presents common problems that may appear when running the application along with solutions for these problems.

### 'Address Family Not Supported by Protocol Family; Connect' Error

[Edit on GitHub](#)

#### Problem

I have experienced the following error: "*Address Family Not Supported by Protocol Family; Connect*". How do I solve it?

#### Solution

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Author prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

A quick fix for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (`java.net.preferIPv4Stack=true`).

In order to do this, follow this procedure:

1. Edit the `custom_commons.vmoptions` file that is located in the Oxygen XML Author installation folder, by adding the Java property `java.net.preferIPv4Stack=true`, and save it in the same location.
2. Restart Oxygen XML Author.
3. Make sure the procedure was successful by going to **Help > About > System properties** and check that the value of the `java.net.preferIPv4Stack` property is `true`.

### Alignment Issues of the Main Menu on Linux Systems Based on Gnome 3.x

[Edit on GitHub](#)

On some Linux systems based on Gnome 3.x (Ubuntu 11.x, 12.x), the main menu of Oxygen XML Author has alignment issues when you navigate it using your mouse.

This is a known problem caused by Java SE 6 1.6.0\_32 and earlier. You can resolve this problem using the latest Java SE 6 JRE from Oracle. To download the latest version, go to <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

To bypass the JRE bundled with Oxygen XML Author, go to the installation directory of Oxygen XML Author and rename or move the `jre` folder. If Oxygen XML Author does not seem to locate the system JRE, either set the `JAVA_HOME` environment variable to point to the location where you have installed the JRE, or you can simply copy that folder with the JRE to the installation directory and rename it to `jre` to take the place of the bundled JRE.

### Cannot Associate Oxygen XML Author With a File Type on My Windows Computer

[Edit on GitHub](#)

#### Problem

I cannot associate the Oxygen XML Author application with a file type on my Windows computer by right clicking a file in Windows Explorer, selecting **Open With > Choose Program** and browsing to the file `oxygenAuthor18.0.exe`. When I select the file `oxygenAuthor18.0.exe` in the Windows file browser dialog box, the Oxygen XML Author application is not added to the list of applications in the **Open With** dialog box. What can I do?

## Solution

The problem is due to some garbage Windows registry entries remained from versions of Oxygen XML Author older than version 9.0. Uninstall all your installed versions of Oxygen XML Author and run a registry cleaner application for cleaning these older entries. After that just reinstall your current version of Oxygen XML Author and try again to create the file association.

## Cannot Connect to SVN Repository from Repositories View

[Edit on GitHub](#)

### Problem

I cannot connect to a SVN repository from the **Repositories** view of SVN Client. How can I find more details about the error?

### Solution

First check that you entered the correct URL of the repository in the **Repositories** view. Also check that a SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command line SVN client from CollabNet.

If you try to access the repository with a `svn+ssh` URL also check that a SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository please generate a logging file on your computer and send the logging file to support@oxygenxml.com. For generating a logging file you need to create a text file called `log4j.properties` in the install folder with the following content:

```
log4j.rootCategory= debug, R2

log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=logging.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [%t] %c - %m%n
```

Restart the application, reproduce the error, close the application and send the file `logging.log` generated in the install directory to support@oxygenxml.com.

## Cannot Open XML Files in Internet Explorer

[Edit on GitHub](#)

### Problem

Before installing Oxygen XML Author I had no problems opening XML files in Internet Explorer. Now when I try to open an XML file in Internet Explorer it opens the file in Oxygen XML Author. How can I load XML files in Internet Explorer again?

### Solution

XML files are opened in Oxygen XML Author because Internet Explorer uses the Windows system file associations for opening files and you associated XML files with Oxygen XML Author in the installer panel called **File Associations**. Therefore, Internet Explorer opens XML files with the associated Windows application.

By default, the association with XML files is disabled in the Oxygen XML Author installer panel called **File Associations**. When you enabled it the installer displayed a warning message about the effect that you experience right now.

For opening XML files in Internet Explorer, again you have to set Internet Explorer as the default system application for XML files (for example by right-clicking an XML file in Windows Explorer, selecting **Open With > Choose Program**, selecting IE in the list of applications and selecting the checkbox **Always use the selected program**). Also, you have to run the following command from a command line:

```
wscript revert.vbs
```

where `revert.vbs` is a text file with the following content:

```
function revert()
 Set objShell = CreateObject("WScript.Shell")
 objShell.RegWrite "HKCR\.xml\", "xmlfile", "REG_SZ"
 objShell.RegWrite "HKCR\.xml\Content Type", "text/xml", "REG_SZ"
end function

revert()
```

## Compatibility Issue Between Java and Certain Graphics Card Drivers

[Edit on GitHub](#)

Under certain settings, a compatibility issue can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled. If you encounter this problem, update your graphics card driver. Another possible workaround is, *open the Preferences dialog box (**Options > Preferences**)*, go to **Appearance > Fonts**, and set the value of the **Text antialiasing** option to ON.

**Note:** If this workaround does not resolve the problem, set the **Text antialiasing** option to other values.

## Crash at Startup on Windows with an Error About the `nvogl32.dll` File

[Edit on GitHub](#)

### Problem

I try to start Oxygen XML Author on Windows but it crashed with an error message about “Fault Module Name: nvogl32.dll”. What is the problem?

### Solution

It is an OpenGL driver issue that can be avoided by creating an empty file called `opengl32.dll` in the Oxygen XML Author install folder (if you start Oxygen XML Author with the shortcut created by the installer on the Start menu or on Desktop) or in the subfolder `bin` of the home folder of the Java virtual machine that runs Oxygen XML Author (if you start Oxygen XML Author with the `oxygen.bat` script). The home folder of the Java virtual machine that runs Oxygen XML Author is the value of the `java.home` property that is available in the **System properties** tab of the **About** dialog box (opened from the **Help > About** menu).

## Damaged File Associations on OS X

[Edit on GitHub](#)

### Problem

After upgrading OS X and Oxygen XML Author, it is no longer associated to the appropriate file types (such as XML, XSL, XSD, etc.) How can I create the file associations again?

### Solution

The upgrade damaged the file associations in the LaunchService Database on your OS X machine. You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and will rescan the

entire file system searching for applications that declare file associations and collecting them in a database used by Finder.

1. Find all the Oxygen XML Author installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Author installation kit on your desktop.
5. Copy the contents of the archive into the folder / Applications / Oxygen.
6. Run the following command in a Terminal:

```
/System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/
LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain
local -domain system -domain user
```

7. Restart Finder with the following command:

```
killall Finder
```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Author icon.
9. Double-click the file.
10. Accept the confirmation.

**Result:** When you start Oxygen XML Author, the file associations should work correctly.

## Details to Submit in a Request for Technical Support Using the Online Form

[Edit on GitHub](#)

### Problem

What details should I add to my request for technical support on the online form in the product website?

### Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

To generate an Oxygen XML Author log file, follow these steps:

1. Create a text file called `log4j.properties` in the application installation folder, with the following content:

```
log4j.rootCategory= debug, R2

log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [%t] %c - %m%n
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `log4j.properties` file because it might cause performance issues if you leave it in the installation folder.

**Important:** The logging mode may severely decrease the performance of the application. Therefore, please do not forget to delete the `log4j.properties` file when you are done with the procedure.

The resulting log file is named `oxygen#.log` (for example, `oxygen.log`, `oxygen.log.1`, `oxygen.log.2`, etc.) and is located in the `Desktop\oxygenLog` folder.

## DITA Map Transformation Fails (Cannot Connect to External Location)

[Edit on GitHub](#)

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the [the Proxy preferences page](#)

## DITA PDF Transformation Fails

[Edit on GitHub](#)

To generate the PDF output, Oxygen XML Author uses the DITA Open Toolkit.

If your transformation fails you can detect some of the problems that caused the errors by running [the Validate and Check for Completeness action](#). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA Map, broken links, and missing external resources.

You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or to support@oxygenvxml.com.

## DITA to CHM Transformation Fails

[Edit on GitHub](#)

Oxygen XML Author uses the DITA Open Toolkit and the HTML Help compiler (part of the Microsoft HTML Help Workshop) to transform DITA content into *Compiled HTML Help* (or *CHM* in short).

It is a good practice to validate the DITA map before executing the transformation scenario. To do so, run [the Validate and Check for Completeness action](#). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

However, the execution of the transformation scenario may still fail. Reported errors include:

- [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped. - This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content. To solve this issue, close the CHM help file and run the transformation scenario again.
- [exec] HHC5003: Error: Compilation failed while compiling fileName - Possible causes of this error are:
  - The processed file does not exist. Fix the file reference before executing the transformation scenario again.
  - The processed file has a name that contains space characters. To solve the issue, remove any spacing from the file name and run the transformation scenario again.

### Related information

[Compiled HTML Help \(CHM\) Output Format](#) on page 710

## Drag and Drop Without Initial Selection Does Not Work

[Edit on GitHub](#)

### Problem

When I try to drag with the mouse an unselected file from the **Project** view or the **DITA Maps Manager** view, the drag never starts, it only selects the resource. I need to drag the resource again after it becomes selected. As a result any drag and drop without initial selection becomes a two step operation. How can I fix this?

### Solution

This is *a bug* present in JVM versions prior to 1.5.0\_09. This issue is fixed in 1.5.0\_09 and newer versions. See [the installation instructions](#) for setting a specific JVM version for running the Oxygen XML Author application.

## Gray Window on Linux With the Compiz / Beryl Window Manager

[Edit on GitHub](#)

### Problem

I try to run Oxygen XML Author on Linux with the Compiz / Beryl window manager but I get only a gray window that does not respond to user actions. Sometimes the Oxygen XML Author window responds to user actions but after opening and closing an Oxygen XML Author dialog or after resizing the Oxygen XML Author window or a view of the Oxygen XML Author window the content of this window becomes gray and it does not respond to user actions. What is wrong?

### Solution

Sun Microsystems' Java virtual machine *does not support the Compiz window manager and the Beryl one very well*. It is expected that better support for Compiz / Beryl will be added in future versions of their Java virtual machine. You should turn off the special effects of the Compiz / Beryl window manager before starting the Oxygen XML Author application or switch to other window manager.

## Image Appears Stretched Out in the PDF Output

[Edit on GitHub](#)

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

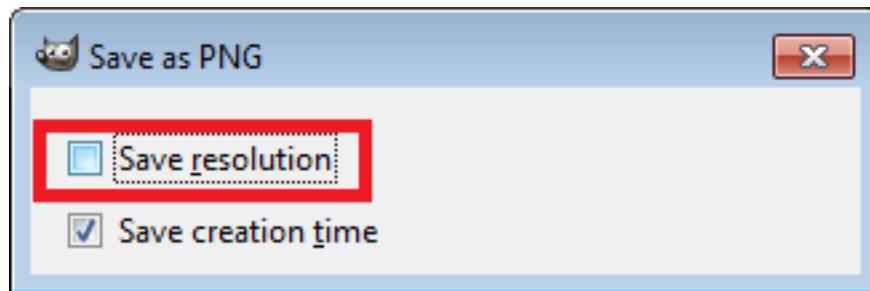

PDF output from XML content is obtained by first obtaining a intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `external-graphic` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA_OT_DIR]/plugins/org.dita.pdf2/fop/conf/fop.xconf`. The configuration file contains two XML elements called `source-resolution` and `target-resolution`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

**Tip:** It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

## Increasing the Memory for the Ant Process

[Edit on GitHub](#)

For details about setting custom JVM arguments to the Ant build process see [this section](#).

## JPEG CMYK Color Space Issues

[Edit on GitHub](#)

JPEG images with CMYK color profile having the color profiles embedded in the image should be properly rendered in the **Author** mode.

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the `profileFileName.icc` to the `[OXYGEN_INSTALL_DIR]\lib` directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The **Unsupported Image Type** message is displayed above the image.

## Keyboard Shortcuts Do Not Work

[Edit on GitHub](#)

### Problem

The keyboard shortcuts listed in the [Menu Shortcut Keys preferences](#) do not work. What can I do?

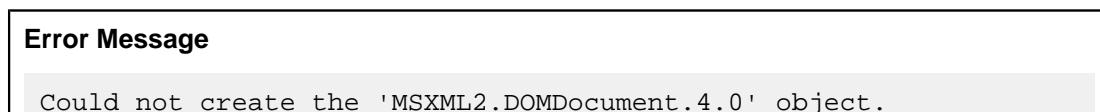

### Solution

Usually this happens when a special keyboard layout is set in the operating system that generates other characters than the usual ones for the keys of a standard keyboard. For example if you set the extended Greek layout for your keyboard you should return to the default Greek layout or to the English one. Otherwise, the Java virtual machine that runs the application will receive other key codes than the usual ones for a standard keyboard.

## MSXML 4.0 Transformation Issues

[Edit on GitHub](#)

If the latest MSXML 4.0 service pack is not installed on your computer, you are likely to encounter the following error message in the **Results** panel when you run a transformation scenario that uses the MSXML 4.0 transformer.

Make sure that MSXML version 4.0 is correctly installed on the machine.

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

## Navigation to the web page was canceled when viewing CHM on a Network Drive

[Edit on GitHub](#)

When viewing a CHM on a network drive, if you only see the TOC and an empty page displaying “Navigation to the web page was canceled” note that this is normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.

As a workaround, copy the CHM file on your local system and view it there.

## Out Of Memory Error When Opening Large Documents

[Edit on GitHub](#)

### Problem

I am trying to open a file larger than 100 MB to edit it in Oxygen XML Author, but it keeps telling me it runs out of memory (**OutOfMemoryError**). What can I do?

### Solution

You should make sure that the minimum limit of document size that enables the support for editing large documents (the value of the ***Optimize loading in the Text edit mode for files over*** option) is less than the size of your document. That will enable the optimized support for large documents. If that fails and you still get an Out Of Memory error you should *increase the memory available to Oxygen XML Author*.

Other tips:

- Make sure that you close other files before opening the large file.
- You can set the default editing mode *in the Preferences dialog box*. The **Text** editing mode uses less memory than other editing modes.
- If the file is too large for the editor to handle, you can *open it in for viewing in Large File Viewer*.

## Oxygen XML Author Crashed on My Mac OS X Computer

[Edit on GitHub](#)

### Problem

Oxygen XML Author crashed the Apple Java virtual machine/Oxygen XML Author could not start up on my OS X computer due to a JVM crash. What can I do?

### Solution

Usually it is an incompatibility between the Apple JVM and a native library of the host system. More details are available in the crash log file generated by OS X and reported in the crash error message.

## Oxygen XML Author Takes Several Minutes to Start

[Edit on GitHub](#)

**Problem:** Some anti-virus software can cause Java applications, such as Oxygen XML Author, to start very slowly due to scanning of compressed archives (such as the JAR libraries that all Java applications use).

**Solution:** The solution is to add the Oxygen XML Author folder to the list of exceptions in the anti-virus software settings.

## PDF Processing Fails to Use the DITA OT and Apache FOP

[Edit on GitHub](#)

There are cases when publishing DITA content fails when creating a PDF file. This topic lists some common problems and solutions.

- The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file: C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo <Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.....
[fop] Caused by: java.io.FileNotFoundException: C:\Users\radu_coravu\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

- One of the DITA tables contains more cells in a table row than the defined number of *colspec* elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file: D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows
the number of fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of
cells in the row overflows the number of fo:table-columns specified for
the table. (See position 179:-1)
[fop] at
org.apache.fop.tools.attasks.FOPTaskStarter.renderInputHandler(Fop.java:657)
[fop] at
net.sf.saxon.event.ContentHandlerProxy.startContent(ContentHandlerProxy.java:375)
.....
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
-> D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

To resolve this issue, correct the *colspec* attribute on the table that caused the issue. To locate the table that caused the issue:

- Edit the transformation scenario and set the parameter *clean.temp* to *no*.
  - Run the transformation, open the *topic.fo* file in Oxygen XML Author, and look in it at the line specified in the error message (See position 179:-1).
  - Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view) to find the original DITA topic for which the table was generated.
- There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [main] org.apache.fop.apps.FOUserAgent - Page 6:
Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

To resolve this issue:

1. Use the  **Validate and Check for Completeness** action available in the **DITA Maps Manager** view to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the **DITA Map Completeness Check** dialog box.
3. If the  **Validate and Check for Completeness** action does not discover any issues, edit the transformation scenario and set the *clean.temp* parameter to *no*.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Author, and search in it for the `unique_4_Connect_42_wrongID id`.
5. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view) to find the original DITA topic for which the table was generated.

## Scroll Function of my Notebook Trackpad is Not Working

[Edit on GitHub](#)

### Problem

I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Author.

### Solution

It is a problem with the Synaptics™ trackpads that can be fixed by adding the following lines to the `C:\Program Files\Synaptics\SynTP\TP4table.dat` file:

```
* , * , oxygen18.0.exe , * , * , * , WheelStd,1,9
* , * , oxygenAuthor18.0.exe , * , * , * , WheelStd,1,9
* , * , oxygenDeveloper18.0.exe , * , * , * , WheelStd,1,9
* , * , syncroSVNCClient.exe , * , * , * , WheelStd,1,9
* , * , diffDirs.exe , * , * , * , WheelStd,1,9
* , * , diffFiles.exe , * , * , * , WheelStd,1,9
```

## Segmentation Fault Error on Mac OS X

[Edit on GitHub](#)

### Problem

On my Mac OS X machine the application gives a *Segmentation fault* error when I double-click the application icon. Sometimes it gives no error but it does not start. What is the problem?

### Solution

Make sure you have the latest Java update from the Apple website installed on your Mac OS X computer. If installing the latest Java update does not solve the problem, copy the file `JavaApplicationStub` from the `/System/Frameworks/JavaVM.framework` folder to the `OxygenAuthor.app/Contents/MacOS` folder. For browsing the `.app` folder you have to (**CMD+click**) the Oxygen XML Author icon and select **Show Package Contents**.

## Set Specific JVM Version on Mac OS X

[Edit on GitHub](#)

### Problem

How do I configure Oxygen XML Author to run with the version X of the Apple Java virtual machine on my Mac OS X computer?

### Solution

Oxygen XML Author uses the first JVM from the list of preferred JVM versions set on your Mac computer that has a version number 1.6.0 or higher. You can move your desired JVM version up in the preferred list by dragging it with the mouse on a higher position in the list of JVMs available in the **Java Preferences** panel that is opened from **Applications > Utilities > Java > Java Preferences**.

## Signature Verification Failed Error on a Resource from Documentum

[Edit on GitHub](#)

### Problem

When I try to open/edit a resource from Documentum, I receive the following error:

```
signature verification failed: certificate for All-MB.jar.checksum not signed
by a certification authority.
```

### Solution

The problem is that the certificates from the Java Runtime Environment 1.6.0\_22 or later no longer validate the signatures of the UCF jars.

Set the `-Drequire.signed.ucf.jars=false` parameter, as explained in the [Setting a Parameter in the Launcher Configuration File / Startup Script](#) topic.

## Special Characters are Replaced with a Square in Editor

[Edit on GitHub](#)

### Problem

My file was created with other application and it contains special characters (such as é, ©, ®, etc.) Why does Oxygen XML Author display a square for these characters when I open the file in Oxygen XML Author?

### Solution

You must set a font able to render the special characters in the [Font preferences](#). If it is a text file you must set also [the encoding used for non XML files](#). If you want to set a font that is installed on your computer but that font is not accessible in the **Font** preferences that means the Java virtual machine is not able to load the system fonts, probably because it is not a True Type font. It is a problem of the Java virtual machine and a possible solution is to copy the font file in the `[JVM_DIR]/lib/fonts` folder. `[JVM_DIR]` is the value of the property `java.home` that is available in the **System properties** tab of the **About** dialog box that is opened from menu **Help > About**.

## SVG 1.2 Rendering Issues

[Edit on GitHub](#)

Oxygen XML Author uses the *Apache Batik* open source library to render SVG images and it only has partial support for SVG 1.2. For more information, see <http://xmlgraphics.apache.org/batik/dev/svg12.html>.

This partial support could lead to some rendering issues in Oxygen XML Author. For example, if you are using the *Inkscape* SVG editor, it is possible for it to save the SVG as 1.1, while using SVG 1.2 elements (such as `flowRoot`) inside it. This means that the image will not be properly rendered inside the application.

**Note:** SVG images shown in the **Author** visual editing mode are rendered as static images, without support for animations and JavaScript.

## Syntax Highlight Not Available in Eclipse Plugin

[Edit on GitHub](#)

### Problem

I associated the .ext extension with Oxygen XML Author in Eclipse. Why does an .ext file opened with the Oxygen XML Author plugin not have syntax highlight?

### Solution

Associating an extension with Oxygen XML Author in Eclipse versions 3.6-3.8, 4.2-4.5 requires three steps:

1. Associate the .ext extension with the Oxygen XML Author plugin..
  - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **General > Editors > File Associations**.
  - b. Add \*.ext to the list of file types.
  - c. Select \*.ext in the list by clicking it.
  - d. Add Oxygen XML Author to the list of **Associated editors** and make it the default editor..
2. Associate the .ext extension with the **Oxygen XML** content type.
  - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **General > Content Types**.
  - b. Add \*.ext to the **File associations** list for the **Text > XML > Oxygen XML Author** content type.
3. Press the **OK** button in the Eclipse preferences dialog box.

**Result:** Now when an \*.ext file is opened the icon of the editor and the syntax highlight should be the same as for XML files opened with the Oxygen XML Author plugin.

## TocJS Transformation Does not Generate All Files for a Tree-Like TOC

[Edit on GitHub](#)

### Problem

The *TocJS* transformation of a DITA map does not generate all the files needed to display the tree-like table of contents.

### Solution

To get a complete working set of output files, follow these steps:

1. Run the *XHTML* transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the *TocJS* transformation.
2. Copy the content of *DITA\_OT\_DIR/plugins/com.sophos.tocjs/basefiles* folder in the transformation output folder.
3. Copy the *DITA\_OT\_DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html* file in the transformation's output folder.
4. Edit *frameset.html* file.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace "concepts/about.html" with "index.html".

## Topic References Outside the Main DITA Map Folder

[Edit on GitHub](#)

Referencing to a DITA topic, map or to a binary resource (for example: image) that is located outside of the folder where the main DITA map is located usually leads to problems when publishing the content using the DITA Open

Toolkit. The DITA OT does not handle it well when links to topics that are outside the directory where the published DITA map is found. By default it does not even copy the referenced topics to the output directory.

You have the following options:

1. Create another DITA map that is located in a folder path above all referenced folders and reference from it the original DITA map. Then transform this DITA map instead.
2. Edit the transformation scenario and in the **Parameters** tab edit the **fix.external.refs.com.oxygenxml** parameter. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. The allowed values are "false" and "true". The default value is false.

## Wrong Highlights of Matched Words in a Search in User Manual

[Edit on GitHub](#)

### Problem

When I do a keyword search in the User Manual that is included with the Oxygen XML Author application, the search highlights the wrong word in the text. Sometimes the highlighted word is several words after the matched word. What can I do to get correct highlights?

### Solution

This does not happen when Oxygen XML Author runs with a built-in Java virtual machine, that is a JVM that was installed by Oxygen XML Author in a subfolder of the installation folder (for example, on Windows and Linux when installing Oxygen XML Author with the installation wizard specific for that platform). When Oxygen XML Author runs from an All Platforms installation, it uses whatever JVM was found on the host system, which may be incompatible with the JavaHelp indexer used for creating the built-in User Manual. Such a JVM may offset the highlight of the matched word with several characters, usually to the right of the matched word. To see the highlight exactly on the matched word, it is recommended to install the application with the specific installation wizard for your platform (available only for Windows and Linux).

## XML Document Takes a Long Time to Open

[Edit on GitHub](#)

### Problem

If Oxygen XML Author takes a long time to open a document, check the following:

### Solution

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

If the content is on a single line, you can speed up loading by enabling the *Format and indent the document on open option* (in the **Format** preferences page).

If the document is very large (above 30 MB), make sure that the value of the *Optimize loading in the Text edit mode for files over option* (in the **Open/Save** preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (**OutOfMemoryError**) you can *increase the memory available to Oxygen XML Author*.

## DITA Authoring and Publishing

---

### Topics:

- [Working with DITA Maps](#)
- [Working with DITA Topics](#)
- [Working with Keys](#)
- [Reusing DITA Content](#)
- [Linking in DITA](#)
- [Publishing DITA Output](#)
- [DITA Profiling / Conditional Text](#)
- [DITA Open Toolkit Support](#)
- [DITA Specialization Support](#)
- [Metadata](#)
- [Creating an Index in DITA](#)
- [Migrating OOXML Documents to DITA](#)
- [DITA 1.3 Support](#)

This chapter is designed to be a guide to help content authors who use DITA.

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Author features that are specific to working with DITA documents and concepts.

### DITA Resources

For more general information and technical details about working with DITA, refer to the following resources:

- [The DITA Specifications](#).
- [The DITA Style Guide Best Practices for Authors](#).

- Various sample DITA topics and maps can be found in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.

## Working with DITA Maps

[Edit on GitHub](#)

In the DITA standard architecture you create documents by collecting topics into maps.

### DITA Maps

A DITA map organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Author provides support for *creating* and *managing DITA maps* through the **DITA Maps Manager**. There are also specialized types of DITA maps, such as a *bookmap*, which is intended for creating the structure of a book.

### Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller *submaps* that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The **DITA Maps Manager** provides support for easily creating and managing submaps.

### Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the **DITA Maps Manager** or in the XML editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the **DITA Maps Manager**, simply double-click it (or right-click it and select **Open**).
- To open a map in the XML editor from the **DITA Maps Manager**, right-click it and select **Open Map in Editor**.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- If you open a file with the `.ditamap` or `.bookmap` extension (from the **Project** view or a system browser), a dialog box is opened that offers you the choice of opening it in the XML editor or in the **DITA Maps Manager**.

**Note:** If you select the **Do not show the dialog again** option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting **Always ask** for the *When opening a map option in the DITA preferences page*.

- To open a map in the **DITA Maps Manager**, you can right-click a map file in the **Project** view and select **Open with > DITA Maps Manager**.
- If you have a *DITA map* file open in the XML editor, you can open it in the **DITA Maps Manager** by right-clicking the title tab and selecting **Open in DITA Maps Manager View**.

### Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to *output multiple topics as a single output page (also known as chunking)*. To support this, Oxygen XML Author provides an *Edit Properties dialog box* that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

### Validating a Map

You should *validate your maps* to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Author provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

To watch a video on DITA editing , go to [http://oxygentools.com/demo/DITA\\_Editing.html](http://oxygentools.com/demo/DITA_Editing.html).

## DITA Maps Manager

[Edit on GitHub](#)

Oxygen XML Author provides a view for managing and editing *DITA maps*. The **DITA Maps Manager** view presents a DITA map as a table-of-contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats.

The **DITA Maps Manager** includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the **DITA Maps Manager**. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

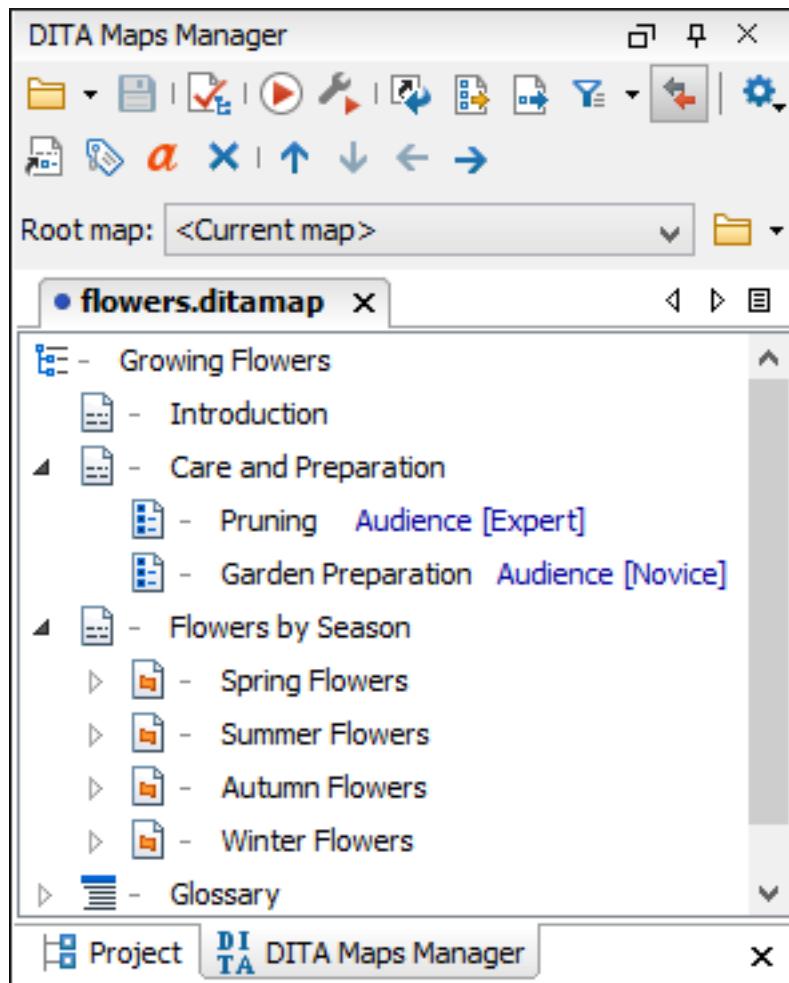

Figure 444: DITA Maps Manager View

### Opening Maps in the DITA Maps Manager

The **DITA Maps Manager** view supports multiple open maps at the same time, with each one presented in its own tab. To open a DITA map in the **DITA Maps Manager**, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select **Open**).
- If you open a file with the **.ditamap** or **.bookmap** extension (from the **Project** view or a system browser), a dialog box is opened that offers you the choice of opening it in the **DITA Maps Manager** or the XML editor.

**Note:** If you select the **Do not show the dialog again** option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting **Always ask** for the *When opening a map option in the DITA preferences page*.

- Right-click a map file in the **Project** view and select **Open with > DITA Maps Manager**.
- If you have a *DITA map* file open in the XML editor, you can right-click the title tab and select **Open in DITA Maps Manager View**.

If your map references other DITA maps, they will be shown, expanded, in the **DITA Maps Manager** view and you will be able to navigate their content. To edit the submaps and their content, you need to open each referenced map separately.

### Drag and Drop in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the **Ctrl** or **Shift** key. Drop operations can be performed before, after, or as child of the targeted node.

Drag and drop operations include:

#### **Copy**

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the **Ctrl** key. The mouse pointer changes

to a  symbol to indicate that a copy operation is being performed.

#### **Move**

Select the nodes you want to move and drag and drop them in the appropriate place.

#### **Promote (Alt + LeftArrow)/Demote (Alt + RightArrow)**

You can move nodes between child and parent nodes by using the **Promote (Alt + LeftArrow)** and **Demote (Alt + RightArrow)** operations.

### DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the **DITA Maps** menu) and their availability depend on the nodes that are selected:

**Note:** If multiple nodes are selected, the availability of the actions depend on the nodes that are selected.

You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:

- List of recently viewed DITA maps that can be selected to reopen them.
- **Clear history** - Clears the history list of the recently viewed DITA maps.
-  **Open** - Allows you to open the map in the **DITA Maps Manager** view. You can also open a map by dragging it from the file system explorer and dropping it into the **DITA Maps Manager** view.
-  **Open URL** - Displays the **Open URL** dialog box that allows you to access any resource identified through a URL (defined by a protocol, host, resource path, and an optional port). The following actions are available in this drop-down menu:
  -  **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local DITA map.

-  **Browse for remote file** - Displays the *Open URL dialog box* that allows you to open a remotely stored DITA map.
-  **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to browse the content of an archive and choose a DITA map.
-  **Browse Data Source Explorer** - Opens the **Data Source Explorer** that allows you to browse the data sources defined in the *Data Sources preferences page*.
-  **Search for file** - Displays the *Open/Find Resource dialog box* that allows you to search for a DITA map.

 **Save (Ctrl (Meta on Mac OS)+S)**

 **Validate and Check for Completeness**

 **Apply Transformation Scenario(s)**

 **Configure Transformation Scenario(s)**

*Applies the DITA Map transformation scenario* that is associated with the current map.

*Allows you to associate a DITA Map transformation scenario* with the current map.

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from the Oxygen XML Author, the DITA map is updated automatically.

 **Open Map in Editor with Resolved Topics**

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

**Tip:** If you want to print the expanded content, you should consider changing the **Styles** drop-down to + **Print ready**.

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

**Note:** You can also use this action to open referenced DITA maps in the **Editor**.

This drop-down menu contains the following actions:

- **Show Profiling Colors and Styles** - Enable this option to turn on conditional styling. To configure the colors and styles *open the Preferences dialog box*

**Profiling/Conditional Text Drop-down Menu**

([Options > Preferences](#)) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.

- **Show Profiling Attributes** - Enable this option to display the values of the profiling attributes at the end of the titles of topic references. When enabled, the values of the profiling attributes are displayed in both the **DITA Maps Manager** view and in the **Author** view.
- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the **Outline** and **DITA Maps Manager** views. When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.
-  **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the **DITA Maps Manager** view and the **Author** view. When a profiling condition set is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

#### **Link with Editor**

Disables/Enables the synchronization between the file path of the current editor and the selected topic reference in the **DITA Maps Manager** view.

**Note:** This button is disabled automatically when you move to the **Debugger** perspective.

#### **Settings**

#### **Root map**

Allows you to choose whether or not to **Show extended toolbar** and **Show root map toolbar**.

Specifies a master DITA map that Oxygen XML Author uses to establish a *key space* that you can use with any other DITA map that is contained by the master map.

#### **Browse Drop-down menu**

You can use this drop-down menu to browse for root maps with the following choices:

-  **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
-  **Browse for remote file** - Displays [the Open URL dialog box](#) that allows you to select a remotely stored root map.
-  **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to browse the content of an archive and choose a root map.
-  **Browse Data Source Explorer** - Opens the **Data Source Explorer** that allows you to browse the data sources defined in the [Data Sources preferences page](#).

**Tip:** You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.

- **Search for file** - Displays the **Find Resource** dialog box to search for a root map.

The following additional actions are displayed in the toolbar when the **Show extended toolbar** option is selected in the **Settings** menu:

Opens *the Insert Reference dialog box* that allows you to insert references to targets such as anchors, topics, maps, topic sets, or key definitions.

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box* on page 1609.

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in *Attributes View in Author Mode* on page 293.

Deletes the selected node.

Moves the selected node up within the DITA map tree.

Moves the selected node down within the DITA map tree.

Moves the selected node up one level to the level of its parent node.

Moves the selected node down one level to the level of its child nodes.

## Contextual Menu of the DITA Maps Manager

### Root Map

The following actions can be invoked from the contextual menu on the *root map* of an opened DITA map:

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only

	and you have to use the contextual menu action <b>Edit Reference</b> to open the topic for editing.
<b>Export DITA Map</b>	Allows you to choose a destination for exporting the DITA map.
<b>Find Unreferenced Resources</b>	Allows you to search for orphaned resources that are not referenced in the DITA maps.
 <b>Edit Properties</b>	Opens the <b>Edit Properties</b> dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see <a href="#">Edit Properties Dialog Box</a> on page 1609.
<b>Append Child submenu</b>	<p>Container sub-menu for a number of actions that create a map node as a child of the currently selected node:</p> <ul style="list-style-type: none"> <li>• <b>New</b> - Opens a dialog box that allows you to configure some options for <a href="#">inserting a new topic</a>.</li> <li>•  <b>Reference</b> - Inserts a reference to a topic file. You can find more details about this action in the <a href="#">Inserting References</a> topic.</li> <li>• <b>Reference to the currently edited file</b> - Inserts a reference to the currently edited file. You can find more details about this action in the <a href="#">Inserting References</a> topic.</li> <li>• <b>Key Reference</b> - Opens an <a href="#">Insert Key Definition dialog box</a> that allows you to insert a key reference.</li> <li>• <b>Key Reference with Keyword</b> - Opens a simplified <a href="#">Insert Key Definition dialog box</a> that allows you</li> </ul>

to define a key and a value inside a *keyword*.

- A set of actions that open the *Insert Reference dialog box* that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

#### Search References

Searches all references to the current topic in the entire DITA map.

#### Refactoring submenu

The following actions are available from this submenu:

**Rename resource** Allows you to *change the name of a resource linked in the edited DITA map*.

**Move resource** Allows you to *change the location on disk of a resource linked in the edited DITA map*.

**XML Refactoring** Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

**Other XML Refactoring Actions** For your convenience, the last 5 *XML Refactoring tool operations* that are used will also appear in this submenu.

Allows you to find and replace content across multiple files.

Allows you to *spell check multiple files*.

Allows you to paste content from the clipboard into the DITA map.

#### Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

#### Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Allows you to expand the entire DITA map structure.

Allows you to collapse the entire DITA map structure.

## Child Nodes

The following actions are available when the contextual menu is invoked on a child node of a DITA map (submaps need to be opened in the **DITA Maps Manager** to access these actions since they are in a read-only state in the parent map):

**Note:** If multiple nodes are selected, the availability of the actions depend on the nodes that are selected.

#### Open

Opens in the editor the resources referenced by the nodes that you select.

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details

about this dialog box, see [Edit Properties Dialog Box](#) on page 1609.

<b>Append Child submenu</b>	Container sub-menu for a number of actions that create a map node as a child of the currently selected node:
-----------------------------	--------------------------------------------------------------------------------------------------------------

- **New** - Opens a dialog box that allows you to configure some options for [inserting a new topic](#).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References](#) topic.
- **Key Reference** - Opens an [Insert Key Definition dialog box](#) that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified [Insert Key Definition dialog box](#) that allows you to define a key and a value inside a *keyword*.
- A set of actions that open the [Insert Reference dialog box](#) that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

**Insert After submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for *inserting a new topic*.
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References* topic.
- **Key Reference** - Opens an *Insert Key Definition dialog box* that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified *Insert Key Definition dialog box* that allows you to define a key and a value inside a *keyword*.
- A set of actions that open the *Insert Reference dialog box* that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

 **Search References**

Searches all references to the current topic in the entire DITA map.

**Refactoring submenu**

The following actions are available from this submenu:

**Rename resource** Allows you to *change the name of a resource linked in the edited DITA map.*

**Move resource** Allows you to *change the location on disk of a resource linked in the edited DITA map.*

 **XML Refactoring** Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

**Other XML Refactoring Actions** For your convenience, the last 5 *XML Refactoring tool operations* that are used will also appear in this submenu.

 **Find/Replace in Files**

Allows you to find and replace content across multiple files.

 **Check Spelling in Files**

Allows you to *spell check multiple files.*

**Cut**

Deletes the currently selected node and copies it to the clipboard.

**Copy**

Copies the currently selected node to the clipboard.

**Paste**

Allows you to paste content from the clipboard into the DITA map.

#### **Paste Before**

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

#### **Paste After**

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

**Delete**

Deletes the currently selected node from the DITA map.

#### **Organize**

Allows you to organize the DITA map with the several submenu actions:

- **↑ Move Up** - Moves the selected node up within the DITA map tree.
- **↓ Move Down** - Moves the selected node down within the DITA map tree.
- **← Promote(Alt + LeftArrow)** - Moves the selected node up one level to the level of its parent node.
- **→ Demote(Alt + RightArrow)** - Moves the selected node down one level to the level of its child nodes.

**Expand All**

Allows you to expand the entire DITA map structure.

**Collapse All**

Allows you to collapse the entire DITA map structure.

## Other Nodes

The following actions are available when the contextual menu is invoked from a node that is not an immediate child node of the *root map*:

**Note:** If multiple nodes are selected, the availability of the actions depend on the nodes that are selected.

<b>Open</b>	Opens in the editor the resources referenced by the nodes that you select.
<b>Open Map in Editor (available when invoking on a submap)</b>	Opens the currently selected DITA map in the editor.
<b>Open parent DITA map (available when invoking on a topic reference or a submap reference)</b>	Opens the parent DITA map of the currently selected reference in the <b>DITA Maps Manager</b> .
 <b>Edit Attributes (only available for relationship table nodes)</b>	Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in <a href="#">Attributes View in Author Mode</a> on page 293.
<b>Edit Profiling Attributes (only available for relationship table nodes)</b>	Allows you to change the <i>profiling attributes</i> defined on the selected node.
 <b>Search References</b>	Searches all references to the current topic in the entire DITA map.
<b>Refactoring submenu</b>	The following actions are available from this submenu:
<b>Rename resource</b>	Allows you to <i>change the name of a resource linked in the edited DITA map</i> .
<b>Move resource</b>	Allows you to <i>change the location on disk of a resource linked in the edited DITA map</i> .
 <b>XML Refactoring</b>	Opens <i>the XML Refactoring</i>

*tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

**Other XML Refactoring Actions** For your convenience, the last 5 *XML Refactoring tool operations* that are used will also appear in this submenu.

#### Find/Replace in Files

Allows you to find and replace content across multiple files.

#### Check Spelling in Files

Allows you to *spell check multiple files*.

#### Copy

Copies the currently selected node to the clipboard.

#### Expand All

Allows you to expand the entire DITA map structure.

#### Collapse All

Allows you to collapse the entire DITA map structure.

To watch our video demonstration about the **DITA Maps Manager** view, go to [http://oxygenvxml.com/demo/DITA\\_Maps\\_Manager.html](http://oxygenvxml.com/demo/DITA_Maps_Manager.html).

### Related information

[DITA Map Validation and Completeness Check](#) on page 1616

[DITA OT Transformation](#) on page 727

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

[DITA Map Transformation Fails \(Cannot Connect to External Location\)](#) on page 1567

[DITA Map Author Mode Actions](#) on page 1055

[Finding and Replacing Text in Multiple Files](#) on page 595

## Creating a Map

[Edit on GitHub](#)

To create a **DITA map**, **subject scheme**, **bookmap**, or other types of DITA maps, follow these steps:

1. Go to **File > New**.  
A **New** document dialog box is opened that allows you to select a document type from various folders.
2. Select one of the **DITA Map** templates from the **Framework templates** folder.
3. Click the **Create** button.
4. Select whether you want to open the map in the **DITA Maps Manager** or the **Editor**.
5. Save the map using the  **Save** button on the toolbar of the **DITA Maps Manager** view.

## Selecting a Root Map

[Edit on GitHub](#)

Oxygen XML Author allows you to select a DITA map as a *key space*, or *root map*, for all the other DITA maps and topics in the project. Specifying the correct *root map* helps to prevent validation problems when you work with **keyrefs** and also acts as the foundation for content completion. All the *keys* that are defined in a *root map* are available in the maps that the *root map* contains.

There are several ways to select or change the *root map*:

- The easiest method is to use the **Root map** drop-down menu in the **DITA Maps Manager** toolbar to select the appropriate *root map*.
- If you insert a *key reference* using the **Cross Reference** action from the  **Link** drop-down menu (from the toolbar or **Link** submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the  **Choose Key Reference** button.
- If you insert a *content key reference* or *key reference* using the  **Reuse Content** action (from the toolbar, **DITA** menu, or **Reuse** submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the  **Choose Key Reference** button.

To watch our video demonstration about the DITA Root Map support, go to [http://oxygenxml.com/demo/DITA\\_Root\\_Map.html](http://oxygenxml.com/demo/DITA_Root_Map.html).

## Creating DITA Submaps

[Edit on GitHub](#)

You can break up a large DITA map into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would *add a new topic or insert an existing topic into a map*, except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a **mapref** element or a **topicref** element with the **format** attribute set to **ditamap**. In most cases, Oxygen XML Author takes care of this for you.

## Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select **Append Child > New**. To insert the submap as a sibling to the current node, select **Insert After > New**. This opens a *New file template dialog box* that allows you to select the type of document and assists you with naming it.
3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file type should be `.ditamap`).
4. Click **Create** to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see [Managing DITA Maps](#) on page 1595.

## Creating a Bookmap in DITA

[Edit on GitHub](#)

If you want to create a traditional book in DITA, you can use a *bookmap* to organize your topics into a book. A DITA bookmap is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as `frontmatter`, `part`, `chapter`, `appendix`, and `backmatter` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the [DITA documentation](#) for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Author.

To create a book in DITA using a bookmap, follow these steps:

1. Create a new bookmap (**File > New > Framework templates > DITA Map > map > Bookmap**). If you want the bookmap to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager**) and selecting **New** from **Append child** or **Insert After**.
2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a bookmap, or children to a section, right-click the bookmap or section icon and choose any of the reference actions in the **Append child** menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the [DITA documentation](#) to fully understand the structure of a DITA bookmap and where to create each element.
3. Create special elements such as an *index* and *table of contents*. The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.
4. [Add topics](#) to your chapters to add content to your book. You may find it easier to manage if you [use submaps](#) to create the content of your chapters. This keeps your bookmap from becoming long and difficult to manage.

## Managing DITA Maps

[Edit on GitHub](#)

You may want to manage your DITA maps in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

## Change the Order of Topics in DITA Maps

[Edit on GitHub](#)

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the **DITA Maps Manager**.
- By highlighting a topic in the **DITA Maps Manager**, holding down the **Alt** key, and pressing the arrow keys.
- By showing the extended **DITA Maps Manager** toolbar (press the  **Settings** icon on the **DITA Maps Manager** toolbar and select the extended toolbar) and then using the arrow keys (   ) on the toolbar to move topics around in the map.

To understand how to organize topics in a *DITA map* using the **DITA Maps Manager**, you can examine and experiment with the sample map called `flowers.ditamap`, located in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.

## Adding Topics to a DITA Map

[Edit on GitHub](#)

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Author supports both approaches.

A DITA map organizes content hierarchically, so you can add a topic as a child of the map root or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

## Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the `topicref` element. See the [DITA documentation](#) for the full range of reference elements and their uses. Oxygen XML Author provides several tools for inserting reference elements into a map:

### Using the Insert Reference Dialog Box

The [Insert Reference dialog box](#) allows you to create various reference types and configure the most commonly used attributes. You can open the **Insert Reference** dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select **Append child** or **Insert After** and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select **Reference to the currently edited file**.
- Selecting an item in the map and click the  **Insert Reference** button from the **DITA Maps Manager** toolbar.
- Select  **Insert Reference** from the **DITA Maps** menu.

### Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a DITA map by dragging and dropping the file into the **DITA Maps Manager**. You can drag and drop files from any of the following:

- Your OS file system explorer.

- The **Project** view.
- The **Open/Find Resource** view.

Adding topics this way will not open the **Insert Reference** dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting **Edit Properties**.

## Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager**, right-click the place in the current map where you want to add the new topic.
2. To insert the topic as a child of the selected node, select **Append Child > New**. To insert the topic as a sibling to the current node, select **Insert After > New**.

**Result:** This opens a *New file template dialog box* that allows you to select the type of document and assists you with naming it.

## Adding Multiple References to the Same Topic in a Map

Oxygen XML Author allows you to add multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected, an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

## Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press **Delete**.
- Highlight the topic and click the **Delete** button on the **DITA Maps Manager** extended toolbar.

## Moving and Renaming Resources

[Edit on GitHub](#)

You can move or rename resources on disk directly from Oxygen XML Author. To do this, use one of the following actions available in the **Refactoring** submenu of the contextual menu when invoked on a resource in the **DITA Maps Manager** view:

### Refactoring > Rename resource

This action allows you to change the name of a resource linked in the edited DITA map, using the **Rename resource** dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Enable this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the *completeness* of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Author is about to make.
- **Rename** - Executes the **Rename resource** operation.

- **Cancel** - Cancels the **Rename resource** operation. No changes are applied.

## Refactoring > Move resource

This action allows you to change the location of a resource linked in the edited DITA map, using the **Move resource** dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Enable this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the *completeness* of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Author is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the **Move resource** operation. No changes are applied.

**Note:** If a root DITA map is not defined, the move and rename actions are executed in the context of the current DITA map.

## Finding Resources Not Referenced in DITA Maps

[Edit on GitHub](#)

Over the course of time large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps. To assist you with organizing project resources, Oxygen XML Author includes an action, **Find Unreferenced Resources**, that searches for orphaned resources that are not referenced in DITA maps.

To perform this search, open the DITA map in the **DITA Maps Manager**, invoke the contextual menu on the DITA map, and select **Find Unreferenced Resources**. This action can also be selected from the **DITA Maps** menu. This action opens the **Find Unreferenced Resources** dialog box, which allows you to specify some search parameters:

- **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to **Add** maps to the list or **Remove** them.
- **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders.
- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

**Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and \* wildcards. Use the drop-down arrow to select a previously used filter pattern.

## Insert References in DITA Maps

[Edit on GitHub](#)

A DITA map may contain various types of references. The targets of the references can be a variety of references, such as anchors, chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the [Insert Reference dialog box](#).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

### Insert Reference Dialog Box

[Edit on GitHub](#)

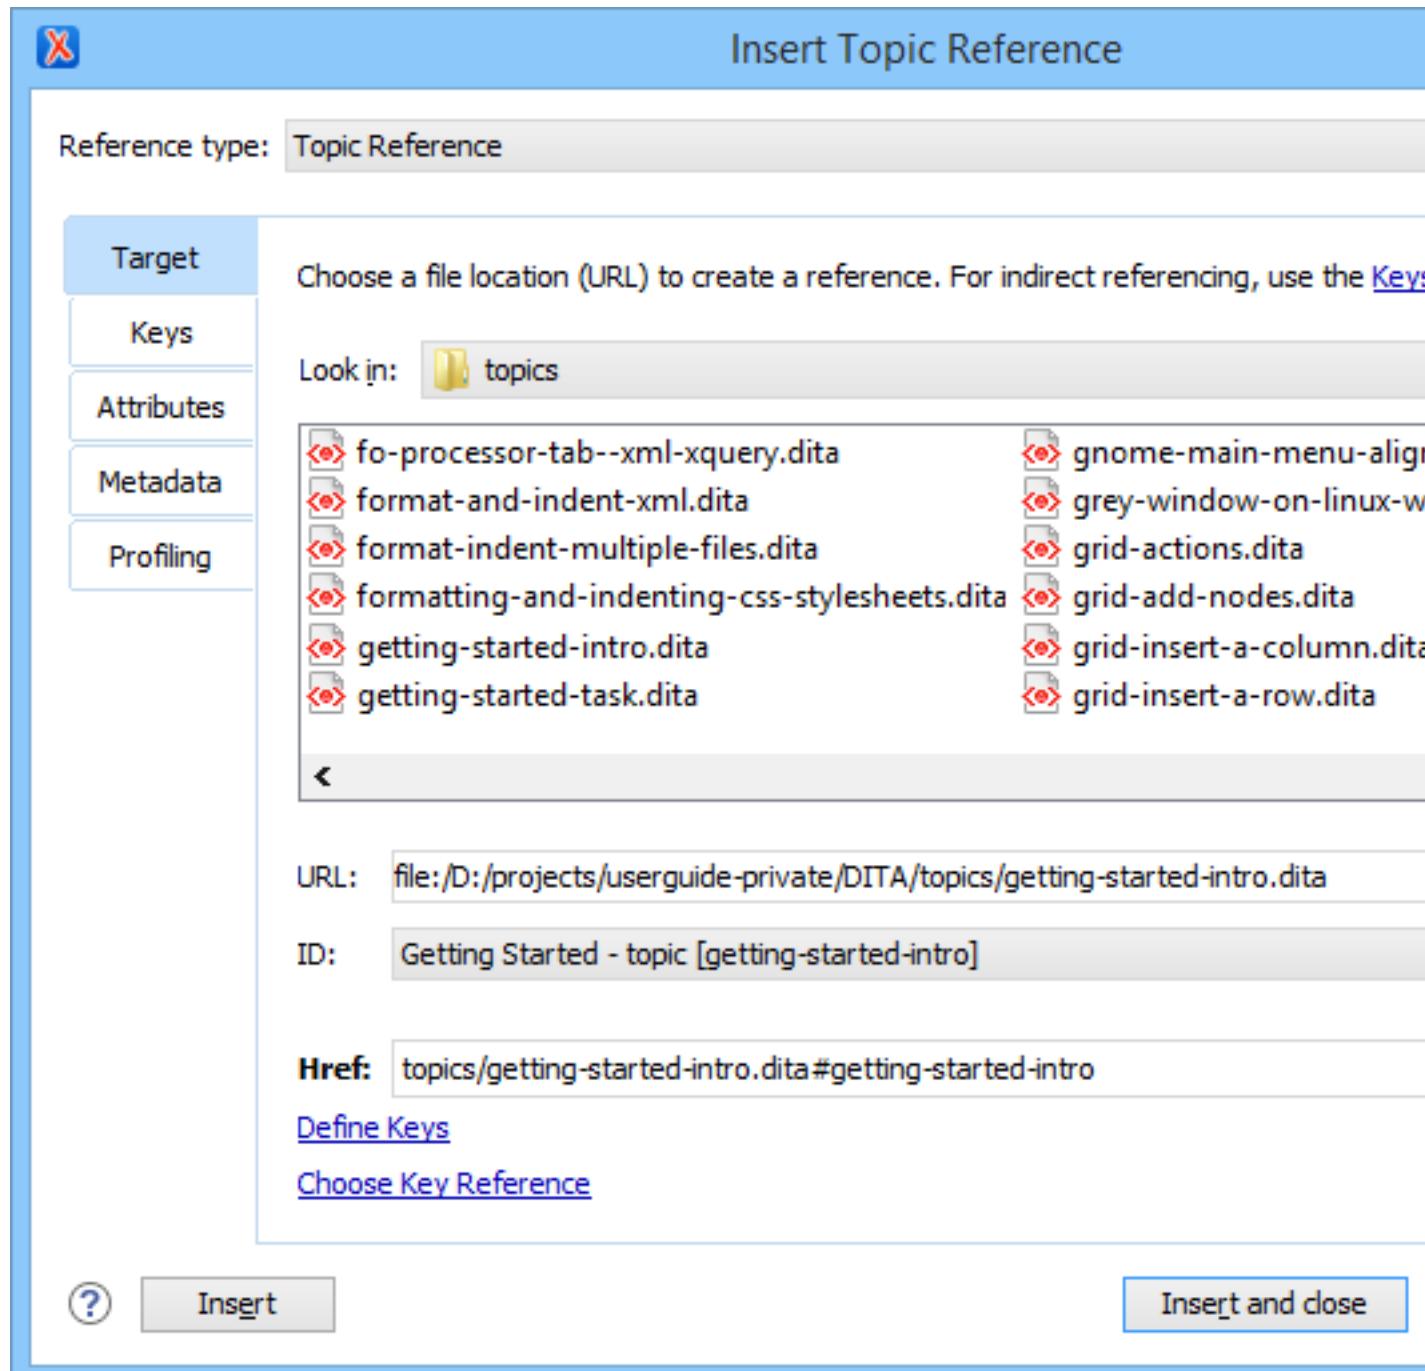

The **Insert Reference** dialog box allows you to insert and configure references in DITA maps. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, anchors, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

- Select  **Reference**, **Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child** and **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager**.
  - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
  - To insert the reference as a sibling of the current node (below the current node in the map), select the reference from the **Insert After** submenu.
- Click the  **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select  **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the  **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Author will propose only valid reference types . When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the **Append Child** and **Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**.

**Target Tab****Figure 445: Insert Reference Dialog Box - Target Tab**

The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the **Look in** drop-down list, browsing tools, or file window in this section.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing tools.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.

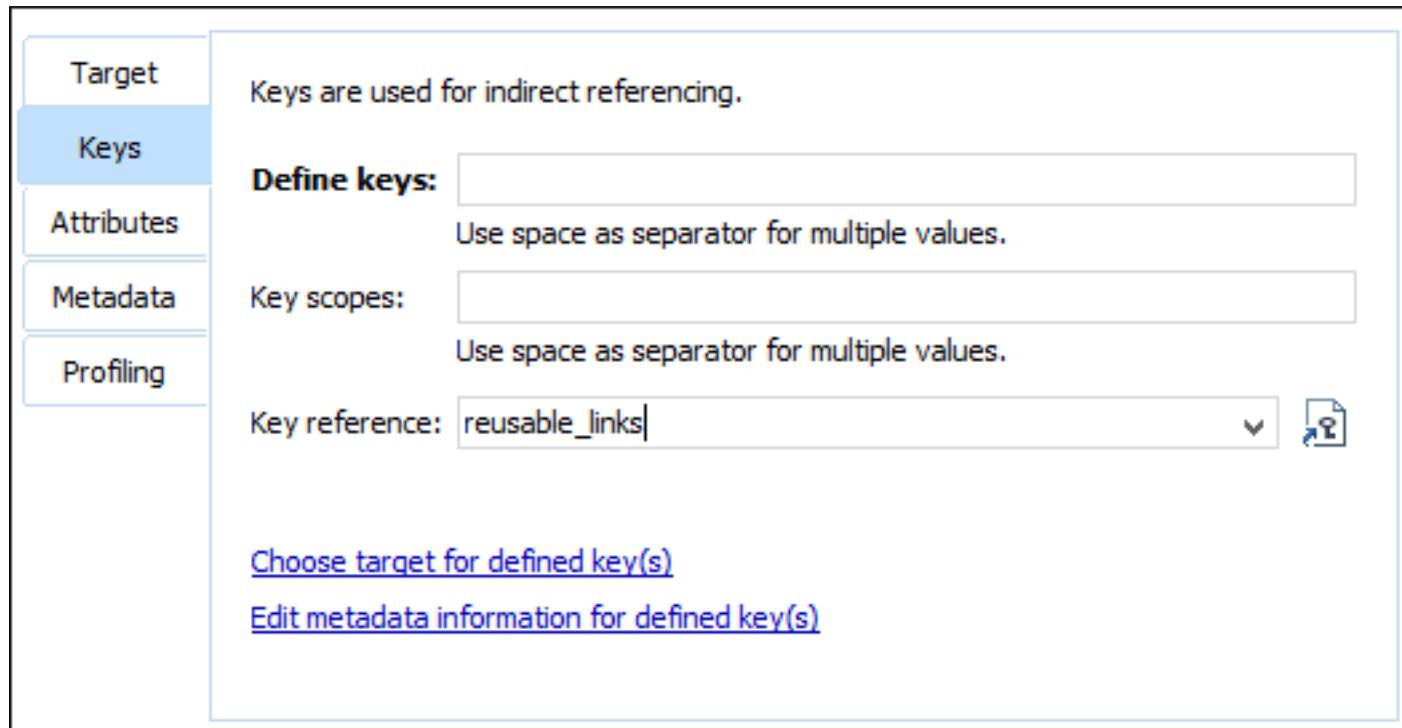

**Keys Tab**

Figure 446: Insert Reference Dialog Box - Keys Tab

The **Keys** tab allows you to use and *define keys* for indirect referencing. For more information, see [Working with Keys](#) on page 1646. This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes** [This option is only available if the *Built-in DITA-OT 2.x (with DITA 1.3 support) option is enabled in the DITA preferences page*]

Use this text field to define or edit the value of a `keyscope` attribute. **Key scopes** allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key

definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current root map.

## Attributes Tab

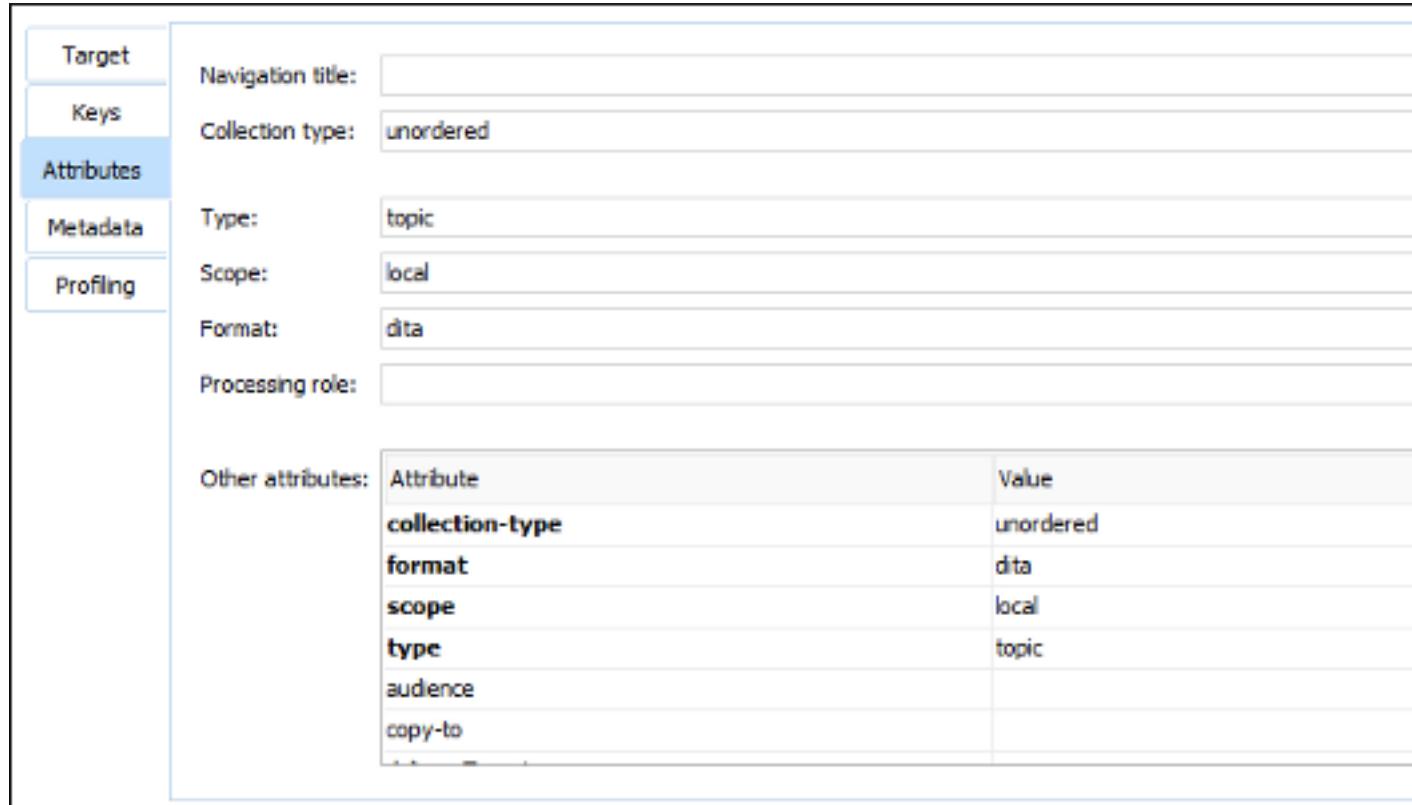

Figure 447: Insert Reference Dialog Box - Attributes Tab

The **Attributes** tab of the **Insert Reference** dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

### Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the **Navigation title** checkbox for the [Always fill values for attributes option in the DITA preferences page](#). You can enforce the use of the specified title by enabling the **Lock** checkbox.

**Tip:** You can also enable the [Prefer navigation title for topicref rendering option in the DITA preferences page](#) to always enforce the use of the navtitle value rather than enabling this **Lock** option on individual topics.

### Collection type

This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

### Type

Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file),

**Scope**

enable the **Type** checkbox for the *Always fill values for attributes option in the DITA preferences page*.

This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the **Scope** checkbox for the *Always fill values for attributes option in the DITA preferences page*.

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the **Format** checkbox for the *Always fill values for attributes option in the DITA preferences page*.

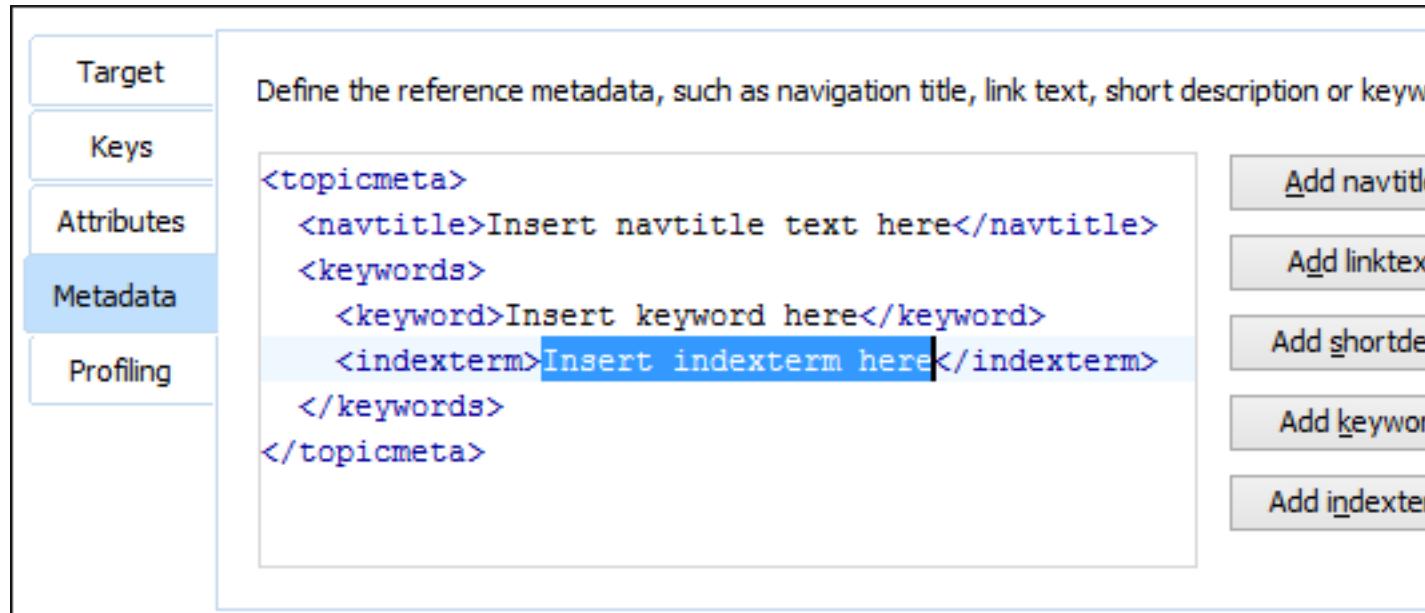

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

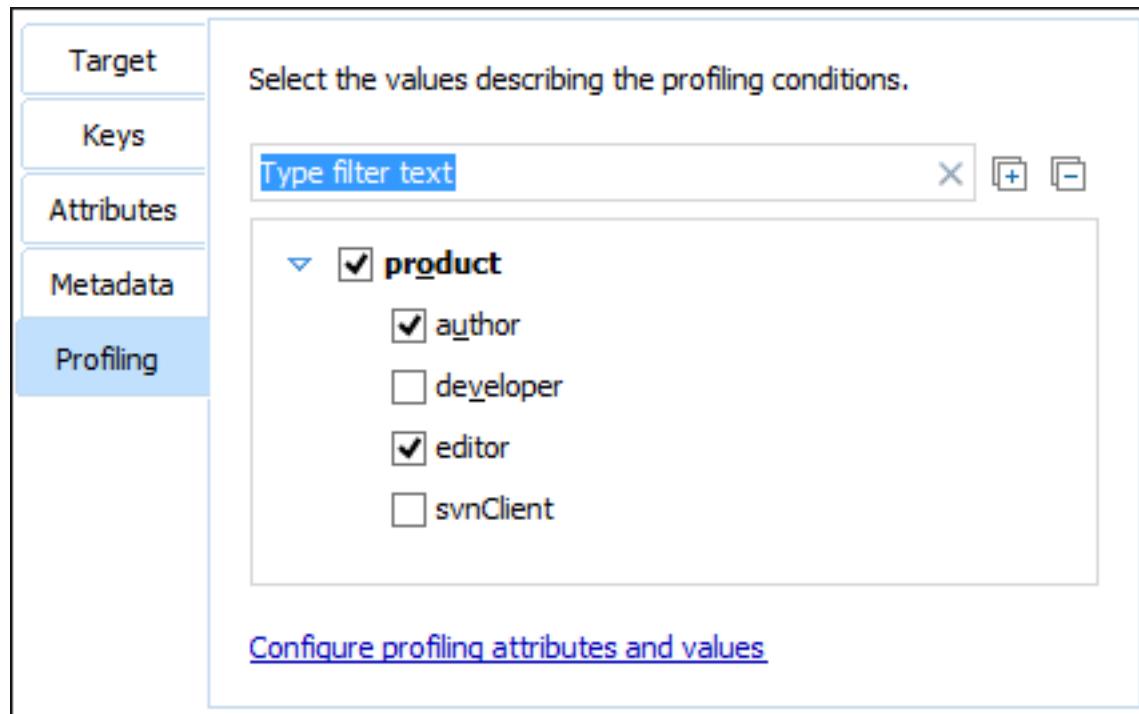

### Metadata Tab

**Figure 448: Insert Reference Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: navtitle, linktext, shortdesc, keyword, indexterm). The metadata elements are inserted inside a topicmeta element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

### Profiling Tab

**Figure 449: Insert Reference Dialog Box - Profiling Tab**

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root DITA map references a DITA subject scheme map that defines values for the profiling attributes, those values are used.
- If your project defines *project-level configuration values for the profiling attributes*, those values are used.
- If Oxygen XML Author defines *global-level configuration values for the profiling attributes*, they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see [DITA Profiling / Conditional Text](#) on page 1699.

## Finalizing Your Insert Reference Configuration

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

**Tip:** You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

### Related information

[DITA Profiling / Conditional Text](#) on page 1699

[Working with Keys](#) on page 1646

## Inserting Topic Headings

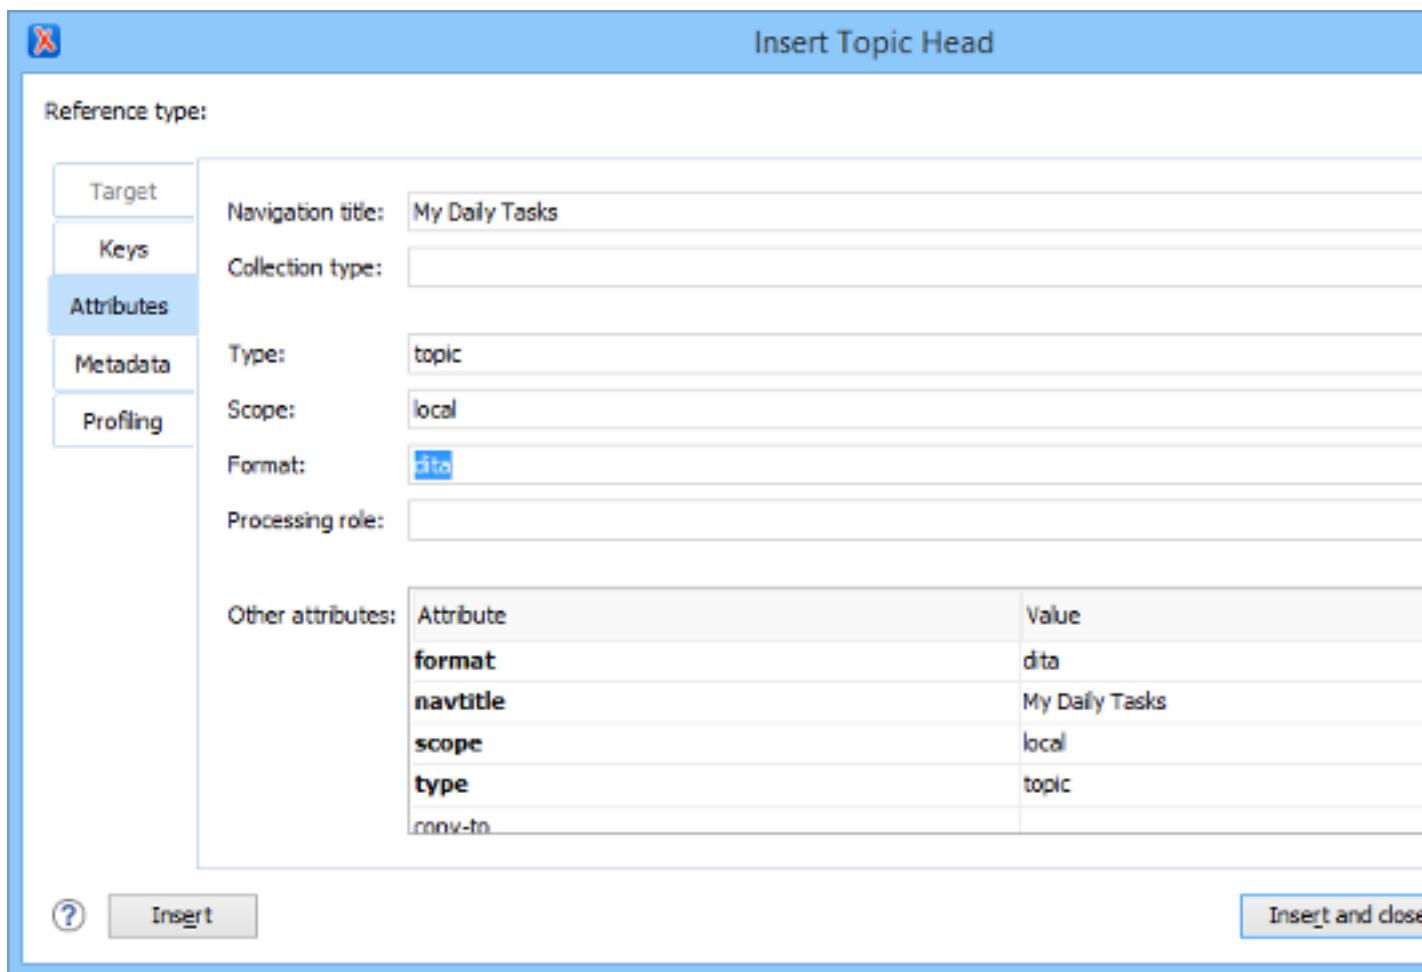

[Edit on GitHub](#)

The `topichead` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `topicref` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child** or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view.
- *Open the DITA map in the XML editor* and select the  **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head dialog box** that allows you to easily insert a `topichead` element. A **Navigation title** (`navtitle` attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)

**Figure 450: Insert Topic Heading Dialog Box**

#### Related information

[Insert Reference Dialog Box](#) on page 1599

### Inserting Topic Groups

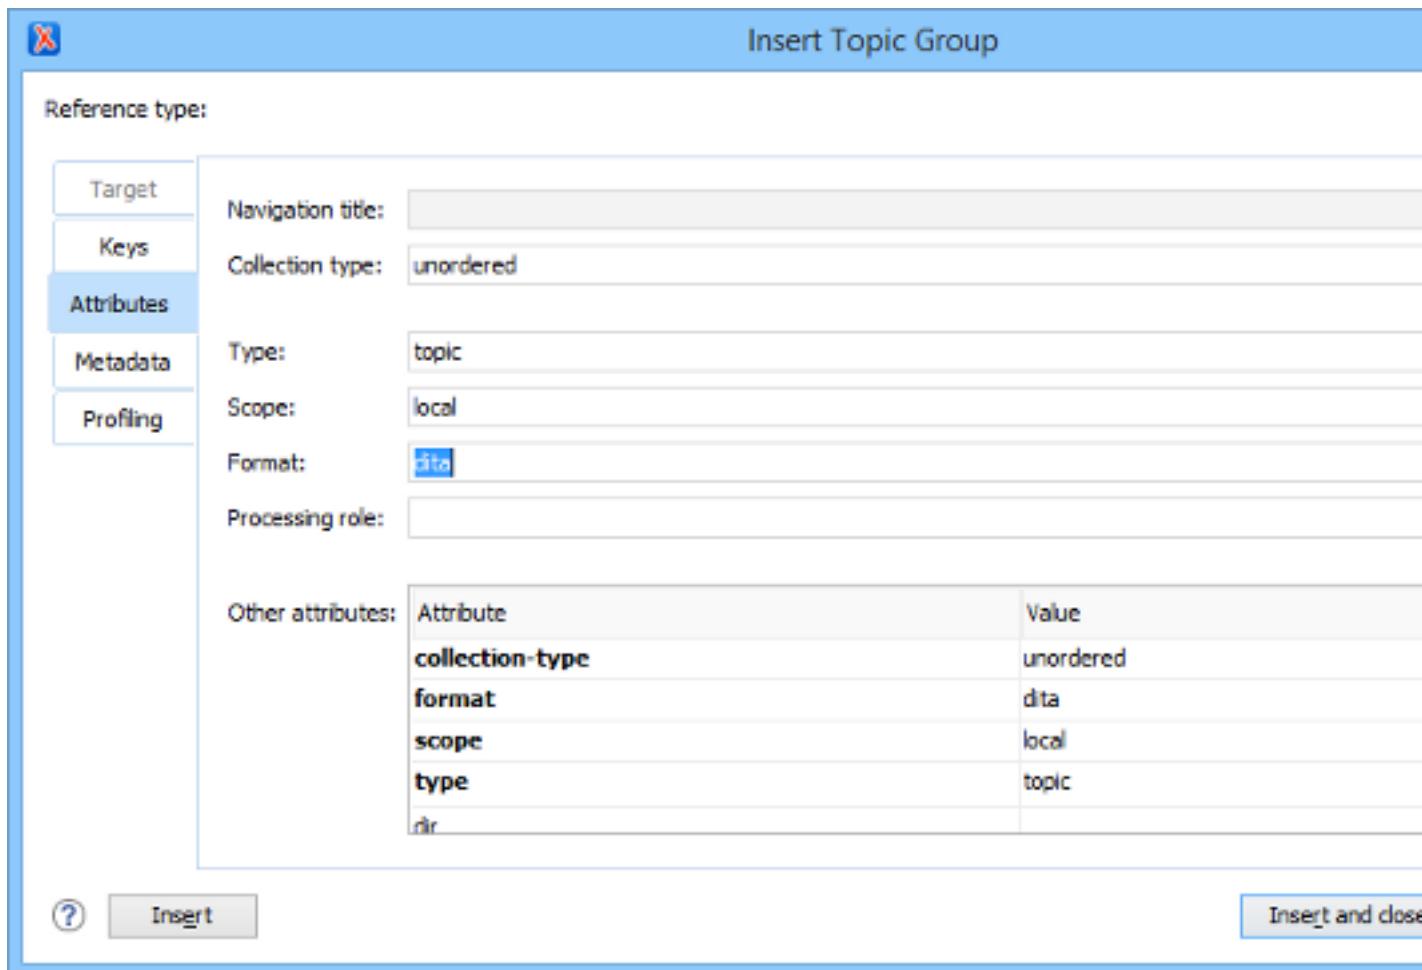

[Edit on GitHub](#)

The `topicgroup` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `topicgroup` can contain other `topicgroup` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `topicgroup` and its children. You can set the collection-type of a container `topicgroup` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child** or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view.
- [Open the DITA map in the XML editor](#) and select the **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the [Insert Topic Group dialog box](#) that allows you to easily insert a `topicgroup` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

**Figure 451: Insert Topic Group Dialog Box**

[Insert Reference Dialog Box](#) on page 1599

### Inserting and Defining Keys in DITA Maps

[Edit on GitHub](#)

DITA uses *keys* to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map.

The following example is a DITA map that defines various values for the product key:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map>
 <!-- product name -->
 <keydef keys="product" product="basic">
 <topicmeta>
 <keywords>
 <keyword>Basic Widget</keyword>
 </keywords>
 </topicmeta>
 </keydef>
 <keydef keys="product" product="pro">
```

```

<topicmeta>
 <keywords>
 <keyword>Professional Widget</keyword>
 </keywords>
</topicmeta>
</keydef>
<keydef keys="product" product="enterprise">
 <topicmeta>
 <keywords>
 <keyword>Enterprise Widget</keyword>
 </keywords>
 </topicmeta>
</keydef>
</map>

```

**Note:** The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

## Key Definition with a Keyword

To insert a *key definition with a keyword* in a DITA map, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition** from the **Append Child** or **Insert After** submenu (depending on where you want to insert the *key definition* in the DITA map). This opens an **Insert Key Definition** dialog box.
3. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
4. Go to the **Metadata** tab and click **Add keyword**. In the editing window enter the key value inside the **keyword** element.

**Note:** You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

5. Once you are done configuring the *key definition*, click **Insert and close**.

Alternatively, there is a simplified method that can be used if you simply want to define a key with a value inside a *keyword*, without configuring any profiling or other attributes. To use the simplified method, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition with Keyword** from the **Append Child** or **Insert After** submenu (depending on where you want to insert the *key definition* in the DITA map). This opens a simplified **Insert Key Definition** dialog box.
3. Enter the name of the key in the **Key** field and its value in the **Keyword** field.
4. Click **Insert and close** to finalize the operation.

## Key Definition with a Target

To insert a *targeted key definition* (for example, to target a resource such as an image or topic) in a DITA map, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition** from the **Append Child** or **Insert After** submenu (depending on where you want to insert the *key definition* in the DITA map). This opens an **Insert Key Definition** dialog box.
3. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
4. Go to the **Target** tab and select a target resource (such as an image or topic).

**Note:** You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

5. Once you are done configuring the *targeted key definition*, click **Insert and close**.

[Working with Keys](#) on page 1646

### Edit Properties Dialog Box

[Edit on GitHub](#)

The **DITA Maps Manager** view includes a feature that allows you to view and edit the properties of a selected node.

The  **Edit properties** action is available on both the **DITA Maps Manager** toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map document in **Author** mode. The action opens the **Edit Properties** dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node for which the action was invoked.

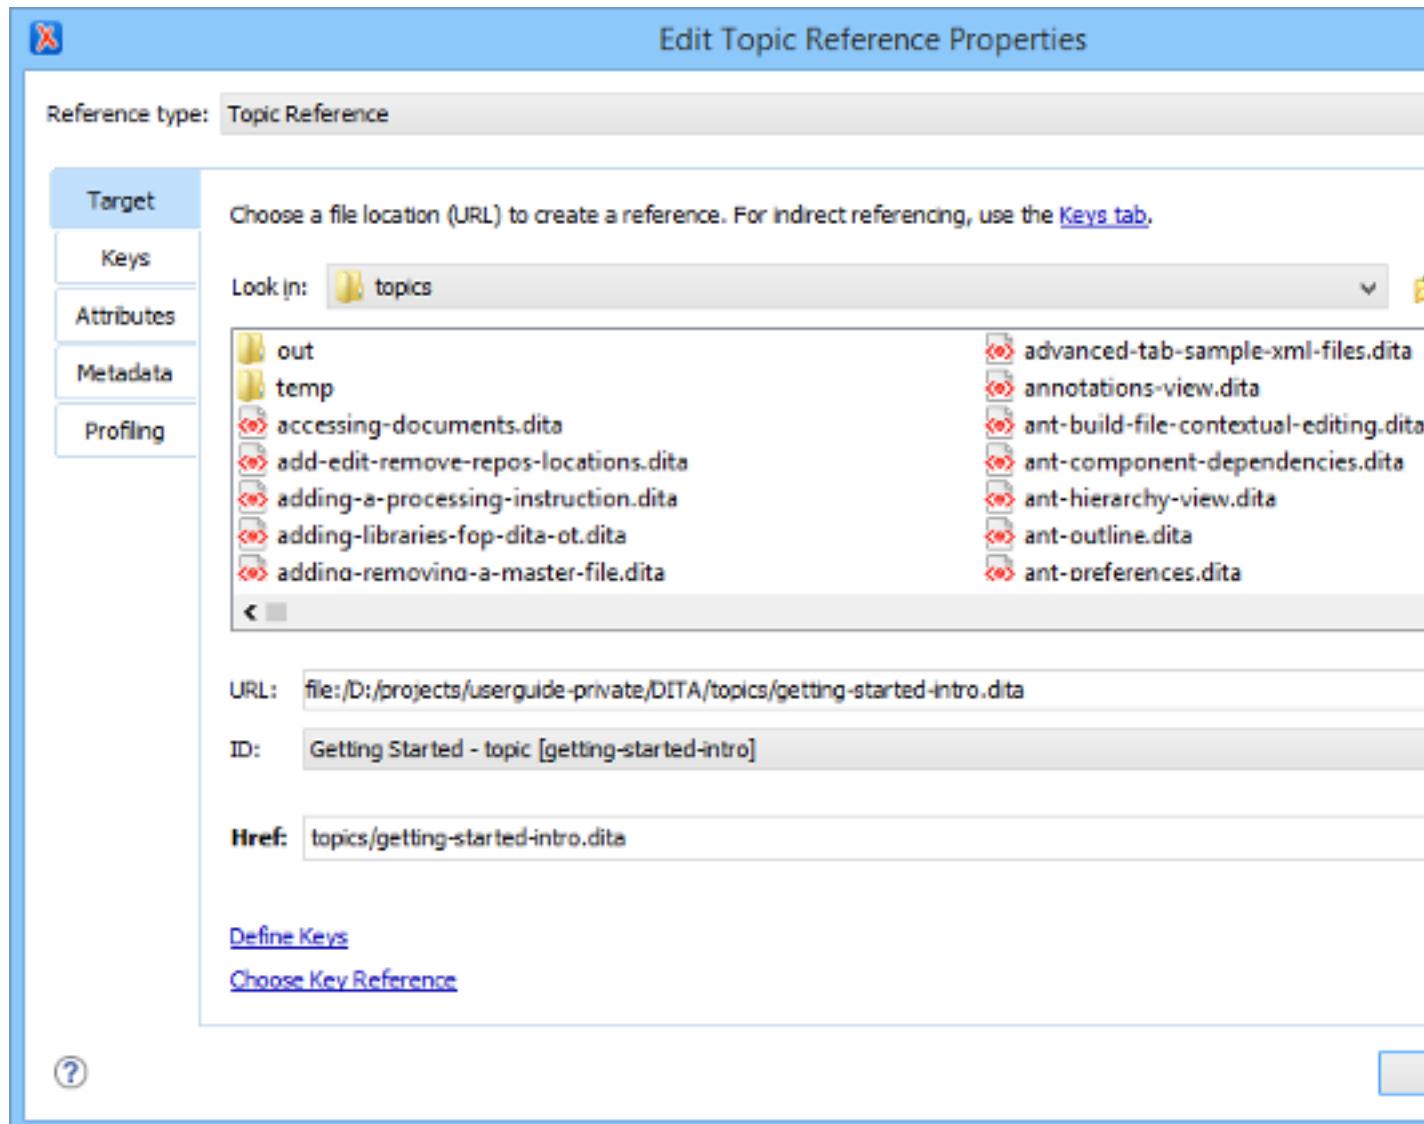

**Note:** If you select multiple sibling nodes and invoke the  **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the **Edit Properties** dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps.

At the top of the **Edit Properties** dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node for which the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map, only the **Attributes**, **Metadata**, and **Profiling** tabs are enabled and the **Title** property can be configured. Also, if you select multiple nodes, only the **Profiling** tab is available.

## Target Tab

**Figure 452: Edit Properties Dialog Box - Target Tab**

The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the **Look in** drop-down list, browsing tools, or file window in this section.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing tools.

**ID**

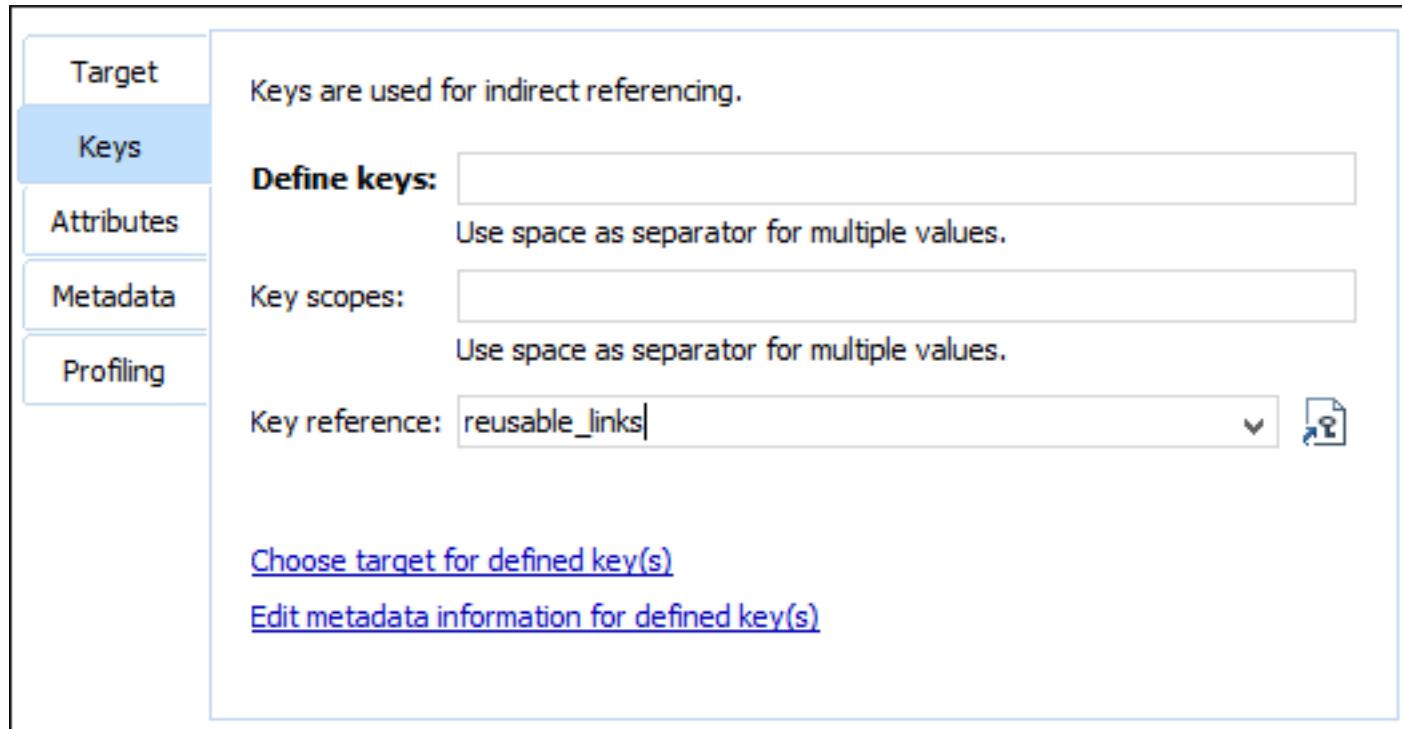

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a **navref** element requires a **mapref** attribute instead.

## Keys Tab

**Figure 453: Edit Properties Dialog Box - Keys Tab**

The **Keys** tab allows you to use and *define keys* for indirect referencing. For more information, see [Working with Keys](#) on page 1646. This tab includes the following:

### Define keys

Use this text field to define the **keys** attribute for the target.

**Key scopes** [This option is only available if the *Built-in DITA-OT 2.x (with DITA 1.3 support) option is enabled in the DITA preferences page*]

Use this text field to define or edit the value of a **keyscope** attribute. **Key scopes** allow you to specify different sets of key definitions for different map branches.

### Key reference

Use this combo box (or the **Choose key reference** button) to select a key that is already defined in the root map.

## Attributes Tab

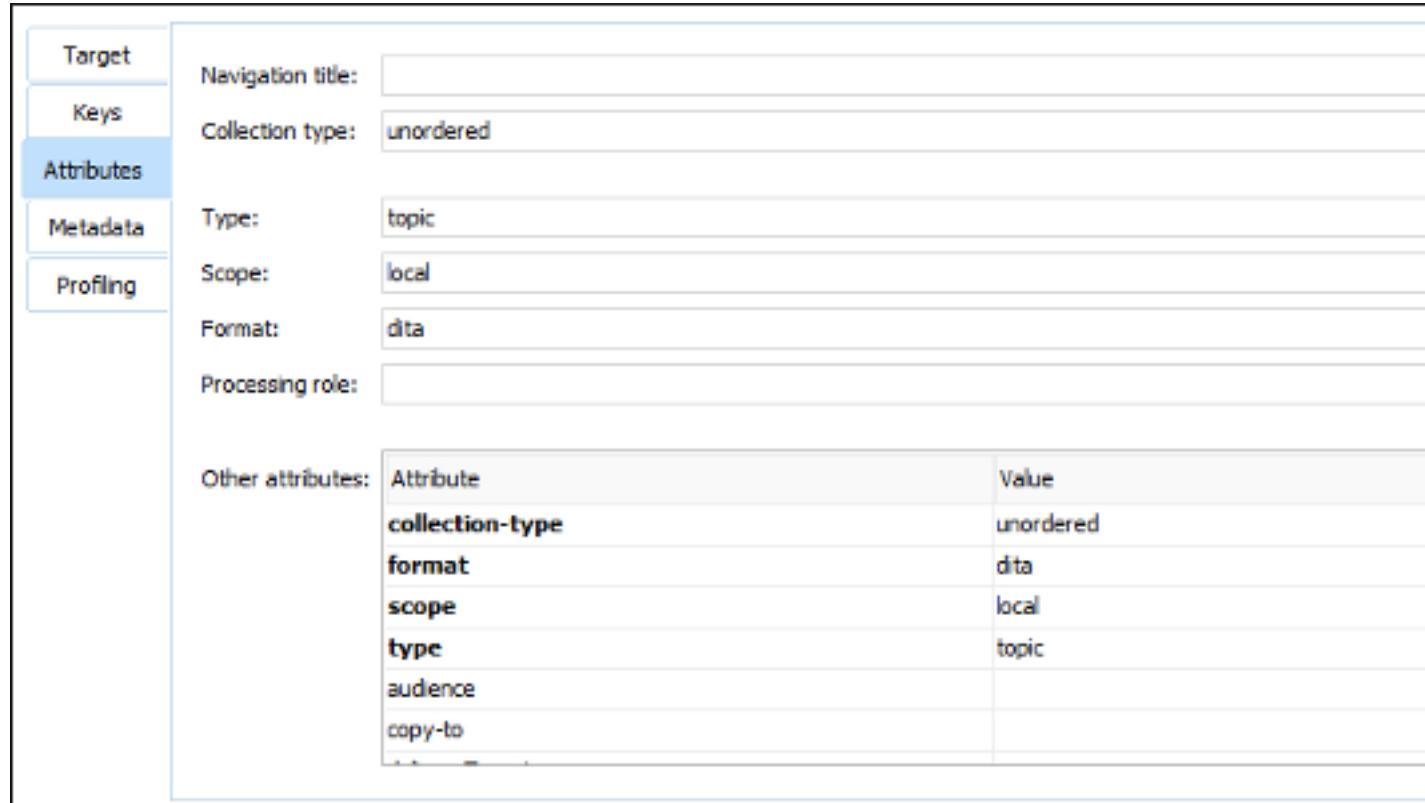

Figure 454: Edit Properties Dialog Box - Attributes Tab

The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node for which the action was invoked.

If the target is a root map, the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**.

<b>Title:</b>	DITA Authoring						
<b>Set to:</b>	<input checked="" type="radio"/> Attribute <input type="radio"/> Element <input type="radio"/> All						
<b>Other attributes:</b>	<table border="1"> <thead> <tr> <th>Attribute</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td><b>id</b></td> <td>chapter.author-dita</td> </tr> <tr> <td><b>title</b></td> <td>DITA Authoring</td> </tr> </tbody> </table>	Attribute	Value	<b>id</b>	chapter.author-dita	<b>title</b>	DITA Authoring
Attribute	Value						
<b>id</b>	chapter.author-dita						
<b>title</b>	DITA Authoring						

Figure 455: Attributes Tab for a Root Map

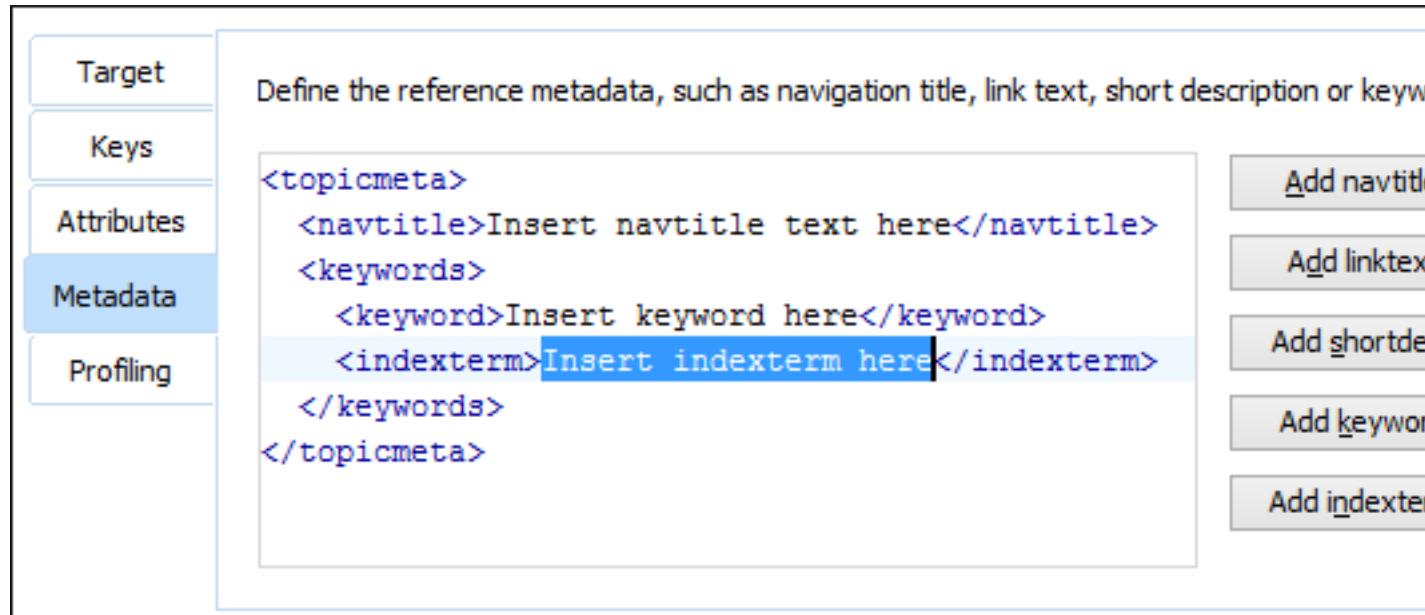

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

### Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the

<b>Collection type</b>	Navigation title checkbox for the <i>Always fill values for attributes option in the DITA preferences page</i> . You can enforce the use of the specified title by enabling the <b>Lock</b> checkbox.
<b>Type</b>	<b>Tip:</b> You can also enable the <i>Prefer navigation title for topicref rendering option in the DITA preferences page</i> to always enforce the use of the navtitle value rather than enabling this <b>Lock</b> option on individual topics.
<b>Scope</b>	This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).
<b>Format</b>	Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the <b>Type</b> checkbox for the <i>Always fill values for attributes option in the DITA preferences page</i> .
<b>Processing Role</b>	This property corresponds to the scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the <b>Scope</b> checkbox for the <i>Always fill values for attributes option in the DITA preferences page</i> .
<b>Other attributes table</b>	This property corresponds to the format attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the <b>Format</b> checkbox for the <i>Always fill values for attributes option in the DITA preferences page</i> .
	This drop-down list allows you to set the processing-role attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).
	This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the <b>Value</b> column allows you to use the combo box to enter, edit, or select attribute values.

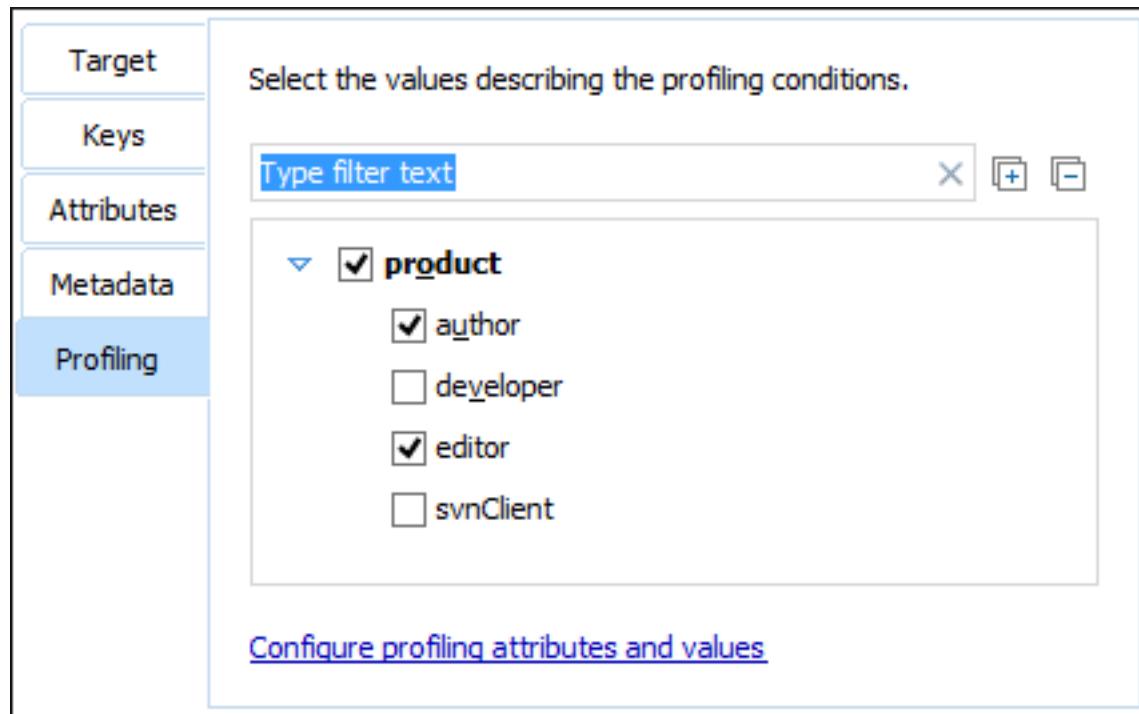

## Metadata Tab

**Figure 456: Edit Properties Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: navtitle, linktext, shortdesc, keyword, indexterm). The metadata elements are inserted inside a topicmeta element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

## Profiling Tab

**Figure 457: Edit Properties Dialog Box - Profiling Tab**

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

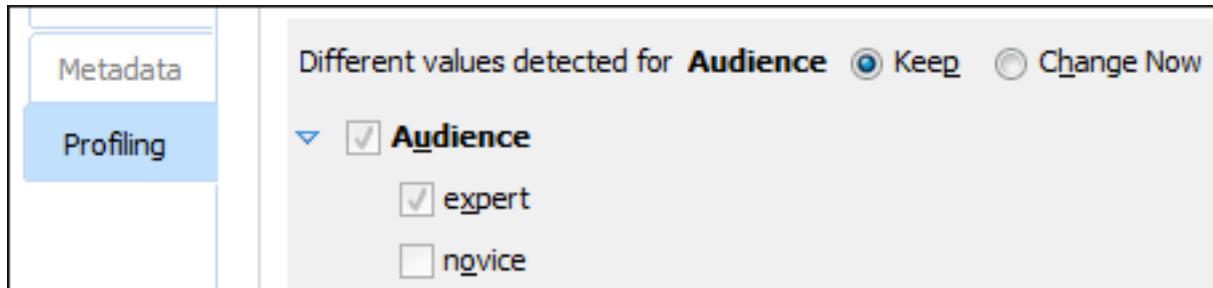

- If your root DITA map references a DITA subject scheme map that defines values for the profiling attributes, those values are used.
- If your project defines *project-level configuration values for the profiling attributes*, those values are used.
- If Oxygen XML Author defines *global-level configuration values for the profiling attributes*, they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name..

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see [DITA Profiling / Conditional Text](#) on page 1699.

**Note:** If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the **Profiling** tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this **Profiling** tab and the changes will be applied to all the selected nodes.

**Figure 458: Profiling Conflict Panel**

## Finalizing Your Modifications

Once you click **OK**, all your changes are applied to the target node.

### Related information

## Creating a Table of Contents in DITA

[Edit on GitHub](#)

In DITA, the order and hierarchy of the table of contents of a document is based directly on *the DITA map that defines the document*. In many media, the creation of a table of contents, based on the map, is automatic. For example, you do not have to do anything special to create a table of contents in WebHelp output.

In other media, you need to tell DITA where the table of contents should occur. For example, in a book you need to tell DITA where to place the table of contents in the structure of the book, and if you want to generate other common content lists, such as a list of figures or tables. You do this by *using a bookmap to define your book*, and adding the appropriate elements to the frontmatter.

To configure a table of contents and other book lists, follow these steps:

1. Open your *bookmap* in the **DITA Maps Manager**.

2. Right-click the bookmap and select **Append child > Frontmatter**. The *Insert Reference dialog box* appears.
3. Click **Insert and Close** to insert the frontmatter element.
4. Right-click the frontmatter element and create a booklist element using **Append child > Book Lists**.
5. Use the same steps to create a toc element and to add other booklist elements, such as tablelist.

## Resolving Topic References Through an XML Catalog

[Edit on GitHub](#)

There are situations where you want to resolve URIs with an XML catalog:

- You customized your DITA map to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Author. The **DITA Maps Manager** view will solve the displayed topic refs through the added XML catalog, as will DITA map transformations (for PDF output, XHTML output, etc.).

To add an XML catalog to the DITA framework, follow these steps:

1. Create an XML catalog using the guidelines described in *Working with XML Catalogs* on page 610.
2. *Open the Preferences dialog box (Options > Preferences)* and go to **Document Type Association**.
3. Select the DITA document type and use the **Edit**, **Duplicate**, or **Extend** button to open a *Document type configuration dialog box*.
4. Go to the **Catalogs tab**.
5. Click on the  **Add** button to open a dialog box that allows you to add your created XML catalog to the list.
6. After adding your catalog, click **OK**. You may need to reopen any currently edited files that use the new catalog or run *a manual Validate action* for the changes to take effect.

**Note:** You could also add your created catalog to the list of global catalogs in the *XML Catalog preferences* page.

## Chunking DITA Topics

[Edit on GitHub](#)

By default, when a **DITA map** is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as *chunking*.

To chunk DITA topics, you set the chunking attribute on the `topicref` that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, `by-topic` or `to-content`). See the **DITA documentation** for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `toc` and `collection-type` attributes on the sub-topics or container topic to suitable values. See the **DITA documentation** for details.

You can set the `collection-type` attribute on your topics using the **Edit Properties** action in the **DITA Maps Manager**. To set the `toc` and `chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon  in the **DITA Maps Manager** to open the map in the editor).

## DITA Map Validation and Completeness Check

[Edit on GitHub](#)

You should validate your maps regularly to make sure that your topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

## Validating a DITA Map

To validate a DITA, follow these steps:

1. In *the DITA Maps Manager view*, make sure that the tab that holds your *root map* is selected and that the **Root map** selection is set either to the name of your *root map* or to <current map>.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the **DITA Maps Manager** view and click **Reload (F5)**.
3. Click the **Validate and Check for Completeness** button on the **DITA Maps Manager** toolbar to open the *DITA Map Completeness Check dialog box*.
4. If you are using profiling, check the **Use DITAVAL filters** box and select the appropriate option.
5. Select any other options you want to check.
6. Click **Check** to run the validation process.

## Validation Process

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an href attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

## DITA Map Completeness Check Dialog Box

The **DITA Map Completeness Check** dialog box allows you to configure the DITA map validation.

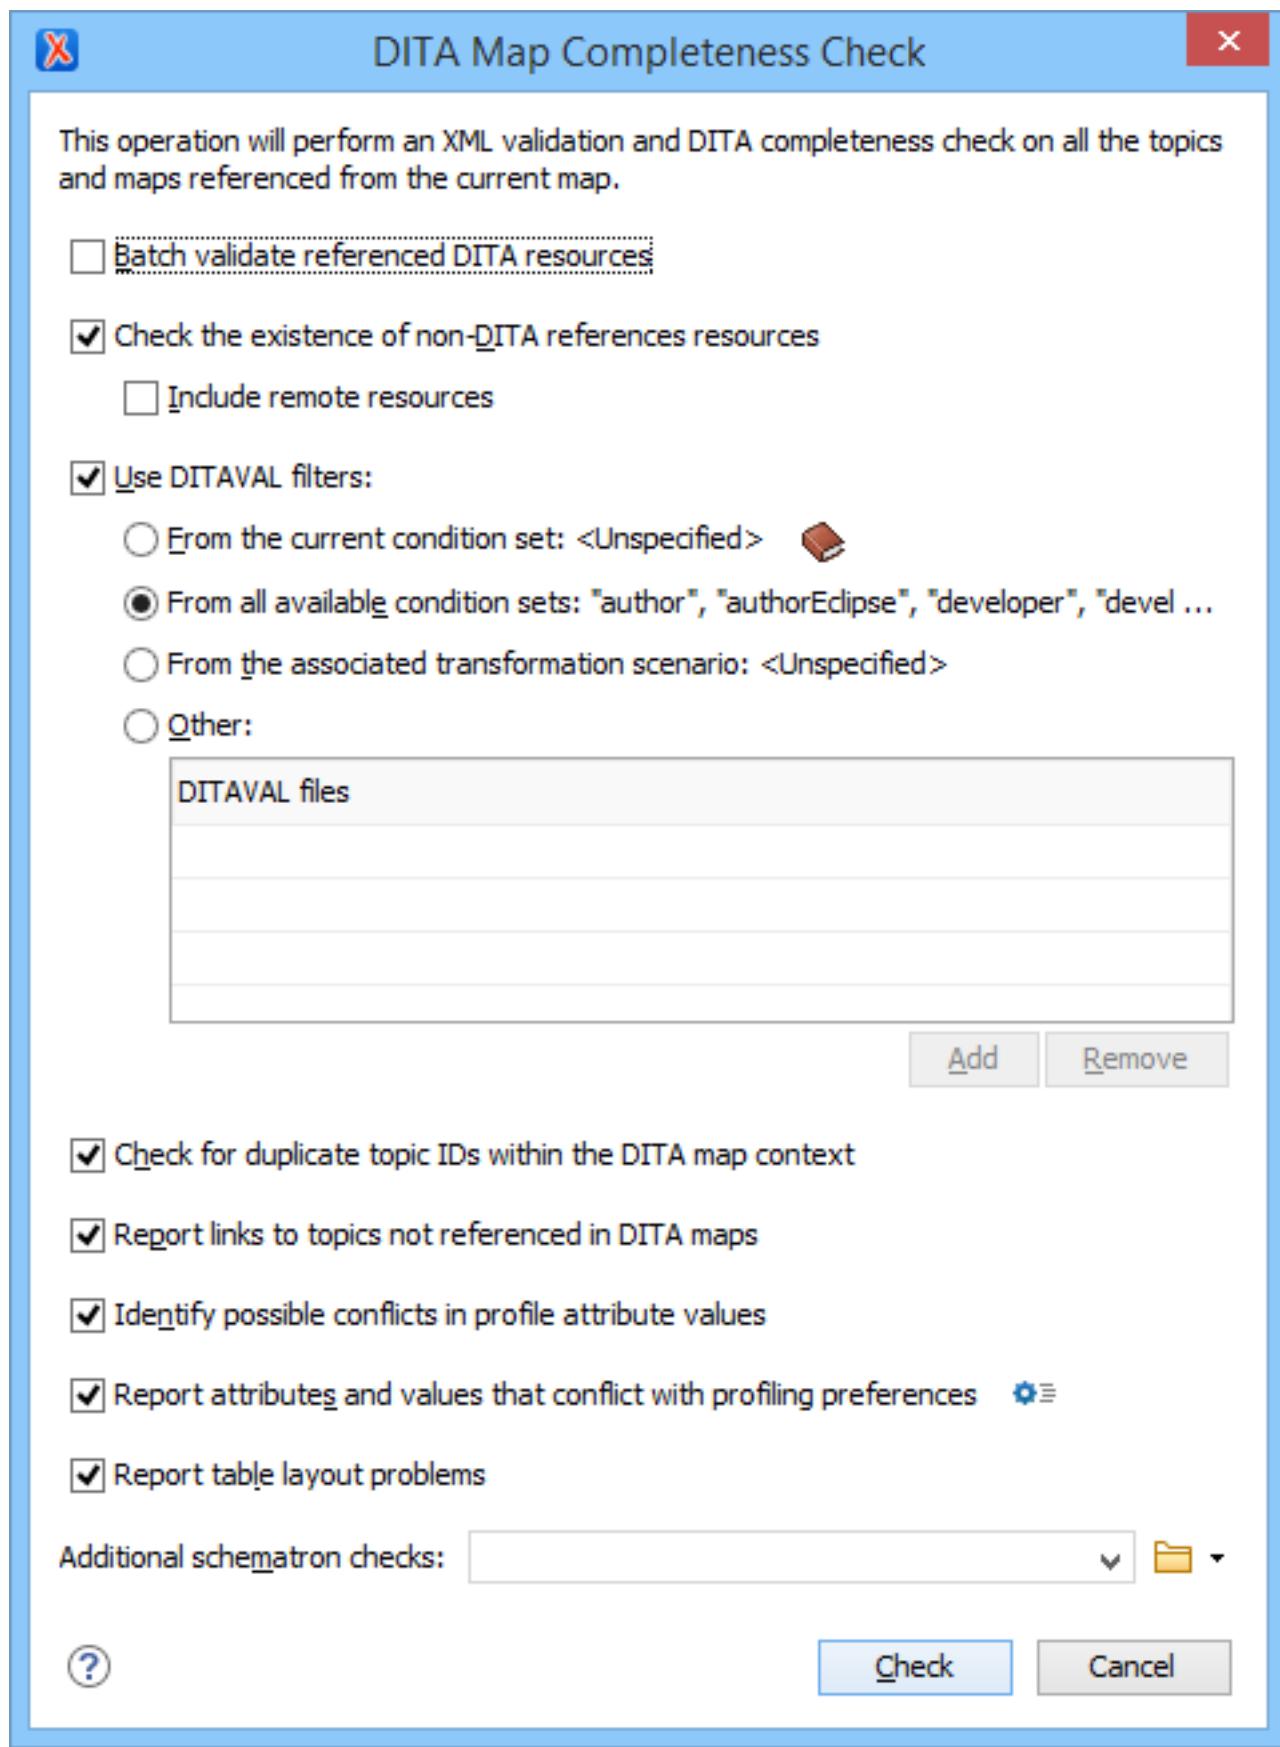

Figure 459: DITA Map Completeness Check Dialog Box

You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is checked, the DITA files will be validated using rules defined in their associated *validation scenario*.

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources** Enable this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Use DITAVAL filters**

The content of the map is filtered by applying a *profiling condition set* before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager** view. Clicking the  icon opens a topic in the Oxygen XML Author User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using the condition set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list.

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report links to topics not referenced in DITA maps**

Checks that all referenced topics are linked in the DITA map.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

## Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page](#) (you can click the  Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

## Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of colspecs is different than the number of columns detected from the table cols attribute.
- For a CALS table, if the number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the cols, rowsep, or colsep attributes are not numeric.
- For a CALS table, if the namest, nameend, or colname attributes point to an incorrect column name.

## Additional schematron checks

Allows you to select a Schematron schema that Oxygen XML Author uses for the validation of DITA resources.

Click the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

## Working with DITA Topics

[Edit on GitHub](#)

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

### Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

### Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as p, ol, and simpletable. [The DITA markup](#) specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

## Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `task` element specifies that a block of content contains the description of a task.
- A `codeblock` element specifies that a block of text consists of programming code.
- A `uicontrol` element specifies that a word is the name of a control in a computer GUI.
- The `platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

## Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

## Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`wintitle`), or to mark a piece of text as applying only to a particular product.

## Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `audience` element to capture audience metadata.

## Creating Topic Structures

Oxygen XML Author provides a number of tools to help you create topic structures:

- **Content Completion Assistant** - Shows you which elements can be created at the current position.
- **Model** view - Shows you the complete structure supported by the current element.
- **Outline** view - Shows you the current structure of your document.
- **DITA** toolbar - Helps you to easily insert many common structures.

### Related information

[Your First DITA Topic](#) on page 25

[Edit on GitHub](#)

## Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- *Concept* - For general, conceptual information such as a description of a product or feature.
- *Task* - For procedural information such as how to use a dialog box.

- *Reference* - For reference information.
- *Topic* - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.

To add a new topic to a DITA map, follow these steps:

1. Select a node of a map open in the **DITA Maps Manager View**.
2. To insert the topic as a child of the selected node, right-click that node and choose **Append Child > New**. To insert the topic as a sibling to the current node, choose **Insert After > New**. A dialog box is displayed that allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

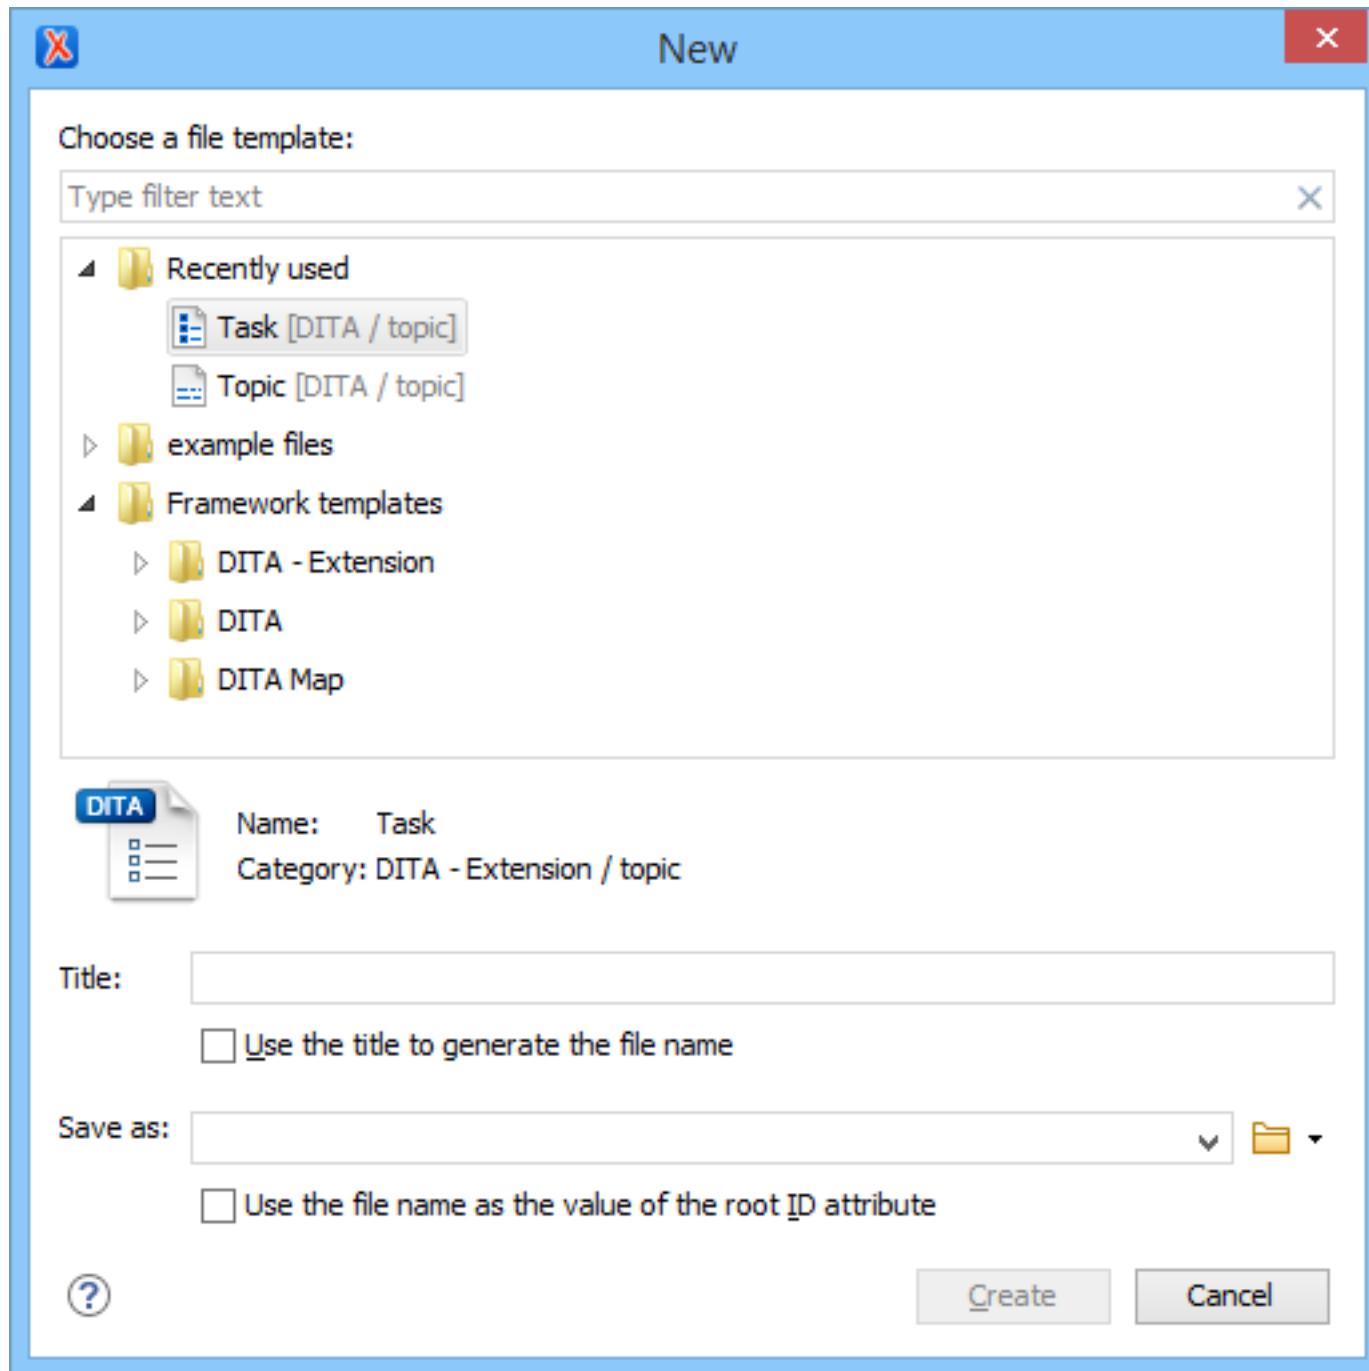

Figure 460: New DITA Topic Dialog Box

**Note:** The templates that appear in this dialog box include all templates that have an associated `.properties` file and the `type` property is set to `dita`, as well as templates that do not have an associated properties file or the `type` property is not defined. It will also include custom templates that you create using the procedures presented in [Creating New Document Templates](#) on page 324.

3. Select the appropriate DITA topic type from the list templates. You can use the **filter** text field to search for a template.
4. You can use the following options to preconfigure some topic creation tasks:
  - a) **Title** - The text entered in this field will be used as the value of the root `title` element for the new topic. The title is set only if the selected template contains a root with a `title` element as its first child.
  - b) **Use the title to generate the file name** - Select this option to use the text entered in the **Title** field to automatically generate a file name. The generated name will transform spaces into underscores (`_`), all illegal characters will be removed, and all upper case characters changed to lower case (the generated name can be seen in the **Save as** field).
  - c) **Save as** - Select a file name and path in this field.
  - d) **Use the file name as the value of the root ID attribute** - Select this option to use the file name (without the file extension) in the **Save as** field as the value of the root `id` attribute for the new topic.
5. Click the **Create** button.

A reference (`topicref`) to the new topic is added to the current map and the new topic is opened in the editor.

## Editing DITA Topics

[Edit on GitHub](#)

Oxygen XML Author provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Author provides for editing XML documents also apply to DITA topics. Oxygen XML Author also provides extensive additional support specifically for DITA.

### Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** (or right-click the topic and select **Open**).
- Double-click the file in the **Project** view (or right-click the file and select **Open**).
- If you have a DITA map opened in the XML editor, you can click the   icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

### Visual Editing in Author Mode

DITA is an [XML format](#), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Author provides a graphical view of your topics in [Author mode](#). Your topics will likely open in **Author** mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in **Author** mode, just click **Author** at the bottom left of the editor window to switch to this mode.

**Author** mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author** mode is not a **WYSIWYG** view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Author has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat **Author** mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. **Author** mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to [Text mode](#). You,

or someone in your organization, can change how the **Author** view looks by changing the CSS stylesheet or providing an alternate stylesheet.

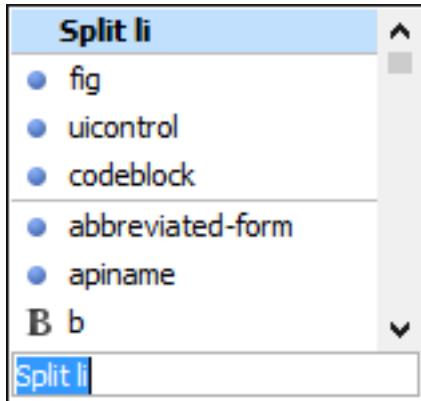

- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author** mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the **Author** view (though there are some exceptions) and cannot be edited directly in the **Author** view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press **Alt+Enter** to bring up the attribute editor. Alternatively, you can use the *Attributes view* to edit attributes.

**Tip:** You can select **Hints** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the *Selecting and Combining Multiple CSS Styles* section.

### Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differ from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Author has a number of content completion assistance features.

- **The Enter key:** In **Author** mode, the **Enter** key does not create line breaks, it brings up the **Content Completion Assistant** to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element **p** in DITA) and tools insert the line breaks in the output and on-screen.

**Figure 461: Content Completion Assistant**

The **Content Completion Assistant** not only suggests new elements you can add. If you press **Enter** at the end of a block element (such as a paragraph) it suggests creating a new element of the same type. If you press **Enter** in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting **Enter** twice (just as you might in a text editor).

As you highlight an element name, a basic description of the element is displayed. Select the desired element and press **Enter** to create it.

To wrap an element around an existing element or piece of text, simply select it and press **Enter** and use the **Content Completion Assistant** to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the **Model** view (**Window > Show View > Model**, if the view is not already open). The **Model** view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

**Tip:** You can also select **Inline actions** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the [Selecting and Combining Multiple CSS Styles](#) section.

## DITA Editing Actions

A variety of actions are available in the DITA framework to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the **DITA** menu, the **DITA (Author Custom Actions)** toolbar, or the **Content Completion Assistant**.

The **DITA** toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the **DITA** toolbar is not displayed, right-click anywhere on the toolbar area, select **Configure Toolbars**, and select it from the displayed dialog box.

**Note:** The **DITA** toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press **Enter** to open the **Content Completion Assistant**.

Whenever the current document in the editor is a DITA document, the **DITA** menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the [DITA framework-specific actions](#), the contextual menu also includes various [general Author mode contextual menu actions](#).

[Edit on GitHub](#)

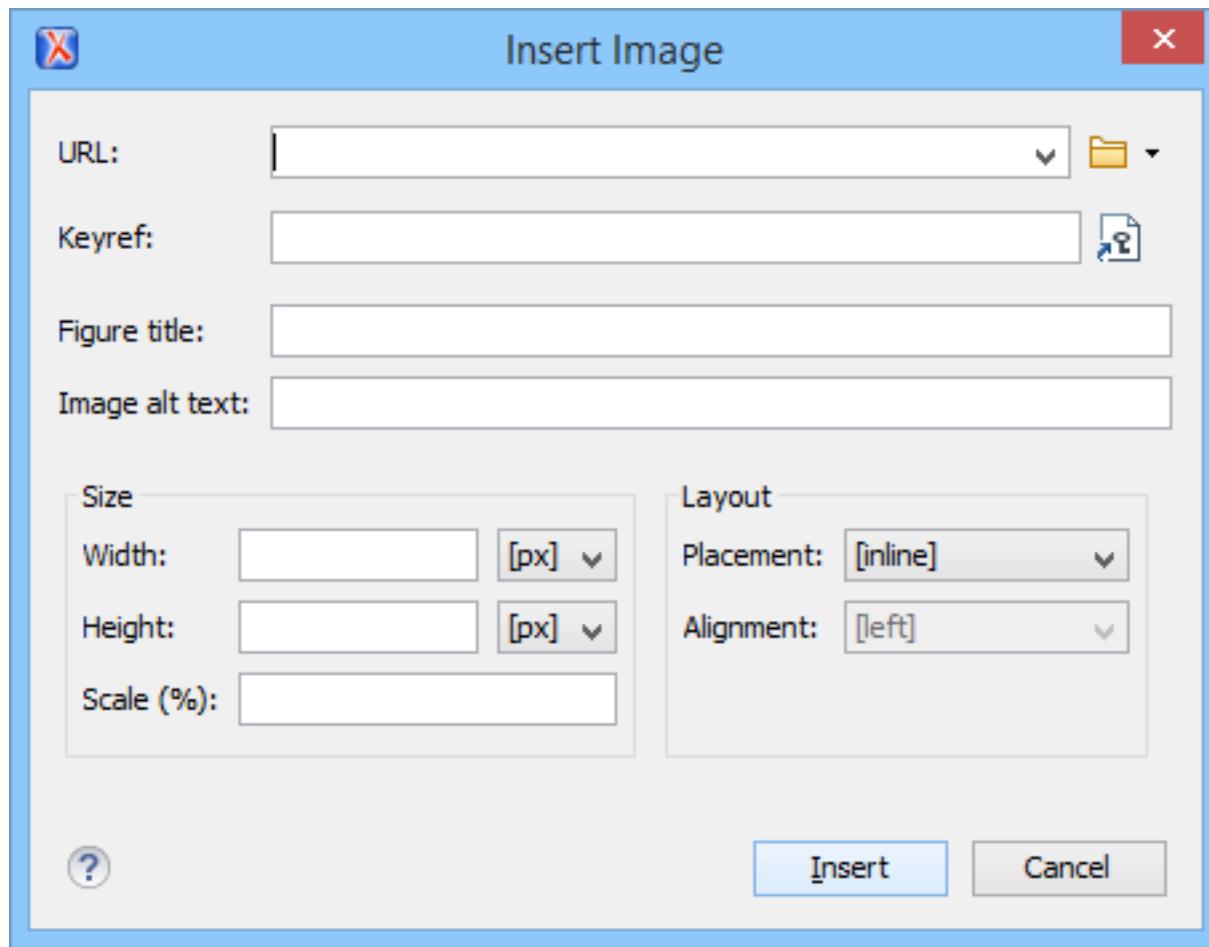

## Adding Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

### Adding an Image Inline

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the **Insert Image** action. The **Insert Image** dialog box appears.

**Figure 462: Insert Image Dialog Box**

3. Configure the options in this dialog box and click **Insert**.

The **Insert Image** dialog box includes the following options for inserting images into a DITA document:

#### URL

Inserts an `image` element with an `href` attribute. You can type the URL of the image you want to insert or

use the  **Browse** drop-down menu to select an image using one of the following options:

- **Browse for local file** - Displays the **Open** dialog box to select a local file.
- **Browse for remote file** - Displays the **Open URL** dialog box to select a remote file.
- **Browse for archived file** - Opens the **Archive Browser** to select a file from an archive.
- **Browse Data Source Explorer** - Opens the **Data Source Explorer** to select a file from a connected data source.
- **Search for file** - Displays the **Find Resource** dialog box to search for a file.

#### Keyref

You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that presents the

list of keys available in the selected root map. Use this dialog box to insert an `image` element with a `keyref` attribute. All keys that are presented in the dialog box are gathered from the root map of the current DITA map. Elements that have the `keyref` attribute set are displayed as links. For more information, see [Adding an Image Using a Key Reference](#) on page 1627.

**Note:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link.

#### Figure title

Use this text box to insert a `title` and `image` element inside a `fig` element.

#### Alternate text

Use this text box to insert an `alt` element inside the `image` element.

#### Size

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `width`, `height`, and `scale` attribute, respectively.

#### Layout

Use the options in this section to insert `placement` and `align` attributes into the `image` element.

### Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `fig` element to your document at the appropriate place.
2. Add a `title` and/or `desc` element to the `fig` element, according to your needs.
3. [Add an image element](#) to the `fig` element.

**Note:** The `fig` element has a number of other child elements that may be appropriate to your content. See the [DITA documentation](#) for complete information about the `fig` element.

**Note:** The order in which the `image`, `title`, and `desc` content are presented in output is determined by the output transformation. If you want to change how they are output, you may have to modify the output transformation, rather than your source content.

### Adding an Image Using a Key Reference

If you want to use a different version of the image depending on the situation (for example, screenshots for multiple platforms or types of output media), you can reference the image using a key reference:

1. Create a DITA map to hold your image keys. You can create one map for each use or create a single map and profile the key definitions for multiple uses. For instance, you might create one map of images to be used in PDF and one for images to be used in Web output, or you might use the platform profiling attribute to manage multiple versions of a screenshot (one for Macintosh and another for the Windows version of your product).
2. For each image, create a `keydef` element with the following structure:

```
<keydef keys="image.test" href="img/test.png" format="png">
```

**Tip:** You can easily create a `keydef` element that targets an image by using the [Key Definition action from the Append Child or Insert After submenus](#).

3. If you are using profiling, add the alternative keydef elements and the appropriate profiling attributes:

```
<keydef keys="image.test" href="img/win/
test.png" platform="windows" format="png">
<keydef keys="image.test" href="img/mac/
test.png" platform="mac" format="png">
```

**Tip:** If you create the keydef element using the *Key Definition action*, you can use the *Profiling tab of the Insert Reference dialog box* to easily add profiling attributes to the target.

4. If you are using separate maps, repeat in each map. For instance, if you are using a separate map for images in PDF output, add a topic ref to that map like this:

```
<topicref href="images.ditamap" format="ditamap">
```

5. To insert an image by key, insert an image element and use a keyref attribute to point to the image:

```
<image keyref="image.test"/>
```

**Tip:** You can also use the *Keyref section of the Insert Image dialog box* to insert a keyref attribute inside an image element.

Oxygen XML Author displays the image in *Author mode*. Which image is displayed depends on the current profiling set that is applied and which *root map* is being used to resolve references.

6. Configure your build so that the appropriate image map is included for each output type and/or the appropriate profiling conditions are applied to each output.

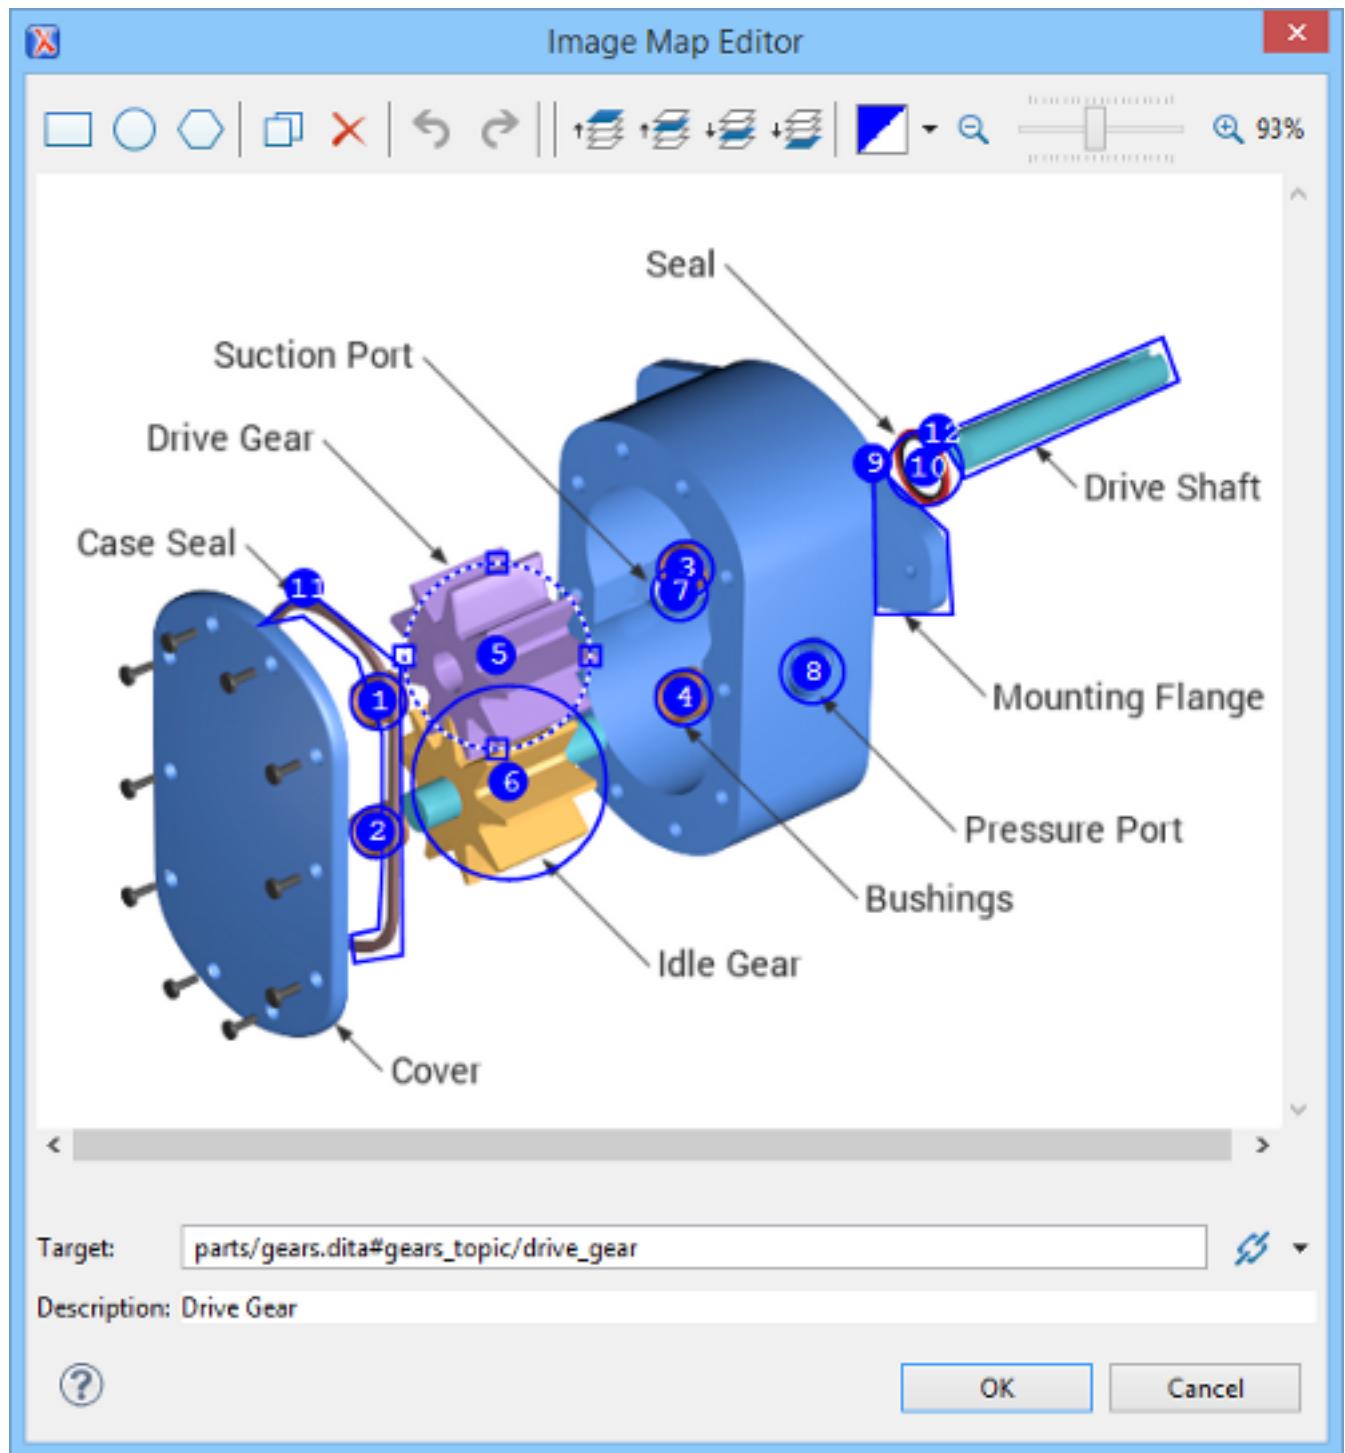

#### Related information

[Image Maps in DITA](#) on page 525

## Image Maps in DITA

[Edit on GitHub](#)

Oxygen XML Author includes support for *image maps* in DITA documents through the use of the imagemap element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 463: Image Map Editor in DITA**

#### Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

##### Toolbar

**New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points

to adjust the size and shape of the rectangle.

**New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

**New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.

**Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

## Area Properties

### Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to

use the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of *inserting links in DITA* by using the identical

 **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see *Inserting*

[a Link in Oxygen XML Author](#) on page 1667.

Description	You can enter an optional description for the selected area (shape) that will be displayed in the <b>Image Map Details</b> section in <b>Author</b> mode and as a tooltip message when the end user hovers over the hyperlink in the output.
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( New Rectangle, New Circle, or New Polygon).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, use one of the *linking options* in the Link drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

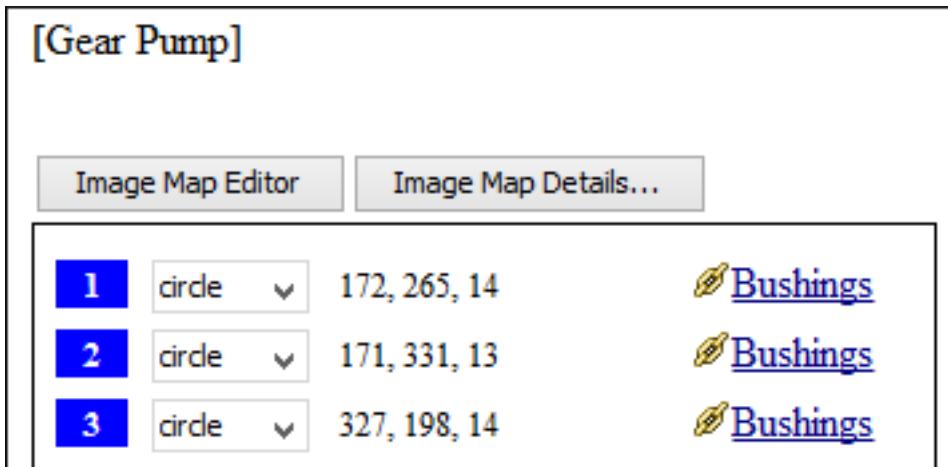

Figure 464: Image Map Details

### How to Edit an Existing Image Map in DITA

To edit an existing image map, right-click the image and select **Image Map Editor** (or click the **Image Map Editor** button below the image). This opens the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

[Adding Images in DITA Topics](#) on page 1625

[Edit on GitHub](#)

## Adding Tables in DITA Topics

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports three types of tables:

- [DITA Simple table model](#) - This is the most commonly used model for basic tables.
- [OASIS Exchange Table Model \(a subset of the CALS table model\)](#) - This is used for more advanced functionality.

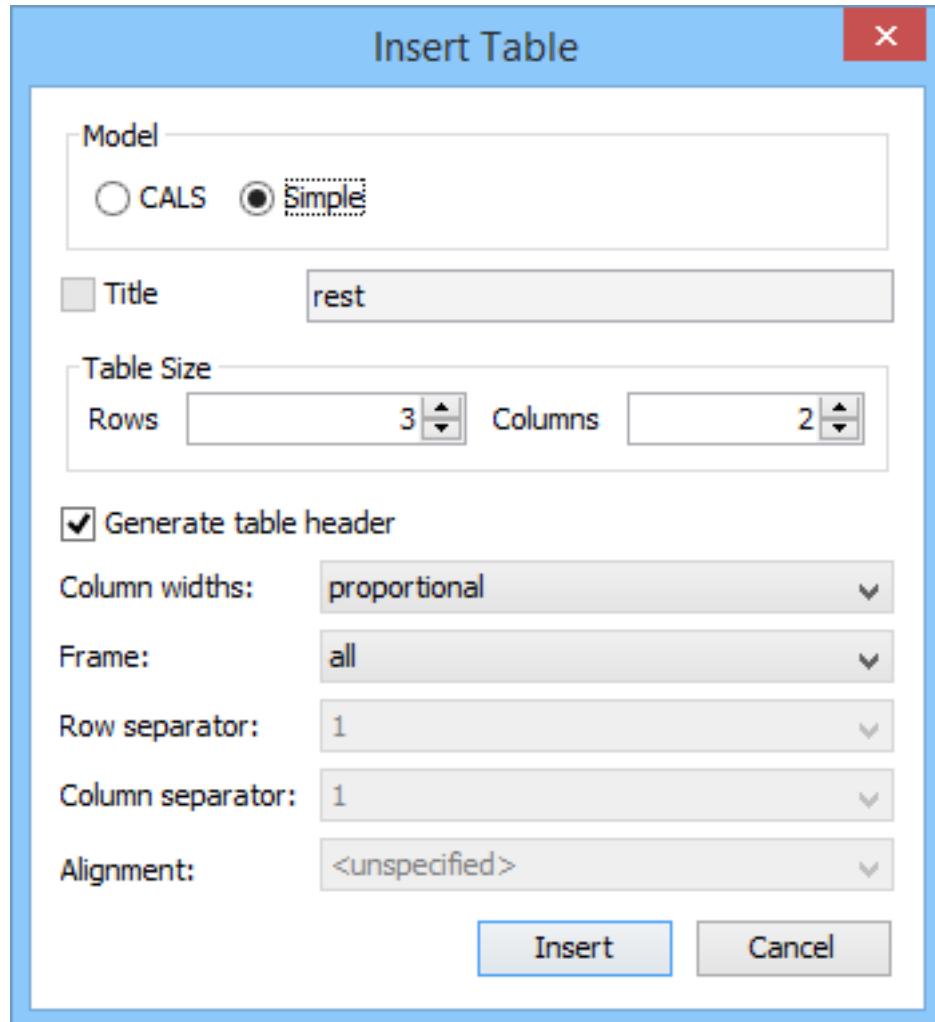

- **DITA Choice table model** - This is used within a step in a DITA task document to describe a series of optional choices that a user must make before proceeding.

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

### Inserting a Simple Table Model

To insert a *Simple* DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

**Figure 465: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Generate table header**

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

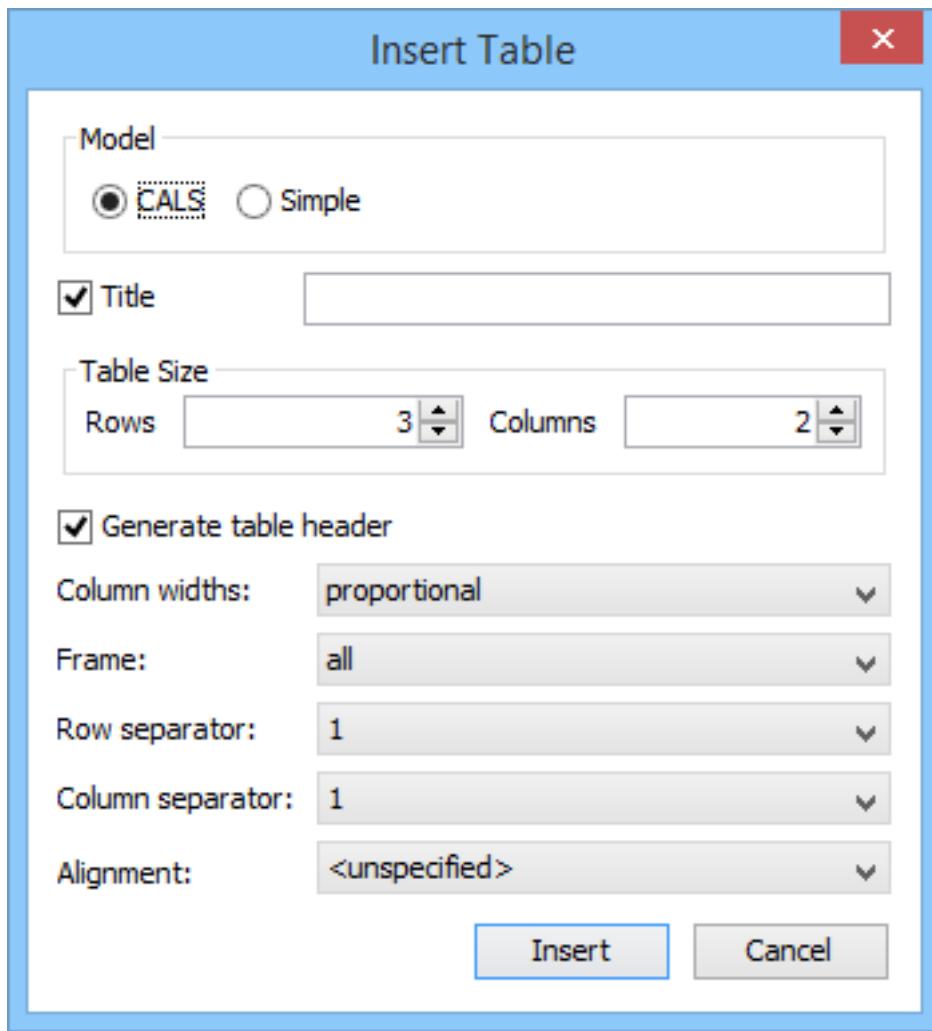

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html>.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (*CALS*), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

**Figure 466: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

**Title**

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the

other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec-common/ditauseconreftarget.html>.

#### Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

#### Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

#### Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec-common/ditauseconreftarget.html>.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

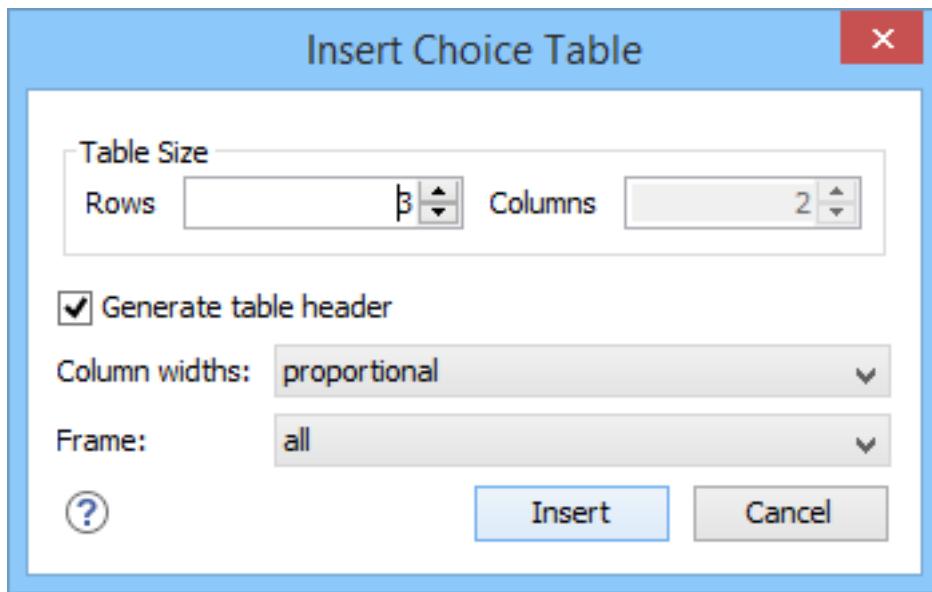

When you insert a CALS table, you see a link for setting the `colspeсs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The screenshot shows a configuration dialog for a CALS table. At the top, the title is "Sample CALS Table with Fixed Width". Below the title, there is a section labeled "colspeсs..." with a dropdown arrow. Inside this section, there are two rows of settings for columns c1 and c2. Each row has four fields: "name" (c1 or c2), "number" (1 or 2), "width" (198pt or 219pt), and "align" (center). To the right of these fields are two checkboxes labeled "colsep" with dropdown arrows. Below this configuration area is a preview of a 4x2 grid table. The first column of the grid contains four empty rows, and the second column also contains four empty rows.

Figure 467: CALS Table in DITA

### Inserting a Choice Table Model

To insert a *Choice* table within a `step` element in a DITA task, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select `choicetable` from the **Content Completion Assistant**. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

**Figure 468: Insert Table Dialog Box - Choice Model**

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA task:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

## Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your task document at the current cursor position (within a `step` element).

## Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). See the [DITA documentation](#) for a full explanation of these attributes.

You can also use the  [Table Properties \(Ctrl + T \(Command + T on OS X\)\)](#) action from the toolbar or contextual menu (or **DITA** menu) to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML, and, if necessary, you can edit the XML directly by switching to **Text mode**.

### Related information

[Editing Tables in Author Mode](#) on page 491

## DITA Table Layouts

[Edit on GitHub](#)

Depending on the context, DITA accepts the following table layouts:

- [CALS table model](#)
- [Simple table model](#)
- [Choice table model](#)

### CALS Table Model Layout

The *CALS* table model allows for more flexibility and table customization than other models. When choosing a *CALS* table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a *CALS* table includes a `colspeсs` section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the [Author mode](#), the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Sample CALS Table with no specified width and proportional column widths**

colspe...

column name c1	number 1	width 0.32*	align	colsep
column name c2	number 2	width 1.49*	align	colsep
column name c3	number 3	width 1.15*	align	colsep
column name c4	number 4	width 0.4*	align	colsep
column name c5	number 5	width 1.67*	align	colsep
Horizontal Span		a3	a4	a5
f1	f2	f3	f4	f5
b1	b2	b3	b4	Vertical <sup>4</sup> Span
c1				c4
d1	Spans Both <sup>4</sup> directions			d5

Figure 469: CALS Table in DITA

### Simple Table Model Layout

When choosing a *Simple* table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 470: DITA Simple Table

### Choice Table Model Layout

A *Choice* table model is used within a step in a DITA task document to describe a series of optional choices that a user must make before proceeding. The **choicetable** element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA tasks either by selecting **choicetable** from the **Content Completion Assistant** (within a **step** element) or by using the **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

**Figure 471: DITA Choice Table**

### Table Validation in DITA

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map with the  **Validate and Check for Completeness** action, if the *Report table layout problems option is enabled in the DITA Map Completeness Check dialog box*, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

#### Simple or Choice Tables

- A row has fewer cells than the number of table columns.

### Editing Table Properties in DITA

[Edit on GitHub](#)

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties (Ctrl + T (Command + T on OS X))** action from the toolbar or the **Table** submenu of the contextual menu (or DITA menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

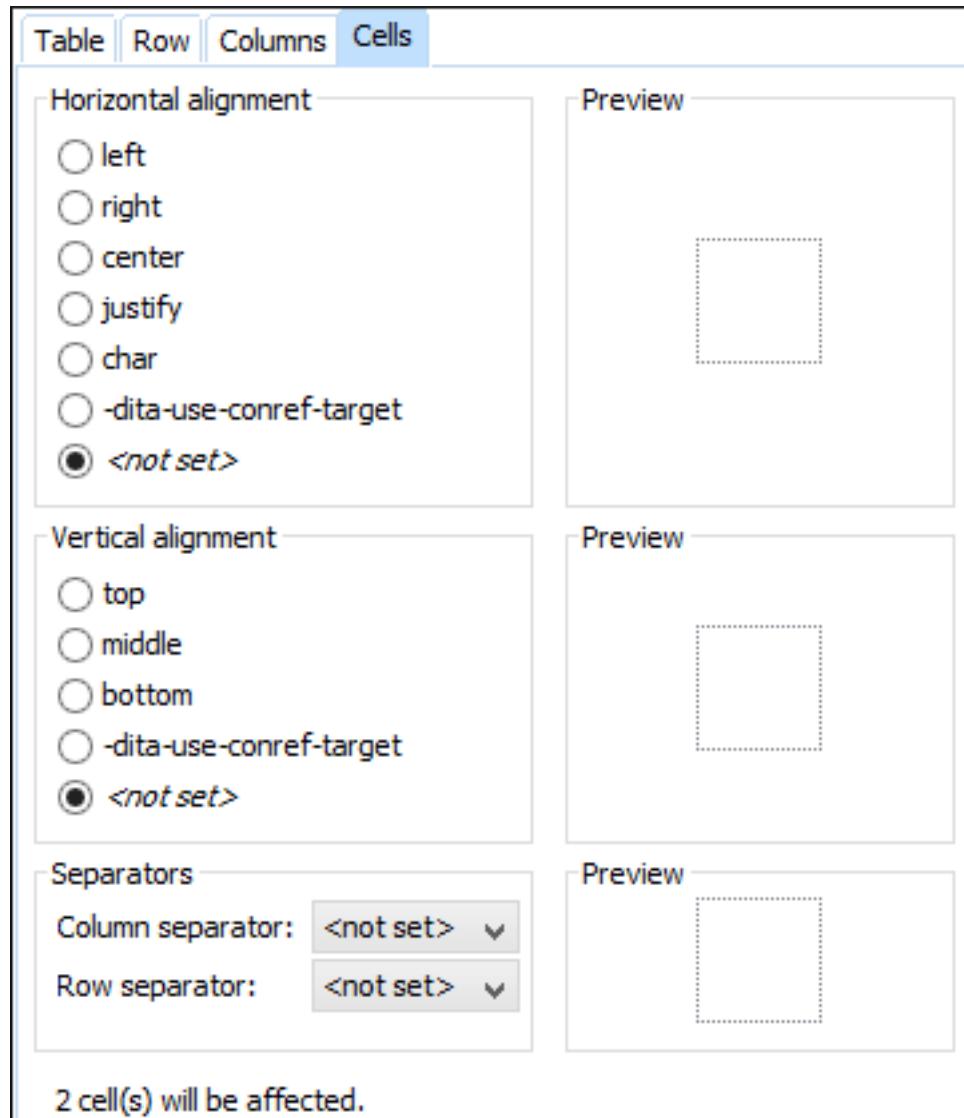

### Edit Table Properties for a CALS Table Model

For a *CALS* table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.

- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 472: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)**

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.

	<ul style="list-style-type: none"> <li>• <b>justify</b> - Stretches the line of text so that it has equal width.</li> </ul> <p><b>Note:</b> The <code>justify</code> value cannot be rendered in <b>Author</b> mode, so you will only see it in the output.</p> <ul style="list-style-type: none"> <li>• <b>char</b> - Aligns text to the leftmost occurrence of the value specified on the <code>char</code> attribute for alignment.</li> <li>• <b>-dita-use-conref-target</b> - Normally, when using a <code>conref</code>, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the <code>conref</code> target. For more information, see <a href="http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html">http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html</a>.</li> </ul>
<b>Vertical alignment (Available in the Row and Cell tabs)</b>	Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells ( <code>valign</code> attribute). The allowed values are as follows:
	<ul style="list-style-type: none"> <li>• <b>top</b> - Aligns the text at the top of the cell.</li> <li>• <b>middle</b> - Aligns the text in a vertically centered position.</li> <li>• <b>bottom</b> - Aligns the text at the bottom of the cell.</li> <li>• <b>-dita-use-conref-target</b> - Normally, when using a <code>conref</code>, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the <code>conref</code> target. For more information, see <a href="http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html">http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html</a>.</li> </ul>
<b>Column separator (Available in the Table, Column, and Cell tabs)</b>	Specifies whether or not to include column separators ( <code>colsep</code> attribute). The allowed values are: 0 (no separator) and 1 (include separators).
<b>Row separator (Available in all four tabs)</b>	Specifies whether or not to include row separators ( <code>rowsep</code> attribute). The allowed values are: 0 (no separator) and 1 (include separators).
<b>Frame (Available only in the Table tab)</b>	Allows you to specify a value for the <code>frame</code> attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
	<ul style="list-style-type: none"> <li>• <b>none</b> - No border will be added.</li> <li>• <b>all</b> - A border will be added to all frames.</li> <li>• <b>top</b> - A border will be added to the top frame.</li> <li>• <b>topbot</b> - A border will be added to the top and bottom frames.</li> <li>• <b>bottom</b> - A border will be added to the bottom frame.</li> <li>• <b>sides</b> - A border will be added to the side frames.</li> <li>• <b>-dita-use-conref-target</b> - Normally, when using a <code>conref</code>, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the <code>conref</code> target. For more information, see <a href="http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html">http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html</a>.</li> </ul>

## Edit Table Properties for a *Simple* or *Choice* Table Model

For a *Simple* or *Choice* table model, the **Table properties** dialog box only allows you to edit a few options.

### Table tab

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <http://docs.oasis-open.org/dita/v1.1/OS/langspec/common/ditauseconreftarget.html>.

### Row tab

#### Row type

Allows you change the row to a body or header type of row.

### Related information

[Adding Tables in DITA Topics](#) on page 504  
[Editing Tables in Author Mode](#) on page 491

## Adding MathML Equations in DITA Topics

[Edit on GitHub](#)

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can start with the **Framework templates / DITA / topic / Composite with MathML** document template, available from the **New** file action wizard.
- Reference an external MathML file as an image, using the  **Insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).

**Note:** MathML equations contained in DITA topics can only be published out-of-the-box in PDF using the **DITA PDF** transformation scenario. For other publishing formats, you must employ additional customizations for handling MathML content.

## Working with Keys

[Edit on GitHub](#)

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

### Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see [Working with Variable Text in DITA](#) on page 1664.

### Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the `keys` attribute of the `topicref` element:

```
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

You can also assign keys to a topic (and insert the `topicref` element in its DITA map) by using the **Keys** tab in the **Edit Properties** dialog box. In the **DITA Maps Manager**, invoke the contextual menu on the topic for which you want to assign a key and select  **Edit Properties**. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can [create a link](#) to it using `<xref keyref="feature.quick-heat"/>`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it [in a map to create a reference to a topic](#) by key: `<topicref keyref="feature.quick-heat">`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to [insert a content reference](#). In this case, the content reference uses the key to locate the topic to pull content from. It uses a `conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure"/>`. In this example, `feature.quick-heat` is the key, and `preheat-`

procedure is the id of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

## Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file) and *insert the image using the key*.

### Related information

*Inserting and Defining Keys in DITA Maps* on page 1607

# Reusing DITA Content

[Edit on GitHub](#)

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Author provides support for each of these methods.

## Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps.

## Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides two mechanisms for including content by reference: `conref` and `conkeyref`. A `conref` creates a direct reference to a specific element of another topic. A `conkeyref` creates a reference to a key, which then points to a specific element in another topic. The advantage of using a `conkeyref` is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map.

Oxygen XML Author provides support for both `conref` and `conkeyref` mechanisms.

While the `conref` and `conkeyref` mechanisms can be used to reference any content element, it is considered best practice to only `conref` or `conkeyref` content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by `conref`. Oxygen XML Author can help you create a reusable component from your current content.

## Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

## Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content, which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

### Related information

*Working with Keys* on page 1646

## Reusing DITA Topics in Multiple Maps

[Edit on GitHub](#)

You can reuse a DITA topic simply by including it in multiple maps (or submaps) using the following procedure:

1. To create a new map, select **File > New** or click the **New** button on the toolbar, go to **Framework templates > DITA Map**, and choose the appropriate type of map.
2. Add existing topics to the new map by dragging and dropping them from the **Project** view or the file system (or right-click the map icon, or on a topic already in the map, and select **Append child** or **Insert After**).
3. If your topics use key references, set up the appropriate key definitions in your new map. You can set the keys when you add the topics, or afterwards by right-clicking the topic in the **DITA Maps Manager**, selecting **Edit Properties**, and defining them in the **Keys** tab.
4. If you want to define relationships between topics, other than those defined in the topics themselves, [add a relationship table to your map](#) or to a separate map linked to your main map.
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the **Validate and Check for Completeness** action on the toolbar in the **DITA Maps Manager**.

## Working with Content References

[Edit on GitHub](#)

The DITA **conref** feature (short for *content reference*) lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place.

There are several strategies for managing content references:

- *Reusable components* - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.
- *Single-source content references* - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.
- *Arbitrary content references* - Although it is not recommended, you can create content references amongst topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

Oxygen XML Author creates a reference to the external content by adding a **conref** attribute to an element in the local document. The **conref** attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Author displays it in **Author** mode as if it is there in the referencing file. If you do not want referenced content displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Edit modes > Author**, and disable the **Display referenced content option**.

**Note:** A reference also displays tracked changes and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select **Edit Reference**.

**Tip:** To search for references made through a direct content references, use the **Search References** action from the contextual menu.

## Creating a DITA Content Reference

[Edit on GitHub](#)

### DITA Content Reference

A DITA content reference, or `conref`, is one of the main [content reuse features of DITA](#). It is a mechanism for reusing the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

### Assigning an *ID* to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select  **Edit Attributes** from the contextual menu (or simply press **Alt+Enter**) to open the [in-place attribute editor](#). Enter `id` as the **Name** of the attribute and a value of your choice in the **Value** field. You can also use [the Attributes view](#) to enter a value in the `id` attribute.

**Note:** The element may already have an `id`, since in some cases Oxygen XML Author automatically generates an `id` value when the `id` attribute is created.

### Creating a Content Reference

To create a content reference (`conref`), follow these steps:

1. Make sure the element you want to reference has an [id assigned to it](#).
2. In [Author mode](#), place the cursor at the location where you want the reused content to be inserted.
3.  Select the **Reuse Content** action on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The [Reuse Content dialog box](#) is displayed.
4. In the **Location** field of the **Reuse Content** dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the **Target ID** of the element (or elements) from which you want to insert the content, and verify the content in the **Preview** pane. The `id` value of the element that you select is automatically added to the **Reference to (conref)** field.
6. Make any other selections you need in the [Reuse Content dialog box](#). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `id` value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

### Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Author also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an `ID` attribute. Also, the location in the document where you paste the element must be valid, although as long as the [Smart paste and drag and drop option](#) is enabled in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (`conref`) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an `ID` attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the **Paste as Content Reference** action from the  **Paste Special** submenu from the contextual menu.

## Other Ways to Reuse Content

An alternate way to reuse content is to use the Oxygen XML Author [Create Reusable Component](#) and [Insert Reusable Component](#) actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an *id* and *conref* and creates reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.

You can also [insert reusable content using content key references](#). This may also make reusable content easier to manage, depending on your particular situation and needs.

## Creating a DITA Content Key Reference

[Edit on GitHub](#)

### DITA Content Key Reference

A DITA content key reference, or *conkeyref*, is a mechanism for inserting a piece of content from one topic into another. It is a version of the [DITA content reference mechanism](#) that uses *keys* to locate the content to reuse rather than direct references to topics that contain reused content.

As with a *conref*, a *conkeyref* requires that the element to be reused has an *id* attribute. It also requires the topic that contains the reusable content to be assigned a *key* in a map. As with all uses of keys, you can substitute multiple maps or [use profiling](#) to create multiple definitions of keys in a single map. This allows the same *conkeyref* to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

### Creating a Content Key Reference

To create a content key reference (*conkeyref*), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an *id* assigned to it.
2. In [Author mode](#), place the cursor at the location where you want the reused content to be inserted.
3.  Select [Reuse Content](#) on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The [Reuse Content dialog box](#) is displayed.
4.  Select the **Key** radio button for the content source and use the [Choose Key Reference](#) button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the **Key** field). The elements that you can reference from the source are presented in the table in the middle of the **Reuse Content** dialog box.
5. Select the **Target ID** of the element (or elements) that you want to insert, and verify the content in the **Preview** pane. The *id* value of the element that you select is automatically added to the **Reference to (conkeyref)** field.
6. Make any other selections you need in the [Reuse Content dialog box](#). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the *id* value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

### Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Author also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an *ID* attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be

valid, although as long as the **Smart paste and drag and drop option** is enabled in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (`conkeyref`) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.
3. In a topic with an assigned key, copy an entire DITA element that has an `ID` attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the **Paste as Content Key Reference** action from the  **Paste Special** submenu from the contextual menu.

#### Related information

- [Reuse Content Dialog Box](#) on page 1651  
[Working with Reusable Components](#) on page 1663  
[Editing DITA Content References](#) on page 1651

## Editing DITA Content References

[Edit on GitHub](#)

Oxygen XML Author also includes some actions that allows you to quickly edit existing content references. When the element that contains a content reference (`conref` or `conkeyref`) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

### Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref/conkeyref` and `conrefend` attributes). For more information, see [Reuse Content Dialog Box](#) on page 1651.

### Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

### Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

## Reuse Content Dialog Box

[Edit on GitHub](#)

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `conref`, `conkeyref`, and `keyref` attributes can be used to insert references to reusable content. The `conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `conkeyref` attribute uses `keys` to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `keyref` attribute also uses `keys` and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:** For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced

element. For more details about DITA `conref` and `conkeyref` attributes, go to <http://docs.oasis-open.org/dita/v1.2/os/spec/archSpec/conref.html>.

**Note:** For the purposes of using a `keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `keyref` attribute, go to <http://docs.oasis-open.org/dita/v1.2/os/spec/common/thekeyrefattribute.html>.

Oxygen XML Author *displays the referenced content* of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA OT transformation needs an XML catalog to map the URIs to local paths, you need to *add the catalog to Oxygen XML Author*. If the URIs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a references to reusable content (`conref`, `conkeyref`, or `keyref`) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Go to **DITA** >  **Reuse Content**.
- Click the  **Reuse Content** action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse** >  **Reuse Content**.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Author will insert a `conref`, `conkeyref`, or `keyref`.

If you select **Location** for the content source, a *content reference* (`conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a *content key reference* (`conkeyref`) or a *key reference* (`keyref`).

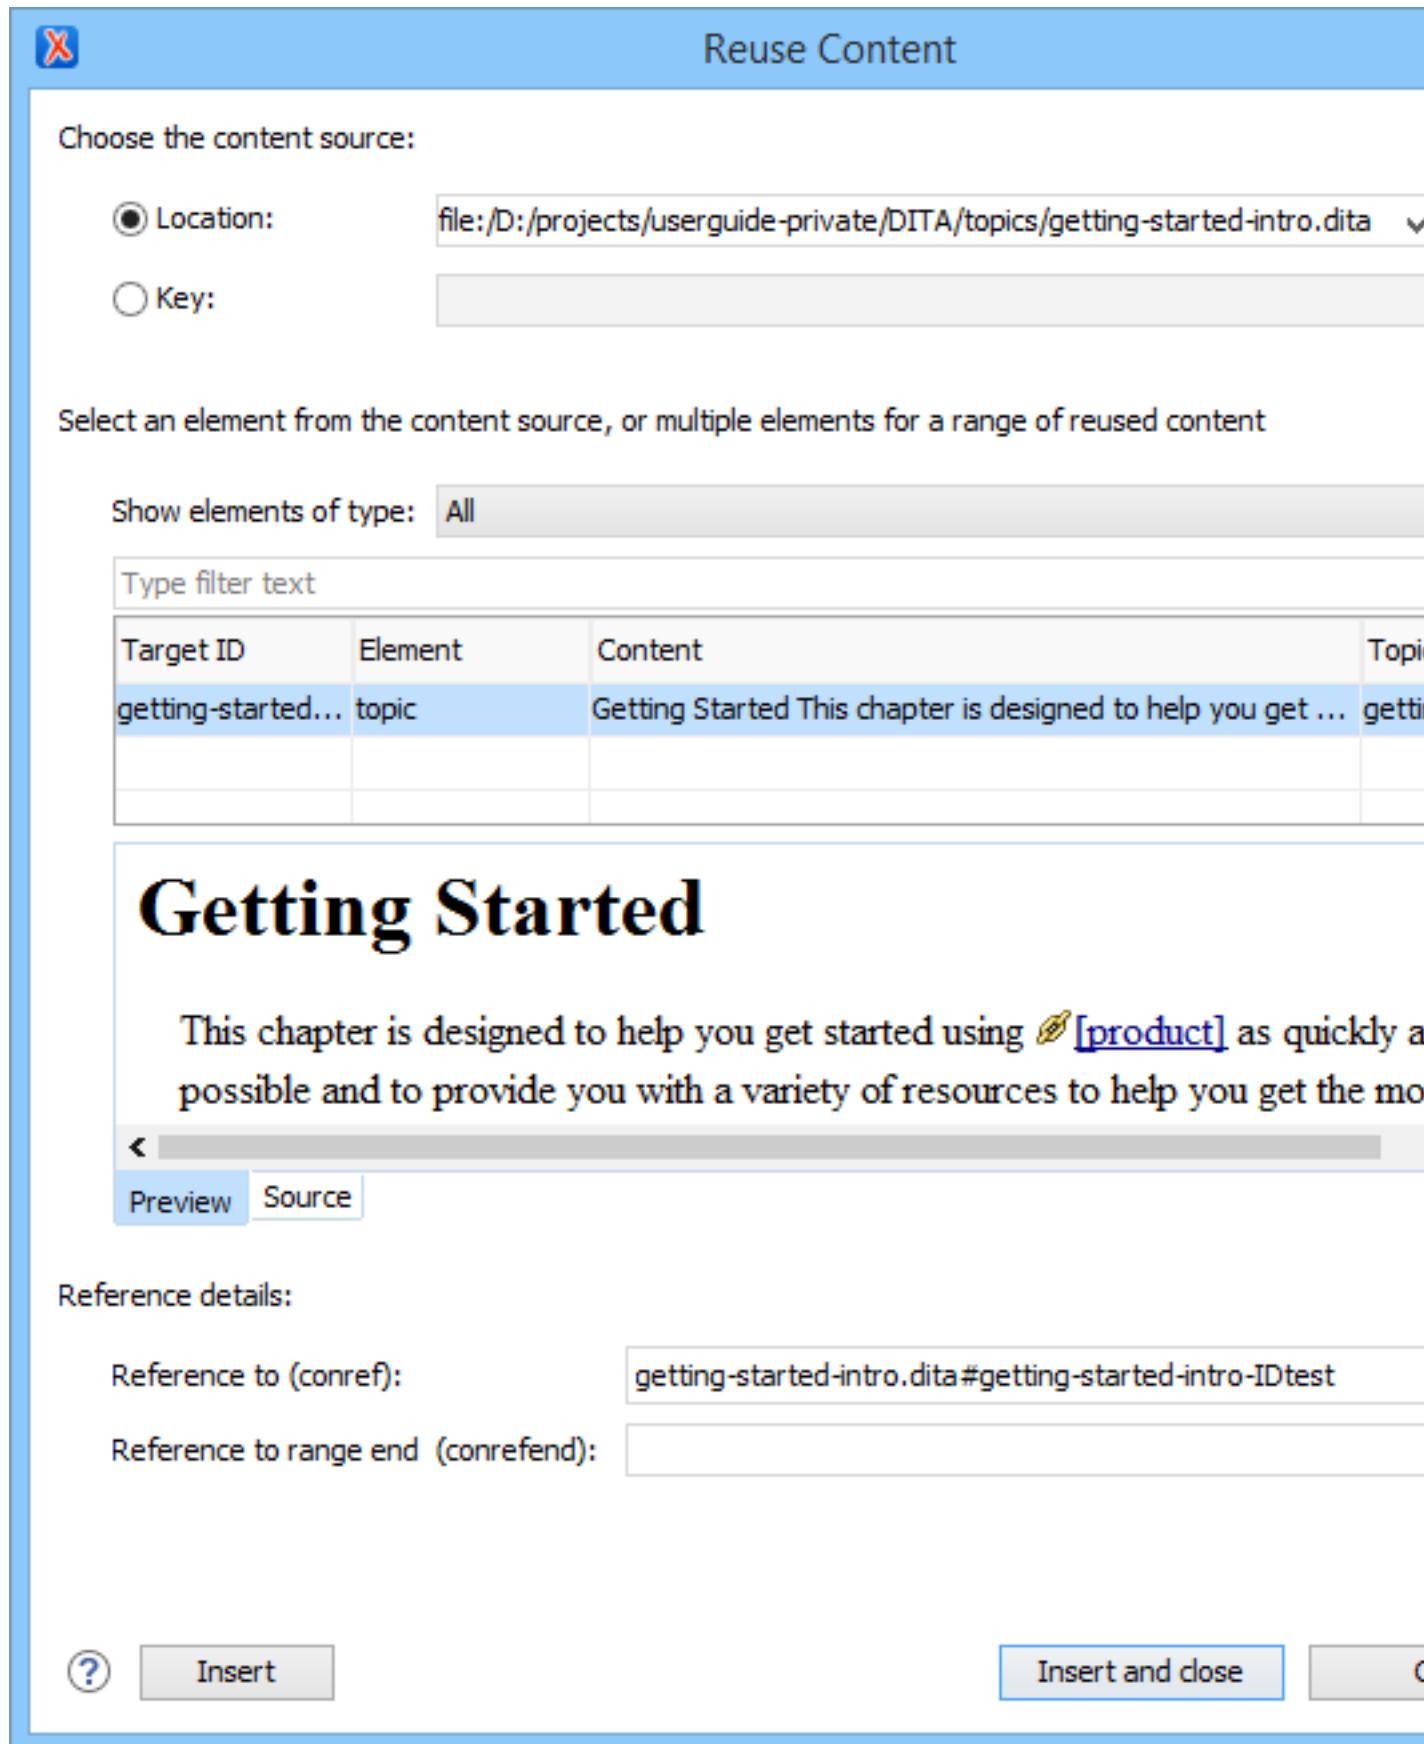

**Content Reference (conref) Options Using the Reuse Content Dialog Box**

Figure 473: Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)

When **Location** is selected for the content source, a *content reference* (`conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

#### Select an element from the content source Section

<b>Show elements of type</b>	You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.				
<b>Text Filter Field</b>	You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.				
<b>Element Table</b>	Presents all the element IDs defined in the source topic. Use this table to select the <b>Target ID</b> of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.				
<b>Preview Pane</b>	Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.				
<b>Source Pane</b>	Displays the source code of the element to be referenced.				
<b>Reference details Section</b>	<table border="0"> <tr> <td><b>Reference to (conref)</b></td> <td>Oxygen XML Author automatically fills this text field with the value of the <code>conref</code> attribute to be inserted. However, you can edit this value if need be.</td> </tr> <tr> <td><b>Reference to range end (conrefend)</b></td> <td>If you select multiple elements (of the same type) in the element table, Oxygen XML Author automatically fills this text field with the <code>id</code> value of the last element</td> </tr> </table>	<b>Reference to (conref)</b>	Oxygen XML Author automatically fills this text field with the value of the <code>conref</code> attribute to be inserted. However, you can edit this value if need be.	<b>Reference to range end (conrefend)</b>	If you select multiple elements (of the same type) in the element table, Oxygen XML Author automatically fills this text field with the <code>id</code> value of the last element
<b>Reference to (conref)</b>	Oxygen XML Author automatically fills this text field with the value of the <code>conref</code> attribute to be inserted. However, you can edit this value if need be.				
<b>Reference to range end (conrefend)</b>	If you select multiple elements (of the same type) in the element table, Oxygen XML Author automatically fills this text field with the <code>id</code> value of the last element				

in your selection. This value will be inserted as a `conrefend` attribute, defining the end of the `conref` range.

### Content Key Reference (`conkeyref`) Options Using the Reuse Content Dialog Box

Choose the content source:

Location:

Key:

Select an element from the content source, or multiple elements for a range of reused content

Show elements of type:

Type filter text

Target ID	Element	Content	Topic ID
insert-image-d...	dlentry	Insert Image Inserts an image reference at the cursor p...	reusables
insert_xinclud...	dlentry	Insert XInclude Opens a dialog box that allows you to b...	reusables

 **Insert Image**

 [Inserts an image reference](#) at the cursor position. Depending on the current location, an image-type element is inserted.

 **Insert XInclude**

Reference to:

[Fallback to \(conref\)](#):

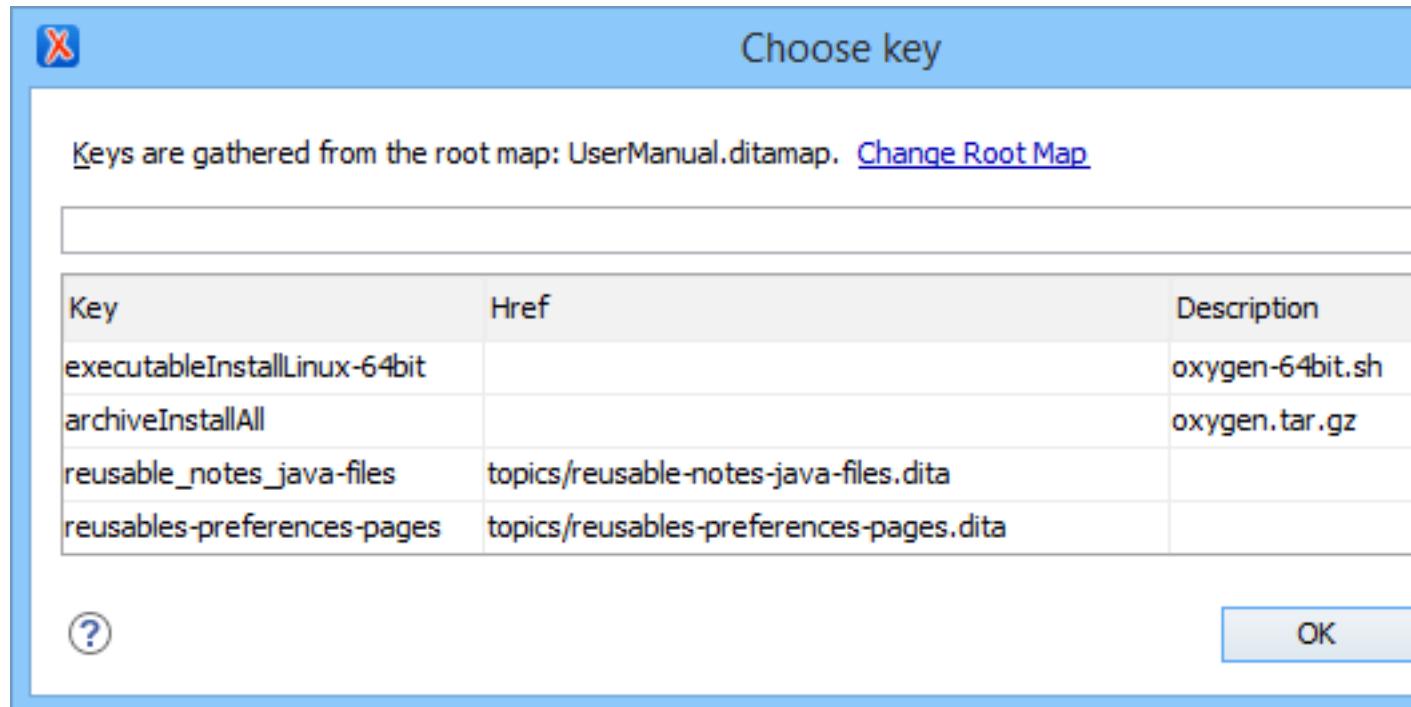

Reference to range end (conrefend):

Figure 474: Insert Content Key Reference Options

#### Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

**Note:** If the current DITA map is not selected as the root map, no keys will be listed.

**Figure 475: Choose Key Dialog Box**

To insert a *content key reference* (`conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the **Href** column. Keys that do not have a value in the **Href** column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `conkeyref`, you need to select a key that has a value (file path) in the **Href** column. After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a *content key reference* has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `conkeyref`:

#### Select an element from the content source Section

#### Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

#### Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

#### Element Table

Presents all the element IDs defined in the source

		topic. Use this table to select the <b>Target ID</b> of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.
<b>Reference details Section</b>	<b>Preview Pane</b>	Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.
	<b>Source Pane</b>	Displays the source code of the element to be referenced.
	<b>Reference type</b>	The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that <b>conkeyref</b> value is automatically selected.
	<b>Reference to</b>	Oxygen XML Author automatically fills this text field with the value of the <b>conkeyref</b> attribute to be inserted. However, you can edit this value if need be.
	<b>Fallback to (conref)</b>	You can enable this option to define a <b>conref</b> attribute to be used as a fallback to determine the content reference relationship if the specified <b>conkeyref</b> cannot be resolved.
	<b>Reference to range end (conrefend)</b>	If you select multiple elements (of the same type) in the element table, Oxygen XML Author automatically fills this text field with the <b>id</b> value of the last element in your selection. This value will be inserted as a <b>conrefend</b> attribute, defining the end of the <b>conkeyref</b> range.

## Key Reference to Metadata (keyref) Options Using the Reuse Content Dialog Box

Choose the content source:

Location:

Key:

Select an element from the content source, or multiple elements for a range of reused content

Show elements of type:

Target ID	Element	Content	Topic

[Preview](#) [Source](#)

Reference details:

Reference type:

Reference to:

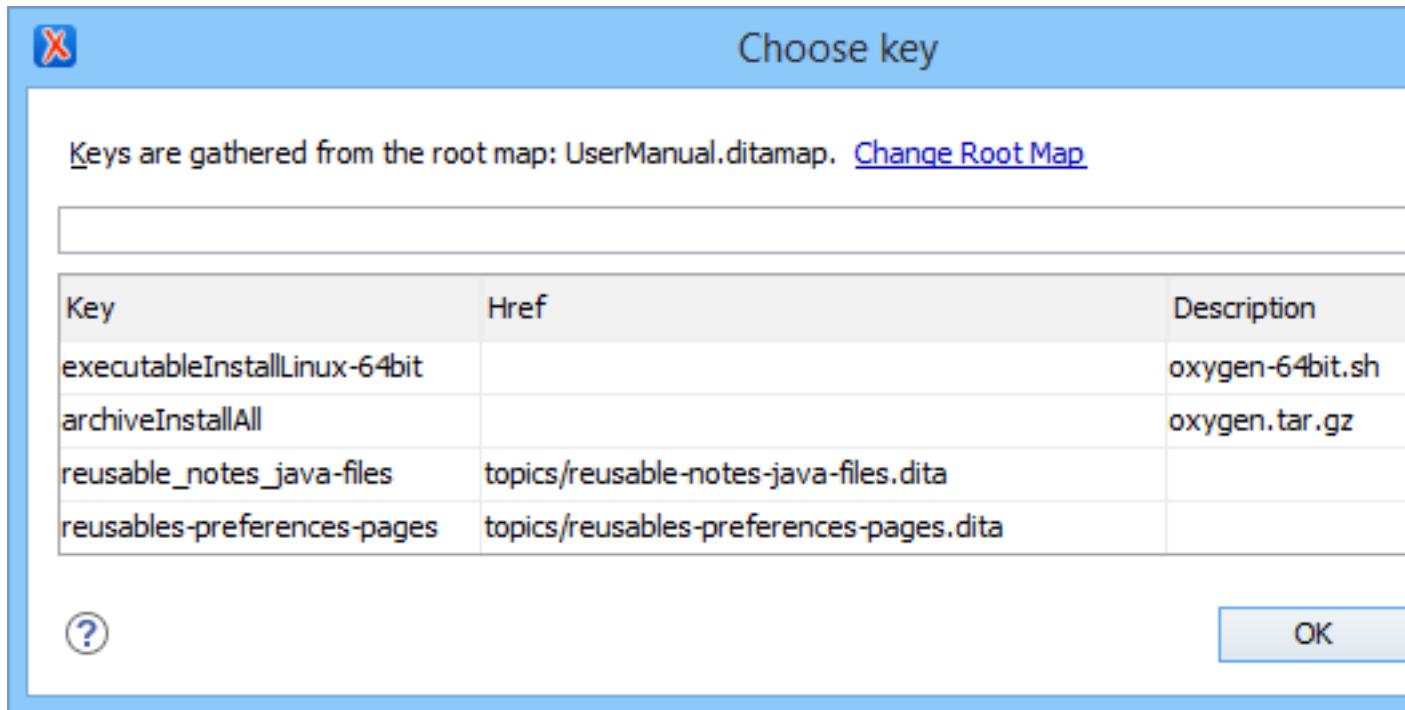

Element name:

**Figure 476: Insert Key Reference Options**

### **Choose the content source Section**

When **Key** is selected for the content source, you can use keys to reference content. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

**Note:** If the current DITA map is not selected as the root map, no keys will be listed.

**Figure 477: Choose Key Dialog Box**

To insert a *key reference* to metadata (`keyref`), select the key you want to reference.

**Note:** Keys that do not have a value in the **Href** column are for referencing metadata with a `keyref` attribute, whereas keys for referencing a `conkeyref` have a value (file path) shown in the **Href** column.

**Note:** The **Description** column collects data from the definition of the key, either from the `navtitle` element or, if missing, from the `keyword` element. The following example shows two key definitions that will be collected in the keys table. Their corresponding information from the **Description** column will display `oxygen.sh` and `oxygen.tar.gz` respectively.

```

<keydef keys="executableInstallLinux">
 <topicmeta>
 <keywords>
 <keyword>oxygen.sh</keyword>
 </keywords>
 </topicmeta>
</keydef>

<keydef keys="archiveInstallAll">
 <topicmeta>
 <navtitle>
 oxygen.tar.gz
 </navtitle>
 </topicmeta>
</keydef>

```

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `keyref`:

**Select an element from the content source Section**

This section is not used when referencing metadata.

**Reference details Section**

**Reference type**

The type of reference that will be inserted. If

you selected a key that does not reference a DITA resource, you will notice that **keyref** value is automatically selected.

#### Reference to

Oxygen XML Author automatically fills this text field with the value of the **keyref** attribute to be inserted.

#### Element name

Oxygen XML Author automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

### Finalizing Your Content Reference Configuration

Once you click **Insert** or **Insert and close**, the configured content reference is inserted into your document.

**Tip:** You can easily insert multiple content references by keeping the **Reuse Content** dialog box opened, using the **Insert** button.

## Working with the Conref Push Mechanism

[Edit on GitHub](#)

### Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be reused. This technique is known as a content reference *push* mechanism (*conref push*).

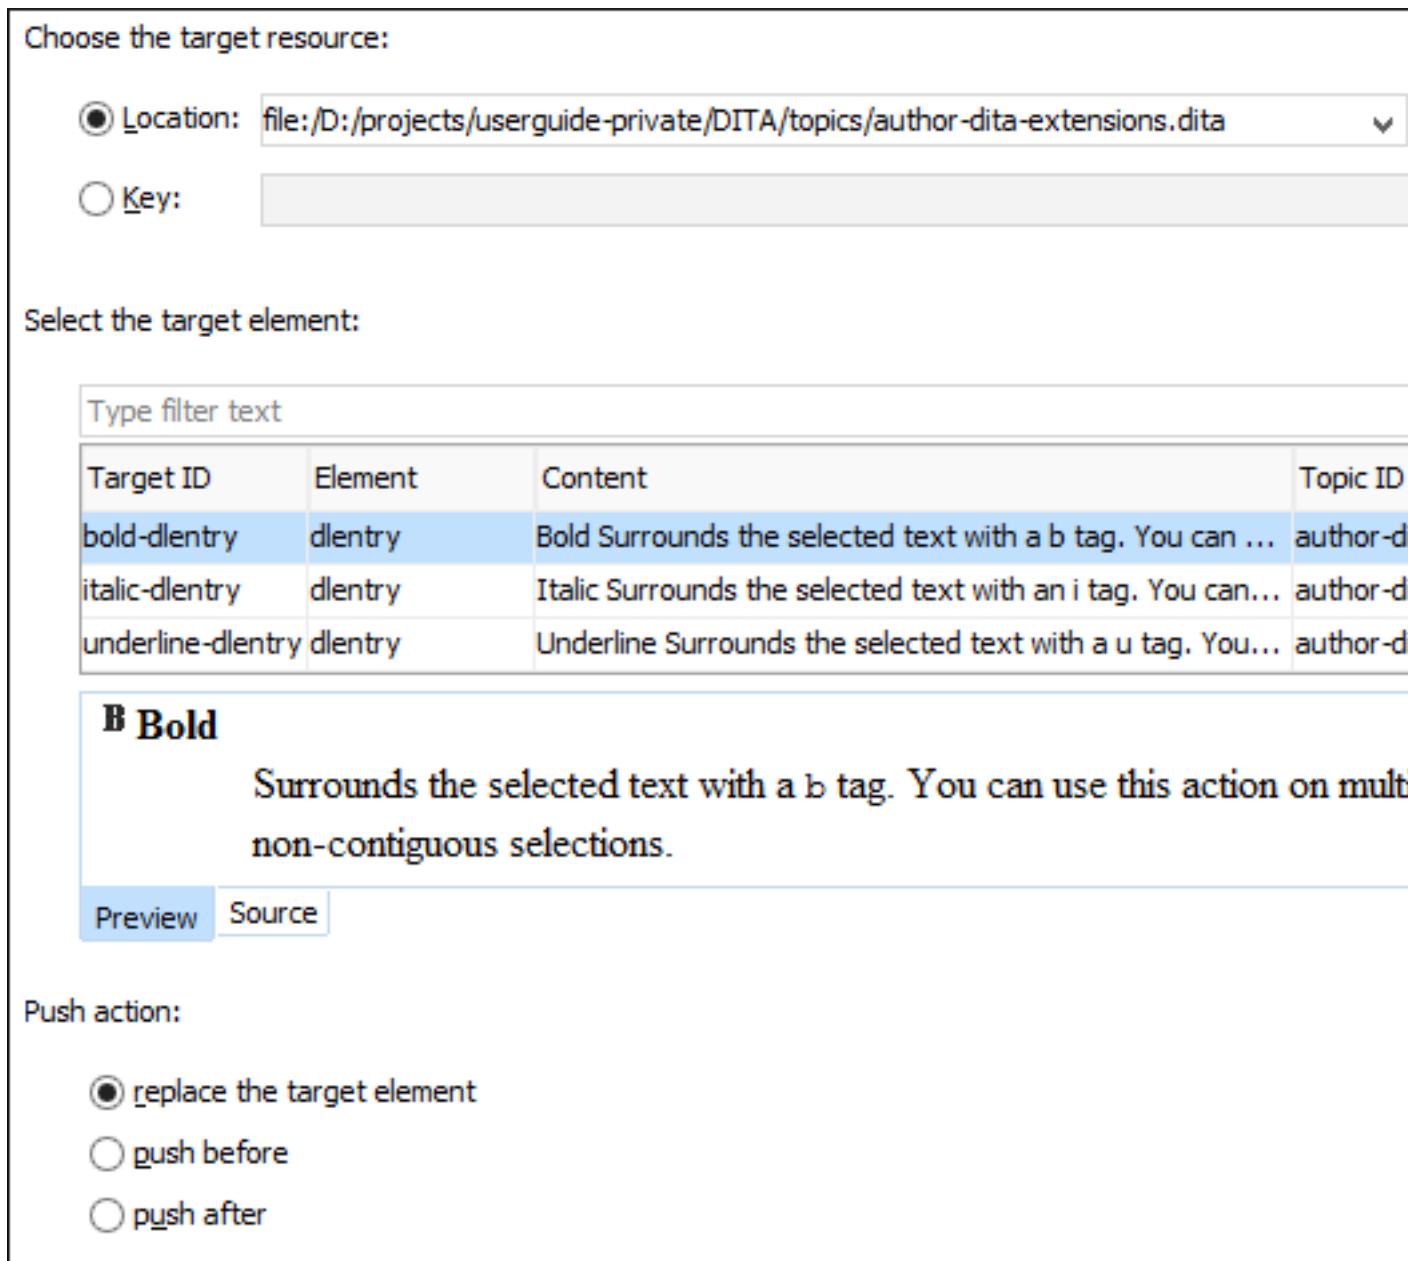

The *conref push* mechanism requires elements in the target topic (the topic where the content is to be pushed) to have *id* elements, as the push mechanism inserts elements *before* or *after* a named element, or *replaces* the named element. Assuming the source topic is included in the DITA map, the *conref push* will be processed during publishing stage for the DITA map.

### Example of a Conref Push Scenario

An example of a scenario in which a *conref push* would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a *conref push* technique to insert specific content without modifying the manufacturer-supplied content.

### Push Current Element Action

Oxygen XML Author includes an action that allows you to easily reference content with a *conref push* mechanism. The **Push Current Element** action is available in the **DITA** menu and in the **Reuse** subfolder of the contextual menu when editing in **Author** mode. Selecting this action opens the **Push current element** dialog box that allows you to select a target resource and element, and where to insert the current element content.

**Figure 478: Push Current Element Dialog Box**

This dialog box allows you to configure the following options for the *conref push* action:

**Choose the target resource**

Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

**Push action**

Allows you to choose one of the following options for where you want to insert the current element content:

**replace the target element**

The target element will be replaced with the current element content.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushreplace` and the `conref` or `conkeyref` attribute will be set to the specified reference.

**push before**

The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref`

attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the *conref push* mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the DITA map.

#### Related information

*For more technical details about the conref push mechanism, refer to "The Conref Push Technique" section of The DITA Style Guide Best Practices for Authors.*

## Working with Reusable Components

[Edit on GitHub](#)

In DITA, the content of almost any element can be made reusable simply by adding an `id` attribute to the element. The DITA content reference mechanism can reuse any element with an `id`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.

Oxygen XML Author allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the **Create Reusable Component** and **Insert Reusable Component** actions.

### Creating a Reusable Content Component

[Edit on GitHub](#)

Oxygen XML Author makes it easy to create reusable content components from existing topic content.

**Note:** To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Author creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In **Author** mode, select the content you want to make into a reusable component.
2. Select the **Create Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.  
The **Create Reusable Component** dialog box is displayed.
3. Use the **Reuse Content** drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.
5. If you want to replace the extracted content with a reference to the new component you should leave the **Replace selection with content reference** option enabled. This is recommended, since the point of reuse is to maintain only one copy of the content.
6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.  
If the **Replace selection with content reference** option was enabled, Oxygen XML Author replaces the current content with a `conref` attribute. The content of the content reference will be displayed in your current topic with

a gray background, but it will no longer be editable since it is stored in a separate file. To edit the source of the reusable component, click the  **Edit Content** icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu. You can also reference this new reusable component by using a *content reference* or *content key reference*.

## Inserting a Reusable Content Component

[Edit on GitHub](#)

Oxygen XML Author includes an **Insert Reusable Content** action that allows you to easily insert a reusable content component that you *created using the Create Reusable Component action*.

**CAUTION:** This action is only designed to insert reusable components created using the Oxygen XML Author **Create Reusable Component** action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The **Insert Reusable Content** action creates a DITA `conref` to insert the content, and creates a parent element for the `conref` attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the `conref`. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the **Create Reusable Component** action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
  2. Select the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
- The **Insert Reusable Component** dialog box is displayed.
3. Locate the reusable content file in which you want to insert its content.
  4. If you select **Content reference** in the **Insert as** drop-down list, the action will add a `conref` attribute to the DITA element at the current location. If you select **Copy** in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
  5. Click **Insert** to perform the action.

## Working with Variable Text in DITA

[Edit on GitHub](#)

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

```
The quick-heat feature allows [product-name] to come up to temperature quickly.
```

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling, as in the following example:

```
<p>The quick-heat feature allows
<ph product="basic">Basic Widget</ph>
<ph product="pro">Pro Widget</ph>
<ph product="enterprise">Enterprise Widget</ph>
to come up to temperature quickly.</p>
```

## Creating Variable Text Using Keys

In DITA, you can create variable text using *keys*.

One way to do this would be to provide conditional values using the `product` profiling attribute.

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

## Creating Variable Content Using a Key Reference

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The key reference stands in for the name of the product. When the content is published, the current value of the key `product` will be inserted.

To insert a key reference into a document in Oxygen XML Author **Author** mode, follow these steps:

1. Press **Enter** and select any DITA element that supports the `keyref` attribute.
2. Select  **Edit Attributes** from the contextual menu (or simply press **Alt+Enter**) to bring up the attribute editor.
3. In the **Name** field, select `keyref`.
4. In the **Value** field, select or enter the name of the key.

**Note:** Additionally, if you have a need for reusing the key reference pattern while editing your documentation, you could add that pattern to a *code template* so that it appears in your list of content completion proposals.

---

## Linking in DITA

[Edit on GitHub](#)

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Author provides support for all forms of linking in DITA.

### Linking Between Parent, Child, and Sibling Topics

A DITA map creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA *collection-type attribute*.

### In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the `xref` element. The destination of the link can be expressed directly using the `href` attribute or indirectly using the `keyref` attribute. If you use the `keyref` attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

## Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the *related links* section of a topic and relationship tables in maps.

## Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The **DITA Maps Manager** provides a way to *validate all the links in the documents that are included in the map*. This can include validating all the profiling conditions that are applied.

## Hierarchical Linking in DITA Maps

[Edit on GitHub](#)

To create hierarchical linking between the topics in a DITA map, you set the appropriate value of the `collection-type` attribute on the map. See the [DITA documentation](#) for the meaning of each of the values of the `collection-type` attribute.

**Note:** Publishing scripts determine when and how to create hierarchical links. The `collection-type` attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the `linking` attribute.

To add the `collection-type` to an item in a map:

1. Right-click the topic and choose  **Edit Properties**. The **Edit Properties** dialog box is displayed.
2. In the **Attributes** tab, select the appropriate value from the **Collection type** drop-down list.
3. You can use the **Other attributes** table to add a value to the `linking` attribute.

## Linking in DITA Topics

[Edit on GitHub](#)

### Direct Links

You can create in-line links in the content of a DITA topic using the `xref` element. The destination of the link can be expressed directly by using the `href` attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct *related links* to topics, files, or websites in a DITA topic using the `related-links` element.

### Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using `keys` to create either in-line links or *related links* (with the `keyref` attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see [Inserting and Defining Keys in DITA Maps](#) on page 1607.

- Key Reference - Created in an `xref` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `topicref` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

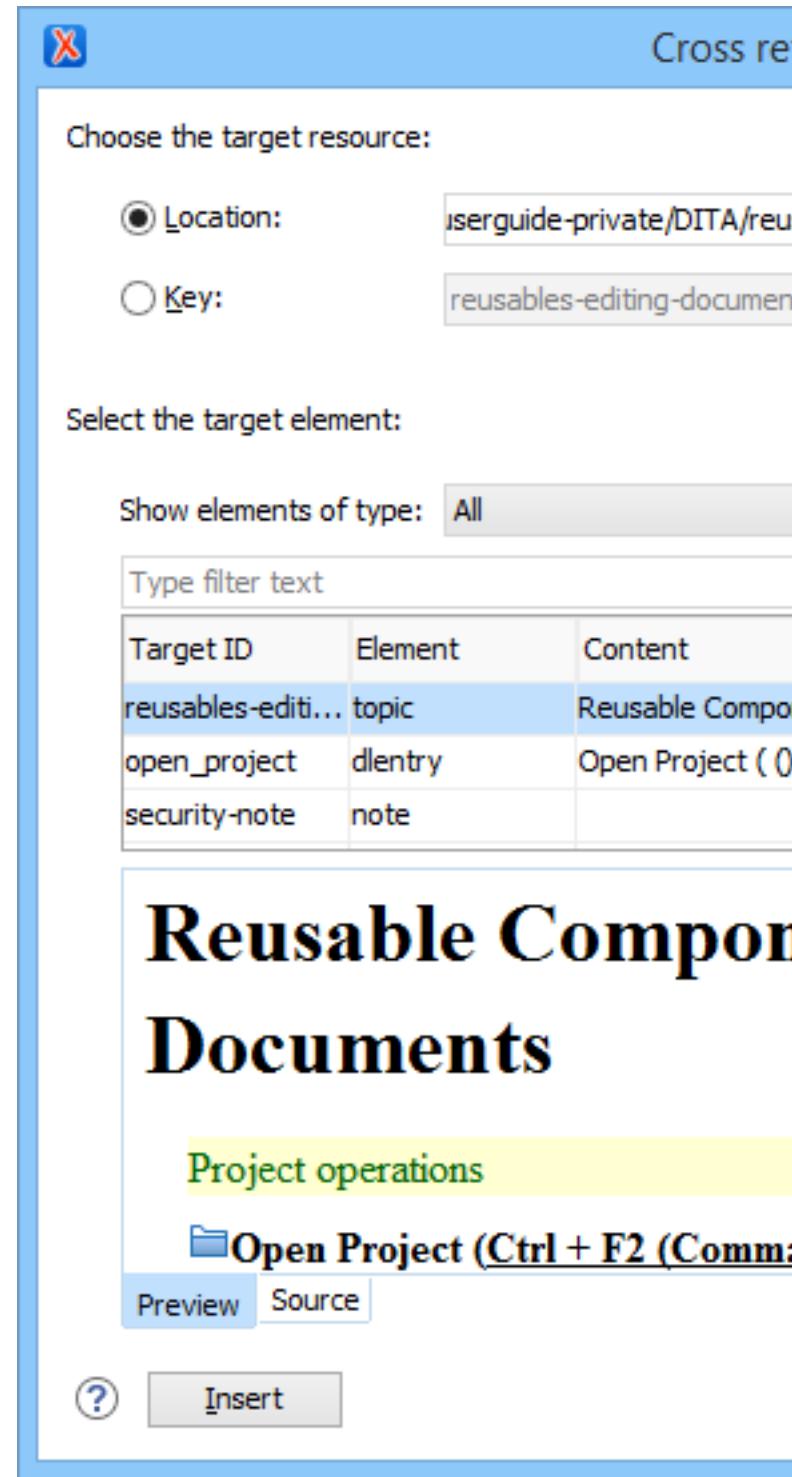

## Inserting a Link in Oxygen XML Author

To insert a link in *Author mode*, use the actions available in the  **Link** drop-down menu from the toolbar (or the  **Link** submenu in the contextual menu or **DITA** menu). You can choose between the following types of in-line links:

### Cross Reference

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `xref` - Used to link to other topics or another location within the same topic and points to the target using the `href` or `keyref` attribute.
- `fragref` - A logical reference to a fragment element within a syntax diagram and points to the target using the `href` or `keyref` attribute.

**Figure 479: Cross Reference (xref) Dialog Box**

This dialog box includes the following sections and fields:

**Choose the Target Resource Section**

**Location** - If you select **Location** for the target, the link is expressed in an `href` attribute.

**Key** - If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You

can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

#### Select the Target Element Section

This section can be used to target a specific element inside the target resource.

**Show elements of type** You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field** You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

<b>Element Table</b>	Presents all the element IDs defined in the source topic. Use this table to select the <b>Target ID</b> of the element that you want to reference.
<b>Preview Pane</b>	Displays the content that will be references.
<b>Source Pane</b>	Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

**Tip:** You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

## File Reference

Opens the **File Reference** dialog box that allows you to insert a link to a target file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute.

### Choose the Target Resource

**Location** - If you select **Location** for the target file, the link is expressed in an `href` attribute.

**Key** - If you select **Key** for the target file, keys will be used to express the link in a `keyref` attribute. You

can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are

**Web Link**

gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute.

**Choose the Target Web Resource**

**URL** - If you select **URL** for the target resource, the link is expressed in an `href` attribute.

**Key** - If you select **Key** for the target resource, keys will be used to express the link in a `keyref` attribute. You can use

the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a [related-links element](#).

This dialog box includes the following sections and fields:

**Choose the Target Resource Section**

**Location** - If you select **Location** for the target, the link is expressed in an `href` attribute.

**Key** - If you select **Key** for the target, keys will be

used to express the link in a `keyref` attribute. You

can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

#### Select the Target Element Section

This section can be used to target a specific element inside the target resource.

**Show elements of type** You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field** You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

<b>Element Table</b>	Presents all the element IDs defined in the source topic. Use this table to select the <b>Target ID</b> of the element that you want to reference.
<b>Preview Pane</b>	Displays the content that will be references.
<b>Source Pane</b>	Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

**Tip:** You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

#### Related Link to File

Opens the **File Reference** dialog box that allows you to insert a link to a target file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a [link element](#) inside a [related-links element](#).

#### Choose the Target Resource

**Location** - If you select **Location** for the target file, the link is expressed in an `href` attribute.

**Key** - If you select **Key** for the target file, keys will be used to express the link in a `keyref` attribute. You

can use the **Choose Key Reference** button to open the **Choose Key**

dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

### Related Link to Web Page

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a *related-links element*.

#### Choose the Target Web Resource

**URL** - If you select **URL** for the target resource, the link is expressed in an `href` attribute.

**Key** - If you select **Key** for the target resource, keys will be used to express the link in a `keyref` attribute. You can use

the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

### Using Copy/Paste Actions to Insert a Cross Reference

Oxygen XML Author also includes support for inserting cross references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute or a `topicref`. Also, the location in the document where you paste the link must be valid, although as long as the *Smart paste and drag and drop option* is enabled in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it. You can paste the link as a cross reference with the link expressed in an `href` attribute or in a `keyref` attribute.

To insert a cross reference link (expressed in an `href` attribute) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it or a `topicref`.
2. Place the cursor at a location, where you want to insert the link.
3. Select the **Paste as Link** action from the **Paste Special** submenu from the contextual menu.

To insert a cross reference link (expressed in a `keyref` attribute) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a `topicref` from a DITA map.
4. Place the cursor at a location, where you want to insert the link.
5. Select the **Paste as Link (keyref)** action from the **Paste Special** submenu from the contextual menu.

[Inserting and Defining Keys in DITA Maps](#) on page 1607

## Linking with Relationship Tables in DITA

[Edit on GitHub](#)

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps :

1. If the map is currently open in the **DITA Maps Manager**, double-click the map icon ( ) to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.
2. Move the insertion point inside the *map* root element (usually *map*, but it might be *bookmap*, or another specialization of the *map* element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the *map* root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the *map* root element.
3. Select the **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu.

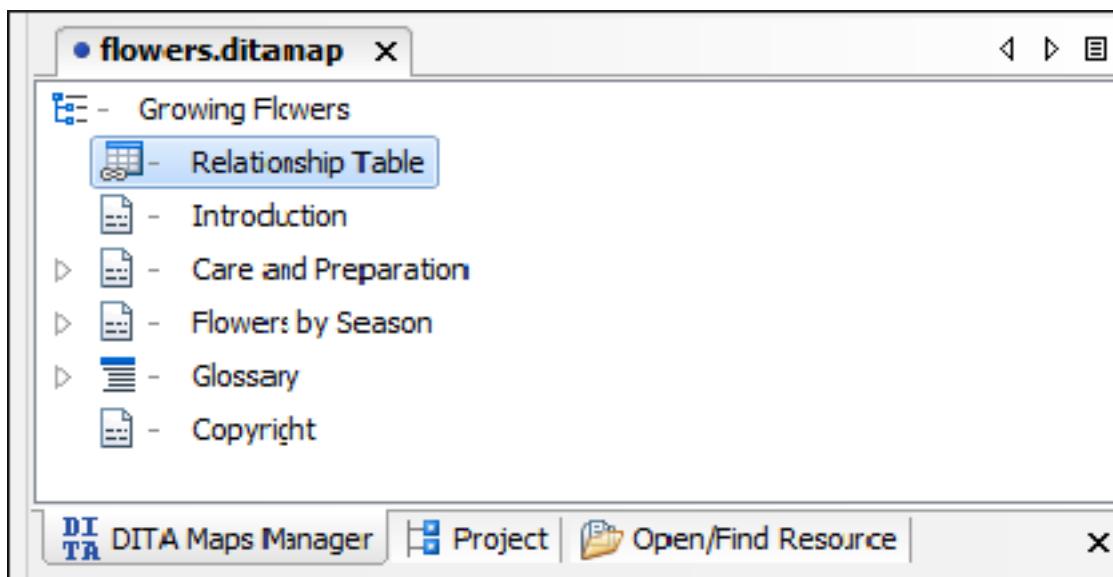

The **Insert Relationship Table** dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.
5. Enter the type of the topics in the header of each column.

The header of the table (the *relheader* element) already contains a *relcolspec* element for each table column. You should set the value of the attribute *type* of each *relcolspec* element to a value such as *concept*, *task*, or *reference*. When you click in the header cell of a column (that is a *relcolspec* element), you can see all the attributes of that *relcolspec* element, including the *type* attribute in the **Attributes** view. You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select **Insert Reference** from the contextual menu or the **DITA Map** toolbar.
7. To add a new row to the table or remove an existing row use **Insert Relationship Row**/**Delete Relationship Row** from the contextual menu or the **DITA Map** toolbar.

8. To add a new column to the table or remove an existing column, use **Insert Relationship Column** / **Delete Relationship Column** contextual menu or the **DITA Map** toolbar. If you double-click the relationship table (or select it and press **Enter**, or choose **Open** from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.
9. To add topic references to your relationship table, drag and drop topics from the **DITA Maps Manager** or the **Project** view into the appropriate cell in the relationship table.  
See the [DITA documentation](#) for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the **Relationship Table** submenu of the contextual menu) or by editing the underlying XML in **Text** mode.
10. Save the DITA map.  
Relationship tables are also displayed in the **DITA Maps Manager** view, along with the other elements in its DITA map.

**Figure 480: Relationship Table**

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the **DITA Maps Manager**.
- Select the relationship table in the **DITA Maps Manager** and press **Enter**.
- Select **Open** from the contextual menu of the relationship table in the **DITA Maps Manager**.

## Publishing DITA Output

[Edit on GitHub](#)

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

This means that you can display the same DITA content in multiple ways, types of media, or publications. It also means that you cannot control every aspect of the presentation of your content in your DITA files. The only way to change the formatting is to change the transformation routines that create it.

Therefore, to create output from your DITA content you have to run a transformation on your content.

Transformations for various types of output are provided by the DITA Open Toolkit. Oxygen XML Author provides a mechanism called transformation scenarios to help you configure and run transformations.

**Note:** Oxygen XML Author does not create any output formats itself. Oxygen XML Author runs externally defined transformations that produce output, and displays the result in the appropriate application, but the output itself is produced by the external transformation, not by Oxygen XML Author.

## Running a Transformation Scenario

To select and run a transformation scenario on your map, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button. The **Configure Transformation Scenario(s)** dialog box appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Author provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Author while the transformation is running. If there are errors or warnings, Oxygen XML Author displays them when the transformation is complete. If the transformation is successful, Oxygen XML Author opens the output in the appropriate application.
3. To rerun the same scenario again, click the  **Apply Transformation Scenario(s)** button.

## Transforming DITA Content

[Edit on GitHub](#)

Oxygen XML Author uses the DITA Open Toolkit (DITA-OT) to transform DITA maps and topics into an output format. For this purpose, both the DITA Open Toolkit and Ant come bundled in Oxygen XML Author.

For more information about the DITA Open Toolkit, see [DITA Open Toolkit Documentation](#).

This section includes information about how to create a DITA OT transformation and how to customize DITA transformations.

### Related information

[Transforming Documents](#) on page 681

### Creating or Editing a DITA OT Transformation

[Edit on GitHub](#)

### Creating a DITA OT Transformation Scenario

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.
- Use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.

**Note:** If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **DITA OT Transformation**.

All three methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

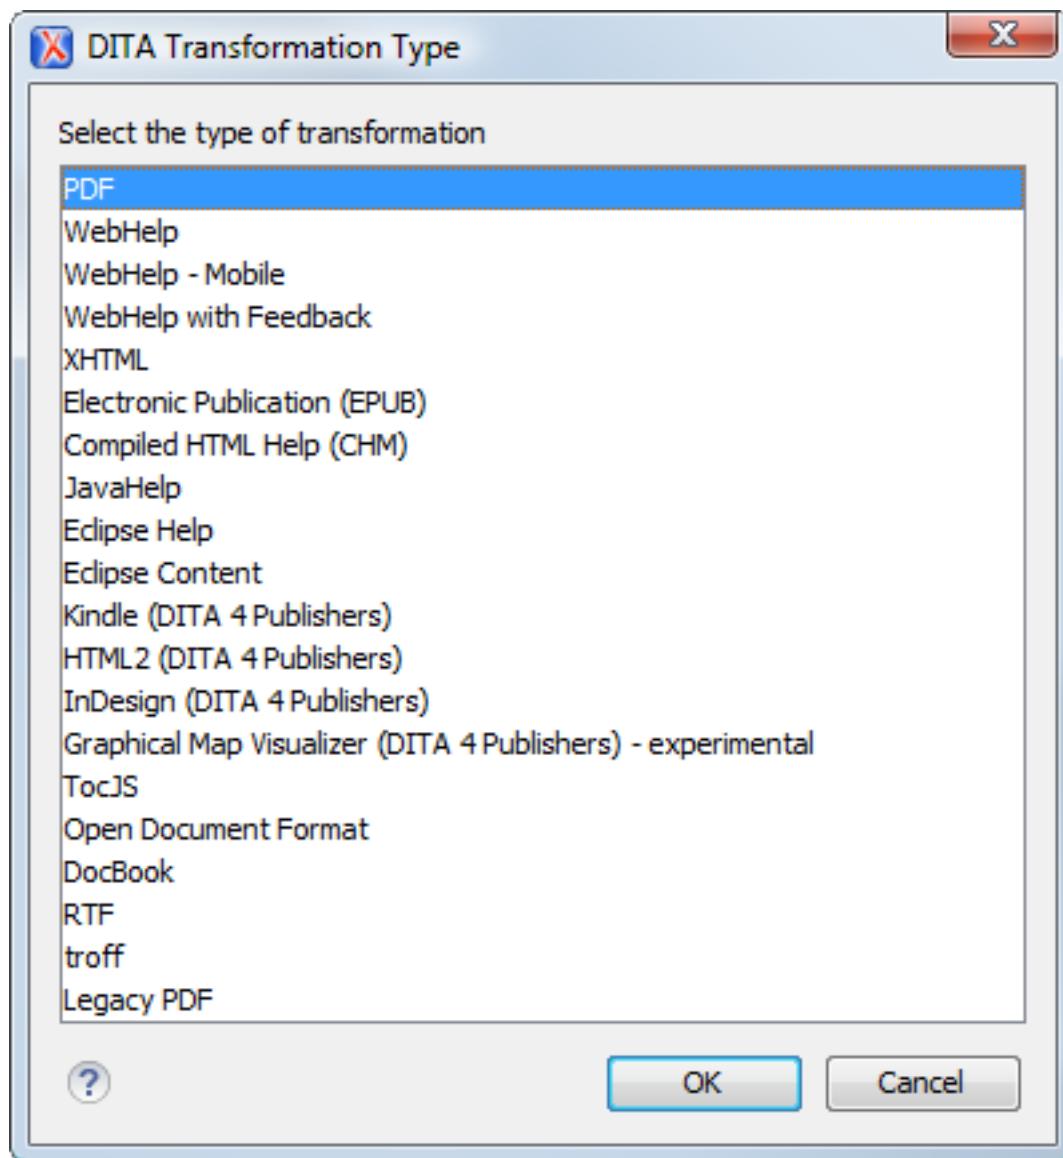

Figure 481: DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.
- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

## Editing a DITA OT Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

**Step Result:** The *Configure Transformation Scenario(s)* dialog box is opened.

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

**Note:** You can edit transformation scenarios that are defined at project level only. To edit a transformation scenario that is associated with a predefined document type, use the **Duplicate** button and then edit the duplicated scenario.

**Result:** This will open an **Edit scenario** configuration dialog box that contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

### Skins Tab (DITA OT Transformations)

[Edit on](#)

[GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

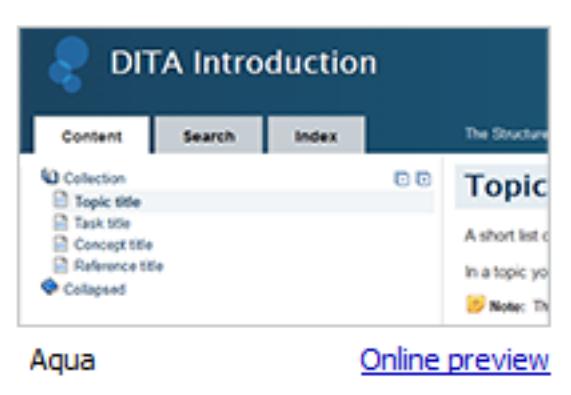

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of predefined skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

**Figure 482: Skins Tab**

The **Skins** tab includes the following sections:

#### *Predefined Skins*

This section presents the predefined skins that are included in Oxygen XML Author. The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Author website, press the **Online preview** link.

#### *Custom Skins*

You can use this section to customize the look of the output.

#### **CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

**Note:** The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

#### Create custom skin

Use this link to open the [WebHelp Skin Builder](#) tool.

### Templates Tab (DITA OT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive** or **WebHelp Responsive with Feedback** output types and it provides a set of predefined *skins* that you can use as a base for the layout of your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output. You can choose predefined skins in a *tile* style of layout or a *tree* style of layout, and you can also [add your own customized skins](#).

**Templates** **Parameters** **Filters** **Advanced** **Output**

### tiles

flowers      green      light

orange      oxygen      Choose custom skin...

### tree

flowers      green      light

orange      oxygen      Choose custom skin...

**Figure 483: Templates Tab**

The **Templates** tab comes by default with the following predefined collections of skins:

#### *Tiles*

This section presents the predefined skins that are arranged in a *tiles* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

**Tree**

This section presents the predefined skins that are arranged in a *tree* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

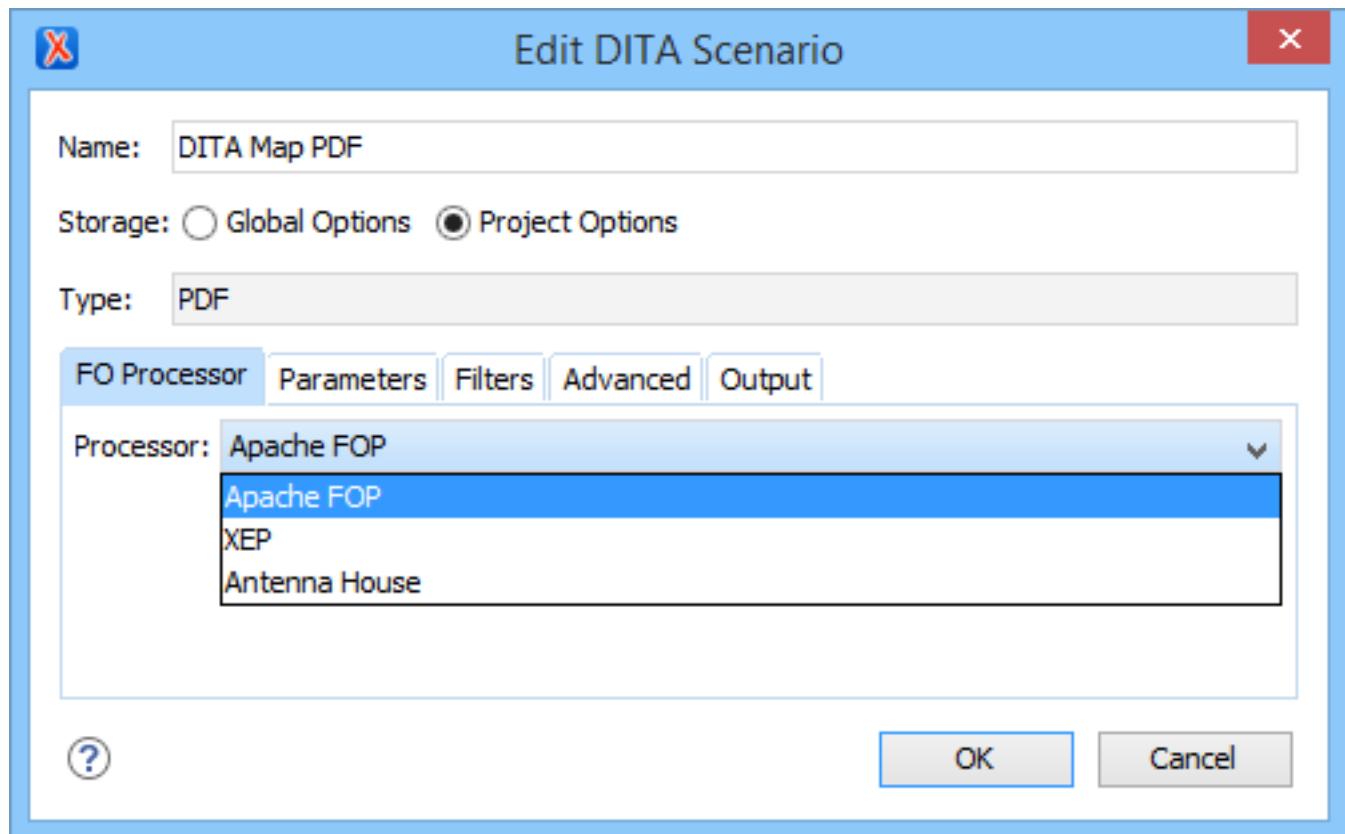

When you add a new collection of skins, this tab will list them.

**FO Processor Tab (DITA OT Transformations)**
[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

**Figure 484: FO Processor Configuration Tab**

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Author.

**XEP**

The *RenderX* XEP processor. If XEP is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the [FO Processors option page](#).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA_OT_DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Author installation directory.

## Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Author preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the [Parameters tab](#).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

## Related information

[FO Processors Preferences](#) on page 170

[XSL-FO Processors](#) on page 776

## Parameters Tab (DITA OT Transformations)

[Edit on GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA OT Documentation](#). You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the [ask editor variable](#) in the **Value** column.

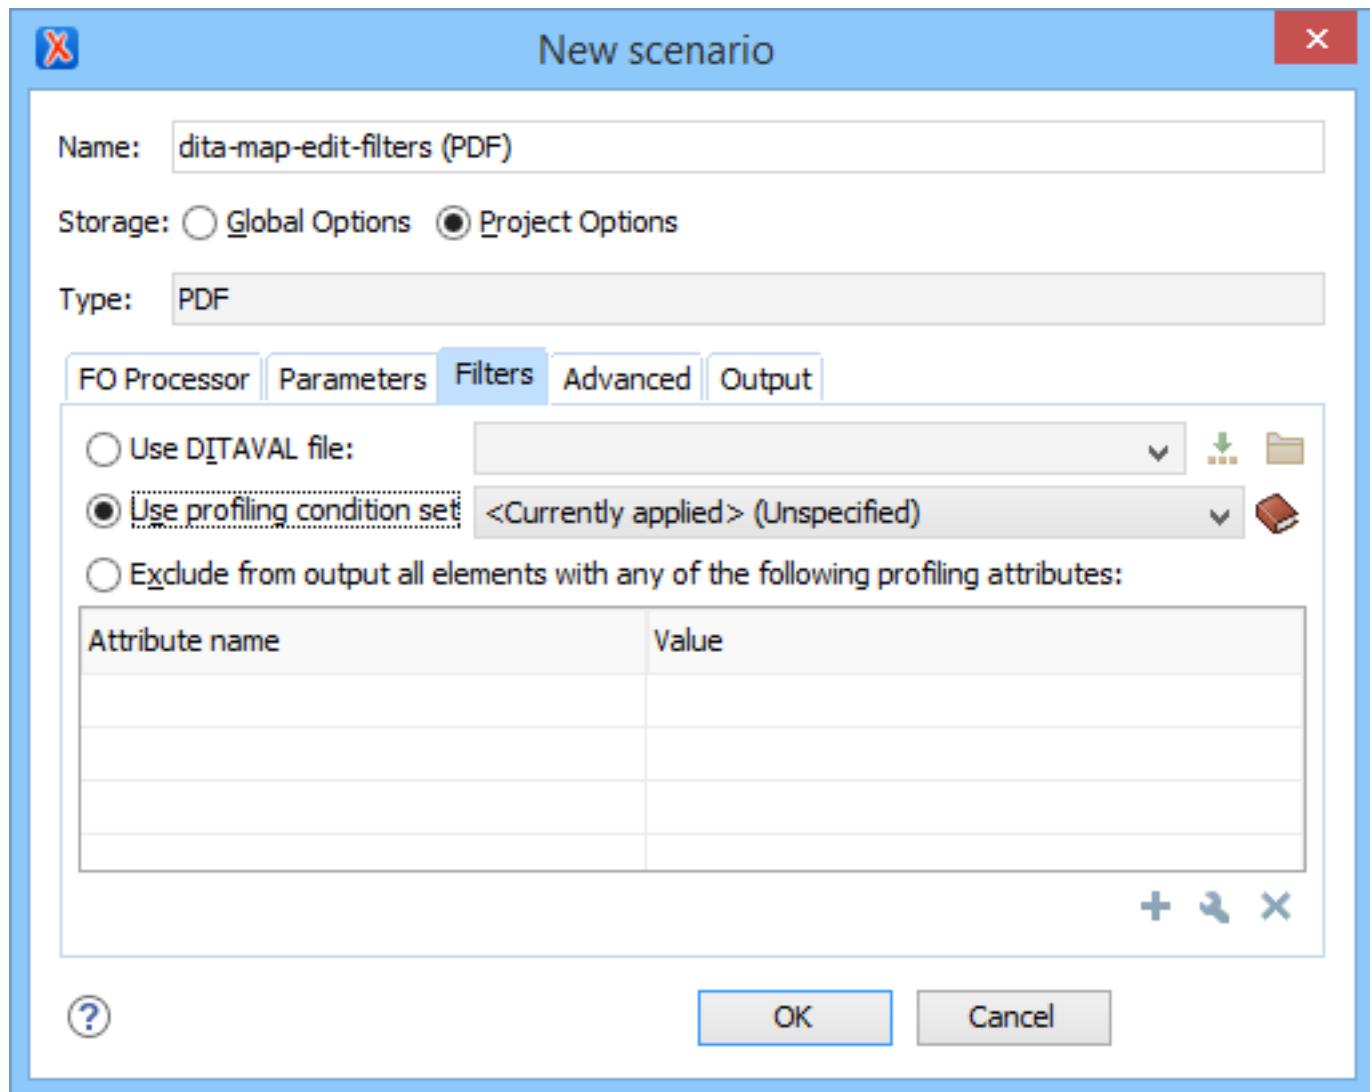

Below the table, the following actions are available for managing parameters:

<b>New</b>	Opens the <b>Add Parameter</b> dialog box that allows you to add a new parameter to the list. You can specify the <b>Value</b> of the parameter by using the  <b>Insert Editor</b> <b>Variables</b> button or the  <b>Browse</b> button.
<b>Unset</b>	Resets the selected parameter to its default value. Available only for edited parameters with set values.
<b>Edit</b>	Opens the <b>Edit Parameter</b> dialog box that allows you to change the value of the selected parameter or its description.
<b>Delete</b>	Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

**Related information**[DITA Open Toolkit Documentation](#)**Filters Tab (DITA Transformations)**[Edit on](#)[GitHub](#)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

**Figure 485: Edit Filters Tab**

You can choose one of the following options to define filters:

#### Use DITAVAL file

If you already have a *DITAVAL* file associated with the DITA map, you can specify the file to be used when filtering content. You can specify the path by using the

text field, the history drop-down menu, the **Insert** **Editor Variables** button, or the **Browse** button. You can find out more about constructing a *DITAVAL* file in the [DITA OT Documentation](#).

**Attention:** If a filter file is specified in the `args.filter` parameter (in [the Parameters tab](#)), that file takes precedence over a *DITAVAL* file specified here.

#### Use profiling condition set

Sets the *profiling condition set* that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

**Advanced Tab (DITA OT Transformations)**

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

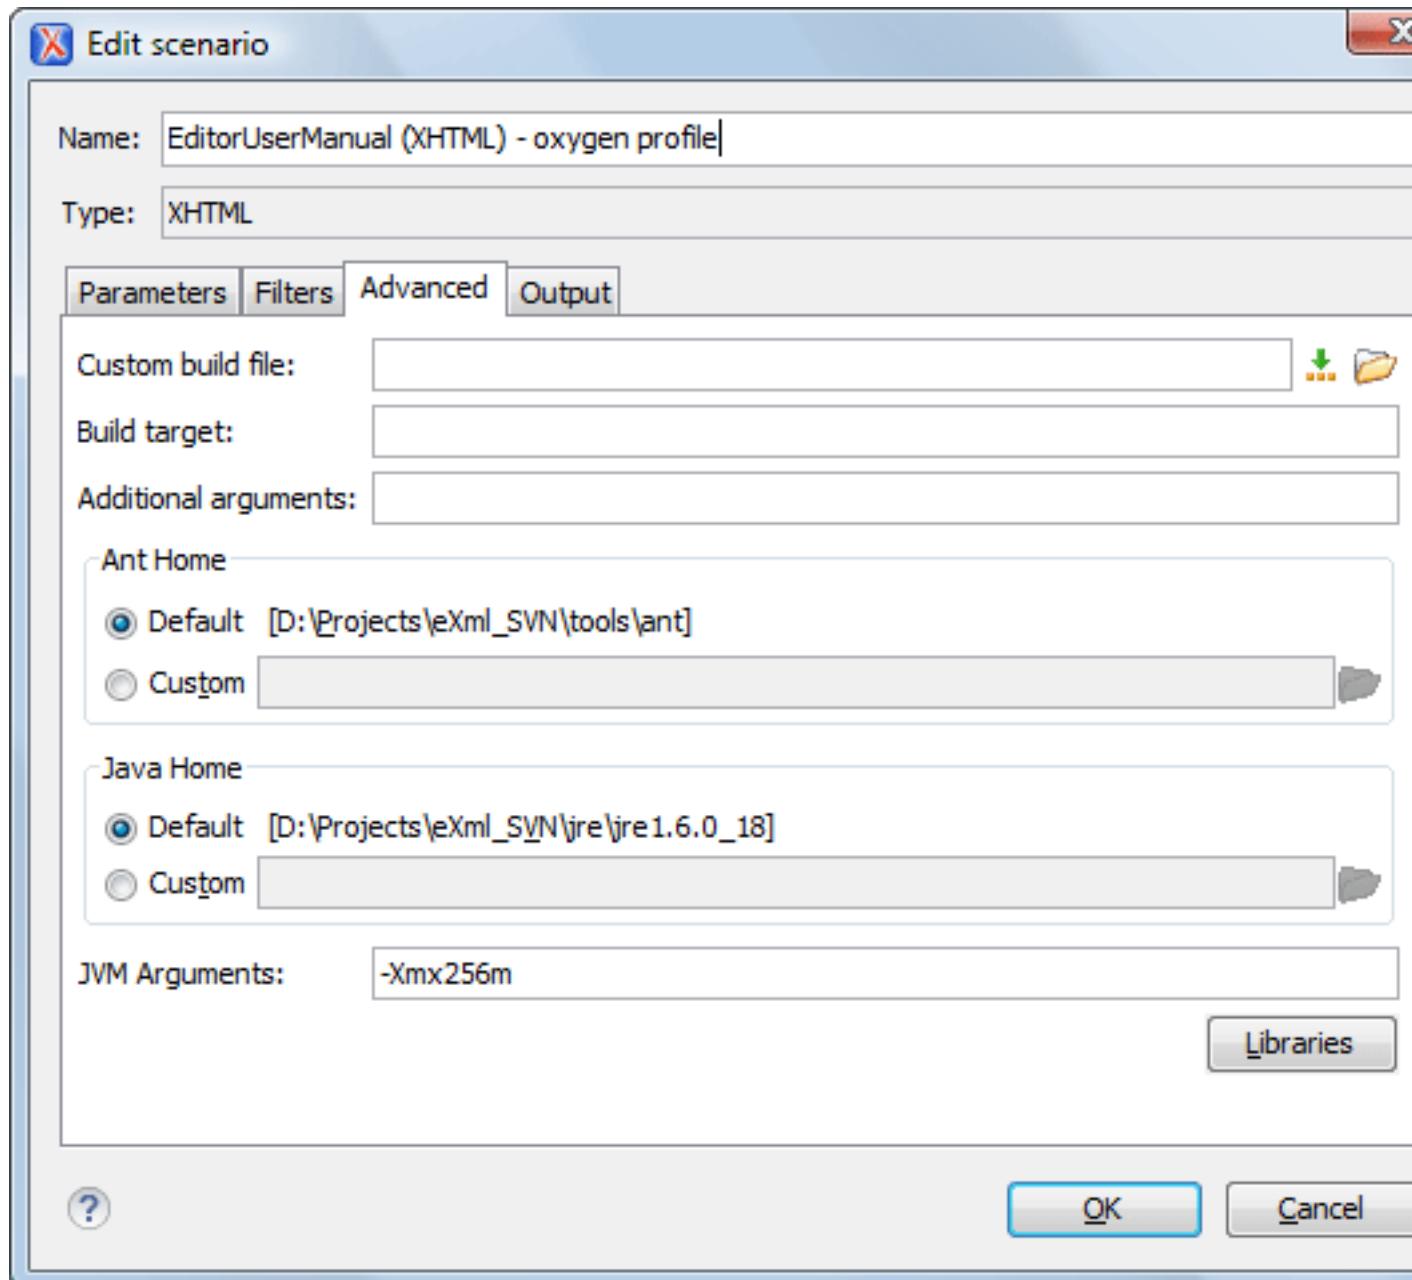

Figure 486: Advanced Settings Tab

You can specify the following parameters:

#### **Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the *Parameters tab* is used. You can specify the path by using the text field, the  **Insert** button, or the  **Browse** button.

#### **Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

#### **Additional arguments**

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

#### **Ant Home**

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the *Ant preferences page*.

#### **Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA OT 1.8.5 and older requires Java 1.6 or later, while DITA OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

#### **JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

#### **Libraries**

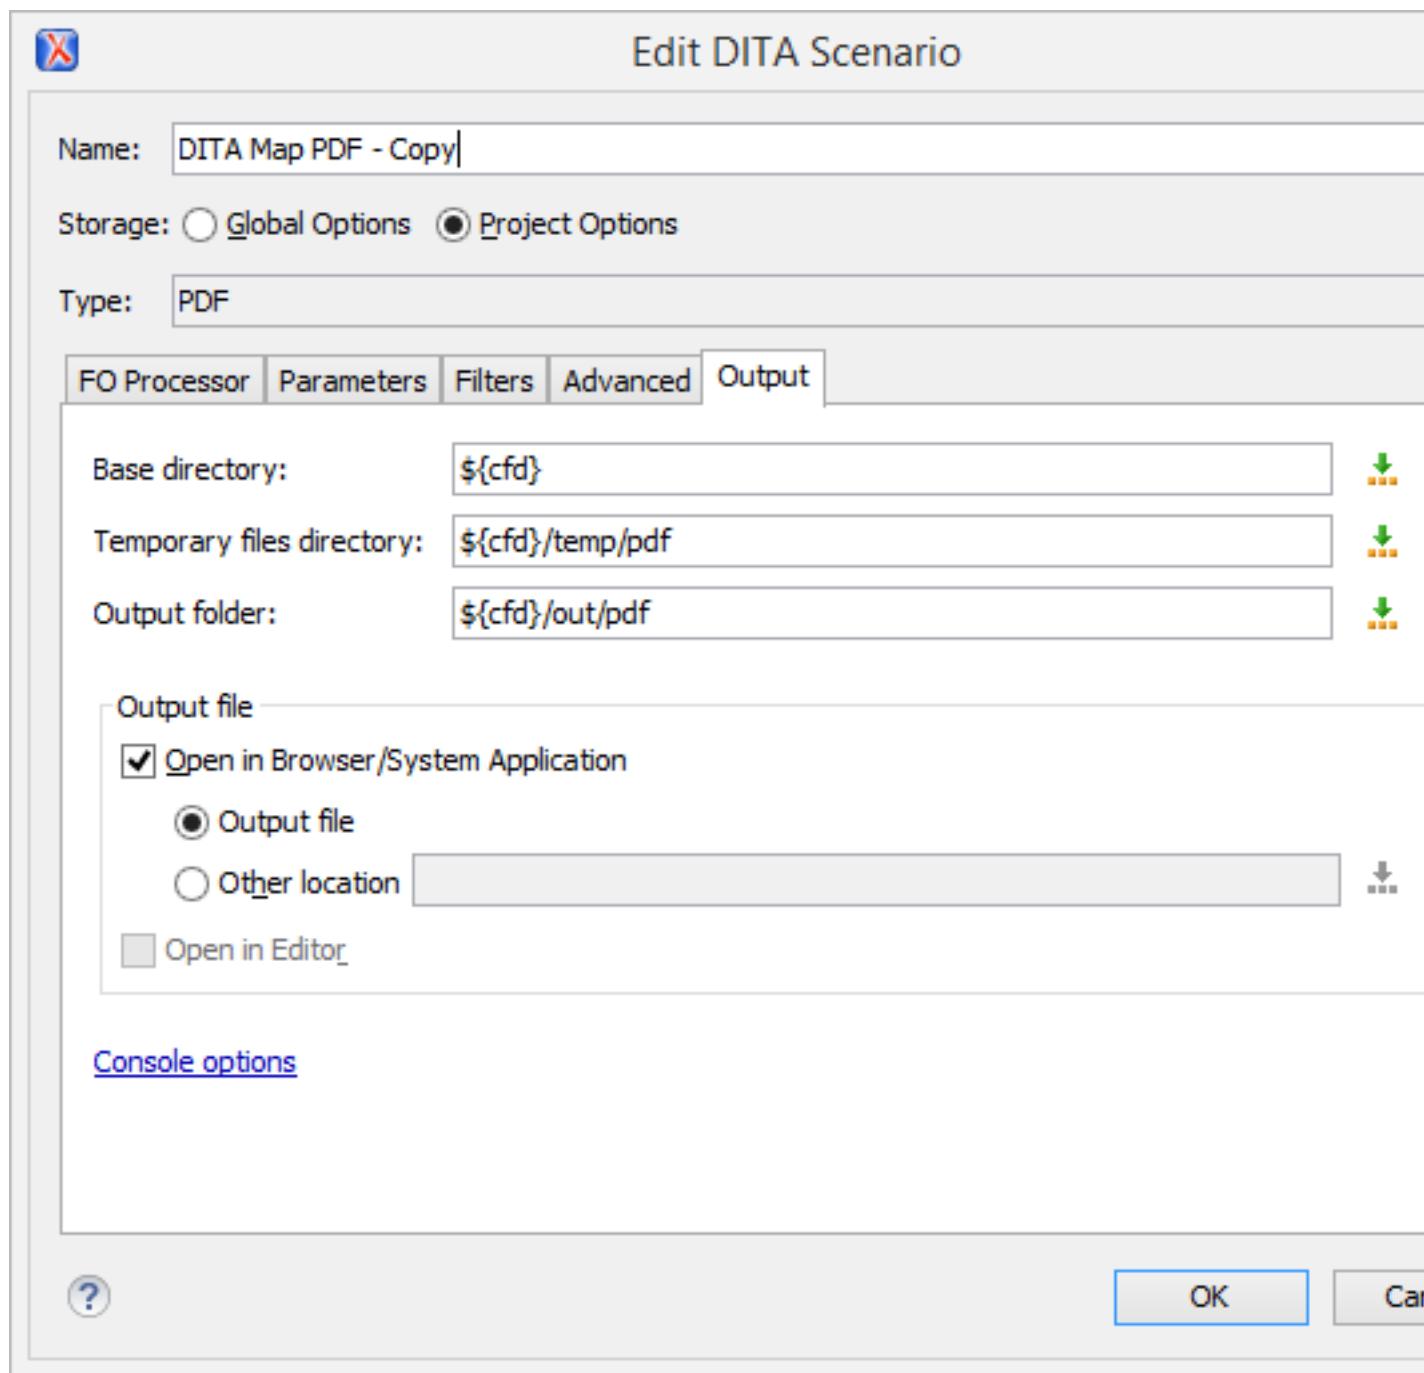

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

### **Output Tab (DITA OT Transformations)**

[Edit on GitHub](#)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

**Figure 487: Output Settings Tab**

You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field,

the **Insert Editor Variables** button, or the **Browse** button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

**Note:** If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If enabled, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

**Open in editor**

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the [Console options](#) preferences page that contains options to control the display of the console output received from the publishing engine.

**Customizing DITA Transformations**

[Edit on GitHub](#)

Oxygen XML Author includes a bundled copy of the DITA-OT as an Oxygen XML Author [framework](#). That framework includes a number of transformation scenarios for common output formats. This section includes topics about customizing DITA transformations, such as using a custom build file, customizing PDF output, and using DITA OT plugins to customize your needs.

## Customizing Output Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Author allows you to *set parameters* on a transformation scenario and you can *save and share them with others*. You can also use the `$(ask) editor variable` in the **Parameters** tab to instruct Oxygen XML Author to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the customization options, you can create a modified version of the transformation code. Some transformation scripts export specific forms of extension or customization. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options it supports.

You can also write your own output transformation scripts to produce a type of output not supported by the DITA Open Toolkit. You can create Oxygen XML Author transformation scenarios to run these scripts once they are complete.

### Related information

[Transforming DITA Content](#) on page 1677

[DITA Open Toolkit Documentation](#)

## Using a Custom Build File

[Edit on GitHub](#)

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the  **Configure Transformation Scenario(s)** action to open the **Configure Transformation Scenario(s)** dialog box.
2. Select the transformation scenario and click **Edit**.
3. Go to the **Advanced** tab and change the **Custom build file** path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA OT, your custom build file would have the following content:

```
<project basedir=". " default="dist">
<!--The DITA OT default build file-->
<import file="build.xml"/>
<target name="dist">
 <!-- You could run your script here -->
 <!--<exec></exec>-->
 <!--Call the DITA OT default target-->
 <antcall target="init"/>
</target>
</project>
```

**Note:** If you use the built-in Ant 1.8.2 build tool that comes bundled with Oxygen XML Author, it is located in the `[OXYGEN_INSTALL_DIR]/tools/ant` directory. Any additional libraries for Ant must be copied to the Oxygen XML Author Ant lib directory.

## DITA to PDF Output Customization

[Edit on GitHub](#)

This section includes topics about customizing DITA to PDF output.

## *Creating a Customization Directory for PDF Output*

[Edit on GitHub](#)

DITA Open Toolkit PDF output can be customized in several ways:

- Creating a DITA Open Toolkit plugin that adds extensions to the PDF plugin. More details can be found in the [DITA Open Toolkit user manual](#).
- Creating a customization directory and using it from the PDF transformation scenario. A small example of this procedure can be found below.

### **How to Create a Customization Directory for PDF Output**

The following procedure explains how to do a basic customization of the PDF output by setting up a customization directory. An example of a common use case is embedding a company logo image in the front matter of the book.

1. Copy the entire directory: *DITA\_OT\_DIR\plugins\org.dita.pdf2\Customization* to another location (for instance, C:\Customization).
2. Copy your logo image to: C:\Customization\common\artwork\logo.png.
3. Rename C:\Customization\catalog.xml.orig to: C:\Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Author and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: C:\Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl
6. Open the custom.xsl file in Oxygen XML Author and create the template called createFrontMatter\_1.0 (you can copy the same template from *DITA\_OT\_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl* and modify it in whatever way necessary to achieve your specific goal). This new template in the custom.xsl file will override the same template from *DITA\_OT\_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl*.

For example, the custom.xsl could now have the following content:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format"
 version="1.1">

 <xsl:template name="createFrontMatter_1.0">
 <fo:page-sequence master-reference="front-matter" xsl:use-
 attribute-sets="__force_page_count">
 <xsl:call-template name="insertFrontMatterStaticContents"/>
 <fo:flow flow-name="xsl-region-body">
 <fo:block xsl:use-attribute-sets="__frontmatter">
 <!-- set the title -->
 <fo:block xsl:use-attribute-
 sets="__frontmatter_title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class,
 'topic/title ')][1]">
 <xsl:apply-templates select="$map/
 *[contains(@class, ' topic/title ')][1]"/>
 </xsl:when>
 <xsl:when test="$map//*[contains(@class,
 'bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//
 *[contains(@class, ' bookmap/mainbooktitle ')][1]"/>
 </xsl:when>
 </xsl:choose>
 </fo:block>
 </fo:flow>
 </fo:page-sequence>
 </xsl:template>
</xsl:stylesheet>
```

```

 <xsl:when test="//*[contains(@class, ' map/map
')]//@title">
 <xsl:value-of select="//*[contains(@class,
' map/map ')]//@title"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/
descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]"/>
 </xsl:otherwise>
 </xsl:choose>
</fo:block>

 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/booktitlealt ')]"/>

 <fo:block xsl:use-attribute-
sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')]"/>
 </fo:block>

 <fo:block text-align="center" width="100%">
 <fo:external-
graphic src="url({concat($artworkPrefix, '/Customization/OpenTopic/common/
artwork/logo.png')})"/>
 </fo:block>
 </fo:block>

 <!--<xsl:call-template name="createPreface"/>-->

 </fo:flow>
</fo:page-sequence>
<xsl:call-template name="createNotices"/>
</xsl:template>
</xsl:stylesheet>
```

7. Edit the **DITA Map to PDF** transformation scenario and in the Parameters tab, set the customization.dir parameter to C:\Customization.

#### Related information

[Automatic PDF plugin customization generator by Jarno Elovirta](#).

[DITA OT Documentation - PDF Customization Plugin](#)

*Customizing the Header and Footer in PDF Output*

[Edit on GitHub](#)

The XSLT stylesheet *DITA\_OT\_DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl* contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is *DITA\_OT\_DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml*. These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory as explained in [Creating a Customization Directory for PDF Output](#) on page 1691.

### *Adding a Watermark to PDF Output*

[Edit on GitHub](#)

To add a watermark to the PDF output of a DITA map transformation, create a DITA-OT customization directory and use it from a DITA to PDF transformation scenario, as in the following procedure:

1. Copy the entire directory: *DITA\_OT\_DIR\plugins\org.dita.pdf2\Customization* to another location (for instance, *C:\Customization*).
2. Copy your watermark image (for example, *watermark.png*) to: *C:\Customization\common\artwork\watermark.png*.
3. Rename the *C:\Customization\catalog.xml.orig* file to: *C:\Customization\catalog.xml*.
4. Open the *catalog.xml* in Oxygen XML Author and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

The uncommented line should look like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: *C:\Customization\fo\xsl\custom.xsl.orig* to: *C:\Customization\fo\xsl\custom.xsl*
6. Open the *C:\Customization\fo\xsl\custom.xsl* file in Oxygen XML Author to overwrite two XSLT templates:
  - The first template is located in the XSLT stylesheet *DITA\_OT\_DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl* and we override it specifying a watermark image for every page in the PDF content, using a *block-container* element that references the watermark image file:

```
<fo:static-content flow-name="odd-body-header">
 <fo:block-container absolute-position="absolute"
 top="-2cm" left="-3cm" width="21cm" height="29.7cm"
 background-image="{concat($artworkPrefix, '/
Customization/OpenTopic/common/artwork/watermark.png')}">
 <fo:block/>
 </fo:block-container>
 <fo:block xsl:use-attribute-sets="__body_odd_header">
 <xsl:call-template name="insertVariable">
 <xsl:with-param name="theVariableID" select="'Body
odd header'" />
 <xsl:with-param name="theParameters">
 <prodname>
 <xsl:value-of select="$productName" />
 </prodname>
 <heading>
 <fo:inline xsl:use-attribute-
sets="__body_odd_header_heading">
 <fo:retrieve-marker retrieve-class-
name="current-header"/>
 </fo:inline>
 </heading>
 <pagenum>
 <fo:inline xsl:use-attribute-
sets="__body_odd_header_pagenum">
 <fo:page-number/>
 </fo:inline>
 </pagenum>
 </xsl:with-param>
 </xsl:call-template>
 </fo:block>
```

```

 </fo:static-content>
</xsl:template>
```

- The second template that we override is located in the XSLT stylesheet `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. We also override it by copying the original template content in our `custom.xsl` and adding the `block-container` element that references the watermark image file:

```

<xsl:template name="createFrontMatter_1.0">
 <fo:page-sequence master-reference="front-matter" xsl:use-
attribute-sets="__force_page_count">
 <xsl:call-template name="insertFrontMatterStaticContents"/>
 <fo:flow flow-name="xsl-region-body">
 <fo:block-container absolute-position="absolute"
 top="-2cm" left="-3cm" width="21cm" height="29.7cm"
 background-image="{concat($artworkPrefix, '/
Customization/OpenTopic/common/artwork/watermark.png')}">
 <fo:block/>
 </fo:block-container>
 <fo:block xsl:use-attribute-sets="__frontmatter">
 <!-- set the title -->
 <fo:block xsl:use-attribute-
sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class,
topic/title ')]*[1]">
 <xsl:apply-templates select="$map/
*[contains(@class,' topic/title ')][1]"/>
 </xsl:when>
 <xsl:when test="$map//*[contains(@class,
bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//
*[contains(@class,' bookmap/mainbooktitle ')][1]"/>
 </xsl:when>
 <xsl:when test="/*[contains(@class, ' map/
map ')]/@title">
 <xsl:value-of select="/
*[contains(@class, ' map/map ')]/@title"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/
descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class,
topic/title ')]"/>
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>

 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//
*[contains(@class,' bookmap/booktitlealt ')]"/>

 <fo:block xsl:use-attribute-
sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//
*[contains(@class,' bookmap/bookmeta ')]"/>
 </fo:block>

 </fo:block>
 <!--<xsl:call-template name="createPreface"/>-->
 </fo:flow>
```

```

</fo:page-sequence>
<xsl:if test="not($retain-bookmap-order)">
 <xsl:call-template name="createNotices"/>
</xsl:if>
</xsl:template>

```

7. Edit your **DITA Map to PDF** transformation scenario. In the Parameters tab, set the customization.dir parameter to C:\Customization.

### Related tasks

[Adding a Watermark to XHTML Output](#) on page 1698

*Force Page Breaks Between Two Block Elements in PDF Output*

[Edit on GitHub](#)

Suppose that in your DITA content you have two block level elements, such as two paragraphs:

```

<p>First para</p>
<p>Second para</p>

```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```

<p>First para</p>
<?pagebreak?>
<p>Second para</p>

```

2. Locate the **DITA Open Toolkit** distribution and in the plugins directory create a new plugin folder (for example, *DITA\_OT\_DIR/plugins/pdf-page-break*).
3. In this new folder, create a new plugin.xml file with the following content:

```

<plugin id="com.yourpackage.pagebreak">
 <feature extension="package.support.name" value="Force Page Break
Plugin"/>
 <feature extension="package.support.email" value="support@youremail.com"/>
 <feature extension="package.version" value="1.0.0"/>
 <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>

```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named pageBreak.xsl with the following content:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/
Transform" xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
 <xsl:template match="processing-instruction('pagebreak')">
 <fo:block break-after="page"/>
 </xsl:template>
</xsl:stylesheet>

```

5. *Install your plugin in the DITA Open Toolkit.*

*Customizing note Images in PDF*

[Edit on GitHub](#)

To customize the images that appear next to each type of note in the PDF output, use a *PDF customization folder* with the following procedure:

1. Copy the `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml` file to the `[CUSTOMIZATION_DIR]\common\vars` folder.
2. Edit the copied `en.xml` file and modify, for example, the path to the image for `<note>` element with the `type` attribute set to `notice` from:

```
<variable id="notice Note Image Path">Configuration/OpenTopic/cfg/common/
artwork/important.png</variable>
```

to:

```
<variable id="notice Note Image Path">Customization/OpenTopic/common/
artwork/notice.gif</variable>
```

3. Add your custom `notice` image to `[CUSTOMIZATION_DIR]\common\artwork\notice.gif`.
4. Edit the **DITA to PDF** transformation scenario and in the **Parameters** tab set the path for the `customization.dir` property to point to the customization folder.

### *Set a Font for PDF Output Generated with FO Processor*

[Edit on GitHub](#)

When a DITA map is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor](#) on page 777.

### **DITA OT PDF Font Mapping**

The DITA OT contains a file `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The `font-family` is defined to be `monospace`, but `monospace` is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this `monospace` alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```
<aliases>
 <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the `Monospaced` has a `logical-font` definition and if so, it will use the `physical-font` specified there:

```
<logical-font name="Monospaced">
 <physical-font char-set="default">
 <font-face>Courier New, Courier</font-face>
 </physical-font>

</logical-font>
```

#### **Important:**

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

### Adding a Watermark to XHTML Output

[Edit on](#)

[GitHub](#)

To add a watermark to the XHTML output of a DITA map transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```
body {
 background-image: url(MyWatermarkImage.png);
}
```

2. Edit a *DITA Map XHTML* transformation scenario and in the **Parameters** tab set the value of the `args.css` parameter as the path to your watermark image.
3. Set the value of the `args.copycss` parameter to `yes`.
4. Apply the transformation scenario.
5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

## Related tasks

[Adding a Watermark to PDF Output](#) on page 1694

### DITA Map to PDF WYSIWYG Transformation

[Edit on](#)

[GitHub](#)

Oxygen XML Author comes bundled with a DITA OT plugin that converts DITA maps to PDF using a CSS layout processor. Oxygen XML Author supports the following processors (not included in the Oxygen XML Author installation kit):

- **Prince Print with CSS** - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

The DITA-OT plugin is located in the following directory: `DITA_OT_DIR/plugins/com.oxygenxml.pdf.css`.

Although it includes a set of CSS files in its `css` subfolder, when this plugin is used in Oxygen XML Author, the CSS files located in the  `${frameworks}`  directory take precedence.

## Creating the Transformation Scenario

To create an experimental DITA map to PDF WYSIWYG transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG - Experimental**.
3. When applied, this new transformation scenario uses the currently selected CSS files for the opened topic files. These CSS files can be selected from the **Styles** drop-down menu from the toolbar.
4. In the **Parameters** tab, configure the following parameters:
  - `css.processor.path.prince` (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

**Important:** The author could open the map in the editor and change its style, but this is ignored in the publishing stage. Since authors usually edit topics instead of the map, Oxygen XML Author uses the styles selected in the opened topics.

- `css.processor.path.antenna-house` (if you are using the **Antenna House Formatter** processor)
  - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- `webhelp.show.changes.and.comments` - When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

## Customizing the Styles (for Output and Editing)

If you need to change the styles in the associated CSS, make sure you install Oxygen XML Author in a folder in which you have full read and write privileges (for instance, your user home directory). This is due to the fact that all the installed files are usually read-only (for instance, in Windows, Oxygen XML Author is installed in the **Program Files** folder where the users do not have change rights).

If you want to change the style of an element, open a document in the editor and select **Inspect Styles** from the contextual menu. *The CSS Inspector view* that shows all the CSS rules that apply to the selected element will be displayed. Click the link for the CSS selector that you need to change and Oxygen XML Author will open the CSS file and position the cursor at that selector. Simply add the properties you need and to see the changes in the editor, press **F5** to reload the document. Once you are satisfied with how it looks, use the transformation scenario and check for the changes in the PDF output.

**Note:** This experimental transformation scenario also allows you to present colored highlights in the PDF output.

## DITA Profiling / Conditional Text

[Edit on GitHub](#)

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Author, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. The profiling configuration can also be shared between content authors through the project file and there is no need for coding or editing configuration files.

### Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (`product`, `platform`, `audience`, `rev`, `props`, and `otherprops`). You can also create your own *custom profiling attributes* and *custom profiling condition sets*. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the `platform` profiling attribute:

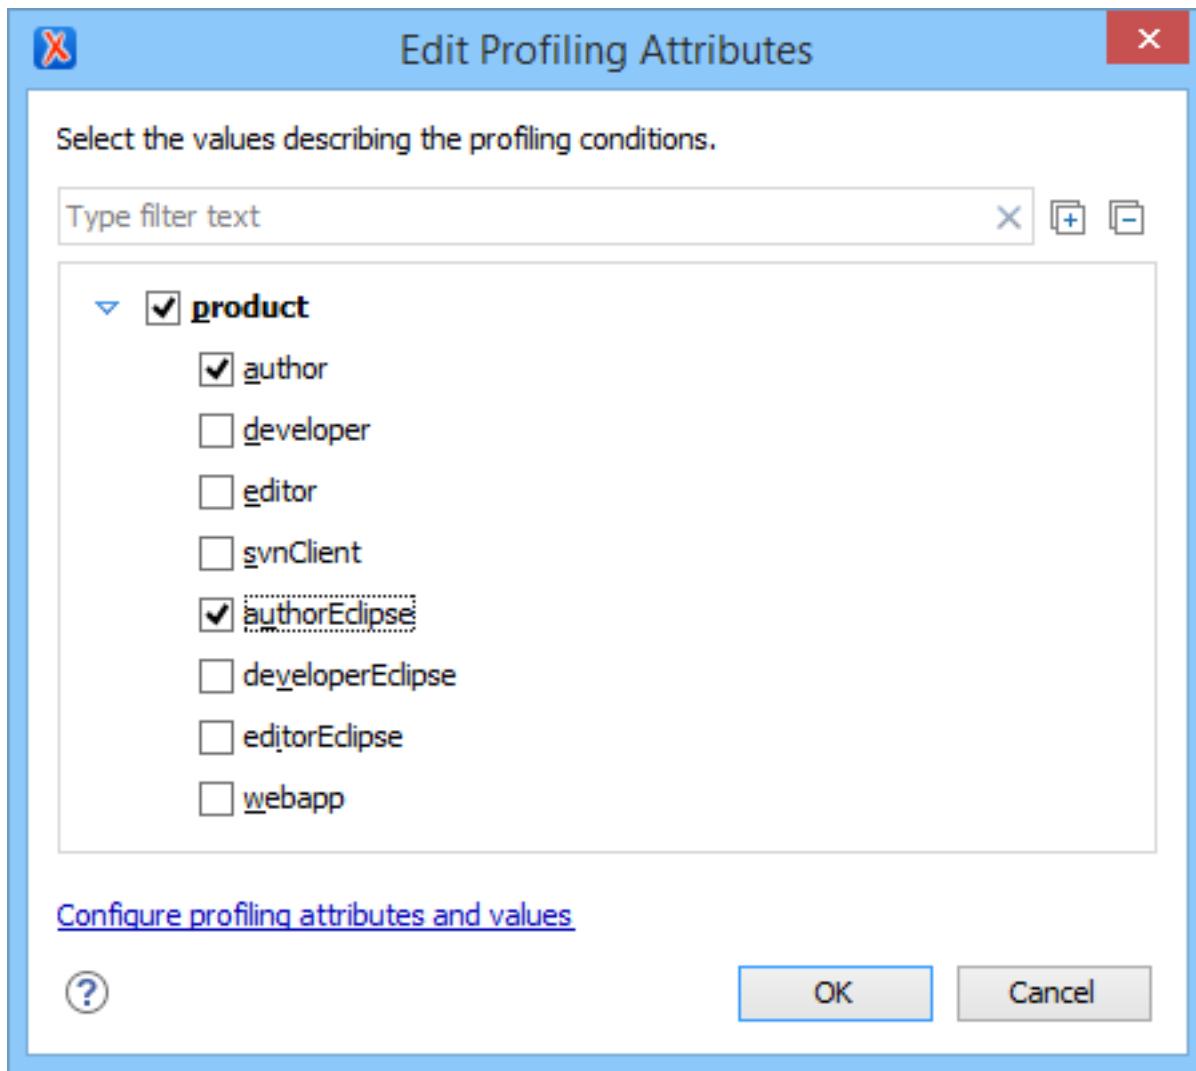

```
<section platform="windows">
```

### Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

### Apply Profiling to DITA Content

To apply a profiling attribute to DITA content, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile specific elements in a topic or map, right-click inside the element and select **Edit Profiling Attributes**. The **Edit Profiling Attributes** dialog box is displayed, allowing you to check each of the profiling tokens that apply for each attribute.

**Figure 488: Edit Profiling Attributes Dialog Box**

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Author. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The content of the dialog box is determined as follows:

- If your root DITA map references a DITA subject scheme map that defines values for the profiling attributes, those values are used. In the *image above* (taken from the Oxygen XML Author documentation project), values are defined for eight products, but none for other profiling attributes. Thus, the others are omitted from the dialog box.
- If your project defines *project-level configuration values for the profiling attributes*, those values are used.
- If Oxygen XML Author defines *global-level configuration values for the profiling attributes*, they are used.
- Otherwise, a basic default set of profiling attributes and values are available.

### Visualizing Profiled Content

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the **DITA Maps Manager** toolbar. You can select which profiles to show, or apply colors to text that is profiled in various ways, as shown in the following image:

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reaches the mark;
- product [Gasoline]
- Sharpen the blades:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Using an electric grinder or a file, grind the length of the blade sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

**Figure 489: Example: Profiled Content**

## Profiling DITA Content

[Edit on GitHub](#)

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets.

### Defining Profiling Attributes for DITA Content

To define or edit profiling attributes for filtering DITA content, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling / Conditional Text**.

2. In the **Profiling Attributes section**, there are already some default attributes for DITA documents (audience, platform, product, otherprops, and rev), although if a **Subject Scheme Map** is used for profiling your content, you will see the attributes defined in your subject scheme map instead. You can add new attributes and values by clicking the **New** button at the bottom of the table, or customize existing attributes and their values by selecting an attribute and clicking the **Edit** button.

**Step Result:** This opens a **Profiling Attribute** configuration dialog box that allows you to define attributes that exist in your schema.

3. In this configuration dialog box, use the **New**, **Edit**, **Delete** buttons to add, edit, or delete possible values of the selected attribute. You can also specify an optional description for each attribute value and you can choose whether the attribute accepts a **Single value** or **Multiple values separated by** a delimiter (DITA only accepts *space* as delimiters for attribute values).
4. Click **OK** to accept your changes.

**Result:** You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets section** to apply more complex filters on your DITA content.

## Applying Profiling Attributes in DITA

You can apply the DITA profiling attributes that were defined in the previous section in the following contexts:

### DITA Topics

To profile DITA topics, right-click a topic reference in the **DITA Maps Manager**, select  **Edit Properties** from the contextual menu, go to the **Profiling** tab, and select the appropriate values.

### DITA Content

To profile DITA content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu and select the appropriate values in the subsequent dialog box.

### DITA Elements

To profile specific XML elements in **Author** mode, right-click inside the element (or right-click the element name in the breadcrumb navigation bar), select **Edit Profiling Attributes**, and select the appropriate values in the subsequent dialog box. You can also use the **Attributes** view to set the profiling attributes on the element at the current cursor position.

To *display the DITA profiling markup* in the **Author** editing mode, enable the **Show Profiling Attributes option**

 in the  **Profiling / Conditional Text** drop-down menu that is available on the toolbar (or from the **DITA > Profiling/Conditional Text** menu).

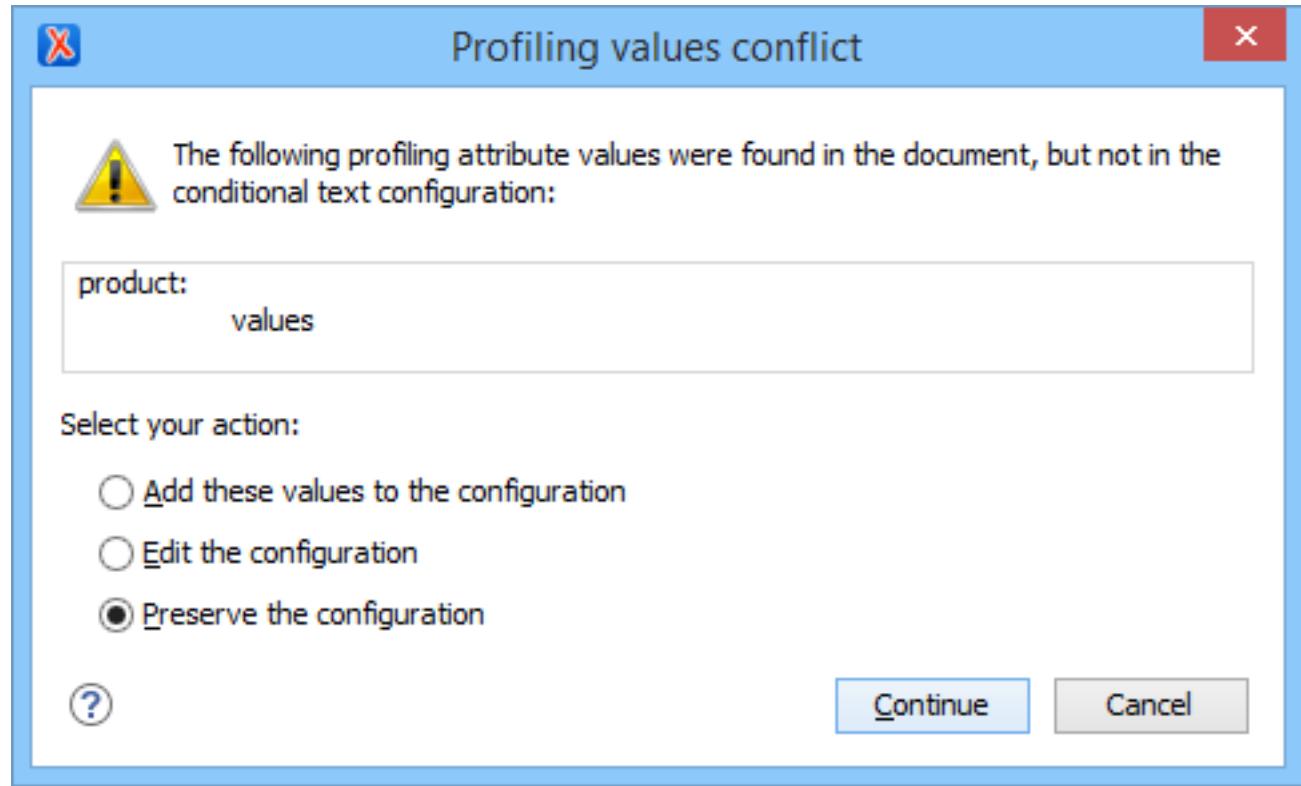

## Adding or Editing Profiling Attribute Values

There are several ways to add values to existing profiling attributes.

- Use the procedure in [Defining Profiling Attributes for DITA Content](#) on page 1701 to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor](#) in **Author** mode, the [Attributes view](#), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the

[Profiling / Conditional Text preferences page](#) where you can edit the profiling configuration. The action selected by default is to preserve the current configuration.

**Note:** If the [Allow additional profiling attribute values collected from the document](#) option is disabled in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, the current conditional text configuration will be preserved, and therefore the second method mentioned above will not be available.

**Figure 490: Profiling Values Conflict Dialog Box**

## Profiling with a Subject Scheme Map

[Edit on GitHub](#)

A subject scheme map allows you to create custom profiling values and to manage the profiling attribute values used in the DITA topics without having to write a DITA specialization.

Subject scheme maps use key definitions to define a collection of profiling values. A map that uses the set of profiling values must reference the subject scheme map in which the profiling values are defined at its highest level, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme" />
```

A profiled value should be a short and readable keyword that identifies a metadata attribute. For example, the audience metadata attribute may take a value that identifies the user group associated with a particular content unit.

Typical user values for a medical-equipment product line might include therapist, oncologist, physicist, radiologist, surgeon, and so on. A subject scheme map can define a list of these audience values.

The following is an example of content from a subject scheme:

```
<subjectScheme>
 <!-- Pull in a scheme that defines audience user values -->
 <subjectdef keys="users">
 <subjectdef keys="therapist"/>
 <subjectdef keys="oncologist"/>
 <subjectdef keys="physicist"/>
 <subjectdef keys="radiologist"/>
 <subjectdef keys="surgeon">
 <subjectdef keys="neuro-surgeon"/>
 <subjectdef keys="plastic-surgeon"/>
 </subjectdef>
 </subjectdef>
 <!-- Define an enumeration of the audience attribute, equal to
 each value in the users subject. This makes the following values
 valid for the audience attribute: therapist, oncologist, physicist,
 radiologist,
 surgeon, neuro-surgeon and plastic-surgeon. -->
 <enumerationdef>
 <attributedef name="audience"/>
 <subjectdef keyref="users"/>
 </enumerationdef>
</subjectScheme>
```

When you edit a DITA topic in the **Text** or **Author** mode, Oxygen XML Author collects all the profiling values from the Subject Scheme Map that is referenced in the map that is currently opened in the [DITA Maps Manager](#). The values of profiling attribute defined in a Subject Scheme Map are available in the [Edit Profiling Attribute dialog box](#), regardless of their mapping in the [Profiling/Conditional Text preferences page](#). They are also available as proposals for values in the [Content Completion Assistant](#).

In the example above, the values therapist, oncologist, physicist, and so on, are displayed in the **Content Completion Assistant** as values for the audience attribute.

Consider that you have the following fragment in a topic:

```
<p audience="neuro-surgeon">Some text.. </p>
```

When you define a DITAVAL filter, you can, for instance, exclude anything that is profiled as surgeon:

```
<val>
 <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map specifying the DITAVAL filter file in the transformation scenario, the p element should be excluded from the output. Therefore, excluding the surgeon audience also excludes neuro-surgeon and plastic-surgeon from the output. More details about how hierarchical filtering and Subject Scheme Maps should work are found in the following specification:<http://docs.oasis-open.org/dita/v1.2/os/spec/langref/subjectScheme.html#subjectScheme>

## Related information

[http://www.oxygenxml.com/demo/DITA\\_Subject\\_Scheme.html](http://www.oxygenxml.com/demo/DITA_Subject_Scheme.html)

<http://docs.oasis-open.org/dita/v1.2/os/spec/langref/subjectScheme.html#subjectScheme>

## Profiling Markers

[Edit on GitHub](#)

If the **Show Profiling Attributes option** (available in the  **Profiling / Conditional Text toolbar menu**) is enabled, all profiling attributes set on the current element are listed at the end of the highlighted block. Profiled text is marked in the **Author** mode with a light green border.

## Tools

Useful tools include the following items:

- Hammer
- Screw driver set
- ▷Electric air compressor◁ Audience [expert] ▷Hand air pump◁  
Audience [novice]

Keep your tools organized in a ▷tool box◁ Audience [expert] ▷shelf◁  
Audience [novice] which you can store in the garage.

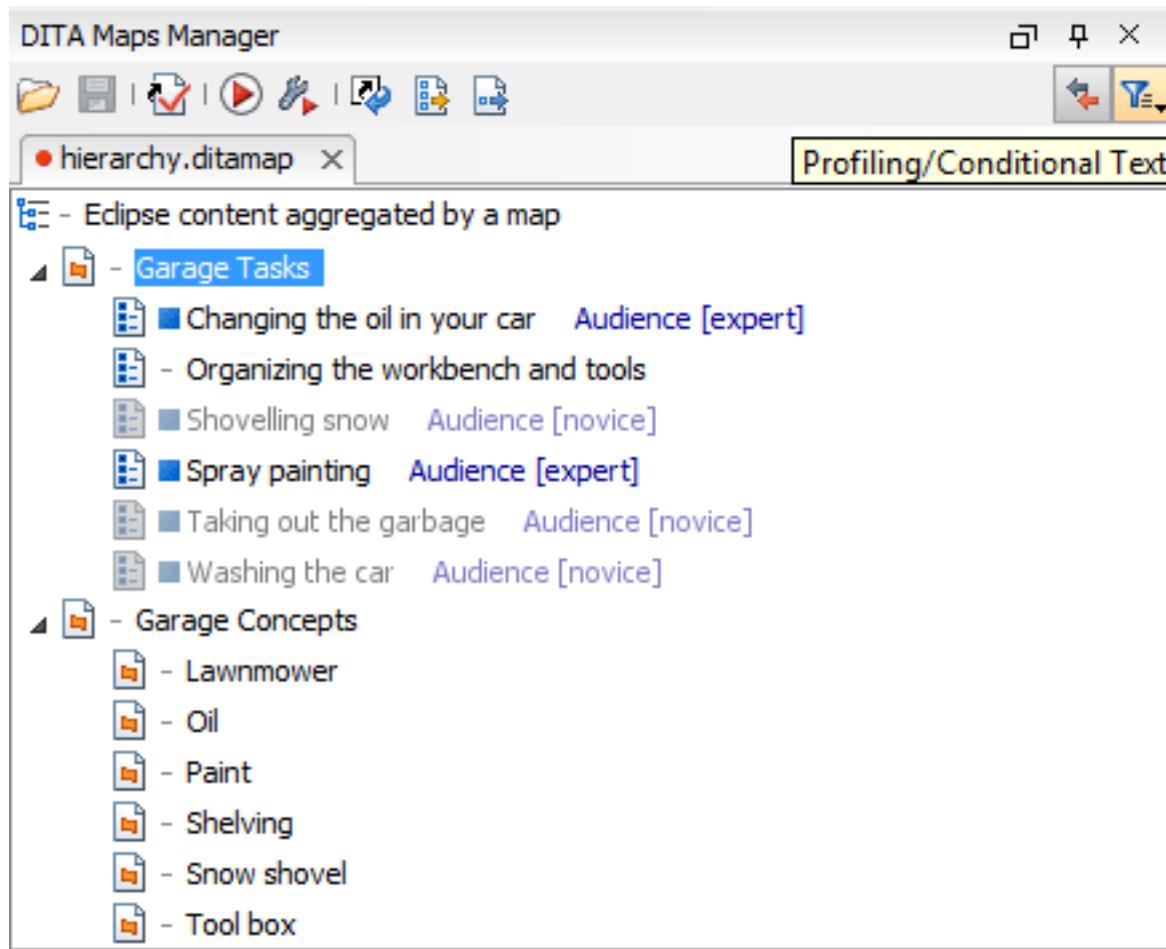

**Related Links:**

- ⚒ [\[task - ../tasks/organizing.xml\]](#)

**Figure 491: Profiling in Author**

In the **DITA Maps Manager view**, the following icons are used to mark profiled and non-profiled topics:

- ■ - The topic contains profiling attributes.
- □ - The topic inherits profiling attribute from its ancestors.
- ☑ - The topic contains and inherits profiling attributes.
- - (dash) - The topic neither contains, nor inherits profiling attributes.

**Figure 492: Profiling in DITA Maps Manager**

The profiled content that does not match the rules imposed by the current condition sets is grayed-out, meaning that it will not be included in the published output.

## Publishing Profiled DITA Content

[Edit on GitHub](#)

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Author includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set into account during the transformation, as defined in the [Filters tab](#) when [creating a DITA transformation](#).

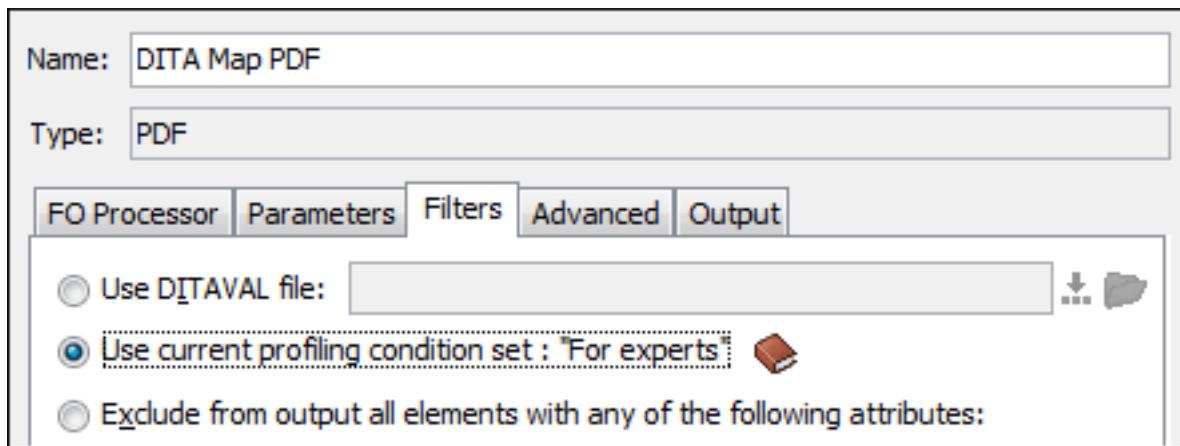

Figure 493: Profiling Option in the Filters Tab (DITA OT Transformations)

## DITA Open Toolkit Support

[Edit on GitHub](#)

Oxygen XML Author includes support for the DITA Open Toolkit. This section includes information about how to create a DITA OT plugin, how to install plugins in the DITA OT, and how to use an external instance of the DITA Open Toolkit.

### Related information

[DITA Open Toolkit Documentation](#)

## Creating a DITA OT Customization Plugin

[Edit on GitHub](#)

To describe the steps involved in creating a **DITA Open Toolkit** plugin, this section uses an example of creating an **XSLT** customization plugin that provides syntax highlighting when publishing DITA `codeblock` elements to **HTML** and **PDF** output formats. This plugin (`com.oxygenxml.highlight`) is available in the **DITA Open Toolkit** distribution that comes bundled with the latest version of Oxygen XML Author, but these instructions show you how to create it as if it were not included.

The steps to help you to create the plugin are as follows:

1. Create a folder for your plugin in the DITA OT `plugins` folder (`DITA_OT_DIR/plugins/`).

**For example, if you are using DITA 1.8 the path would look like this:**

`[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.oxygenxml.highlight`

2. Create a `plugin.xml` file (in the same plugin folder) that contains the extension points of the plugin.

**Note:** You can easily create this file by using the **DITA OT Plugin** new file template that is included in Oxygen XML Author. From the **New** file wizard you can find this template in **Framework templates > DITA > plugin**.

**For example, our syntax highlighting plugin example contains the following:**

```
<plugin id="com.oxygenxml.highlight">
 <feature extension="package.support.name" value="Oxygen XML Editor
Support"/>
 <feature extension="package.support.email" value="support@oxygenxml.com"/>
 <feature extension="package.version" value="1.0.0"/>
 <feature extension="dita.xsl.xhtml" value="xhtmlHighlight.xsl"
type="file"/>
 <feature extension="dita.xsl.xslfo" value="pdfHighlight.xsl" type="file"/>
</plugin>
```

The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other **DITA OT** plugin extension points here: [http://dita-ot.sourceforge.net/1.5.3/dev\\_ref/extension-points.html](http://dita-ot.sourceforge.net/1.5.3/dev_ref/extension-points.html)

3. Create an XSLT stylesheet to customize the output types. In our example, to customize the HTML output we need to create an XSLT stylesheet called **xhtmlHighlight.xsl** (in the same plugin folder).

**Tip:** You can use the **Find/Replace in Files** to find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. In our example we want to overwrite the creation of the HTML content from a DITA **codeblock** element. Since a DITA codeblock element has the `class` attribute value `+ topic/pre pr-d/codeblock` we can take part of the class attribute value (**topic/pre**) and search the **DITA OT** resources for a similar stylesheet.

Our search found the XSLT stylesheet *DITA\_OT\_DIR/org.dita.xhtml/xsl/xslhtml/dita2htmlImpl.xsl* that contains:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" name="topic.pre">
 <xsl:apply-templates select=". " mode="pre-fmt" />
</xsl:template>
```

We use it to overwrite our **xhtmlHighlight.xsl** stylesheet, which results in the following:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" name="topic.pre">
 <!-- This template is deprecated in DITA-OT 1.7. Processing will move
 into the main element rule. -->
 <xsl:if test="contains(@frame,'top')"><hr /></xsl:if>
 <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-
 startprop ')]" mode="out-of-line"/>
 <xsl:call-template name="spec-title-nospace" />
 <pre>
 <xsl:attribute name="class"><xsl:value-of select="name() " /></
 xsl:attribute>
 <xsl:call-template name="commonattributes" />
 <xsl:call-template name="setscale" />
 <xsl:call-template name="setidaname" />
 <!--Here I'm calling the styler of the content inside the codeblock.-->
 <xsl:call-template name="outputStyling" />
 </pre>
 <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-
 endprop ')]" mode="out-of-line"/>
 <xsl:if test="contains(@frame, 'bot')"><hr /></xsl:if><xsl:value-of
 select="$newline" />
</xsl:template>
```

You could also use another XSLT template that applies the XSLTHL library as a Java extension to style the content.

4. Create additional XSLT stylesheets to customize all other desired output types. In our example, to customize the PDF output we need to create an XSLT stylesheet called **pdfHighlight.xsl** (in the same plugin folder).

In this case we found an appropriate XSLT stylesheet *DITA\_OT\_DIR/plugins/legacypdf/xslfo/dita2fo-elems.xsl* to use as a template that we use to overwrite our **pdfHighlight.xsl** stylesheet, which results in the following:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]">
 <xsl:call-template name="gen-att-label" />
 <fo:block xsl:use-attribute-sets="pre">
 <!-- setclass -->
 <!-- set id -->
 <xsl:call-template name="setscale" />
 <xsl:call-template name="setframe" />
 <xsl:apply-templates/>
 </fo:block>
</xsl:template>
```

**Note:** You can edit the newly created stylesheets to customize multiple outputs in a variety of ways. For example, in our case you could edit the **xhtmlHighlight.xsl** or **pdfHighlight.xsl** stylesheets that we created to customize various colors for syntax highlighting.

5. To install the created plugin in the **DITA OT**, run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the **Apply Transformation Scenario(s)** dialog box. If the integrator is not visible, enable the **Show all scenarios** action that is available in the **Settings** drop-down menu. For more information, see *Installing a Plugin in the DITA Open Toolkit* on page 1709.

#### Results of running the integrator using our example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

- a. For the HTML output, in the XSLT stylesheet *DITA\_OT\_DIR/xsl/dita2html-base.xsl* a new import automatically appeared:

```
<xsl:import href="../plugins/com.oxygenxml.highlight/xhtmlHighlight.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: <http://www.w3.org/TR/xslt#import>.

- b. Likewise, for the PDF output, in the top-level stylesheet *DITA\_OT\_DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo\_shell\_fop.xsl* a new import statement appeared:

```
<xsl:import href="../../../../com.oxygenxml.highlight/pdfHighlight.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA OT installation along with some simple installation notes. Your customization will work provided that the templates you are overwriting have not changed from one DITA OT distribution to the other.

#### Related information

[DITA Open Toolkit Documentation](#)

[Edit on GitHub](#)

## Installing a Plugin in the DITA Open Toolkit

The architecture of the **DITA Open Toolkit** allows additional plugins to be installed.

1. The additional plugin(s) should be copied to the *DITA\_OT\_DIR\plugins* directory.

**Note:** If the plugin is only supported in DITA-OT 2.x versions, make sure that you copy the plugin in the *[OXYGEN\_INSTALL\_DIR]/frameworks/dita/DITA-OT2.x* directory.

2. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the **Apply Transformation Scenario(s)** dialog box. If the integrator is not visible, enable the **Show all scenarios** action that is available in the **Settings** drop-down menu.

**Important:** The folder where the **DITA OT** is located needs to have full write access permissions set to it. For example if you are integrating plugins in the **DITA OT** folder bundled with Oxygen XML Author and if you are running on **Windows** and your application is installed in the **Program Files** folder, you can start the Oxygen XML Author main executable with administrative rights for the integrator process to be able to modify resources in the **DITA OT** folder.

Starting with version 17.0, Oxygen XML Author detects the transformation type (`transtype`) declarations from **DITA OT** plugins and presents descriptions, which are contributed in the `transtype` declarations, in the **DITA Transformation Type** dialog box. Oxygen XML Author also shows the contributed parameters from **DITA OT** plugins in the **Parameters** tab in the **Edit DITA Scenario** dialog box.

3. If the plugin contributed a new transformation type that is not detected (for instance, if you are using a previous version of Oxygen XML Author that does not detect the `transtype` declarations), you can create a new **DITA OT** transformation scenario with a predefined type that is similar to the new transformation type. Then edit the transformation scenario, and in the **Parameters** tab add a `transtype` parameter with the value of the new transformation type.

**Note:** A transformation type can also extend another `transtype`. For example, the `pdf-prince` `transtype` extends a `commons` transformation type that contains all the common DITA OT parameters.

#### Example:

```
<plugin id="com.oxygenxml.pdf.prince">
 <!-- extensions -->
 <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
 <feature extension="dita.conductor.target.relative" value="integrator.xml" type="file">
 <feature extension="dita.transtype.print" value="pdf-prince"/>
 <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML - Experimental)">
 <param name="princeExecPath" type="file" desc="Path to the Prince executable file (eg: "c:\path\to\prince.exe" on Windows) which should be run to produce the PDF"/>
 </Transtype>
 </plugin>
```

## Use an External DITA Open Toolkit in Oxygen XML Author

Oxygen XML Author comes bundled with a DITA Open Toolkit, located in the `DITA_OT_DIR` directory. Starting with Oxygen XML Author version 17, if you want to use an external DITA OT for all transformations and validations, you can [open the Preferences dialog box \(Options > Preferences\)](#) and go to [the DITA page](#), where you can specify the DITA OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the **Parameters** tab change the value for the `dita.dir` parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the **Advanced** tab, click the **Libraries** button and uncheck **Allow Oxygen to add high priority libraries to classpath**.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Oxygen XML Author preferences in the **Document Type Association** page, edit the **DITA** and **DITA Map** document types and modify the catalog entry in the **Catalogs** tab to point to the custom catalog file `catalog-dita.xml`.

## Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 1.8 and 2.x distributions that are bundled with Oxygen XML Author include some pre-installed third-party open-source plugins that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Author include:

- **DITA For Publishers** (installed only in DITA OT 1.8) - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.

- **DITA to Reveal JS** (installed only in DITA OT 1.8) - This plugin allows users to publish DITA content to web slides that can be used for presentations.
- **DITA to Word** (installed only in DITA OT 2.x) - This plugin allows users to publish DITA content to MS Word.
- **DITA Markdown** (installed only in DITA OT 2.x) - This plugin allows users to publish DITA content to *Markdown*, or to publish DITA Maps that refer to *Markdown* resources.
- **Lightweight DITA** (installed only in DITA OT 2.x) - This plugin allows users to create, edit, and validate *Lightweight DITA* topics and maps.
- **DITA Community** (installed only in DITA OT 2.x) - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

## DITA Specialization Support

[Edit on GitHub](#)

This section explains how you can integrate and edit a DITA specialization in Oxygen XML Author.

### Integration of a DITA Specialization

[Edit on GitHub](#)

A DITA specialization usually includes:

- DTD definitions for new elements as extensions of existing DITA elements.
- Optional specialized processing that is new XSLT template rules that match the extension part of the `class` attribute values of the new elements and thus extend the default processing available in the DITA Open Toolkit.

A specialization can be integrated in the application with minimum effort:

1. If the DITA specialization is available as a DITA Open Toolkit plugin, copy the plugin to the location of the DITA OT you are using (by default `DITA_OT_DIR\plugins`). Then run the DITA OT integrator to integrate the plugin. In the **Transformation Scenarios view** there is a predefined scenario called **Run DITA OT Integrator** that can be used for this.

**Important:** The directory where the DITA OT is located needs to have full write access permissions set to it.

2. If the specialization is not available as a DITA OT plugin, you have the following options:

- If the DTD that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA OT catalog file for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the DITA maps or topics. The DITA OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA OT, these new stylesheets must be called from the Ant build scripts of DITA OT.

**Important:** If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** checkbox in the **Document Type Association preferences page**.

- In your specialization plugin directory, create a folder called `template_folders`, which would contain all the folders with new file templates. In Oxygen XML Author, the templates contributed by the plugin will be available in the **New** document wizard.

## Editing DITA Map Specializations

[Edit on GitHub](#)

In addition to recognizing the default DITA map formats (map and bookmap), the **DITA Maps Manager** view can also be used to open and edit specializations of DITA maps.

All advanced edit actions available for the map (such as insertion of topic refs, heads, properties editing) allow you to specify the element in an editable combo box. Moreover the elements that appear initially in the combo are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the **DITA Maps Manager** view are collected from the target files by matching the class attribute and not a specific element name.

When editing DITA specializations of maps in the main editor the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at cursor position. You can go to the **DITA Map** document type from the [Document Type Association preferences page](#) and edit the table actions to insert the element names as specified in your specialization. See [Adding or Editing a Document Type Association \(Framework\)](#) on page 1115 for more details.

## Editing DITA Topic Specializations

[Edit on GitHub](#)

In addition to recognizing the default DITA topic formats (topic, task, concept, reference, and composite), topic specializations can also be edited in the **Author** mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles in which the elements are rendered should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the **DITA** document type from the [Document Type Association preferences page](#) and edit the actions to insert the element names, as specified in your specialization. See [Adding or Editing a Document Type Association \(Framework\)](#) on page 1115 for more details.

## Metadata

[Edit on GitHub](#)

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

### Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the prolog element of a topic or inside the topicref element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

### Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using subject scheme maps. When you are authoring, many of the values you choose from have been defined in subject scheme maps.

## Creating an Index in DITA

[Edit on GitHub](#)

In DITA, indexes are created from `indexterm` elements. You can insert index term elements:

- In the header of a topic. In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page in which the topic starts, even if it is not the page in which the indexed term occurs.
- In the `topicref` element in a map that references the topic. This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page in which the topic starts.
- In the body of a topic. In paginated media, this results in an index entry that points to the page in which the `indexterm` element occurs, even if that is not the page in which the topic starts.

To add index terms to the text of a topic of the topic header, *create the elements, as you normally would, in Oxygen XML Author*. To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a bookmap, you need to add an `indexlist` element to the `backmatter` of the book.

1. Open your `bookmap` in the **DITA Maps Manager**.
2. Right-click the bookmap and select **Append child > Backmatter**. The **Insert Reference dialog box** appears.
3. Click **Insert and Close** to insert the `backmatter` element.
4. Right-click the `backmatter` element and create a `booklists` element using **Append child > Book Lists**.
5. Use the same steps to create an `indexlist` element.

**CAUTION:** Adding index entries and an `indexlist` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

## Migrating OOXML Documents to DITA

[Edit on GitHub](#)

Oxygen XML Author integrates the entire DITA for Publishers plugins suite that allows you to migrate content from Open Office XML documents to DITA.

You can use any of the following methods to migrate such documents to DITA:

- Open an OOXML document in Oxygen XML Author. The document is opened in the **Archive Browser** view.
  - From the **Archive Browser**, open `document.xml`.
- Note:** `document.xml` holds the content of the document.
- Click **Configure Transformation Scenario(s)** on the toolbar and apply the **DOCX DITA** scenario (in the **OOXML** section). If you encounter any issues with the transformation, click the link below for further details about the Word to DITA Transformation Framework.
  - Oxygen XML Author includes a **Smart Paste feature** that allows you to copy content from external sources (such as web pages and Office-type documents) and paste it into a DITA topic.

## DITA 1.3 Support

[Edit on GitHub](#)

Starting with version 17.1, Oxygen XML Author includes support for some DITA 1.3 features.

To enable DITA 1.3 support in Oxygen XML Author and use the DITA Open Toolkit 2.x for publishing, [open the Preferences dialog box \(Options > Preferences\)](#), go to **DITA**, and select the **Built-in DITA OT 2.x** radio button.

The Oxygen XML Author publication of the full DITA 1.3 specifications can be found at <http://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html>.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Author:

**Table 13: DITA 1.3 Features Implementation Status**

Feature	Editing	Publishing [Latest DITA Open Toolkit 2.x is used.]
DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.	New DITA 1.3 file templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3  Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements	N/A
Learning Object and Group maps	New file templates	No specific support implemented
Troubleshooting specialization	Create and edit new troubleshooting topics	No specific support implemented
XML markup domain	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Equation and MathML domain	Validation and content completion  Display and Insert equations	Special rendering in PDF and XHTML-based outputs
SVG domain	Validation and content completion  Display referenced SVG content	Special rendering in PDF and XHTML-based outputs
Other new DITA 1.3 elements (div, strike-through, overline, etc)	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Release management domain	Validation and Content Completion	No specific support implemented

Feature	Editing	Publishing [Latest DITA Open Toolkit 2.x is used.]
Scoped keys	Define key scopes Validate and check for completeness Resolve <i>keyrefs</i> and <i>conkeyrefs</i> taking key scopes into account Key scope information is displayed in a tooltip when hovering over an item in the <b>DITA Maps Manager</b>	Partially implemented (Various issues may still be encountered)
Branch filtering	Display, create, and edit <i>ditavalref</i> elements	Partially implemented (Various issues may still be encountered)
Key-based cross deliverable addressing	Special display for references to DITA maps with <b>scope="peer"</b> and a defined <b>keyscope</b> Gather and present keys from peer maps	Not implemented.
Shorthand to address syntax that identifies elements in the same topic	Properly resolved for validation, links, and conrefs	Implemented
Various table attributes ( <i>orientation</i> , <i>rotation</i> , <i>scope</i> , and <i>headers</i> on cells)	Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view	Not implemented
New Map <i>topicref</i> attributes ( <i>cascade</i> , <i>deliveryTarget</i> )	Allow setting new attributes, propose proper values for them	Implemented

## Glossary

---

**Topics:**

- *Active cell*
- *Apache Ant*
- *Block element*
- *Bookmap*
- *DITA Map*
- *DITA\_OT\_DIR*
- *Inline element*
- *Java Archive*
- *Named User*

## Active cell

[Edit on GitHub](#)

The selected cell in which data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

## Apache Ant

[Edit on GitHub](#)

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

### Ant

## Block element

[Edit on GitHub](#)

A block element is intended to be visually separated from its siblings, usually vertically. For instance, a paragraph or a list item are block elements. It is distinct from a *inline element*, which has no such separation.

## Bookmap

[Edit on GitHub](#)

A bookmap is a specialized *DITA map* used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.

## DITA Map

[Edit on GitHub](#)

A DITA map is a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension `.ditamap`.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmap to generate a deliverable using an output type such as XHTML, PDF, HTML Help or Eclipse Help.

## DITA\_OT\_DIR

[Edit on GitHub](#)

DITA\_OT\_DIR is the default directory that is specified for your DITA Open Toolkit distribution in the [\*Options > Preferences > DITA preferences page\*](#).

For example, if you are using DITA 1.8, the default DITA OT directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT` (or if you are using DITA 2.x, `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x`). You can also specify a custom directory.

## Inline element

[Edit on GitHub](#)

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a *block element*, which is visually separated from its siblings.

## Java Archive

[Edit on GitHub](#)

JAR (Java ARchive) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the `jar` command or an archive tool.

Java Archive (JAR)

**JAR**

## Named User

[Edit on GitHub](#)

*Named User* is defined as an individual full or part-time employee who is authorized by *You* (the individual or entity who owns the rights to Oxygen XML Author) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, Named User licenses cannot be shared amongst multiple individuals and separate Named User licenses must be purchased for each individual user.

A Named User license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the Named User's employment with your company.
- (b) Permanent reassignment of a Named User to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen XML license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the Named User license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

**Note:** This definition is taken from the Oxygen XML Author [End User License Agreement](#).
